

# The role of CMR in Arrhythmogenic Cardiomyopathy

**Δήμητρα Αντωνακάκη M.D. MSc**

Καρδιολόγος, Τμήμα Κληρονομικών και Σπάνιων Καρδιαγγειακών Παθήσεων, Αθλητικής Καρδιολογίας & Μαγνητικής Καρδιάς.

Ωνάσειο Καρδιοχειρουργικό Κέντρο

Senior Clinical Lecturer (Hons) St George's University of London

Coordinator of the ESC Council of Cardiovascular Genomics

Nucleus member EAPC, Sports Cardiology Section

# CMR sequences

❖ **Cardiac morphology and function (systolic and diastolic)** (ie black blood, white blood SSFP, myocardial tagging, transmitral velocities, FT stain)

❖ **Quantification of chambers and mass**

❖ **Tissue characterisation**

FSE sequences +/- saturations pulses

T2W sequences (STIR)-increased water content- oedema infiltration infarction

Precontrast T1 T2 mapping, post contrast T1 mapping, ECV

Multiecho T2\* GE

LGE inversion recovery sequence and gadolinium contrast agent- areas with expanded interstitial fibrosis necrosis infiltration

EGE

❖ **Perfusion** ischaemia/microvascular obstruction

❖ **Flows**

❖ **Intracardiac features**

❖ **Extracardiac findings**

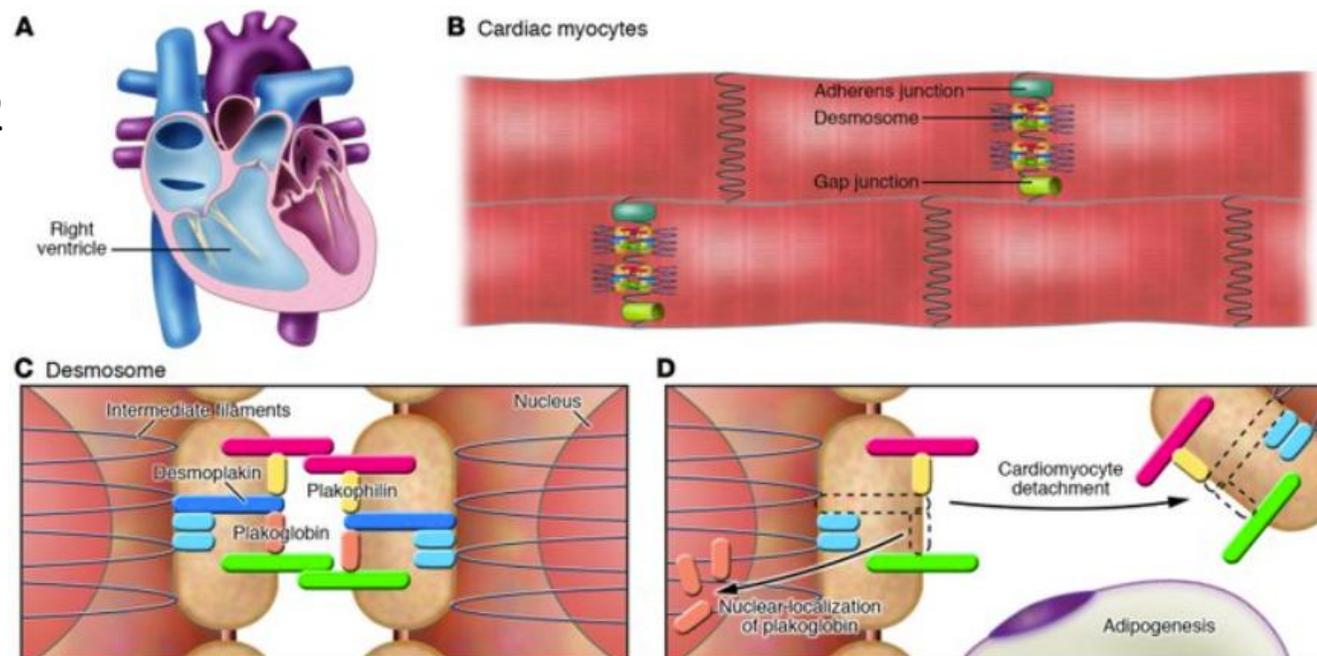

# ARVC

Characterized by a broad phenotypic spectrum

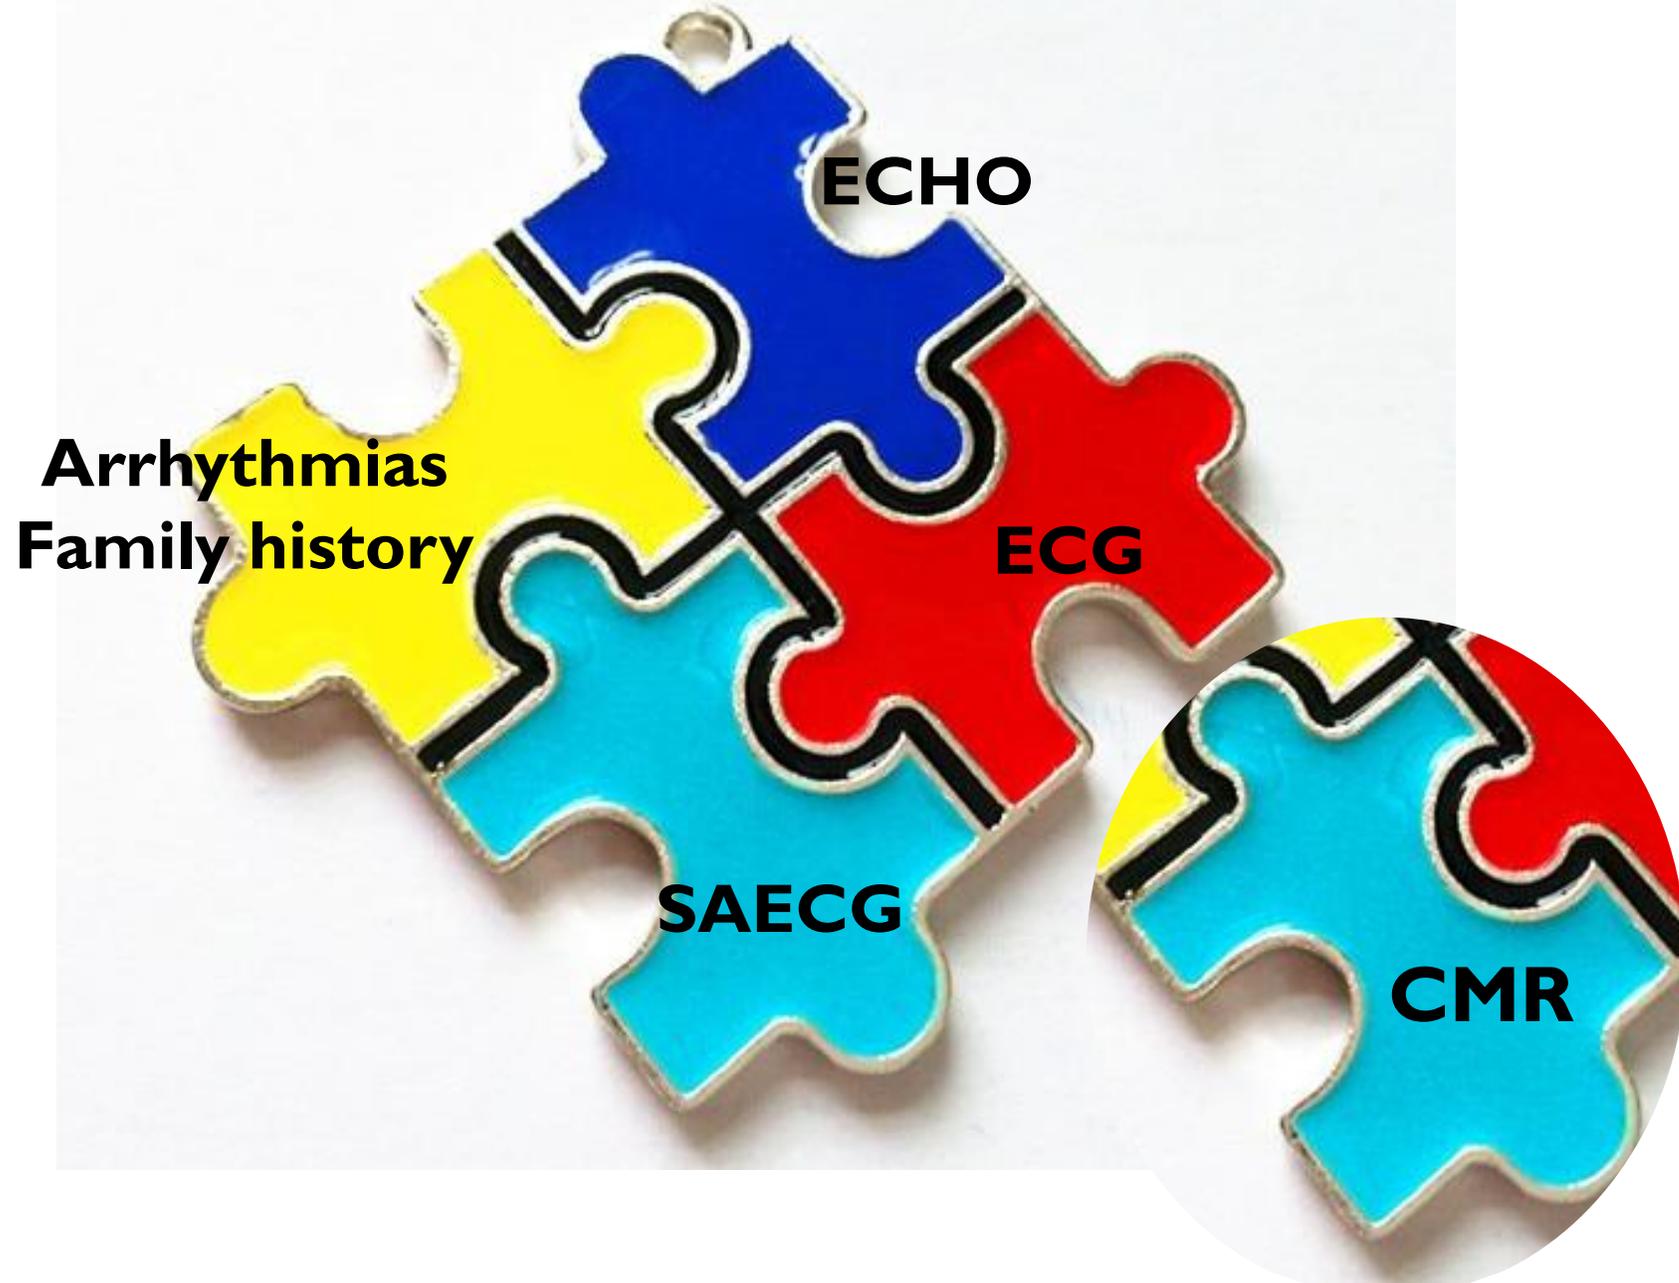

- loss of myocytes in the right ventricular myocardium,
- Fatty or fibrofatty replacement
- Frequent involvement of the LV
- Association with myocarditis
- Genetics: ARVC is a desmosomal cardiomyopathy- defective cell-adhesion proteins

*JUP*—plakoglobin, *PKP2*—plakophilin  
desmosomal cadherins (*DSG2*—desmoglein-2  
*DSC2*—desmocollin-2)  
plakins (*DSP*—desmoplakin)

- Non-desmosomal genes  
*alpha T-catenin (CTNNA3)*,  
*N-cadherin (CDH2)*  
*transmembrane protein 43 (TMEM43)*  
*ryanodine-receptor type 2 (RYR2)*

# Diagnosis in ARVC

# Arrhythmogenic Cardiomyopathy

- “Arrhythmogenic Cardiomyopathy” is currently defined as a genetic heart muscle disease which affects the **RV, the LV, or both**, whose most distinctive phenotypic feature is myocardial scar (**fibro or fibrofatty myocardial replacement**) which **underlies global and/or regional** ventricular dysfunction and predisposes to potentially lethal scar-related ventricular arrhythmias, regardless of the severity of the systolic ventricular dysfunction (*autosomal dominant and recessive PKP2, DSG2, DSP, DSC2, and JUP LMNA, TMEM43, PLN, SCN5A, TGFB3*)

(i) the **“dominant-right”** variant, i.e., the classic ARVC phenotype characterized by the predominant RV involvement, with no or minor LV abnormalities

(ii) the **“biventricular disease”** variant characterized by the parallel involvement of the RV and LV

(iii) the **“dominant-left”** variant (also referred to as “arrhythmogenic left ventricular cardiomyopathy; ALVC”) characterized by the predominant LV involvement, with no or minor RV abnormalities

- ✓ RV assessment (volumes, wall thickness, function, RWMAs)
- ✓ Risk stratification

**Screening 1-2 years probands and family members**

# Revised ARVC Diagnostic Criteria 2010

## Original Task Force Criteria

## Revised Task Force Criteria

### I. Global or regional dysfunction and structural alterations\*

#### Major

- Severe dilatation and reduction of RV ejection fraction with no (or only mild) LV impairment
- Localized RV aneurysms (akinetic or dyskinetic areas with diastolic bulging)
- Severe segmental dilatation of the RV

#### By 2D echo:

- Regional RV akinesia, dyskinesia, or aneurysm
- and 1 of the following (end diastole):
  - PLAX RVOT  $\geq 32$  mm (corrected for body size [PLAX/BSA]  $\geq 19$  mm/m<sup>2</sup>)
  - PSAX RVOT  $\geq 36$  mm (corrected for body size [PSAX/BSA]  $\geq 21$  mm/m<sup>2</sup>)
  - or fractional area change  $\leq 33\%$

#### By MRI:

- Regional RV akinesia or dyskinesia or dyssynchronous RV contraction
- and 1 of the following:
  - Ratio of RV end-diastolic volume to BSA  $\geq 110$  mL/m<sup>2</sup> (male) or  $\geq 100$  mL/m<sup>2</sup> (female)
  - or RV ejection fraction  $\leq 40\%$

#### By RV angiography:

- Regional RV akinesia, dyskinesia, or aneurysm

#### Minor

- Mild global RV dilatation and/or ejection fraction reduction with normal LV
- Mild segmental dilatation of the RV
- Regional RV hypokinesia

#### By 2D echo:

- Regional RV akinesia or dyskinesia
- and 1 of the following (end diastole):
  - PLAX RVOT  $\geq 29$  to  $< 32$  mm (corrected for body size [PLAX/BSA]  $\geq 16$  to  $< 19$  mm/m<sup>2</sup>)
  - PSAX RVOT  $\geq 32$  to  $< 36$  mm (corrected for body size [PSAX/BSA]  $\geq 18$  to  $< 21$  mm/m<sup>2</sup>)
  - or fractional area change  $> 33\%$  to  $\leq 40\%$

#### By MRI:

- Regional RV akinesia or dyskinesia or dyssynchronous RV contraction
- and 1 of the following:
  - Ratio of RV end-diastolic volume to BSA  $\geq 100$  to  $< 110$  mL/m<sup>2</sup> (male) or  $\geq 90$  to  $< 100$  mL/m<sup>2</sup> (female)
  - or RV ejection fraction  $> 40\%$  to  $\leq 45\%$

- I. Imaging
- II. Pathology
- III. ECG
- IV. Ventricular arrhythmias
- V. Family history

*Definite diagnosis:* (2M or 1M+2m or 4m)

➤ *New techniques*

➤ *More sensitive for familial and mild disease*

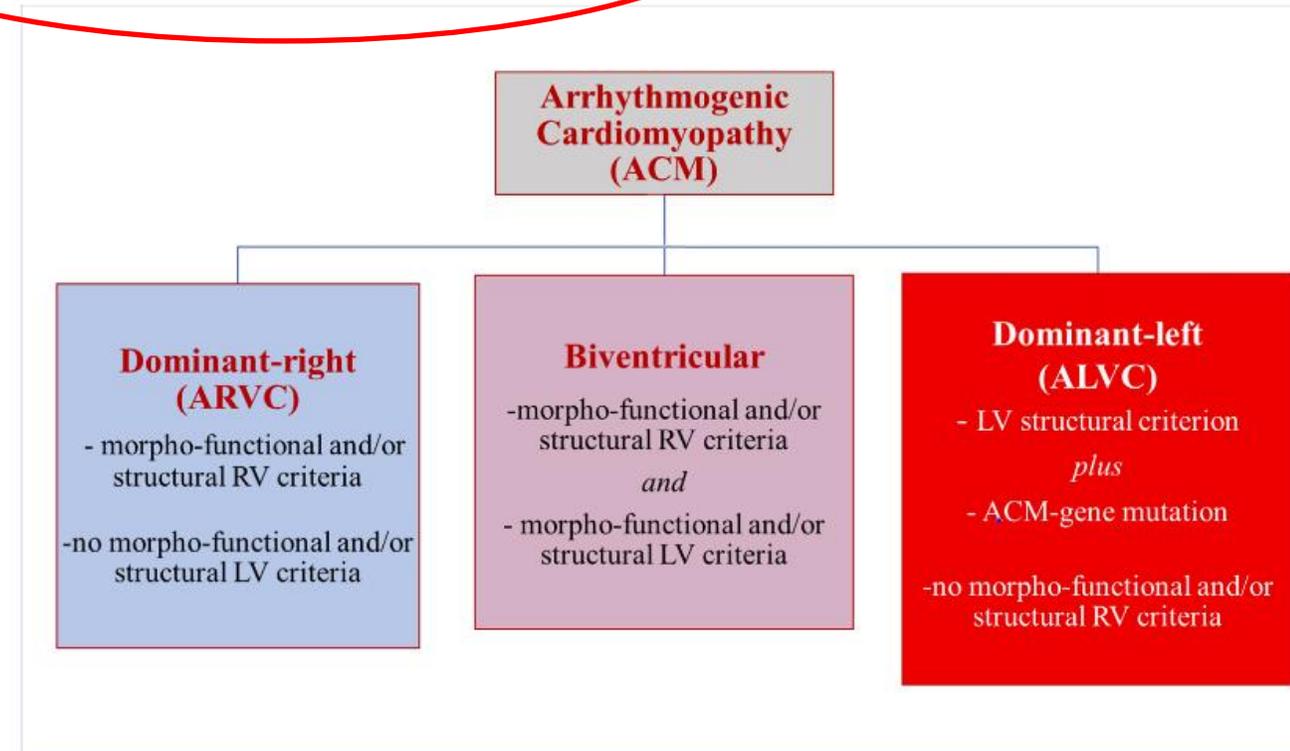

➤ *Early and greater involvement of LV in parallel or exceed the severity or RV involvement*

# The Padua Criteria 2020

- ❖ Tissue characterization by CE-CMR for detection of fibro-fatty myocardial replacement of both ventricles.
- ❖ New ECG criteria, including depolarization/ repolarization abnormalities and ventricular arrhythmias, specific for the LV involvement.

"Padua criteria" for diagnosis of Arrhythmogenic Cardiomyopathy.

