Space Environment

# Space Environment Lecture 2

# Planetary Magnetism

- All planets and generally all solar system bodies have some kind of magnetism.
- The giant outer planets all have strong magnetic fields.
- The innermost small planet Mercury has a substantial magnetic field.
- Jupiter's moon Ganymede has an intrinsic magnetic field.

# Planetary Magnetism

- Europa and Callisto have induced magnetospheres possibly related to a subsurface ocean.
- The Moon has a remnant magnetic field.
- Mars has localized field concentrations.
- Asteroids *may* have a strong magnetic field.

# Planetary magnetism

Planet	Radius (km)	Rotation period (days)	Equatorial magnetic field (nT)
Mercury	2439	58.6	340
Venus	6052	243	0.4
Earth	6371	1	30,000
Mars	3397	1	< 0.5
Jupiter	71,398	0.4	424,000
9969 Braille	0.8	3.6	92,500
Saturn	60,000	0.41	21,500
Uranus	26,200	0.72	22,800
Neptune	24,300	0.70	14,400

# Planetary magnetism

Planet	Radius (km)	Rotation period (days)	Equatorial magnetic field (nT)
Mercury	2439	58.6	340
Venus	6052	243	0.4
Earth	6371	1	30,000
Mars	3397	1	< 0.5
Jupiter	71,398	0.4	424,000
<i>Braille/Gaspra</i>	<i>0.8</i>	<i>3.6</i>	<i>92,500 / 78,000</i>
Saturn	60,000	0.41	21,500
Uranus	26,200	0.72	22,800
Neptune	24,300	0.70	14,400

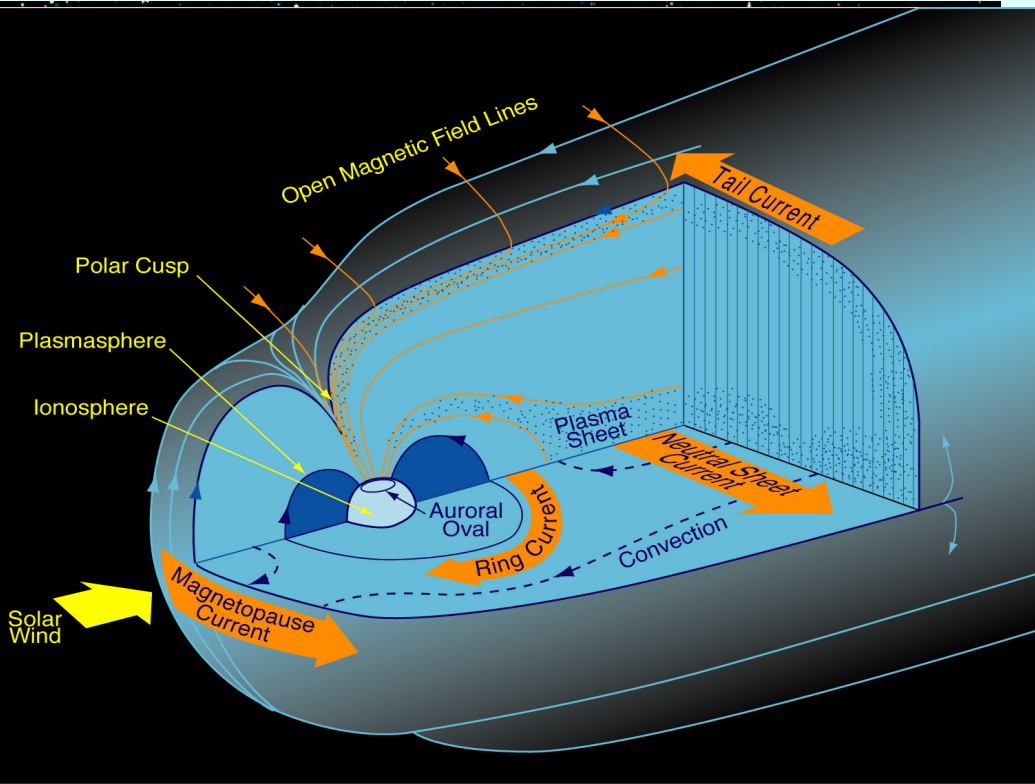

# Planetary Magnetospheres I

- Produced by rotation of conducting fluid
  - Earth: liquid Fe core
  - Jupiter & Saturn: metallic H<sub>2</sub>
  - Uranus & Neptune: salty oceans
- So what?
  - Atmospheric retention
  - Habitability