Category	Right ventricle (upgraded 2010 ITF diagnostic criteria)	Left ventricle (new diagnostic criteria)
I. Morpho-functional ventricular abnormalities	<p><i>By echocardiography, CMR or angiography: Major</i></p> <ul style="list-style-type: none"> <li>Regional RV akinesia, dyskinesia, or bulging <i>plus one</i> of the following:                             <ul style="list-style-type: none"> <li>- global RV dilatation (increase of RV EDV according to the imaging test specific nomograms)</li> <li>- global RV systolic dysfunction (reduction of RV EF according to the imaging test specific nomograms)</li> </ul> </li> </ul> <p><i>Minor</i></p> <ul style="list-style-type: none"> <li>Regional RV akinesia, dyskinesia or aneurysm of RV free wall</li> </ul>	<p><i>By echocardiography, CMR or angiography: Minor</i></p> <ul style="list-style-type: none"> <li>Global LV systolic dysfunction (depression of LV EF or reduction of echocardiographic global longitudinal strain), with or without LV dilatation (increase of LV EDV according to the imaging test specific nomograms for age, sex, and BSA)</li> </ul> <p><i>Minor</i></p> <ul style="list-style-type: none"> <li>Regional LV hypokinesia or akinesia of LV free wall, septum, or both</li> </ul>
II. Structural myocardial abnormalities	<p><i>By CE-CMR: Major</i></p> <ul style="list-style-type: none"> <li>Transmural LGE (stria pattern) of <math>\geq 1</math> RV region(s) (inlet, outlet, and apex in 2 orthogonal views)</li> </ul> <p><i>By EMB (limited indications): Major</i></p> <ul style="list-style-type: none"> <li>Fibrous replacement of the myocardium in <math>\geq 1</math> sample, with or without fatty tissue</li> </ul>	<p><i>By CE-CMR: Major</i></p> <ul style="list-style-type: none"> <li>LV LGE (stria pattern) of <math>\geq 1</math> Bull's Eye segment(s) (in 2 orthogonal views) of the free wall (subepicardial or midmyocardial), septum, or both (excluding septal junctional LGE)</li> </ul>

# Diagnosis of arrhythmogenic cardiomyopathy: The Padua criteria

Domenico Corrado <sup>a,\*</sup>, Martina Perazzolo Marra <sup>a</sup>, Alessandro Zorzi <sup>a</sup>, Giorgia Beffagna <sup>a</sup>, Alberto Cipriani <sup>a</sup>, Manuel De Lazzari <sup>a</sup>, Federico Migliore <sup>a</sup>, Kalliopi Pilichou <sup>a</sup>, Alessandra Rampazzo <sup>b</sup>, Ilaria Rigato <sup>a</sup>, Stefania Rizzo <sup>a</sup>, Gaetano Thiene <sup>a</sup>, Aris Anastasakis <sup>c</sup>, Angeliki Asimaki <sup>d</sup>, Chiara Rucciarelli Ducci <sup>e</sup>, Kristine H. Haugaa <sup>f</sup>, Francis E. Marchlinski <sup>g</sup>, Antonio Pelliccia <sup>k</sup>, Christian Schmied <sup>l</sup>, Sa

Category	Right ventricle (up to 2010 IFF diagnostic criteria)
----------	--

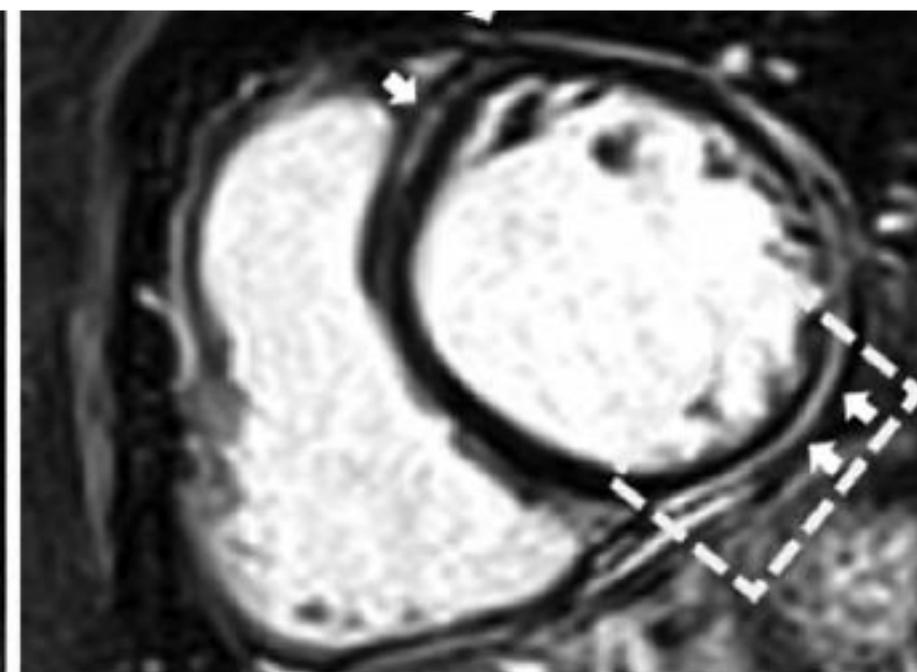

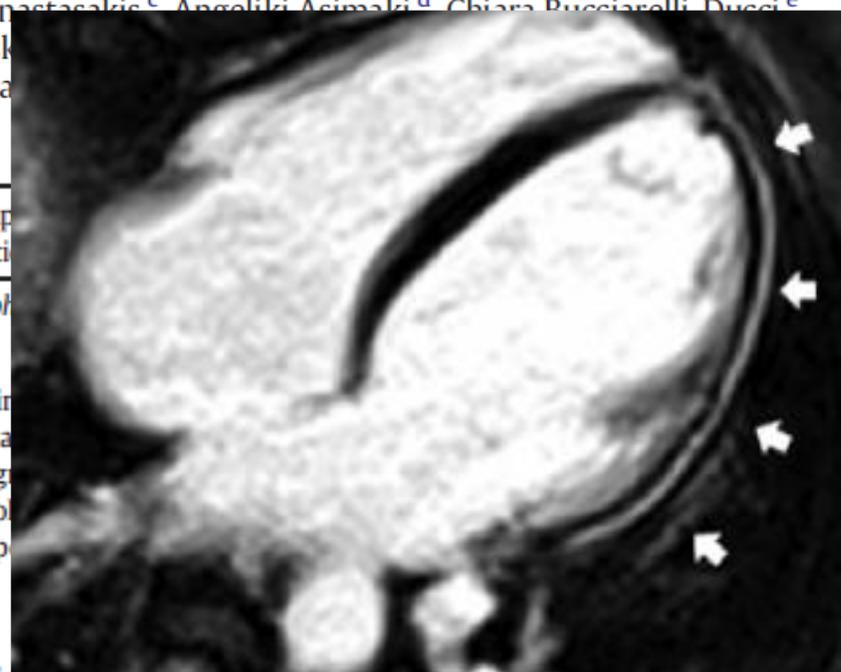

**I. Morpho-functional ventricular abnormalities**

- By echocardiography*
- Major**
- Regional RV akinesis
  - global RV dilatation
  - specific nomogram
  - global RV systolic dysfunction
- By CMR*
- Major**
- Regional RV akinesis or dyskinesia or aneurysm of RV free wall

**Minor**

**II. Structural myocardial abnormalities**

- By CE-CMR:Major*
- Transmural LGE (stria pattern) of  $\geq 1$  RV region(s) (inlet, outlet, and apex in 2 orthogonal views)
- By EMB (limited indications):Major*
- Fibrous replacement of the myocardium in  $\geq 1$  sample, with or without fatty tissue

*By CE-CMR:Major*

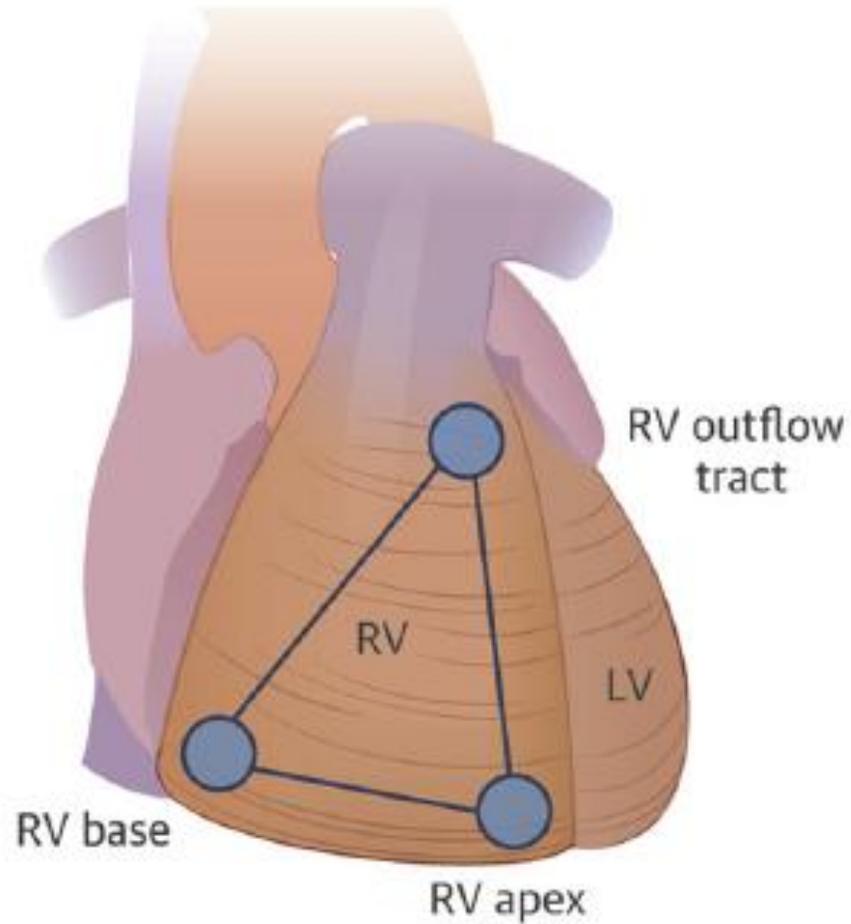

- LV LGE (stria pattern) of  $\geq 1$  Bull's Eye segment(s) (in 2 orthogonal views) of the free wall (subepicardial or midmyocardial), septum, or both (excluding septal junctional LGE)

# Arrhythmogenic cardiomyopathy in CMR

- Akinesia:** Lack of motion (10% wall thickening)
- Hypokinesia:** <40% wall thickening
- (Focal) wall thinning**
- Dyskinesia**
- (Micro)-Aneurysm:** Persistent bulging in both systole and diastole.
- Dyssynchrony:** Regional peak contraction occurring at different times in adjacent myocardium.
- Accordion sign:** specific area/segment of free RV wall myocardium with dyssynchronous micro contraction.

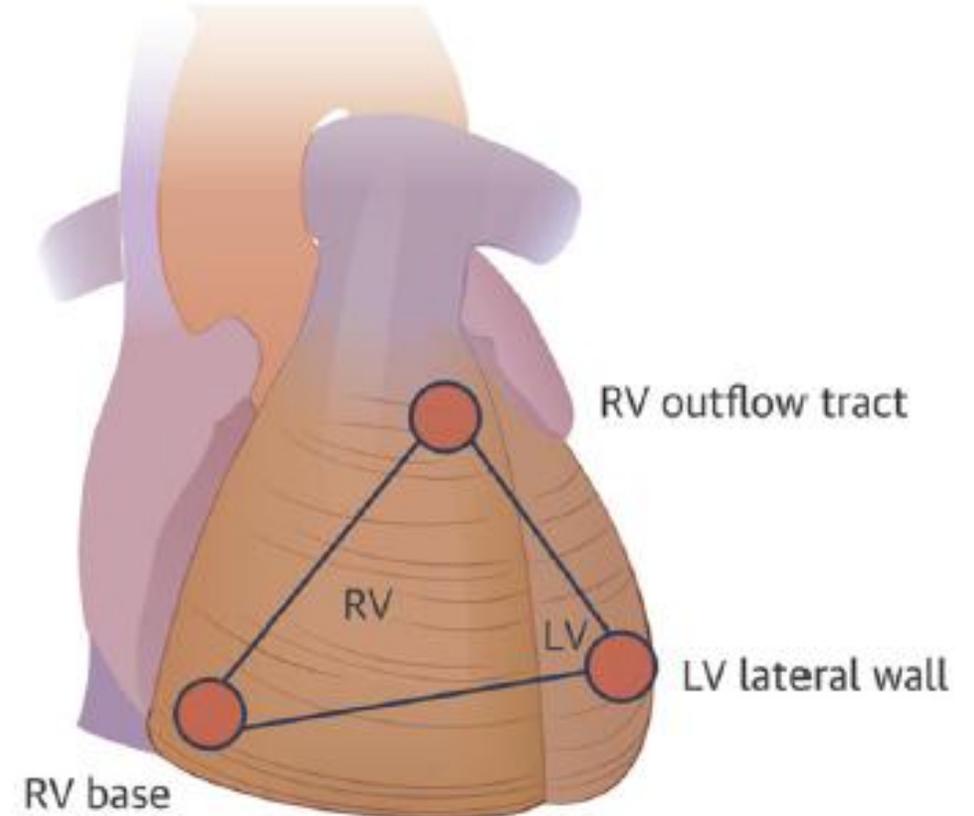

## TRADITIONAL MODEL OF ARVD/C

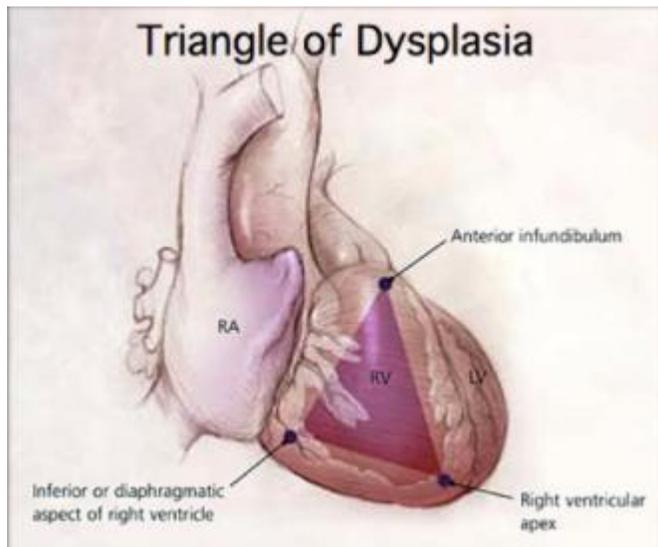

2D Visualization of Structural Substrate,  
Triangle of Dysplasia

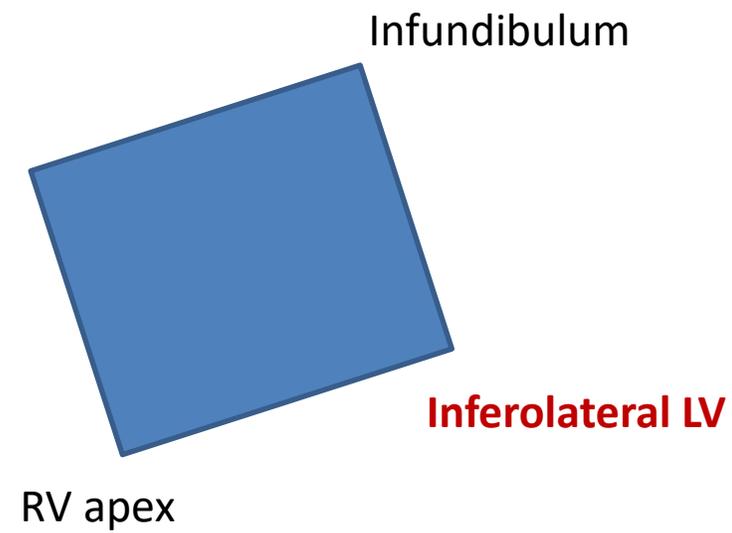

## CONTEMPORARY MODEL OF ARVD/C

Multiplane Visualization of Electrical and Structural Substrate,  
Triangle of Dysplasia Displaced

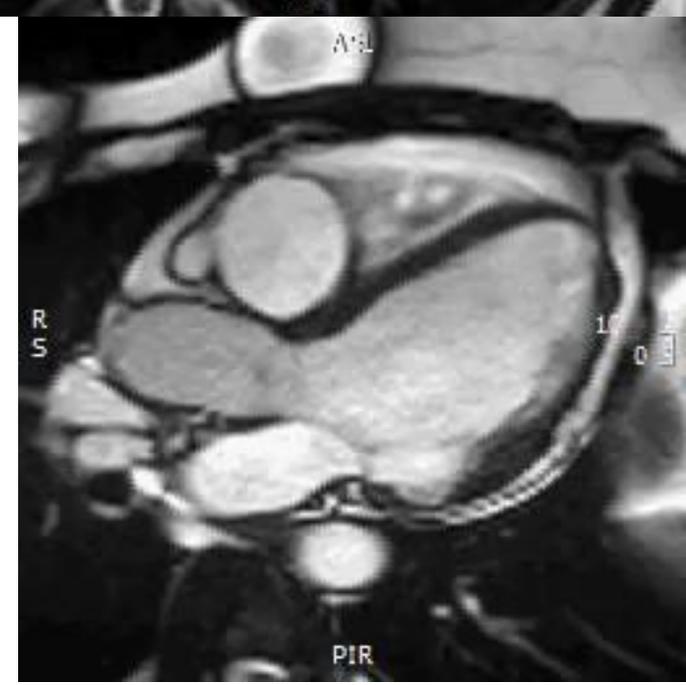

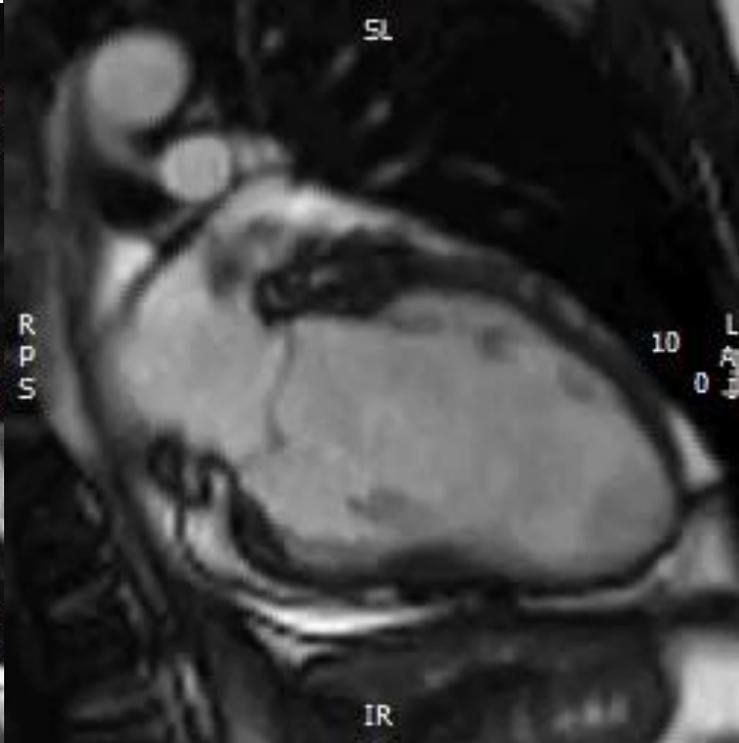

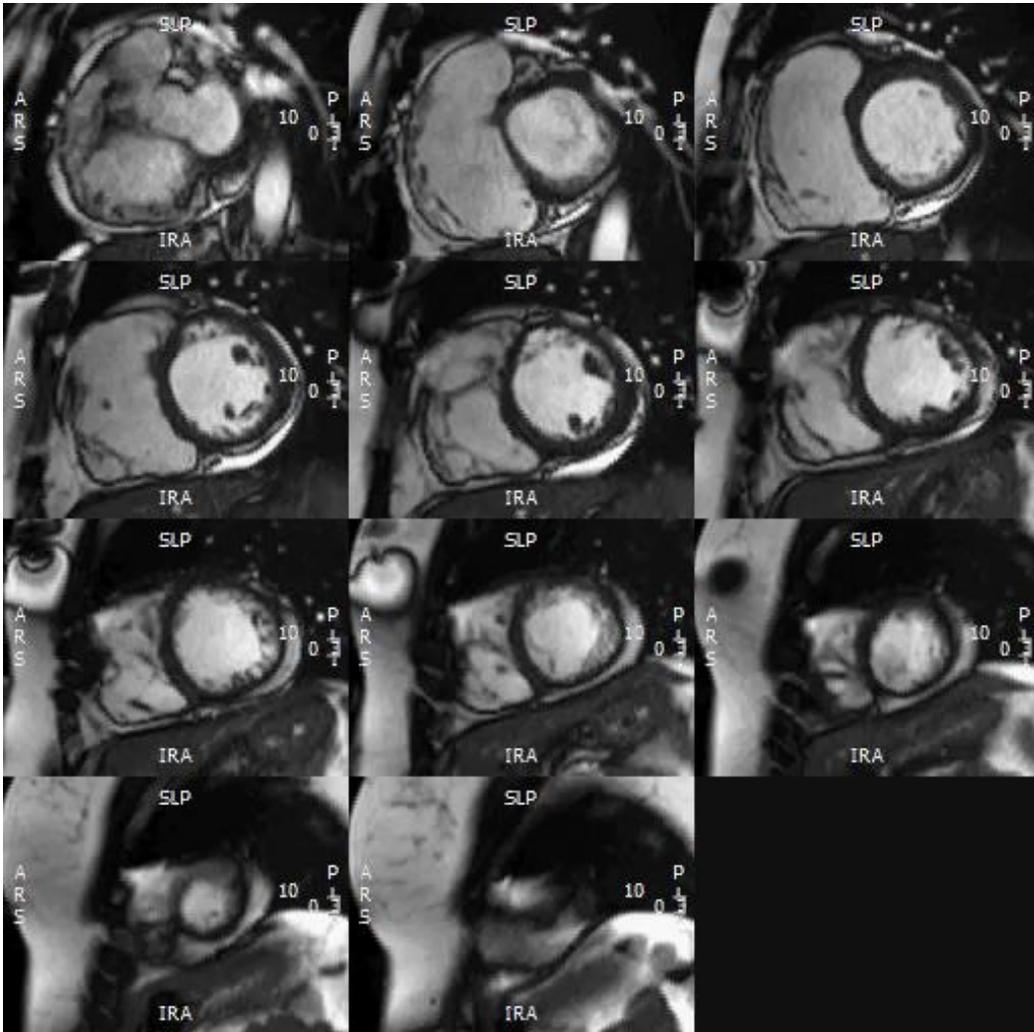

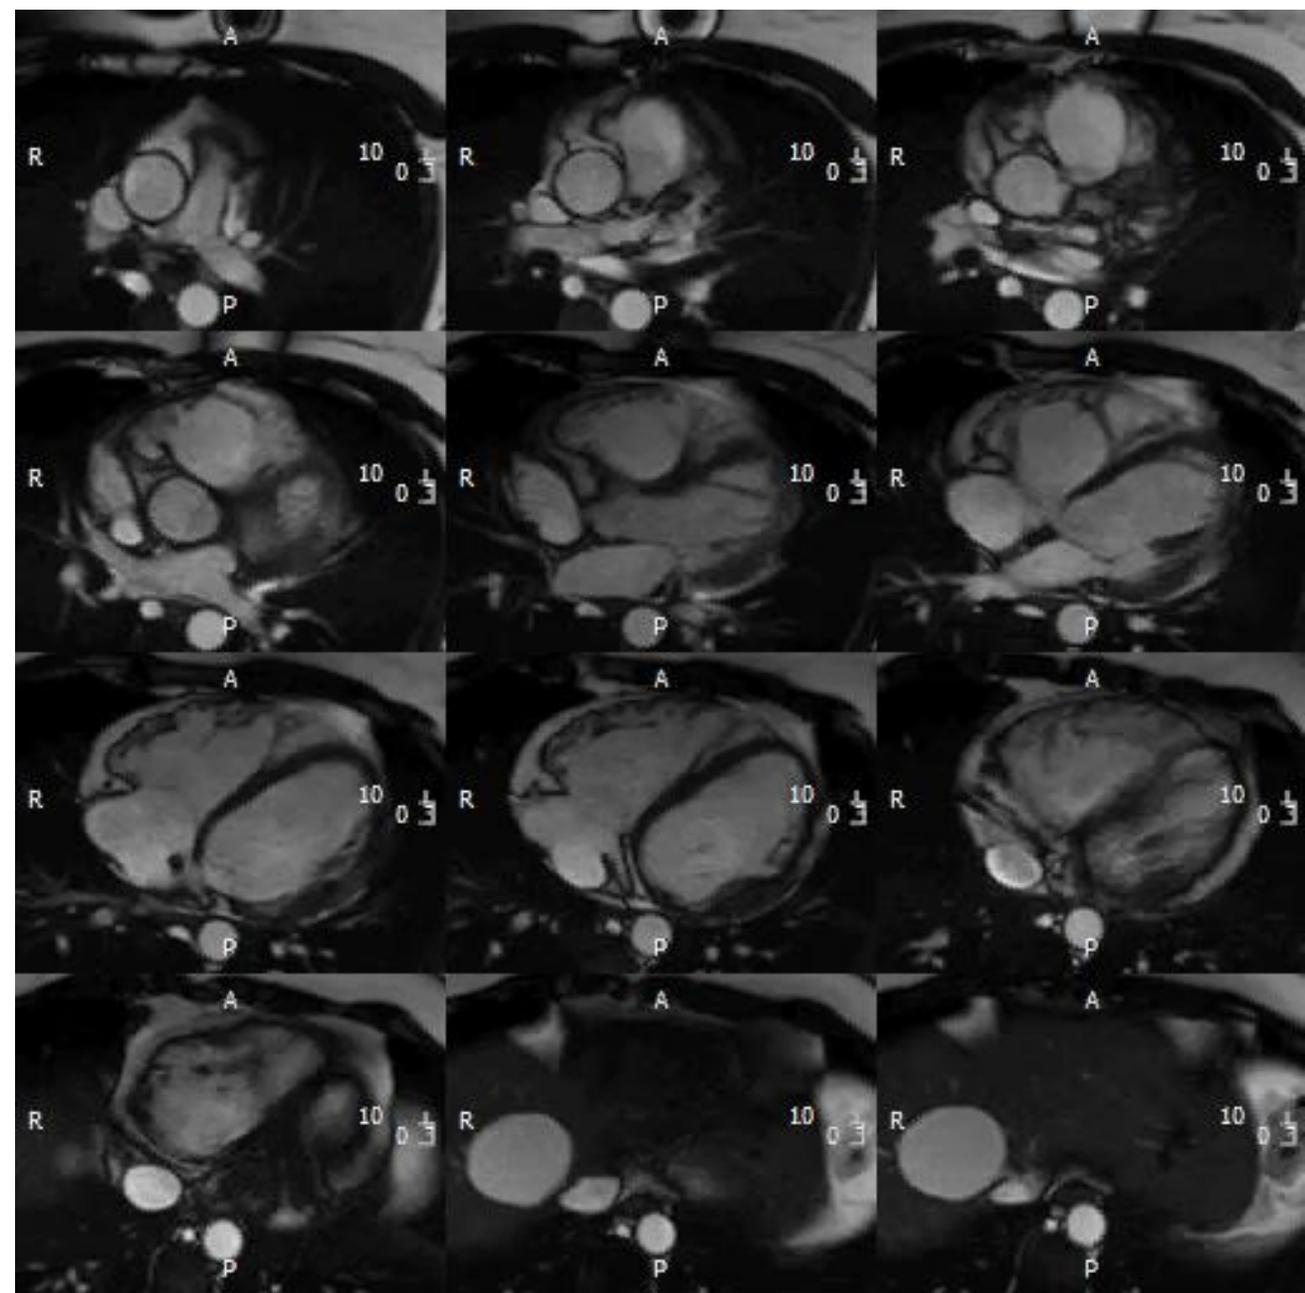

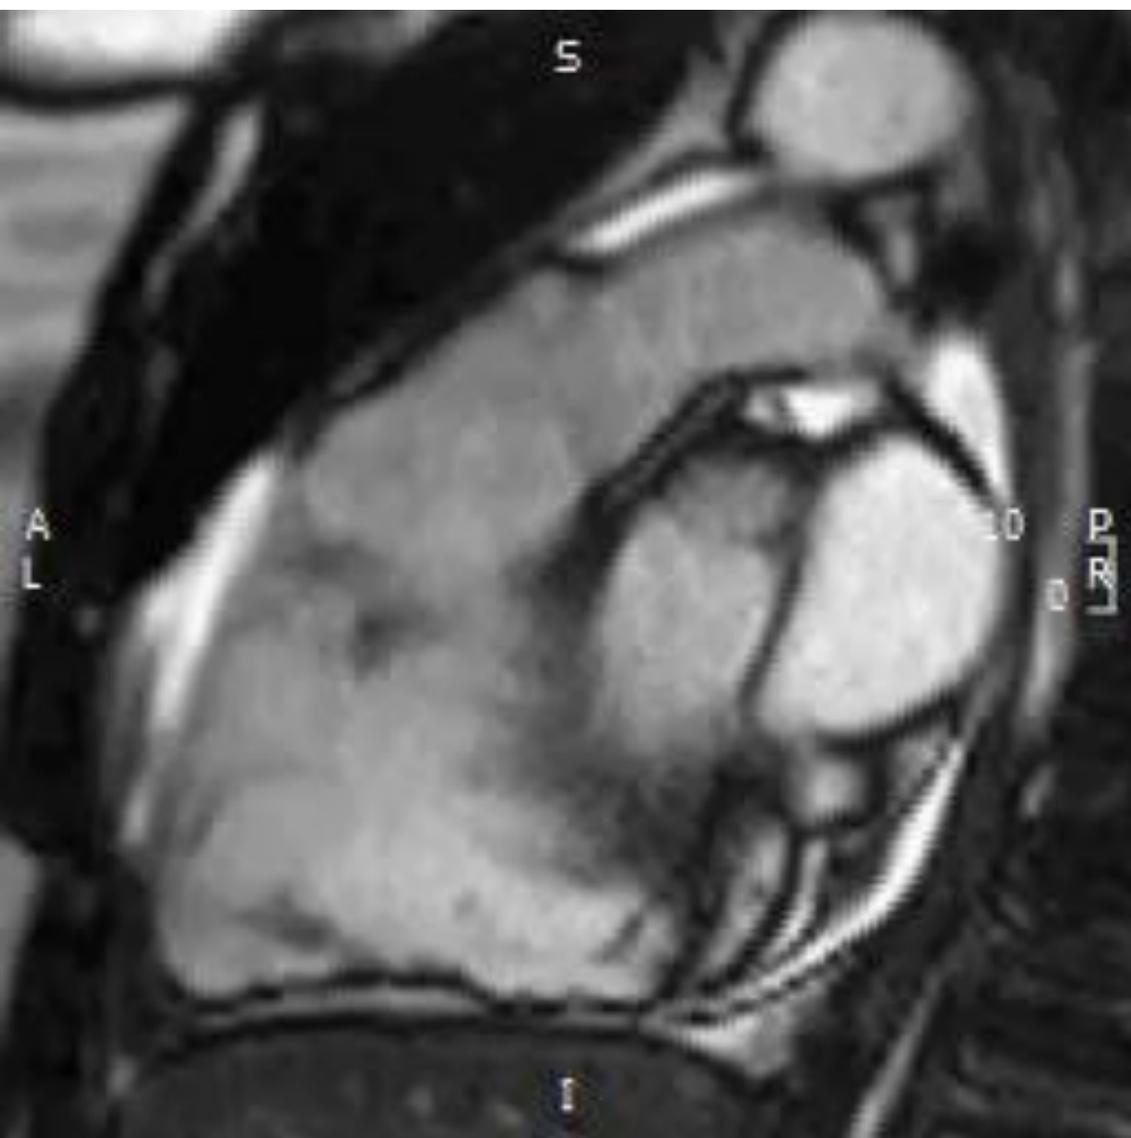

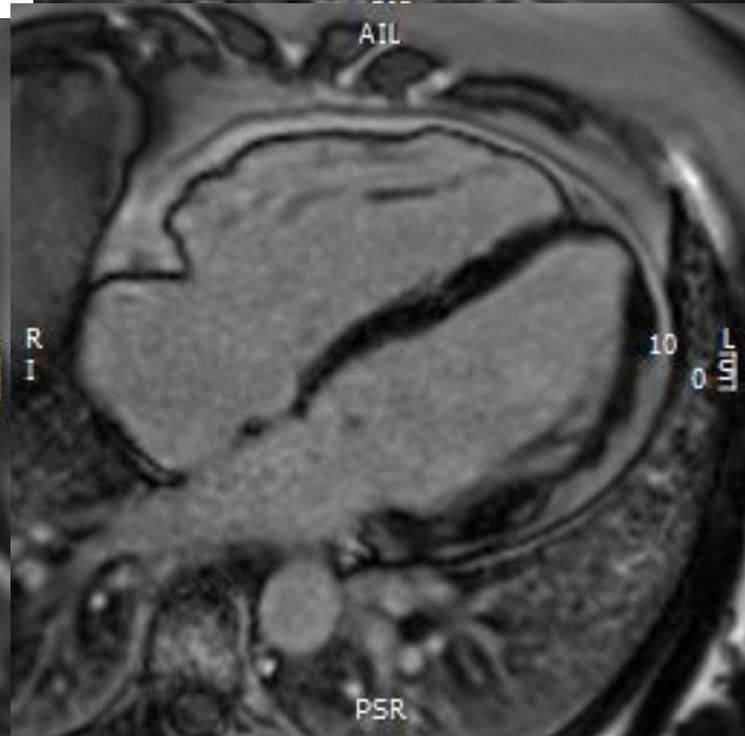

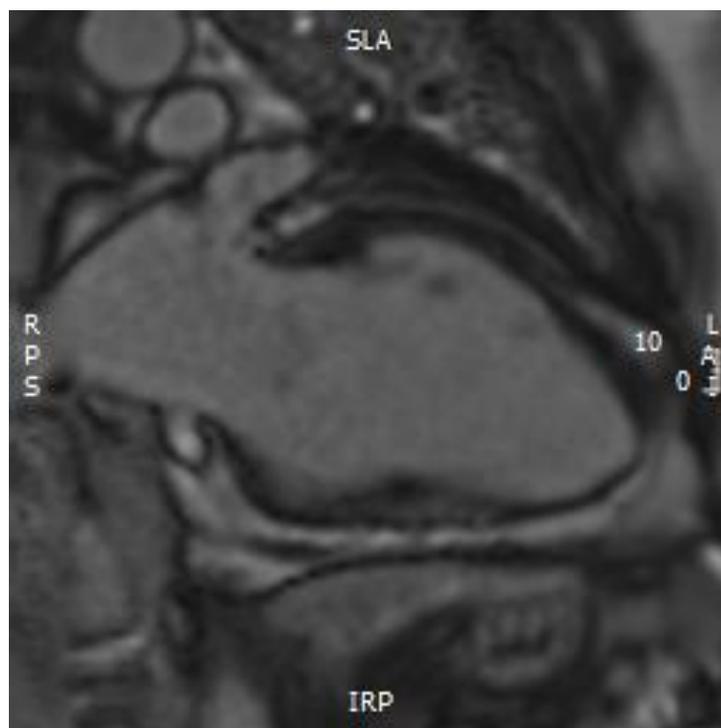

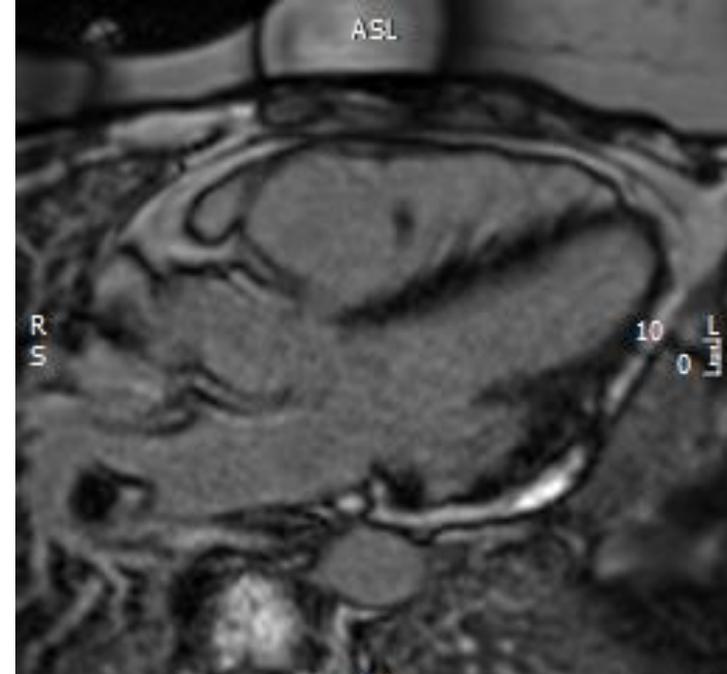

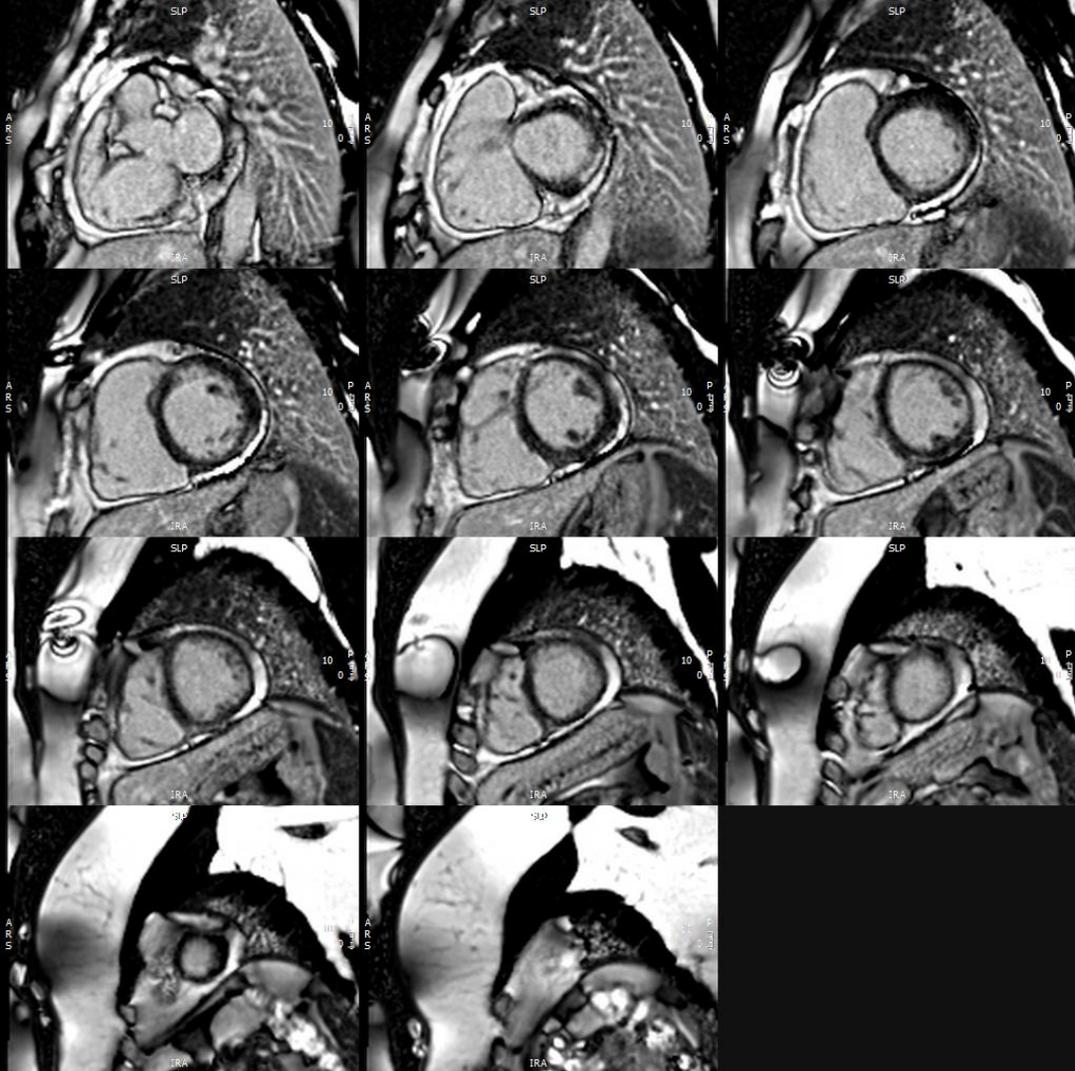

RV sub tricuspid

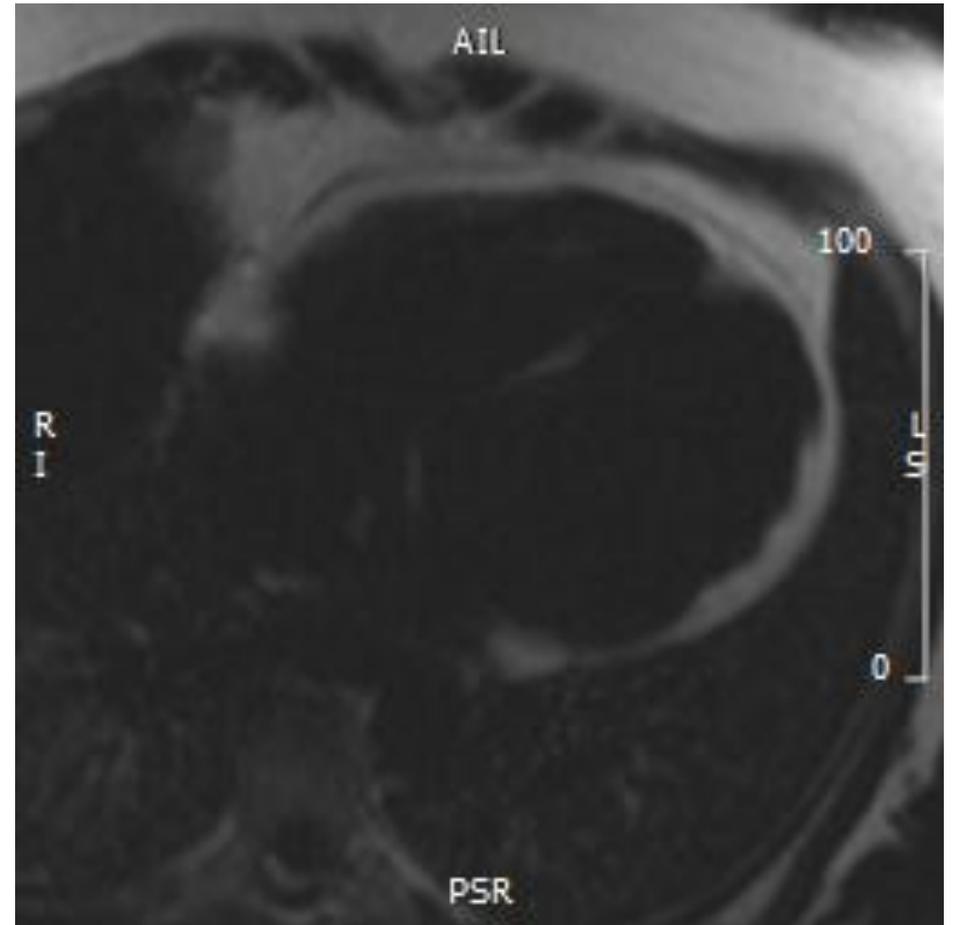

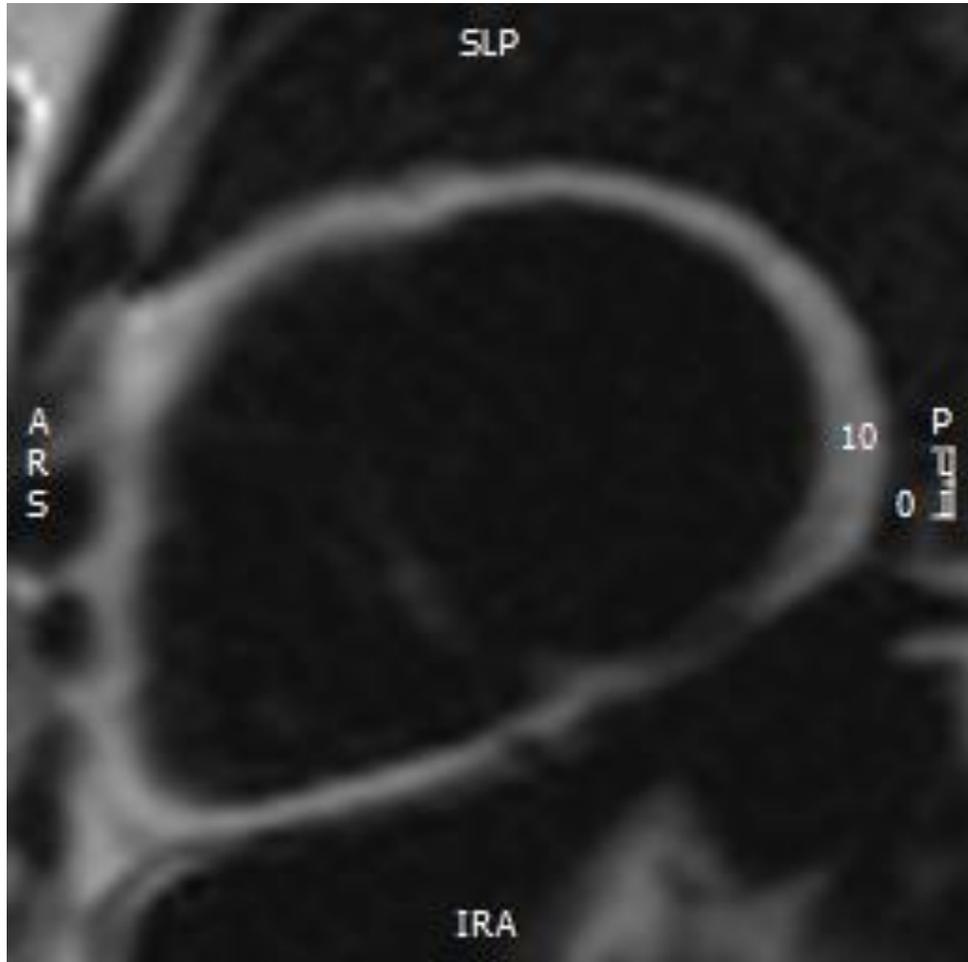

# Case 1

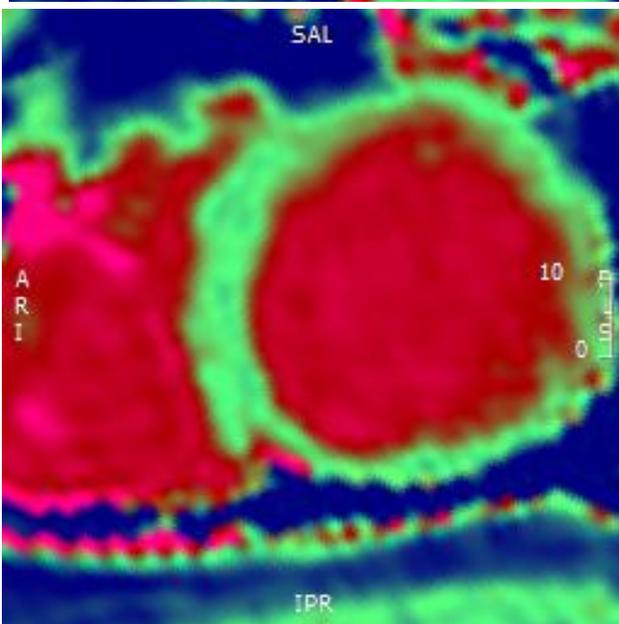

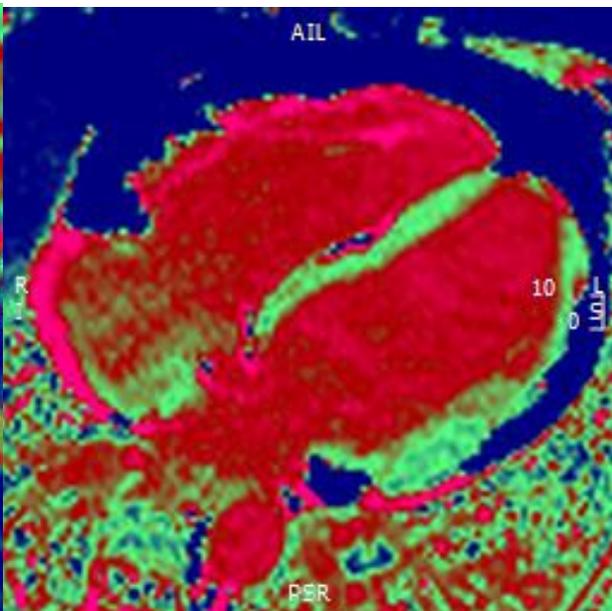

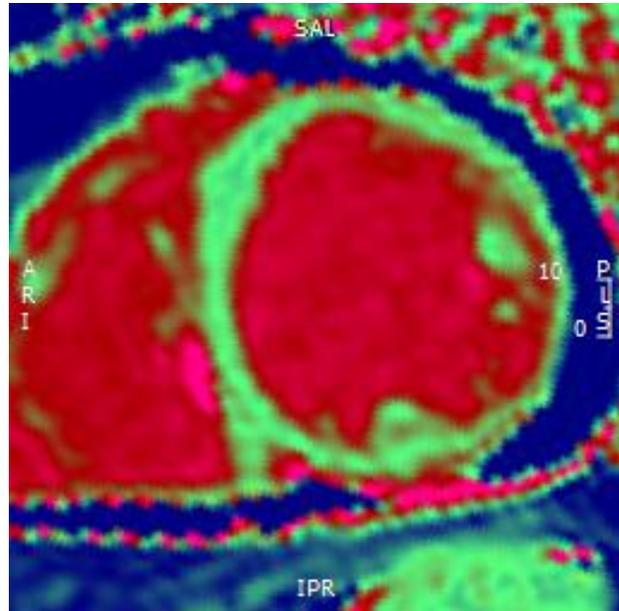

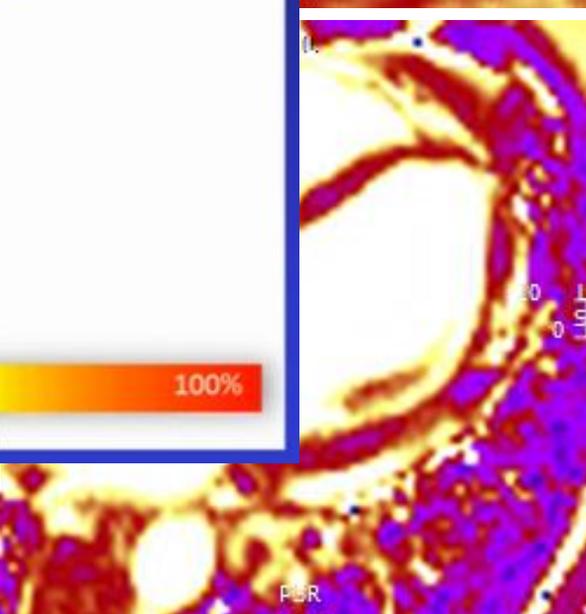

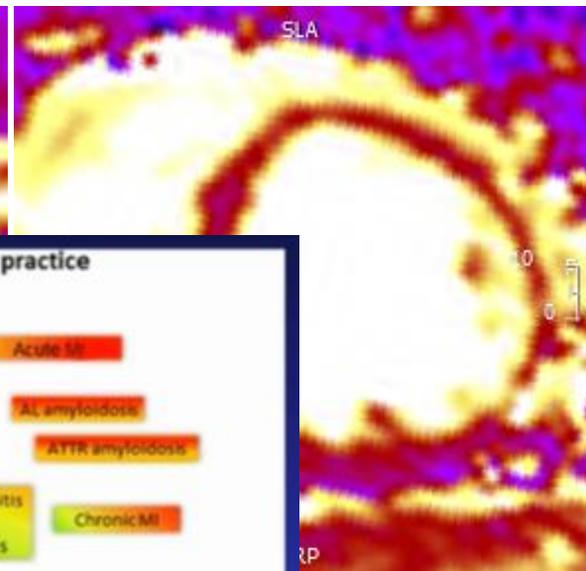

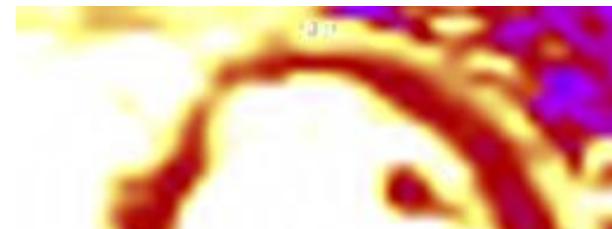

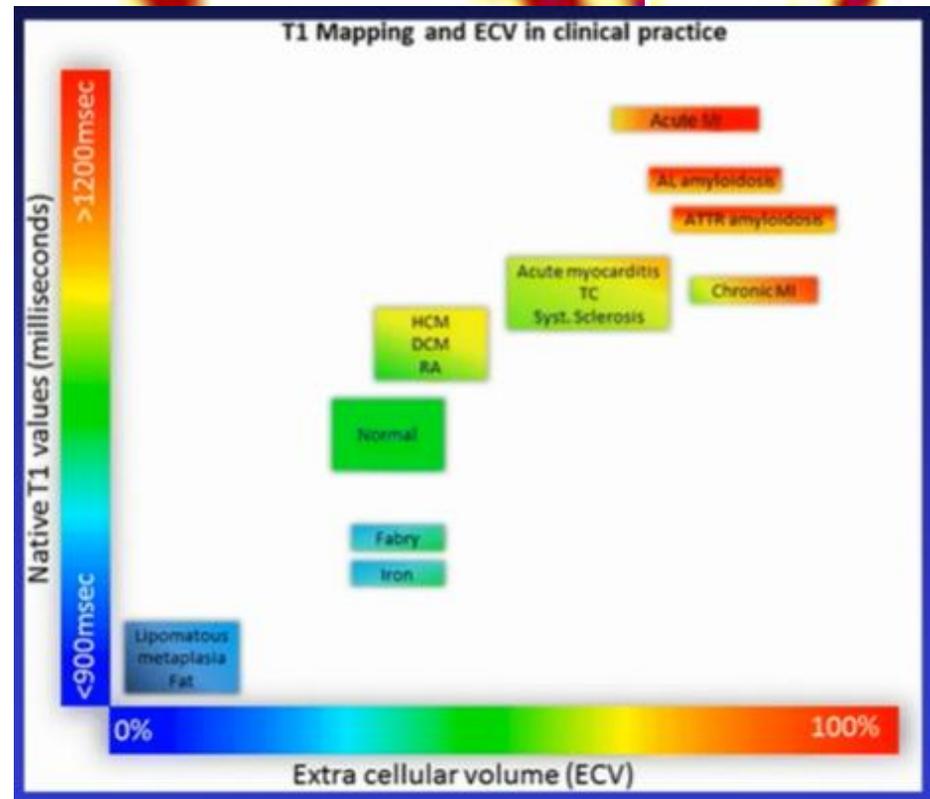

PSR

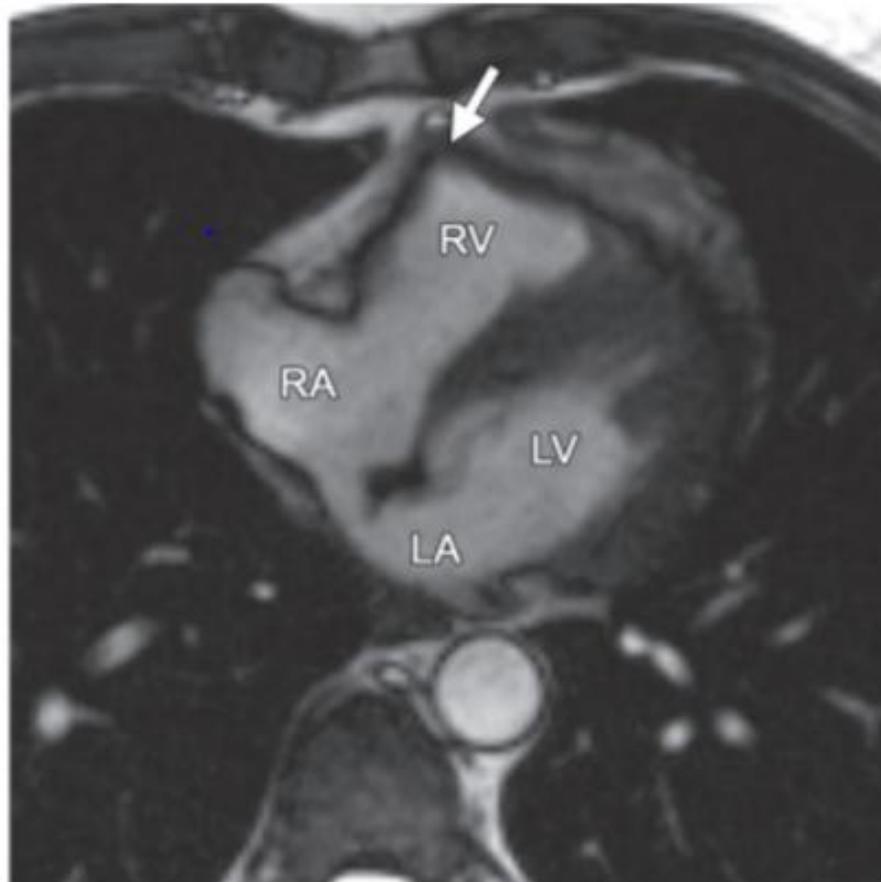

**Be aware of  
“HOT”  
Phases**

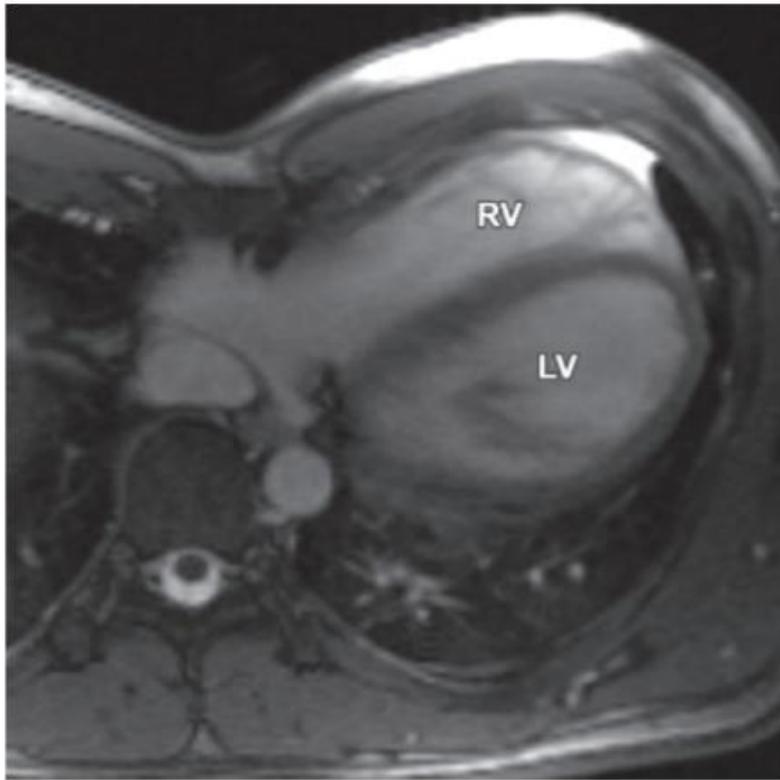

# Pitfalls in imaging of ARVC

*Fatty infiltration*

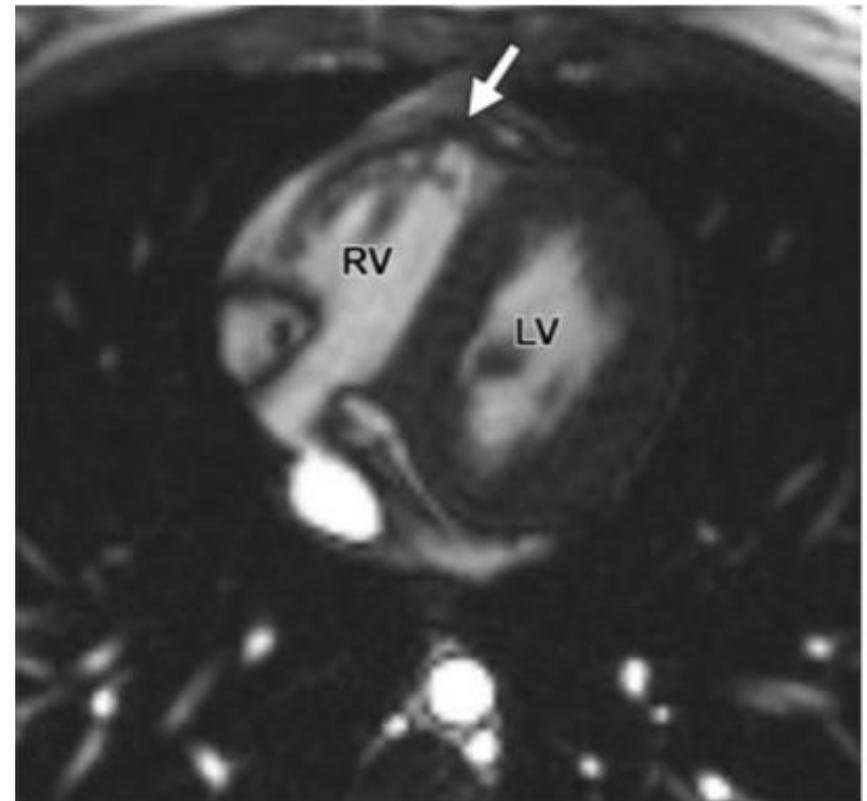

*Free wall tethering*

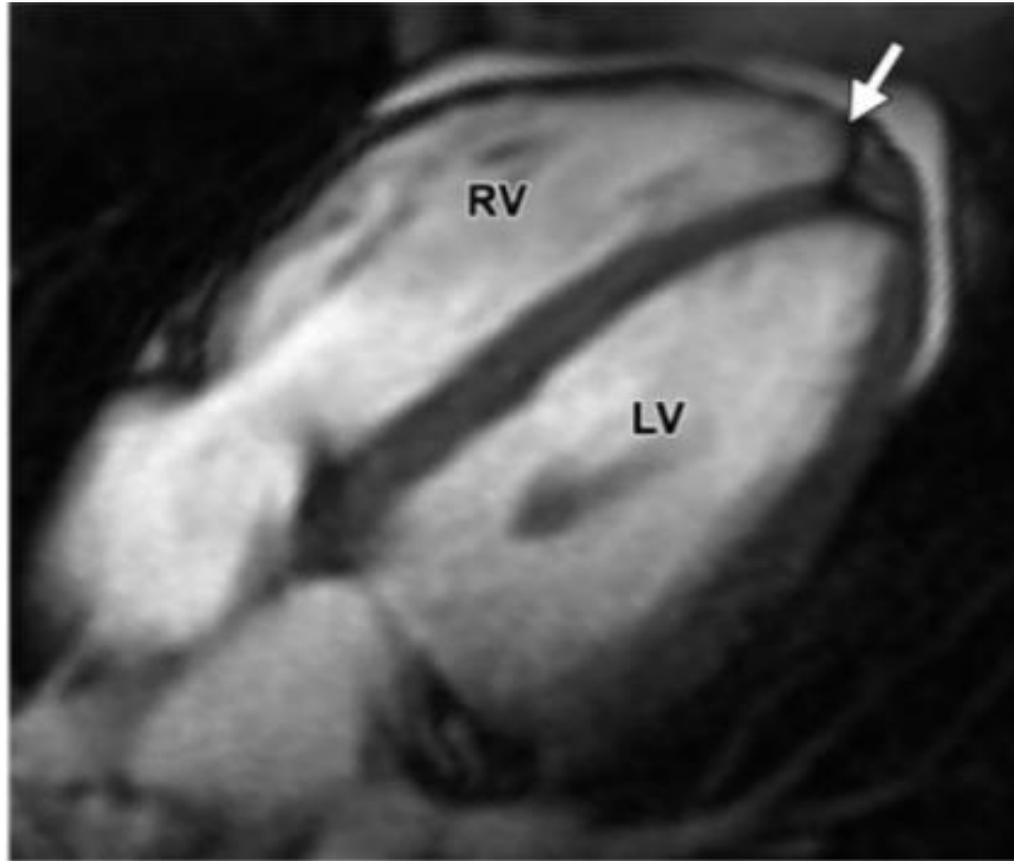

*Pectus excavatum*

*Apicolateral bulge*

*Butterfly apex*

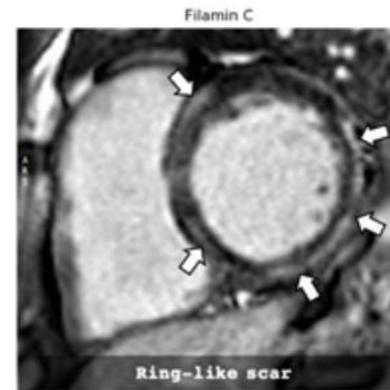

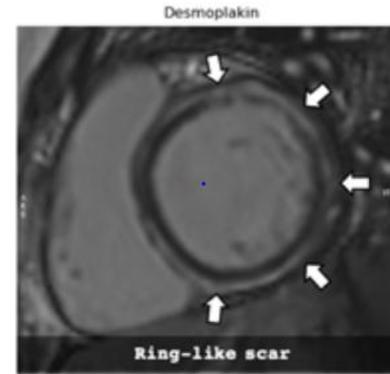

# Correlation of phenotype with genotype

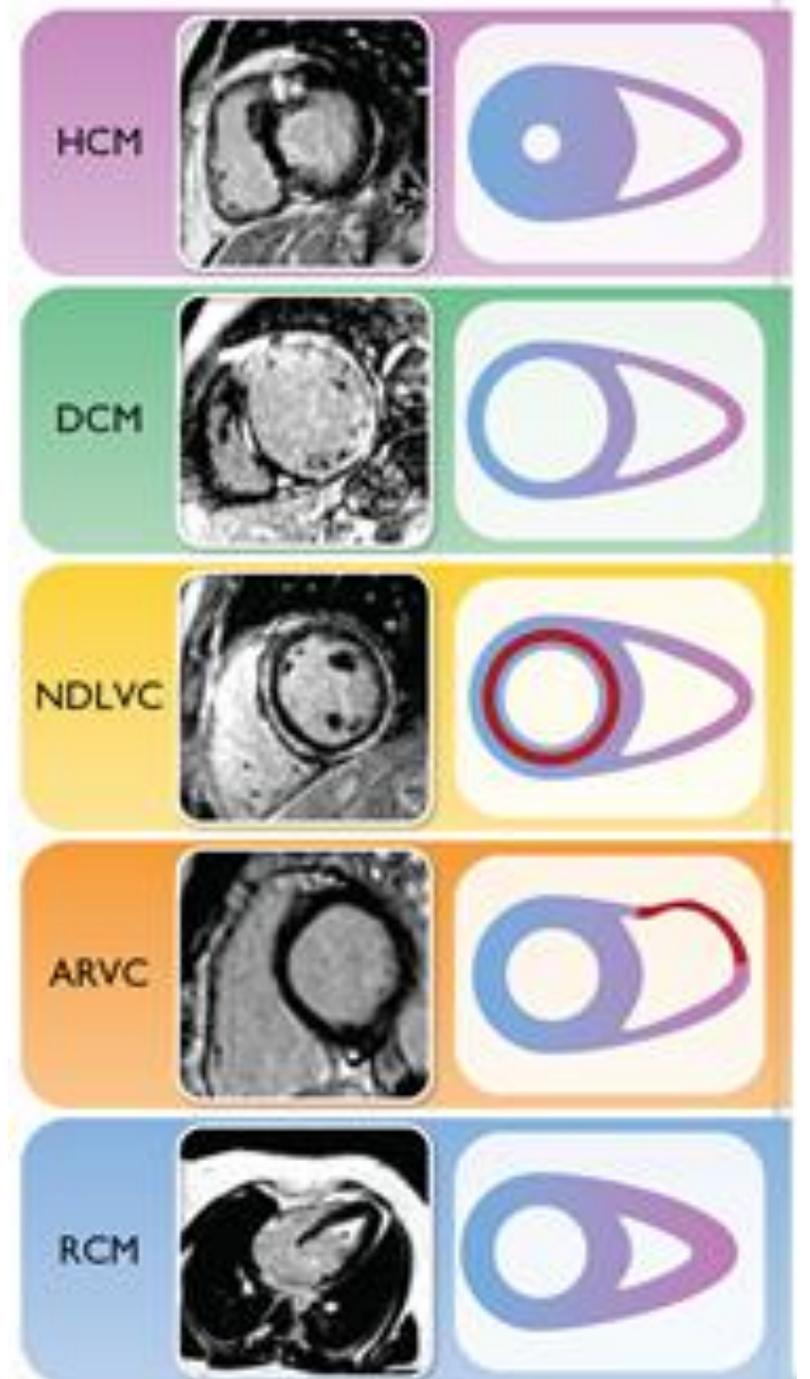

Lamin A/C 6% of DCM

Filamin C

DSP

## 5 Phenotypes

# Non Dilated Left Ventricular Cardiomyopathy (NDLVC)

- Presence of Non ischaemic LV scar/ Fatty replacement WITH or WITHOUT global/regional wall motion abnormalities
- Isolated GLOBAL LV hypokinesia WITHOUT scarring

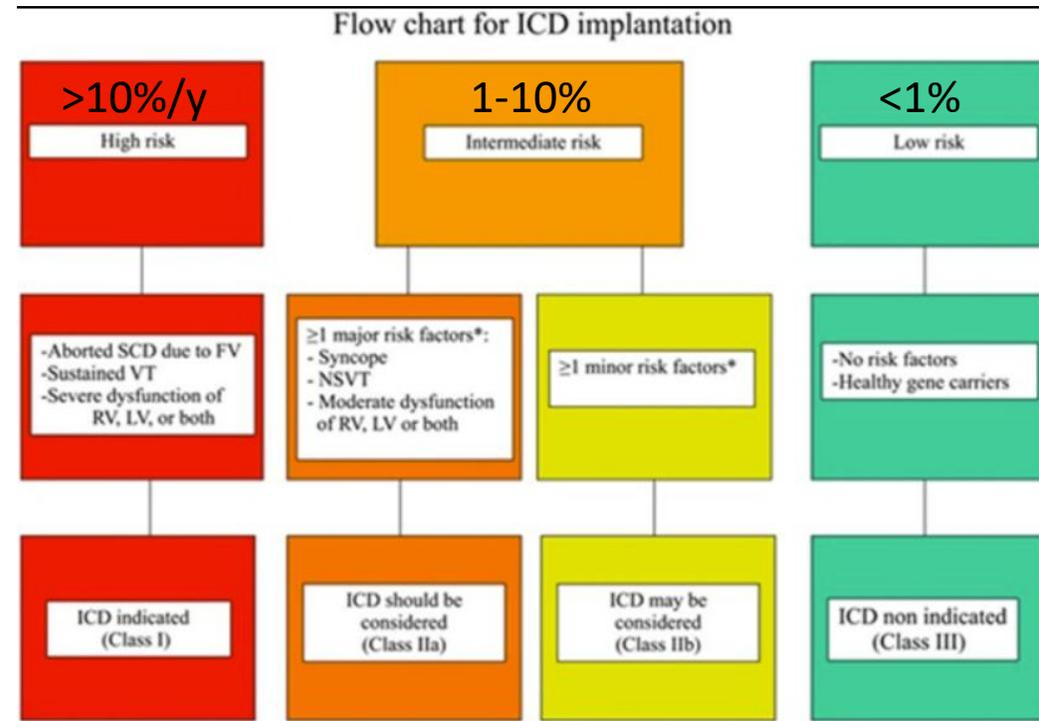

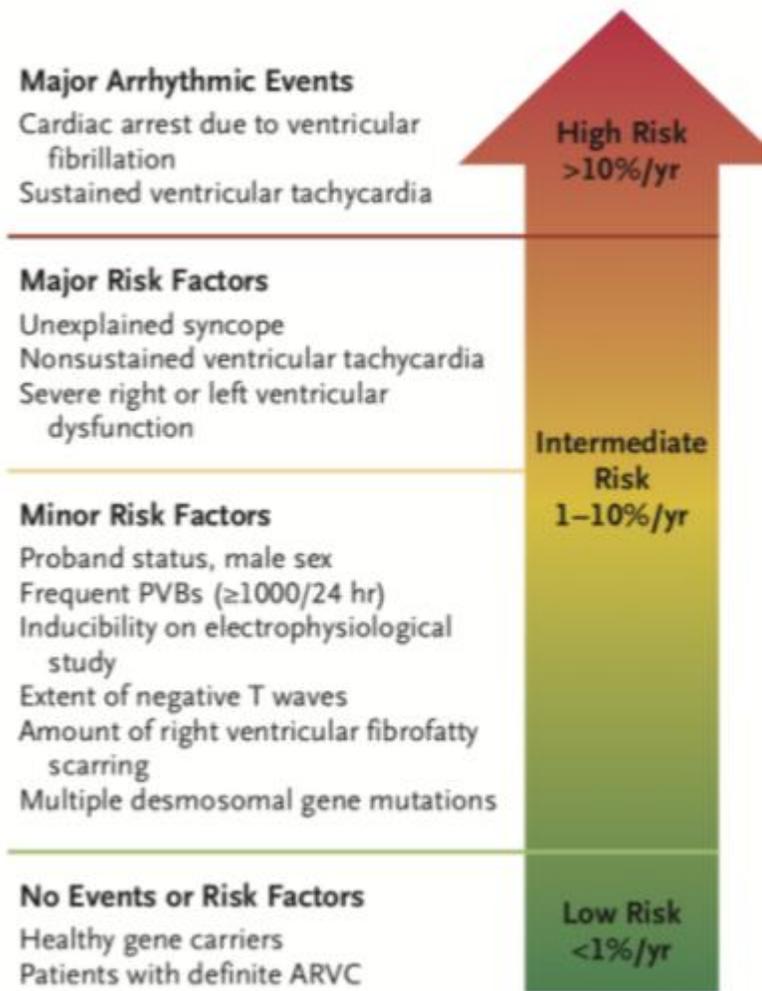