Planetary-scale magnetic fields:  
Earth, Jupiter, Saturn, Uranus, &  
Neptune (Mercury)

# Planetary Magnetospheres II

- Planetary magnetic field immersed in solar wind
- Solar wind is high-speed plasma with embedded magnetic field
- Pressure from solar wind impacts and deforms planetary magnetic field
- Magnetosphere
  - Large objects, e.g., Jovian magnetosphere is 5x diameter of full Moon*

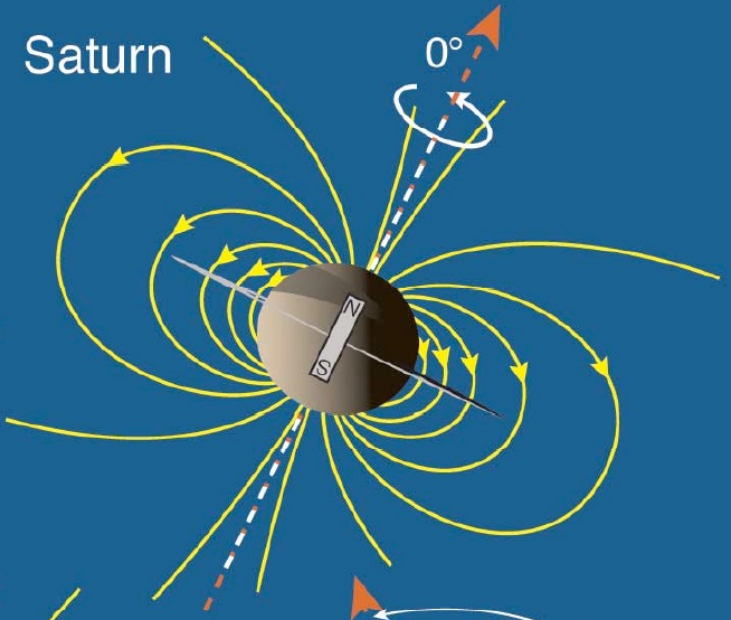

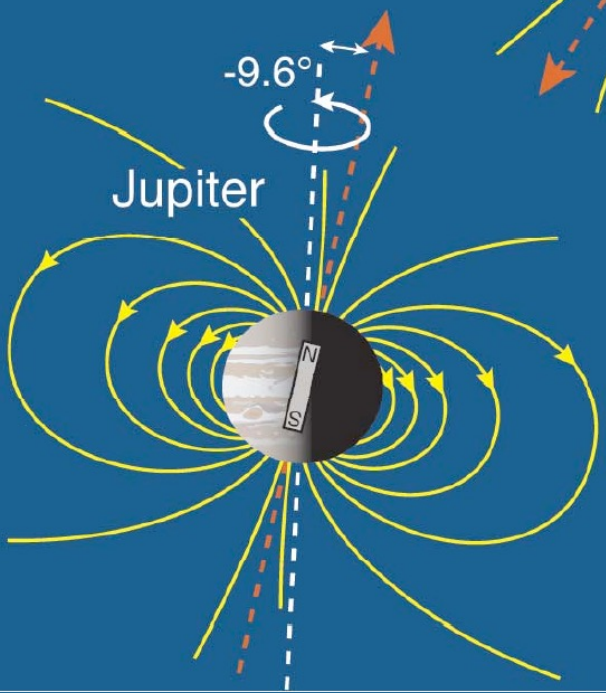

Earth

Saturn

Jupiter

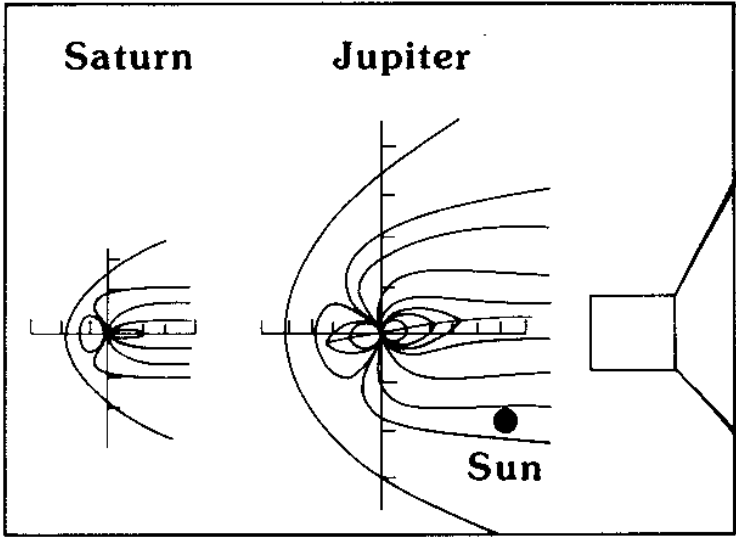