DCM (**NO** LV dilation)

ALVC

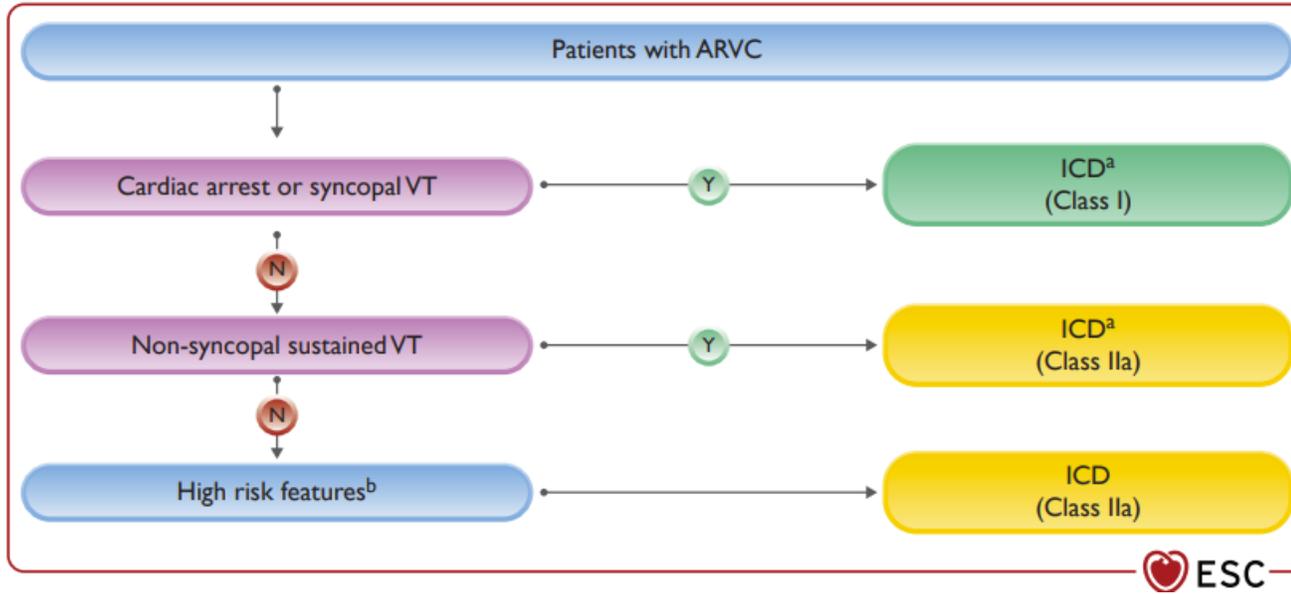

Left dominant ARVC

Arrhythmogenic DCM

**This is NOT the diagnosis**

# ARVC-SCD

- Better for certain genotypes (ie PKP2 vs gene elusive)
- High-risk features are defined as either cardiac syncope NSVT, RVEF<40%, LVEF<45%, SMVT at PES

ICD implantation should be considered in symptomatic<sup>d</sup> patients with definite ARVC, moderate right or left ventricular dysfunction, and either NSVT or inducibility of SMVT at PES.

In ARVC patients with indication for ICDs, a device with the capability of ATP programming for SMVT up to high rates should be considered.

**IIa**

**IIa**

Age at diagnosis  
  
Age at which the patient fulfilled ARVC diagnosis as per 2010 Task Force Criteria (Marcus et al. 2010)

Sex  
 Male  Female

Cardiac syncope (<6 months)  
 Yes  No  
Syncope suspected to be caused by cardiac arrhythmia within 6 months prior to diagnosis.

Number of inverted T-waves  
  
Total number of precordial and inferior leads with inverted T-waves considered 12-lead ECG

Maximum 24 hours PVC count  
  
Maximum number of PVC in 24 hours registered by continuous ECG monitoring (e.g. Holter)

History of non-sustained VT  
 Yes  No  
Specified as a recorded ventricular tachycardia (>100bpm) ending spontaneously within 30 seconds.

Right ventricular ejection fraction (RVEF)  
  
As measured by cardiac MRI

[Calculate](#)

1. For all patients with definite ARVC:  
 Risk of first VT/VR/SCA

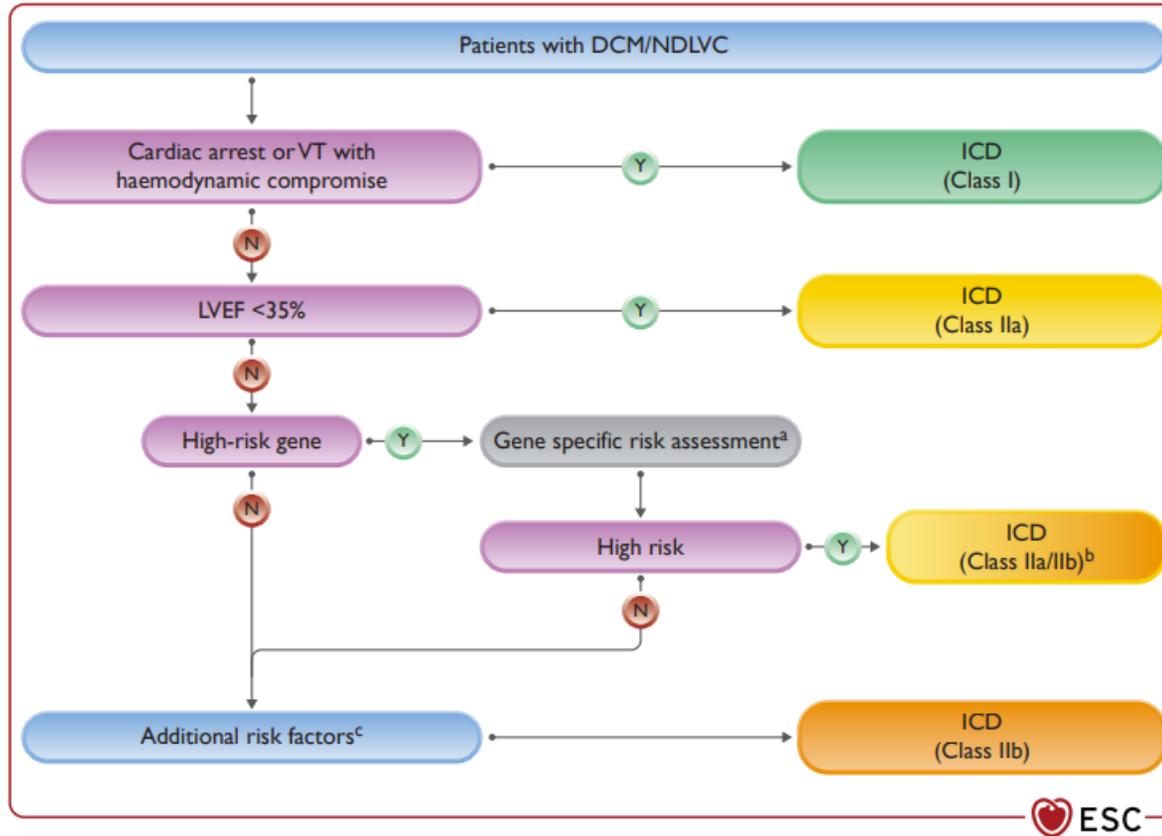

2. For patients without prior sustained VA (primary prevention)  
 Risk of first sustained VA (any type)