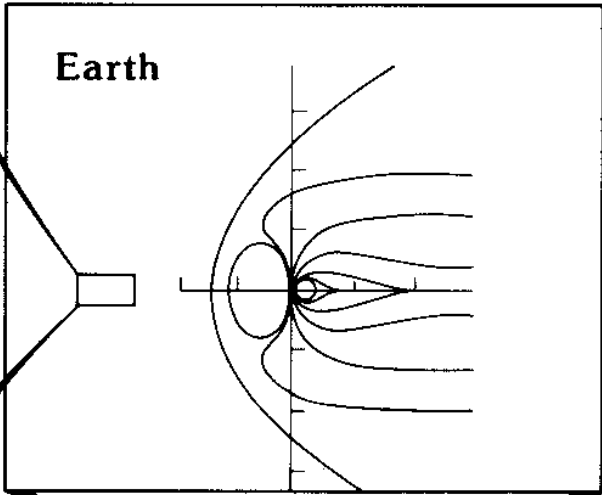

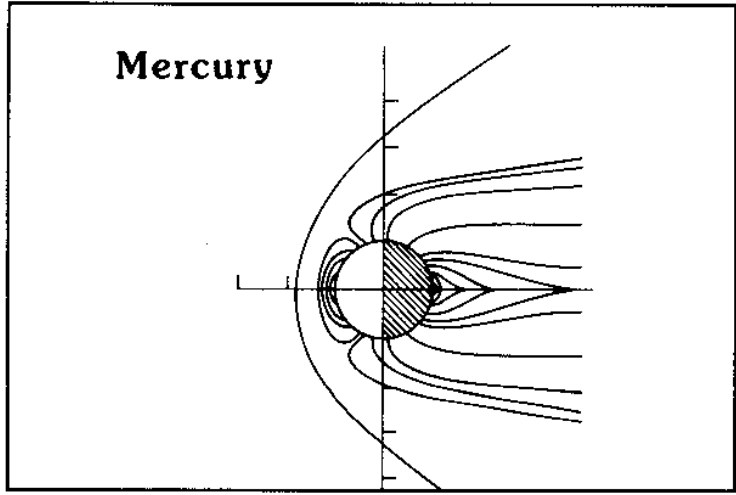

Uranus

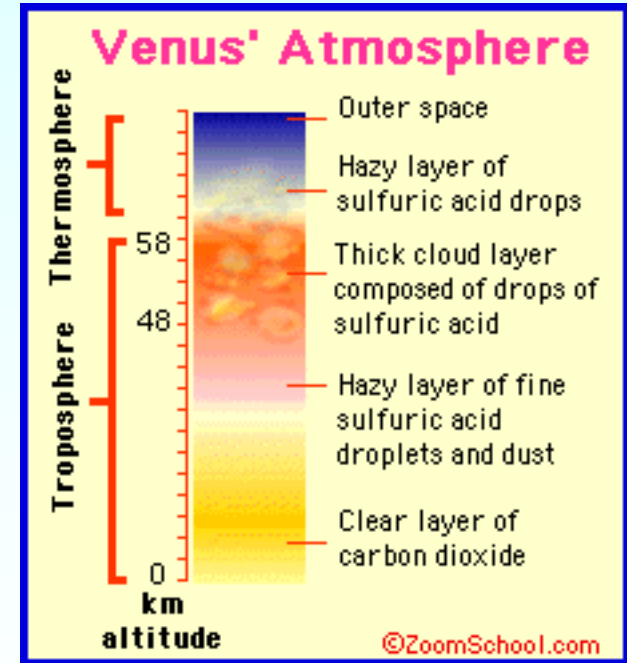

Neptune

# Venus

- Venus rotates too slowly to generate an internal magnetic field, so the solar wind interacts directly with the ionosphere.
- Hydrogen is stripped away, and over time, there is very little left to form water.

# Mars

- Mars also lacks a global magnetic field, although in this case due to the absence of a liquid core layer.
- Most of the Martian atmosphere has been lost to the solar wind, leaving it a dead world.