Optional: programmed ventricular stimulation (PVS)  
 Positive  
 Negative  
 Not performed  
Positive is defined as induction of sustained monomorphic VT lasting >30s or with hemodynamic compromise

[Calculate](#)

Risk of first sustained VA, adjusted for PVS

# DCM/NDLVC-SCD

➤ Syncope IIb

➤ LGE IIb

➤ **Gene specific approach (IIa)**

➤ **Variant Specific** calculators

Primary prevention		
An ICD should be considered to reduce the risk of sudden death and all-cause mortality in patients with DCM, symptomatic heart failure, and LVEF $\leq 35\%$ despite $>3$ months of OMT. <sup>861,885</sup>	IIa	A
The patient's genotype should be considered in the estimation of SCD risk in DCM. <sup>185,186,869,886</sup>	IIa	B
An ICD should be considered in patients with DCM with a genotype associated with high SCD risk and LVEF $>35\%$ in the presence of additional risk factors (see Table 21). <sup>541,542,867,869,873,878,881,886</sup>	IIa	C
An ICD may be considered in selected patients with DCM with a genotype associated with high SCD risk and LVEF $>35\%$ without additional risk factors (see Table 21). <sup>869,873,881,886</sup>	IIb	C
An ICD may be considered in patients with DCM without a genotype associated with high SCD risk and LVEF $>35\%$ in the presence of additional risk factors. <sup>c,138,873,874</sup>	IIb	C

# LMNA-risk VTA calculator

## Risk Prediction Score for Life-Threatening Ventricular Tachyarrhythmias in Laminopathies

Sex  Male  Female

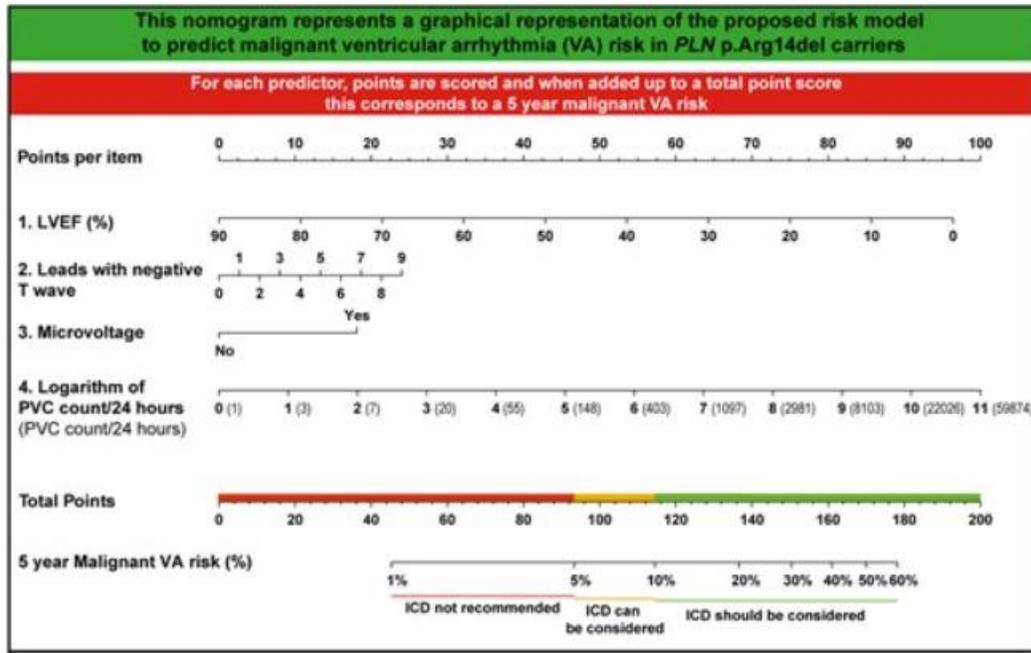

Non-missense LMNA mutation  Yes  No *Non-missense mutations include insertions, deletions, truncating mutations or mutations affecting splicing*

Atrio-ventricular block  Absent  1st degree  High degree *Please select the highest degree. 1st degree AV block corresponds to  $\geq 0.20$  sec PR interval and high degree AV block to type II 2nd degree or 3rd degree (and not type I 2nd degree)*

Non-sustained ventricular tachycardia  Yes  No *NSVT corresponds to  $\geq 3$  consecutive ventricular complexes at a rate  $\geq 120$  bpm on 24-h ambulatory electrocardiographic monitoring*

Left ventricular ejection fraction  % *Left ventricular ejection fraction measurement derived from echocardiogram*

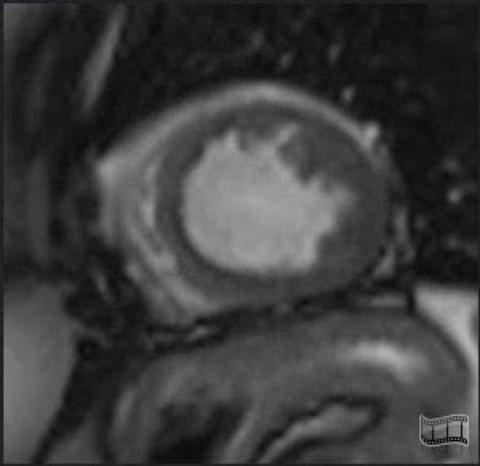

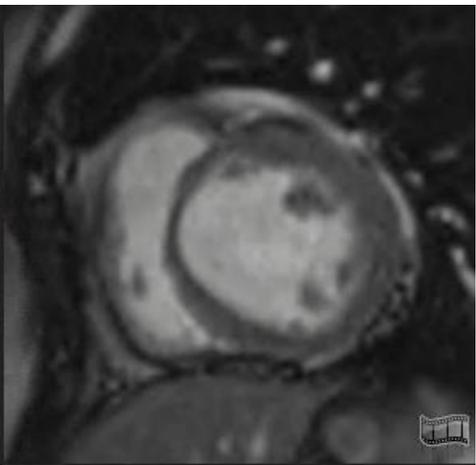

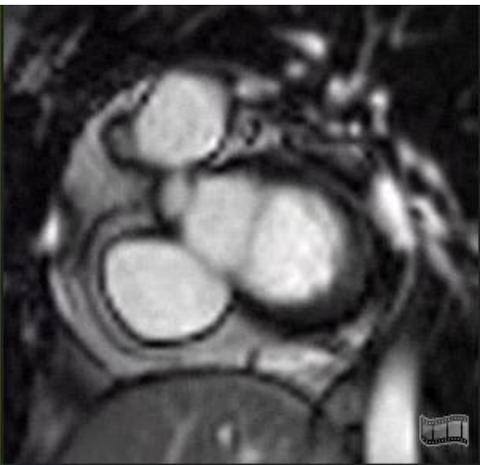

**Risk of Life-Threatening Ventricular Tachyarrhythmias at 5 years**

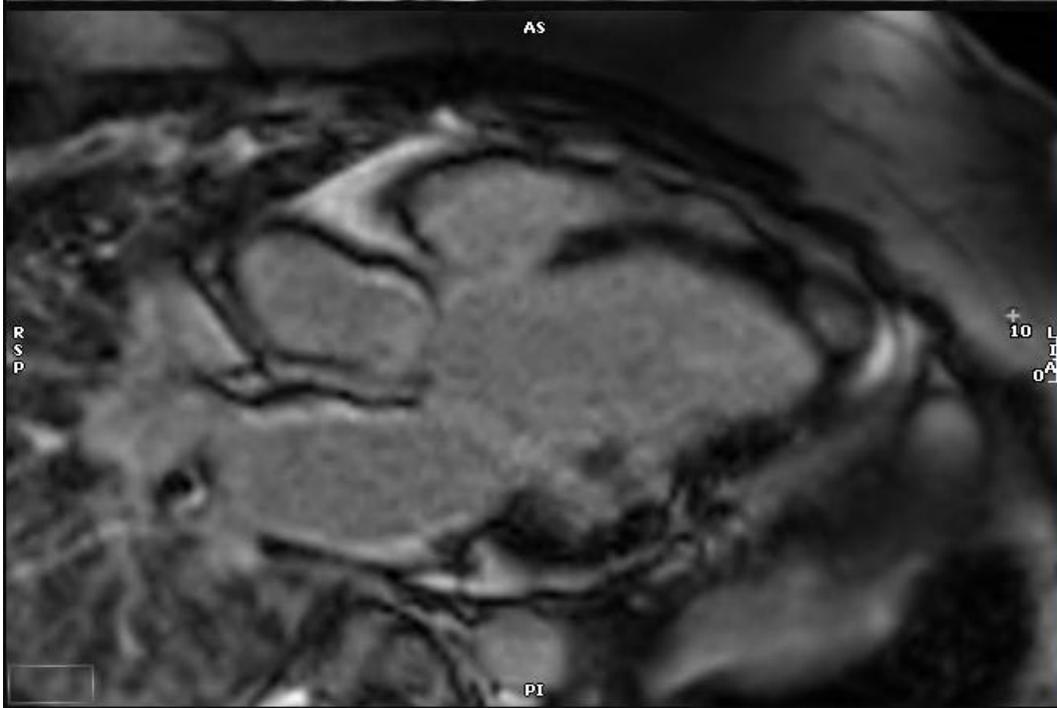

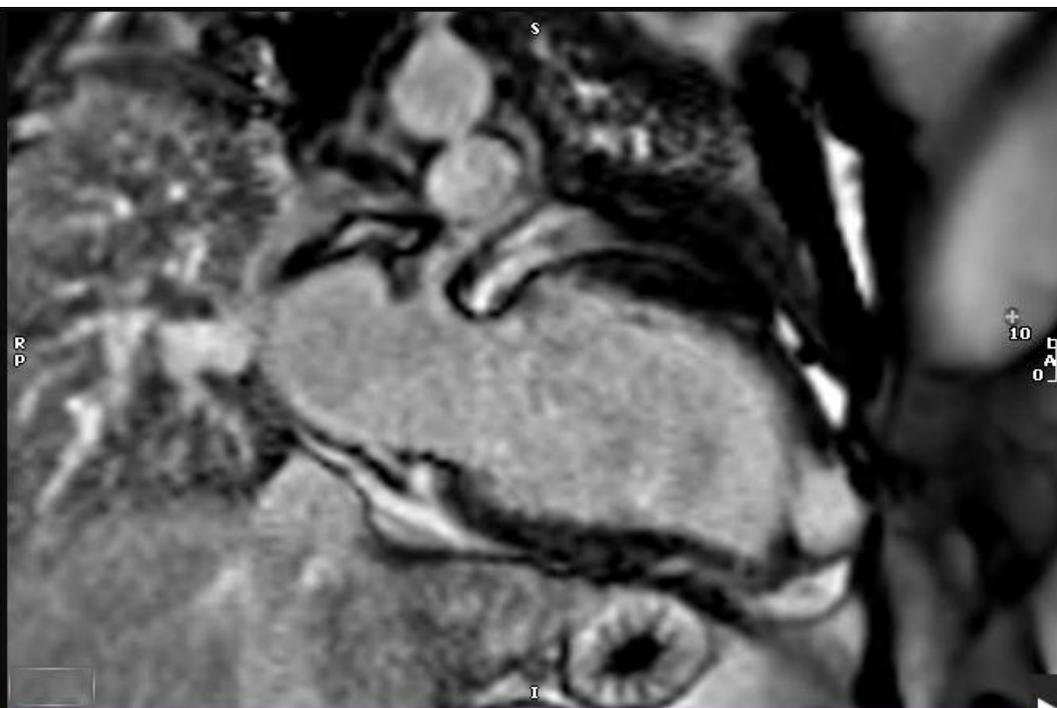

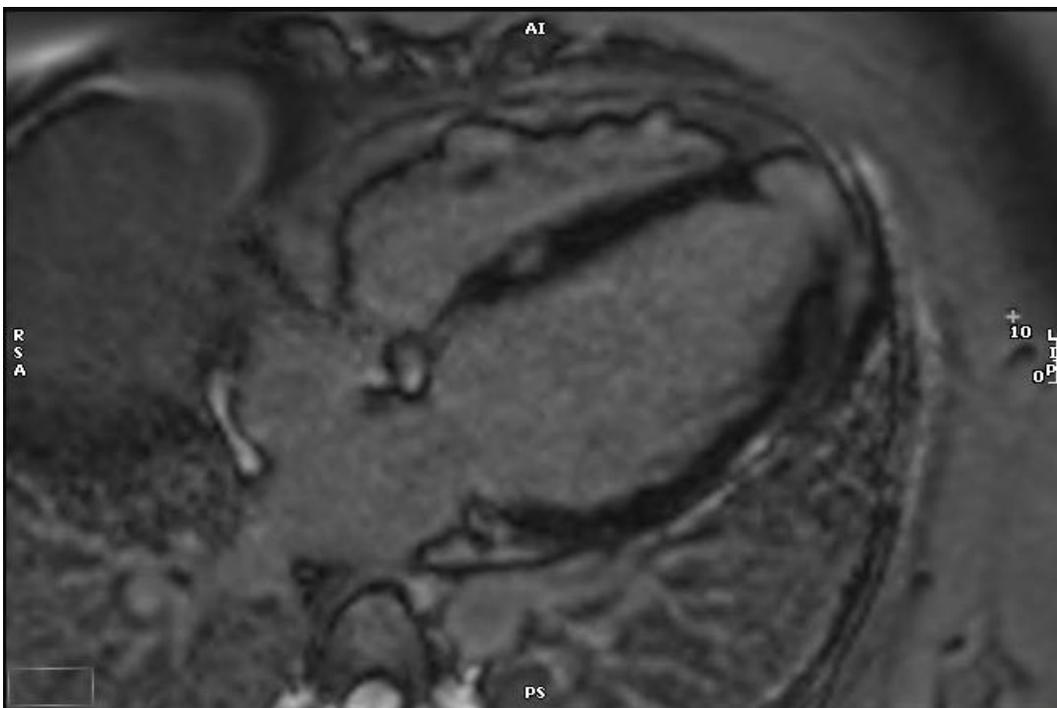

Gene	Annual SCD rate	Predictors of SCD
LMNA <sup>185,186,438,541,865,878,879</sup>	5–10%	Estimated 5-year risk of life-threatening arrhythmia using LMNA risk score ( <a href="https://lmna-risk-vta.fr">https://lmna-risk-vta.fr</a> )
FLNC-truncating variants <sup>866,867,880</sup>	5–10%	LGE on CMR LVEF < 45%
TMEM43 <sup>868,881</sup>	5–10%	Male Female and any of the following: LVEF < 45%, NSVT, LGE on CMR, >200 VE on 24h Holter ECG
PLN <sup>542,882,883</sup>	3–5%	Estimated 5-year risk of life-threatening arrhythmia using PLN risk score ( <a href="https://plnriskcalculator.shinyapps.io/final_shiny">https://plnriskcalculator.shinyapps.io/final_shiny</a> ) LVEF < 45% LGE on CMR NSVT
DSP <sup>185,186</sup>	3–5%	LGE on CMR LVEF < 45%
RBM20 <sup>869</sup>	3–5%	LGE on CMR LVEF < 45%