# Μαγνητόσφαιρα

Μαγνητόσφαιρα είναι εκείνη η περιοχή του διαστήματος γύρω από τον πλανήτη, στην οποία κυριαρχεί το μαγνητικό πεδίο του πλανήτη. Η μαγνητόσφαιρα θωρακίζει τη Γη από ηλιακά επεισόδια

# Sun - Planet Coupling

- **Mercury, Jupiter, Saturn, Uranus and Neptune** have an interaction similar to that at Earth - a supersonic solar wind interacts with a magnetic field to form a magnetospheric cavity but the nature of the obstacle differs greatly as do the solar wind parameters.
- Jupiter's moon **Ganymede** interacts with a plasma wind within Jupiter's vast magnetosphere rather than the solar wind.

# Sun - Planet Coupling

- **Asteroids** may have a strong interaction with the solar wind.
- The ionospheres of **Venus** and **Titan** (when outside Saturn's magnetosphere) interact with the solar wind flow to form an induced magnetospheric cavity.
- The small size of **comets** and the large amount of gas that evaporates from them, make their interaction with the solar wind unique. **Rosetta!**

# **Magnetospheric Control Parameters**

- **Solar wind dynamic pressure**
- **$B_z$  component of the interplanetary magnetic field**
- **Planetary magnetic field**
- **Planetary rotation**
- **Plasma sources and mass density**
- **Ionospheric conductivity**
- **Magnetospheric scale**

# The Moon ?

Radius (km)	Rotation period (days)	Equatorial magnetic field (nT)
1737	?	-

# The Moon

Radius (km)	Rotation period (days)	Equatorial magnetic field (nT)
1737	27.3	-

Τα δύο άκρα  
στο ηλιακό μας σύστημα

# The Magnetosphere of Mercury: Facts

**No atmosphere**

**No ionosphere**

**Exosphere**

**No plasmasphere**

**Weak magnetic field**

**Multi-ion plasma**

**Small magnetosphere**

# The Magnetosphere of Jupiter

Reference:

Dessler, A. J. (Ed.),

Physics of the  
Jovian  
Magnetosphere,

Cambridge, 1983.

Jupiter's magnetosphere is "sharper" than the others because of the rotating plasma.

# Magnetospheric Plasma Sources

**Mercury:** solar wind and sputtering of surface material, e.g. sodium

**Earth:** solar wind and ionosphere

**Jupiter:** solar wind and volcanic activity of the moon Io

**Saturn:** solar wind, atmosphere of moon Titan, sputtering at surfaces of icy moons and rings

**Uranus:** polar ionosphere, minor solar wind contribution

**Neptune:** ionosphere, moon Triton

# Solar Wind

- Observations of comets suggested solar ionized outflow (Biermann, 1951)
- Confirmed in 1960s by spacecraft measurements
- At 1 AU (Earth orbit)
  - speed: 200–1400 km/s (~400 km/s)
  - density: 1–100 cm<sup>-3</sup>
  - magnetic field: 2–20 nT
- Great variability during solar storms

# Importance of data routing ...

Sputnik 2 detected the Earth's outer radiation belt in the far northern latitudes, but the significance of the elevated radiation was not realized. In Australia, Professor Harry Messel intercepted the signals but the Soviets **would not provide the code** and the Australians **would not send the data.**

# The first RB map

The actual ability of the geomagnetic field to trap high-energy electrons was experimentally verified by the Argus space experiment, which was proposed by Nicholas C. Christofilos in 1957 and carried out in 1959

<b>Solar wind mass loss</b>	$5 \times 10^{16} \text{ kg/year}$ $= 2.5 \times 10^{-14} M_{\odot}/\text{year}$

# Lightbulb Sun

The solar radiation energy absorbed in some form by the Earth's atmosphere, oceans, continents and living organisms in or on them has an average value of 250 watts per square meter. 250 watts correspond to the power of four humble standard lightbulbs.

Despite its rather modest magnitude this energy, combined with the equally modest greenhouse effect of the terrestrial atmosphere, keeps the average temperature of our planet at 15 degrees centigrade, making life - as we know it - possible on Earth.