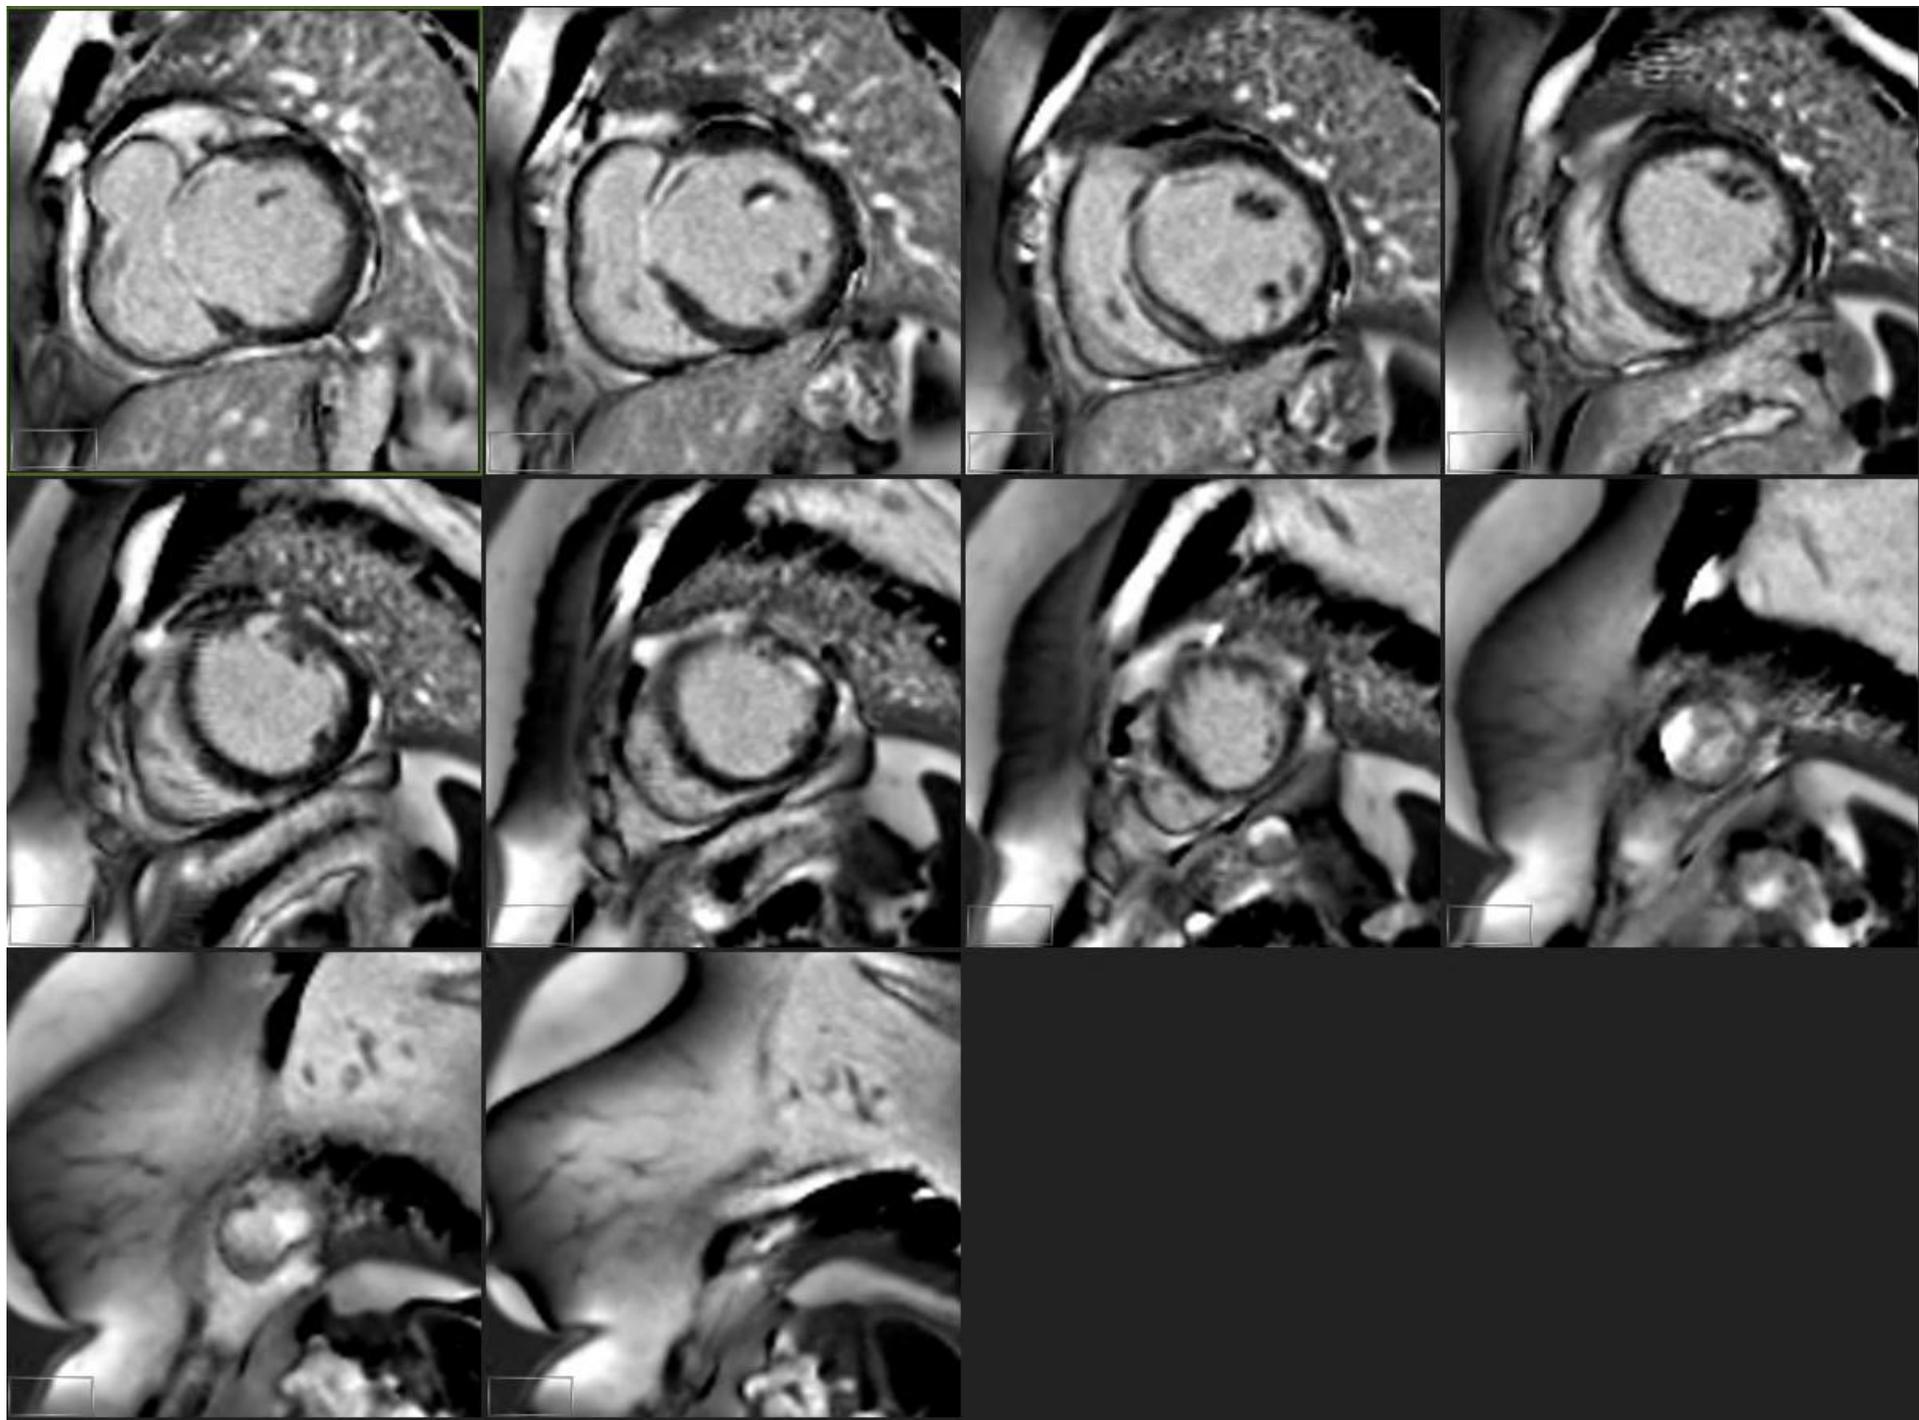

# Case 2

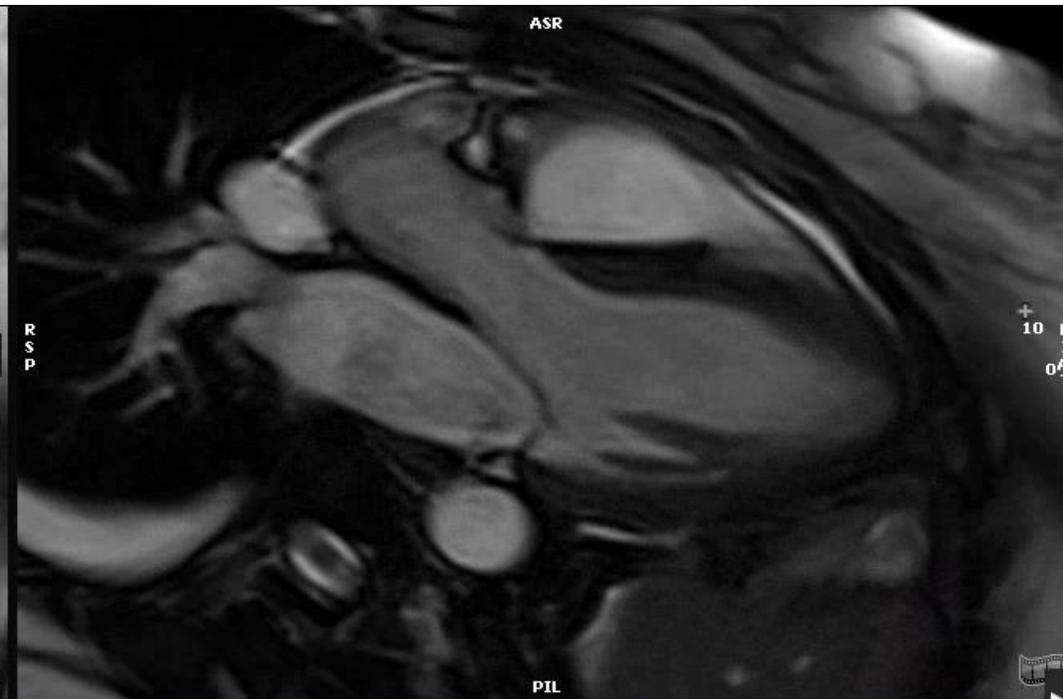

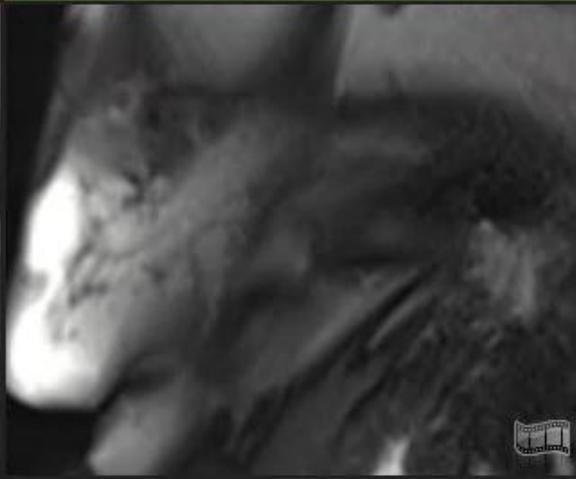

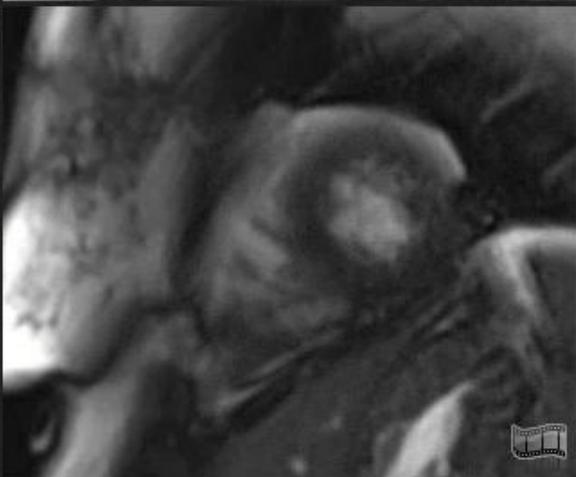

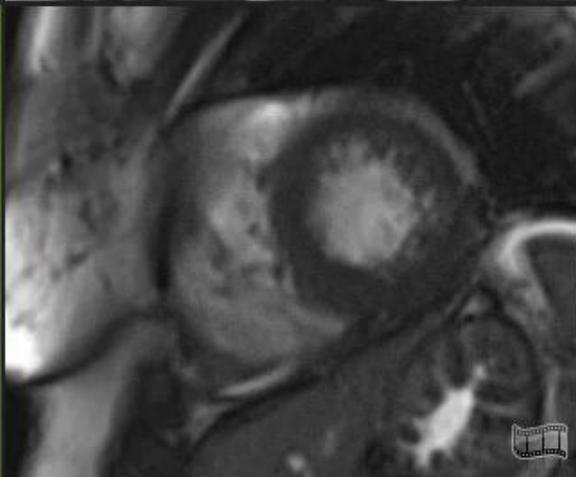

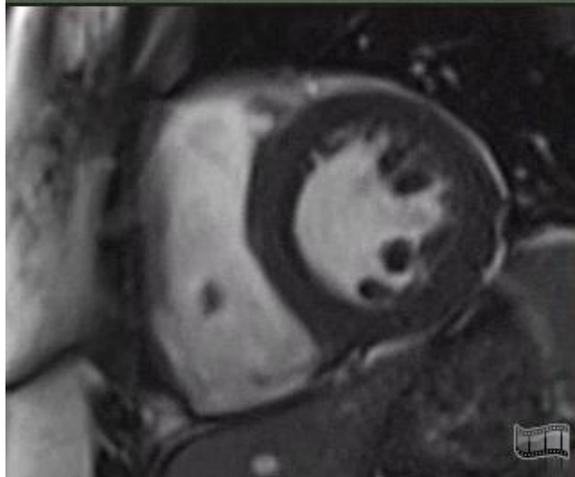

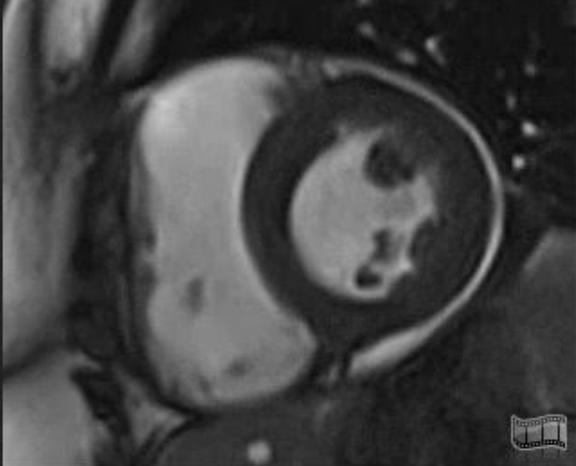

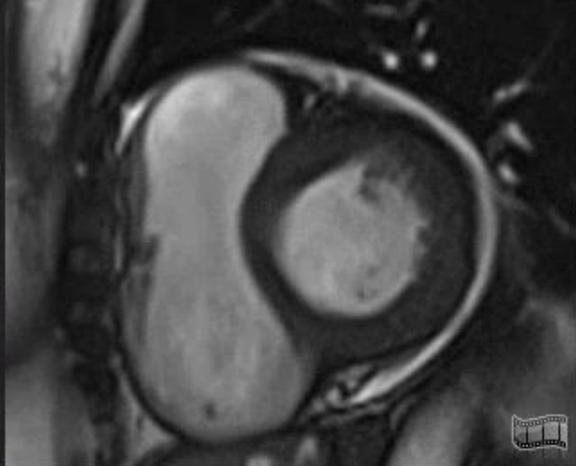

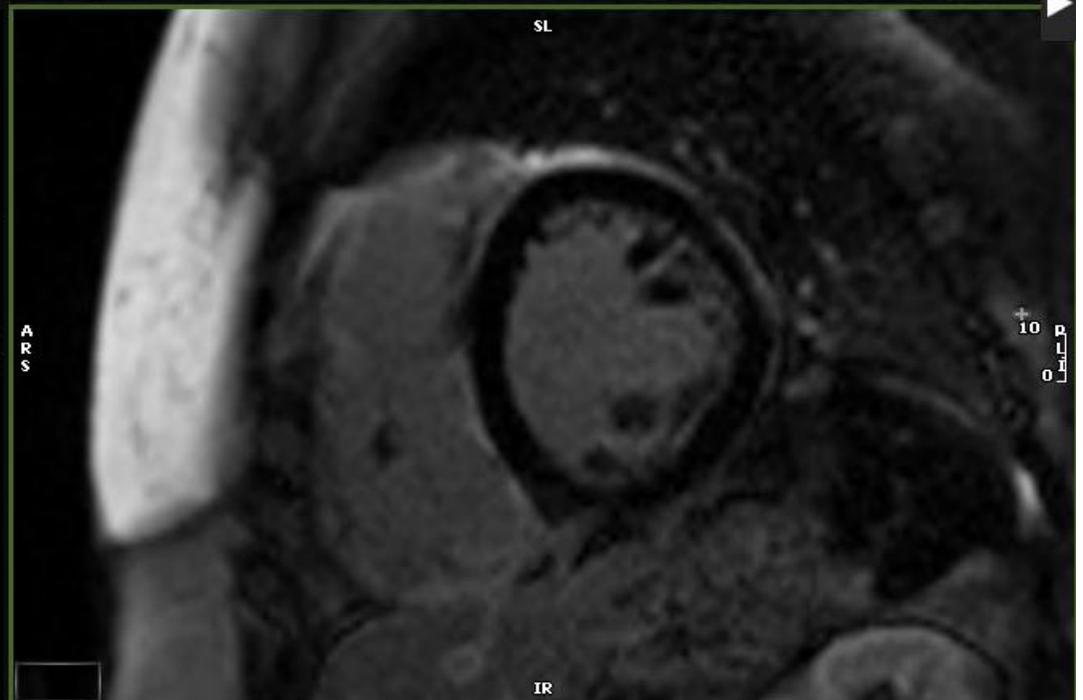

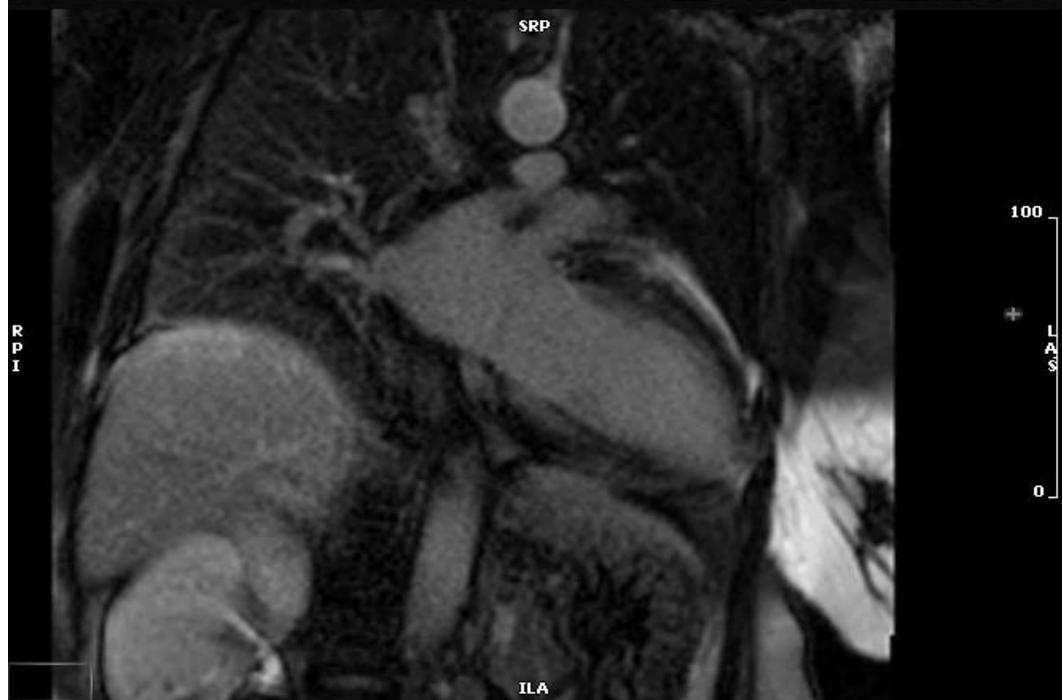

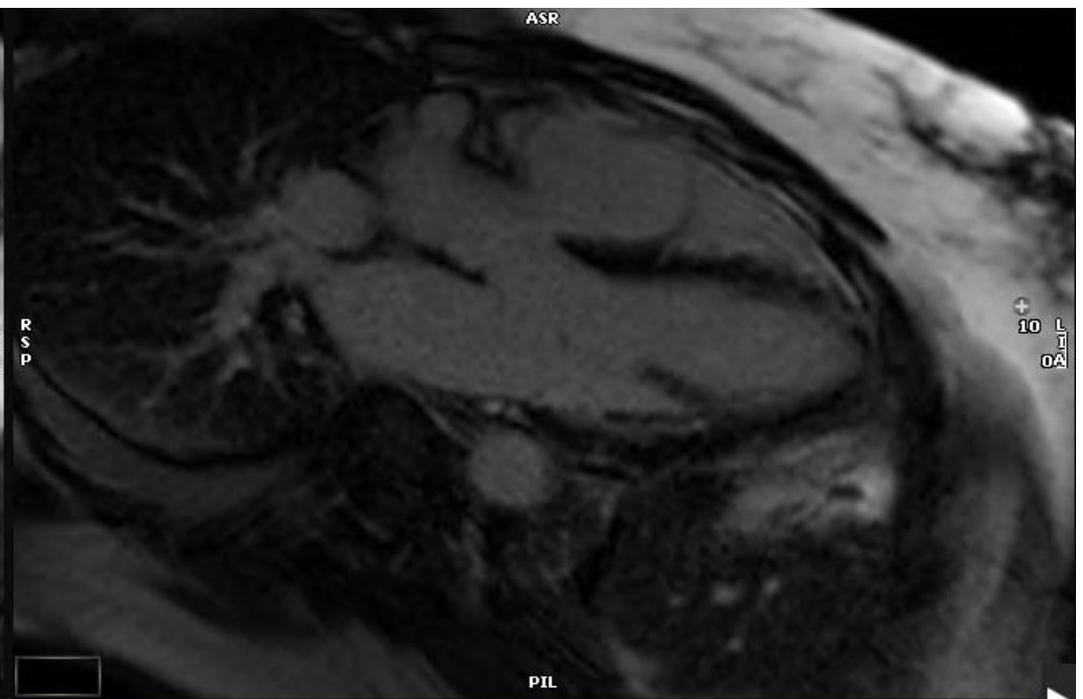

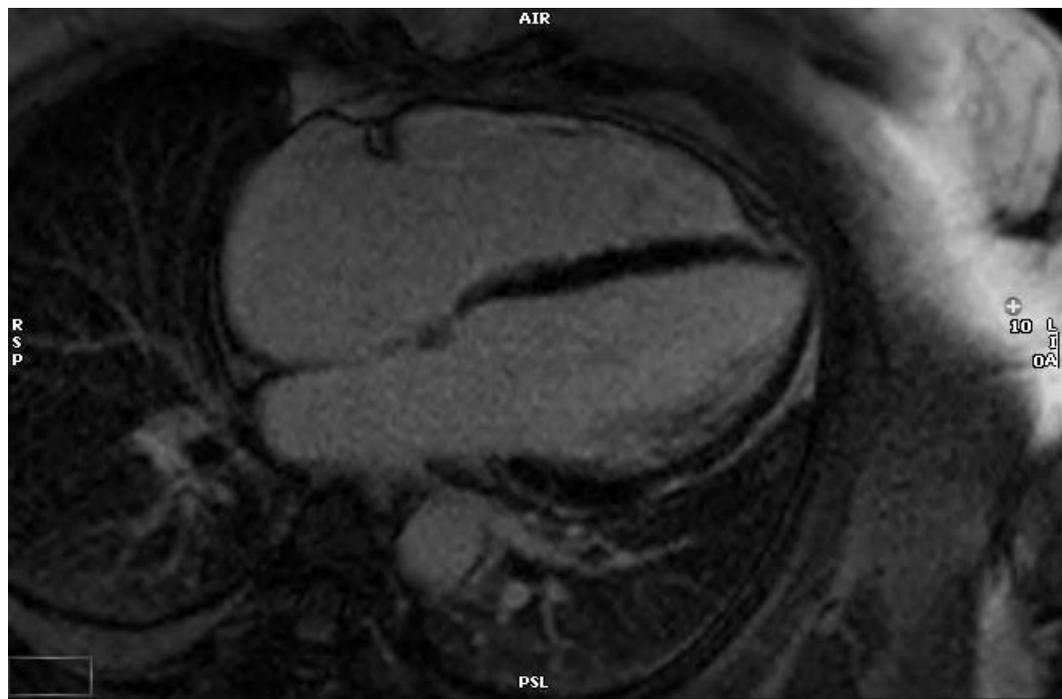

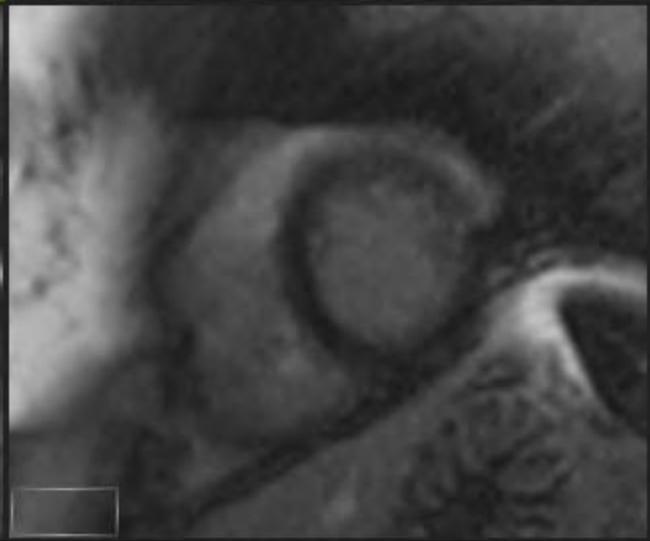