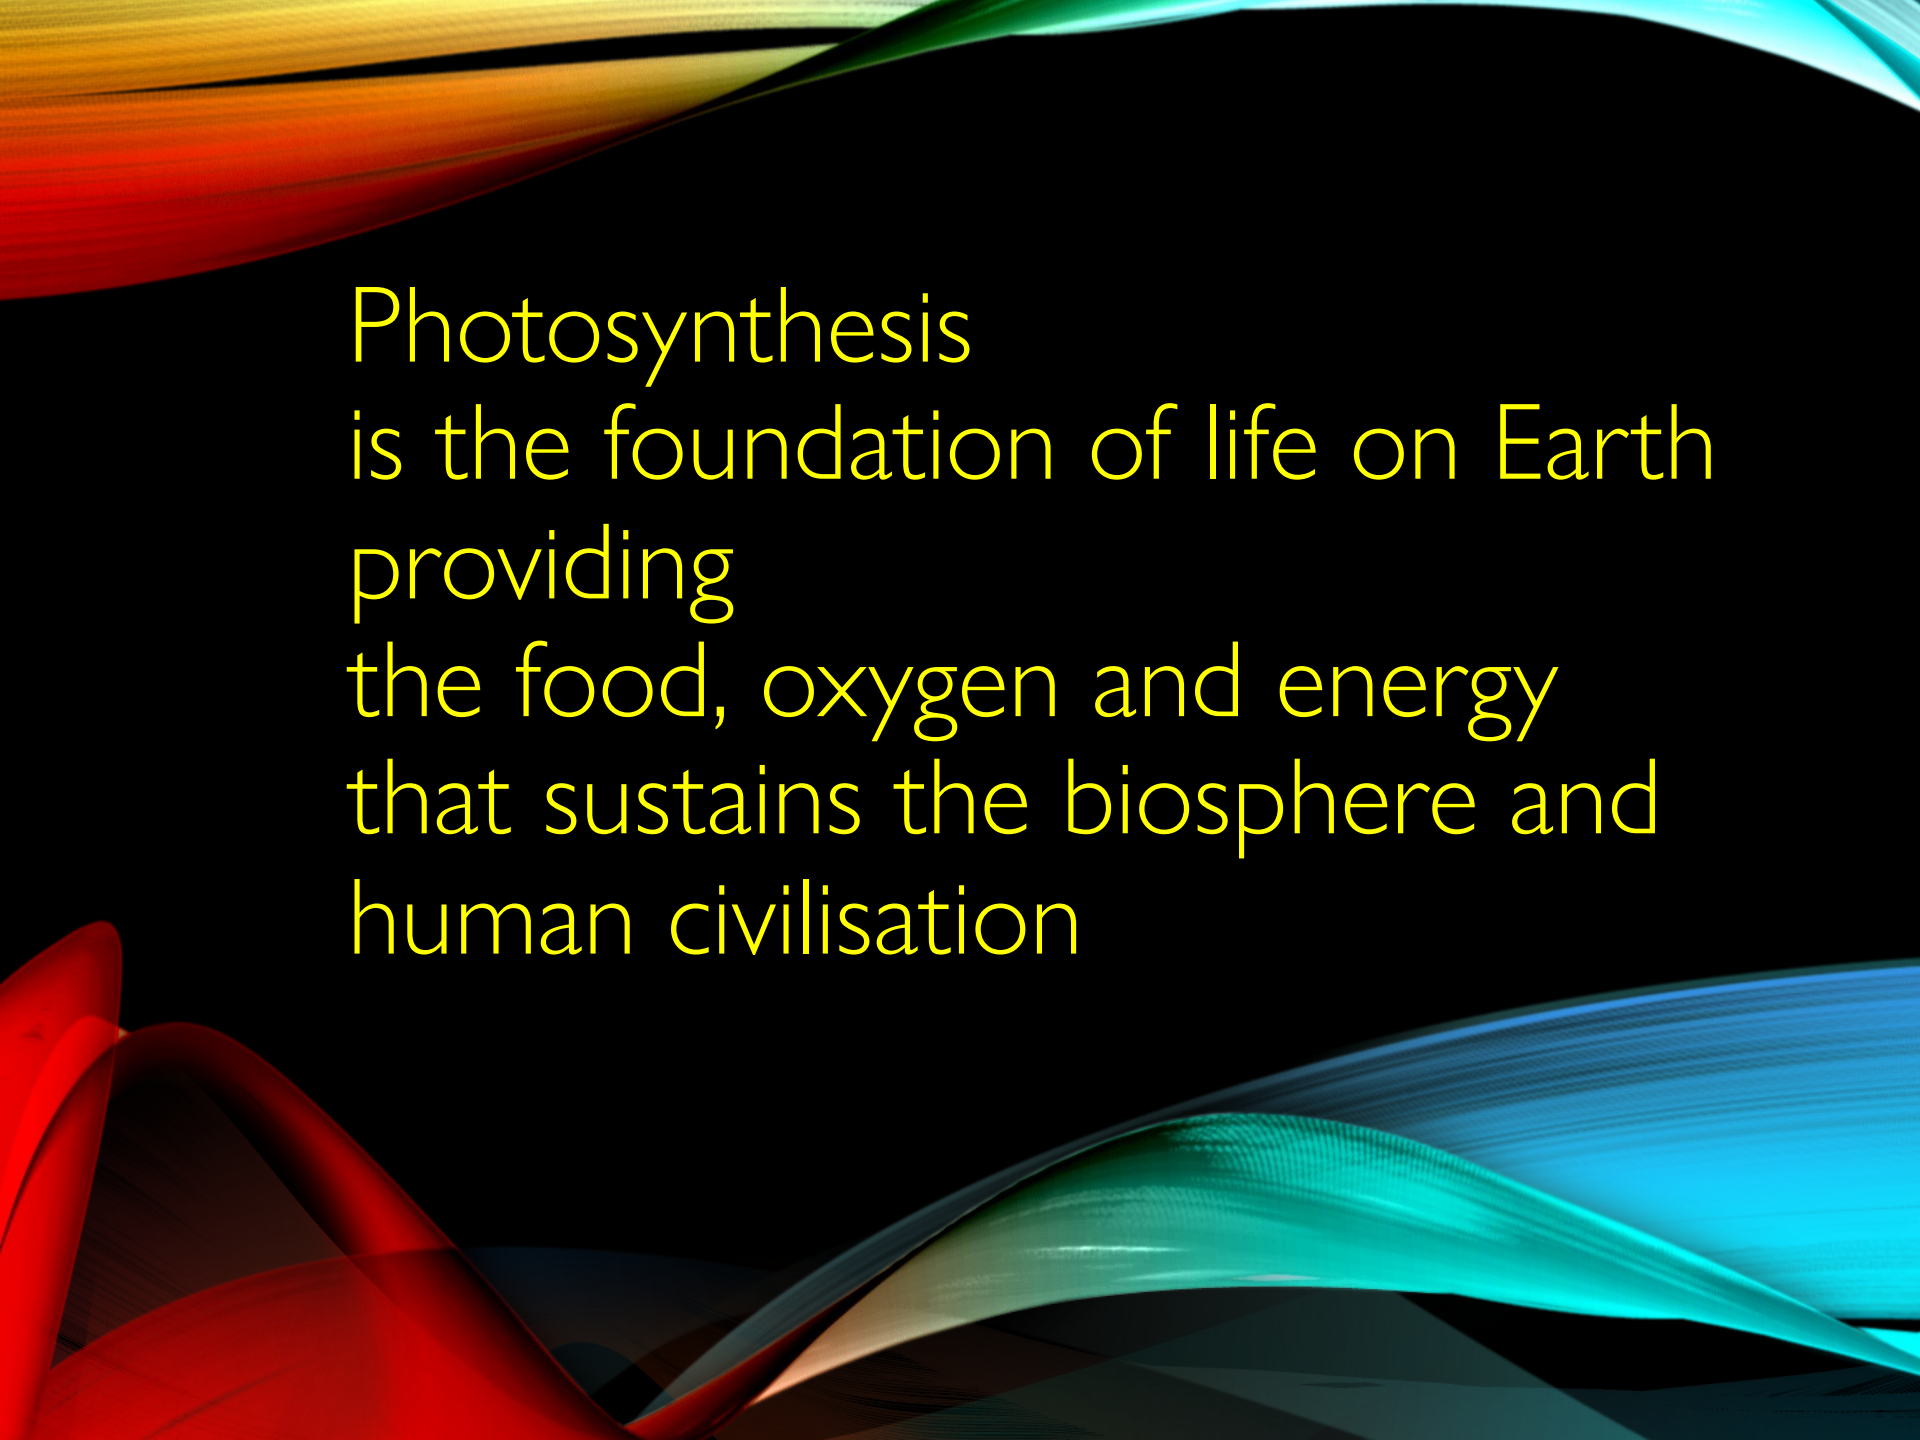

# The Sun is a lightbulb

Είναι λοιπόν αλήθεια ότι η ισχύς της ηλιακής ακτινοβολίας που φτάνει στην επιφάνεια της Γης έχει μάλλον ταπεινό μέγεθος.

Αλλά είναι επίσης αλήθεια ότι χωρίς αυτήν δεν θα υπήρχε ίχνος ζωής.

Photosynthesis  
is the foundation of life on Earth  
providing  
the food, oxygen and energy  
that sustains the biosphere and  
human civilisation