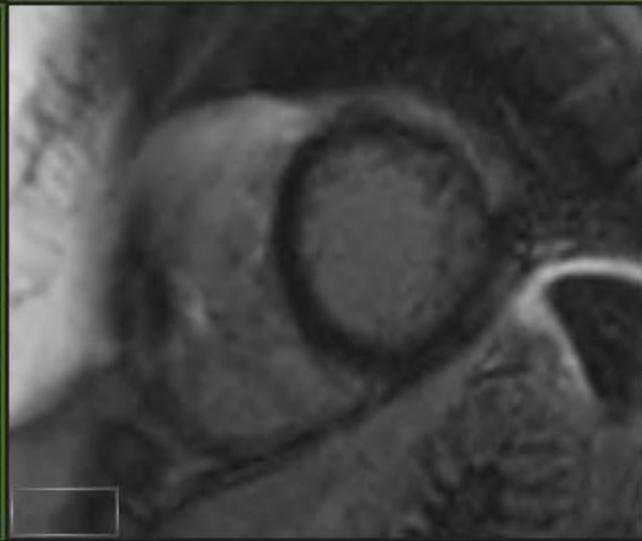

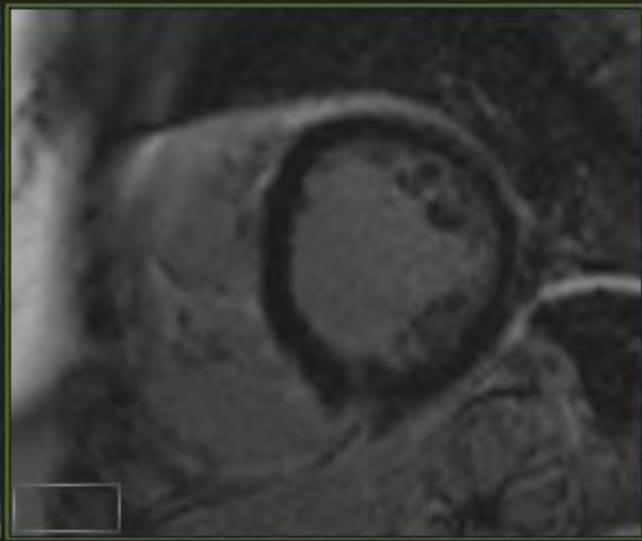

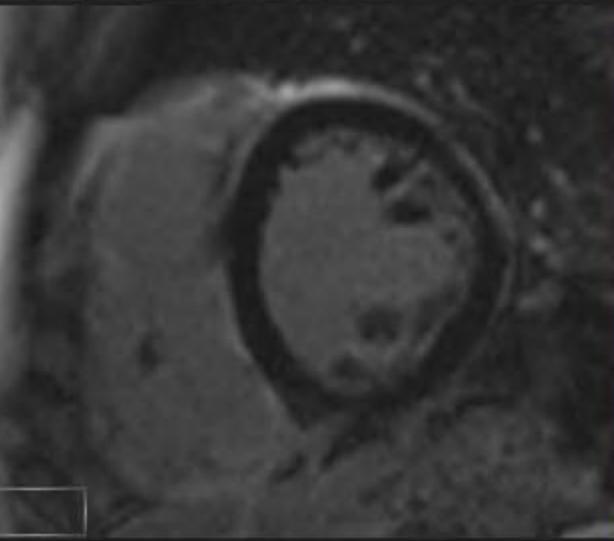

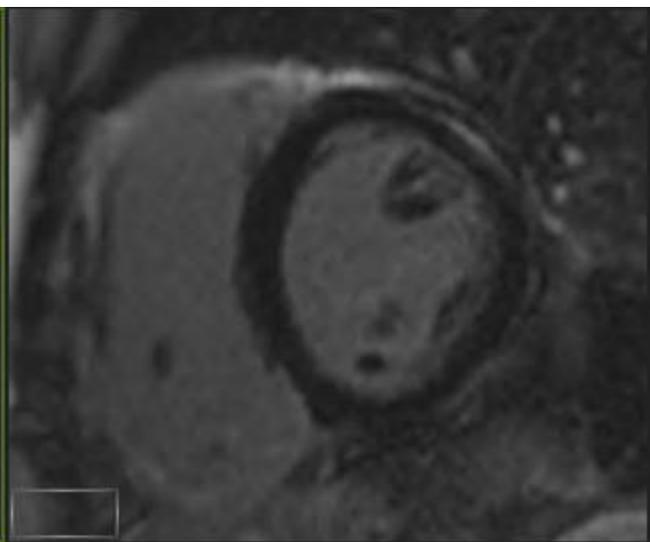

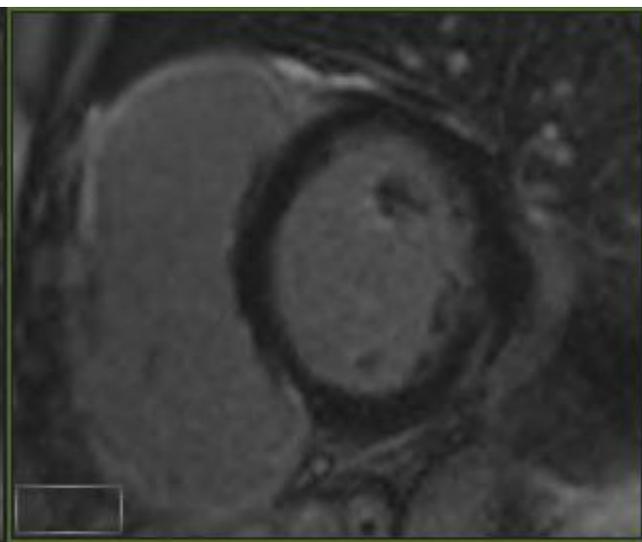

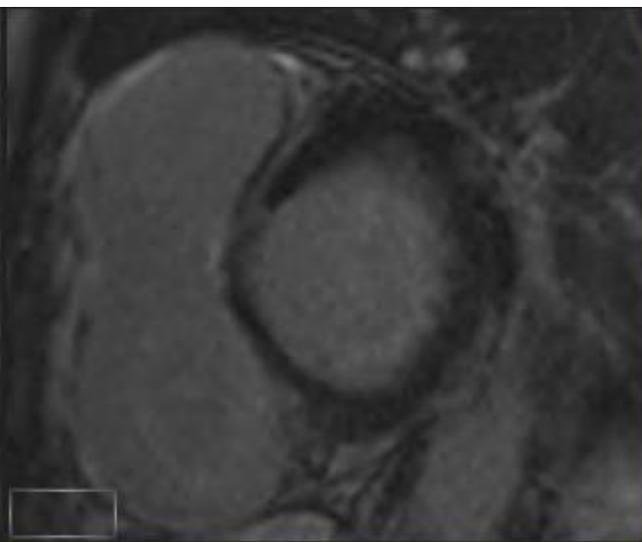

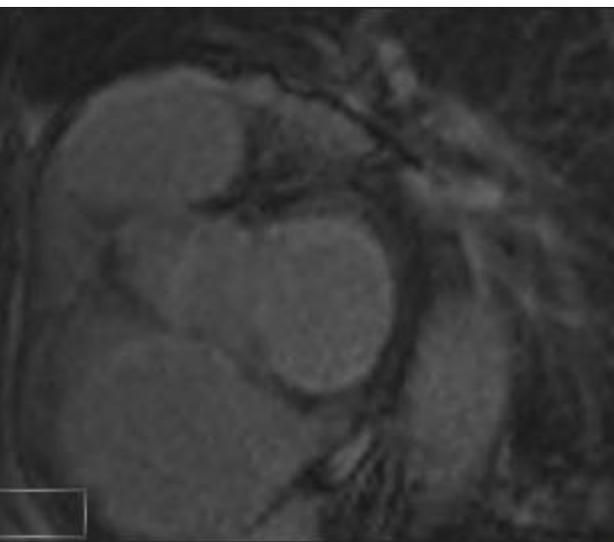

# Case 3

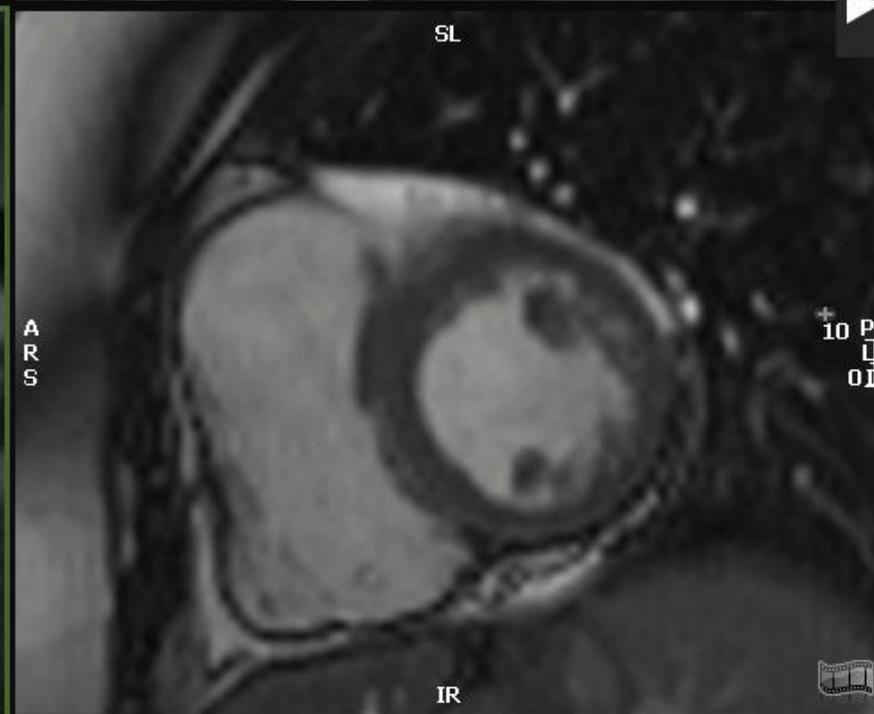

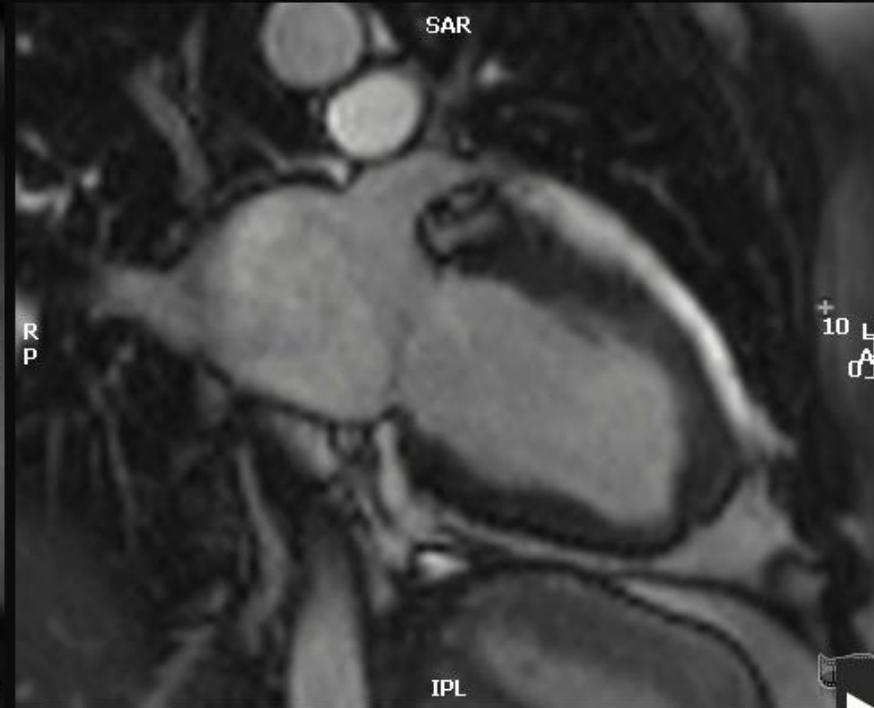

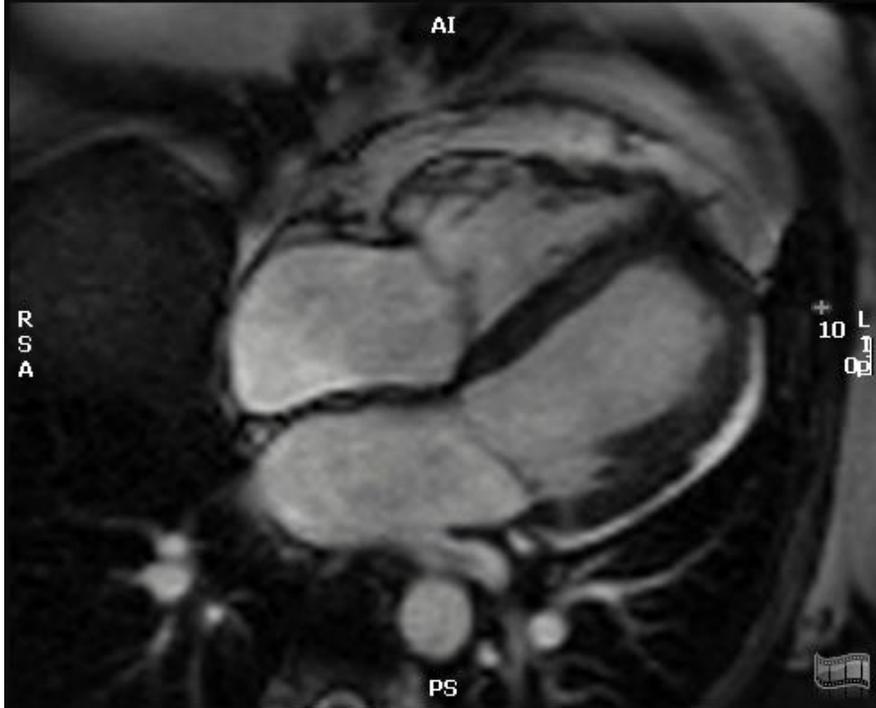

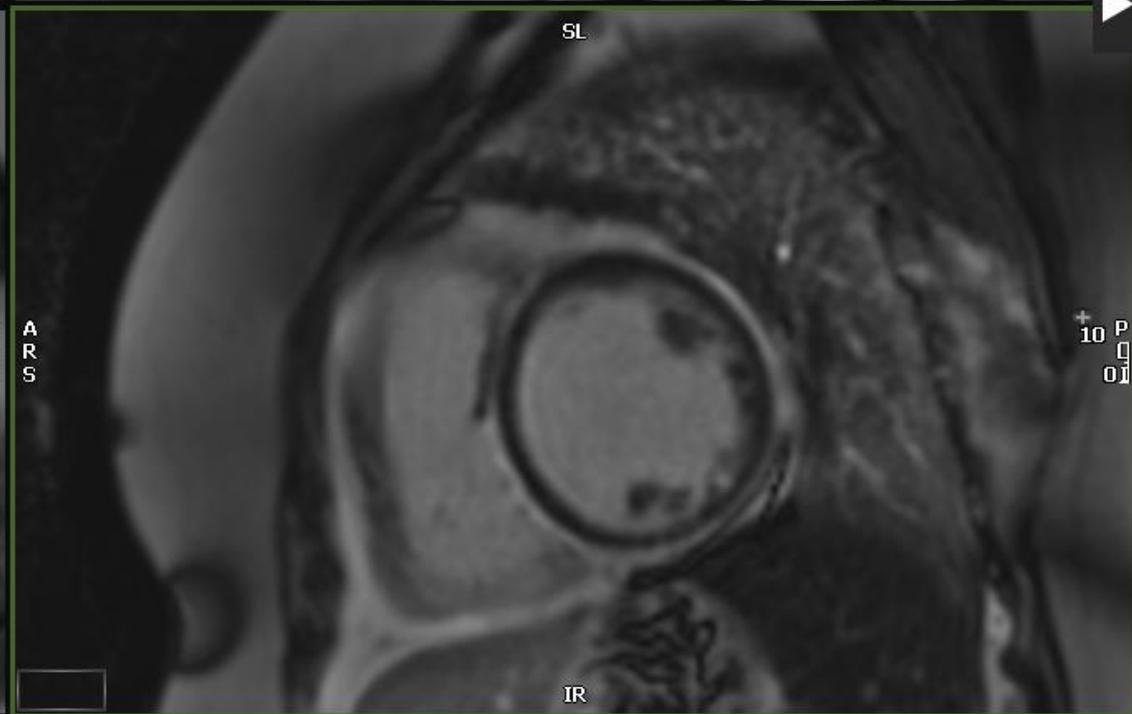

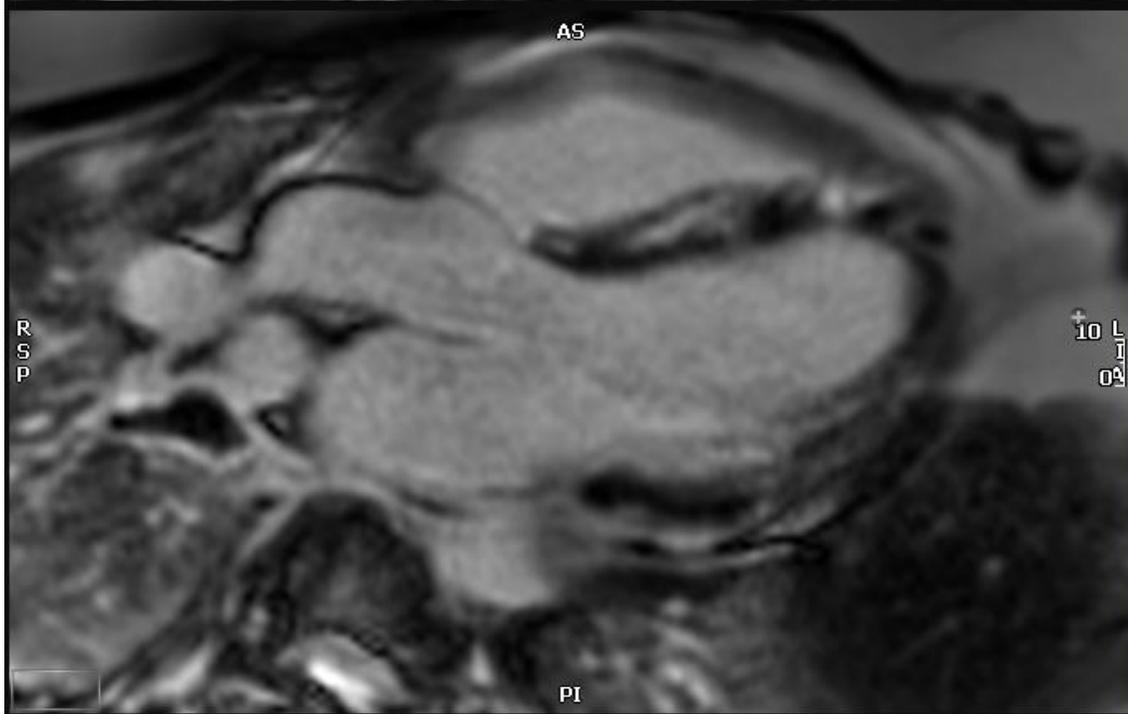

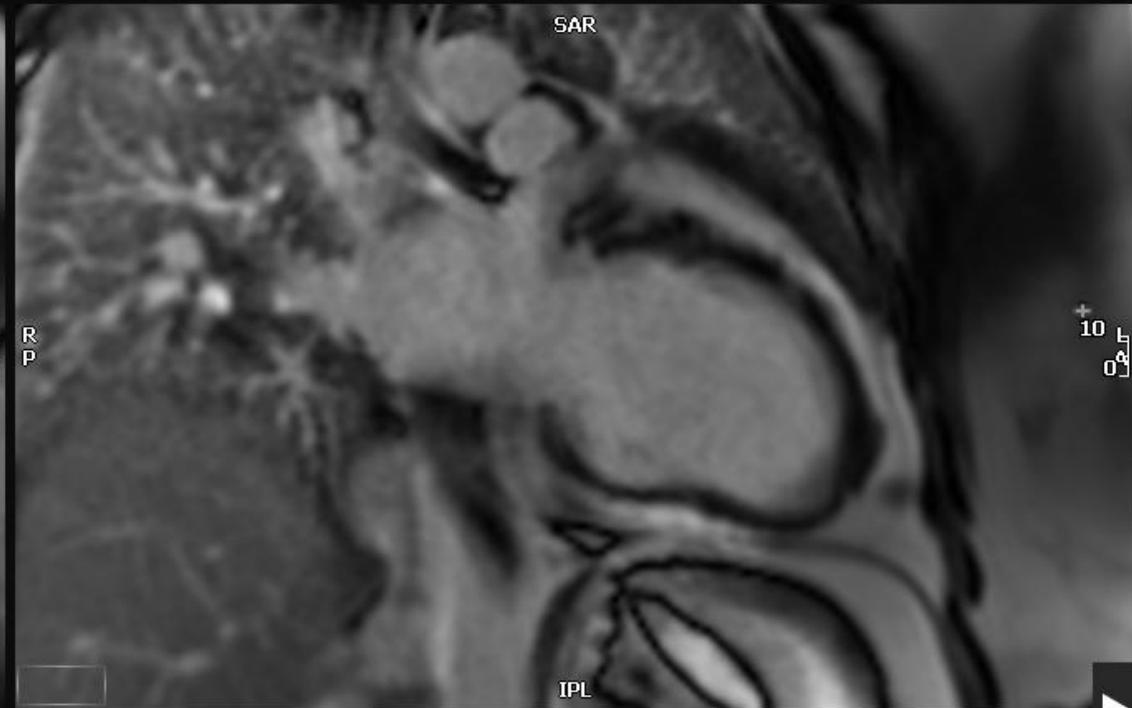

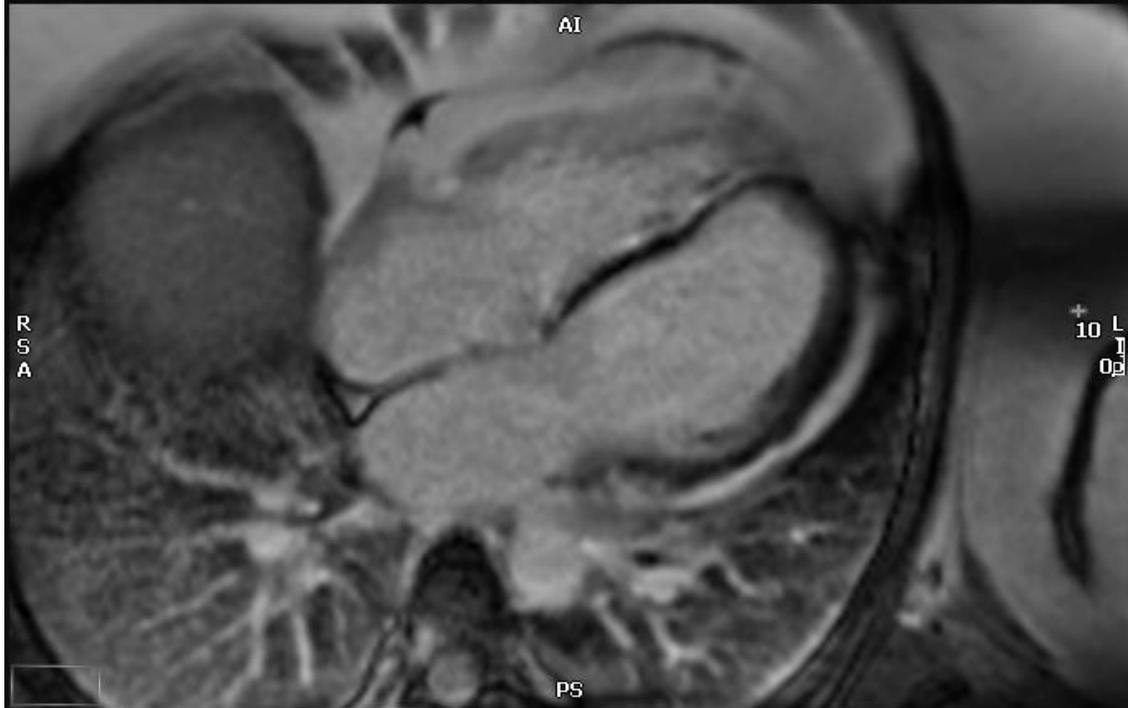

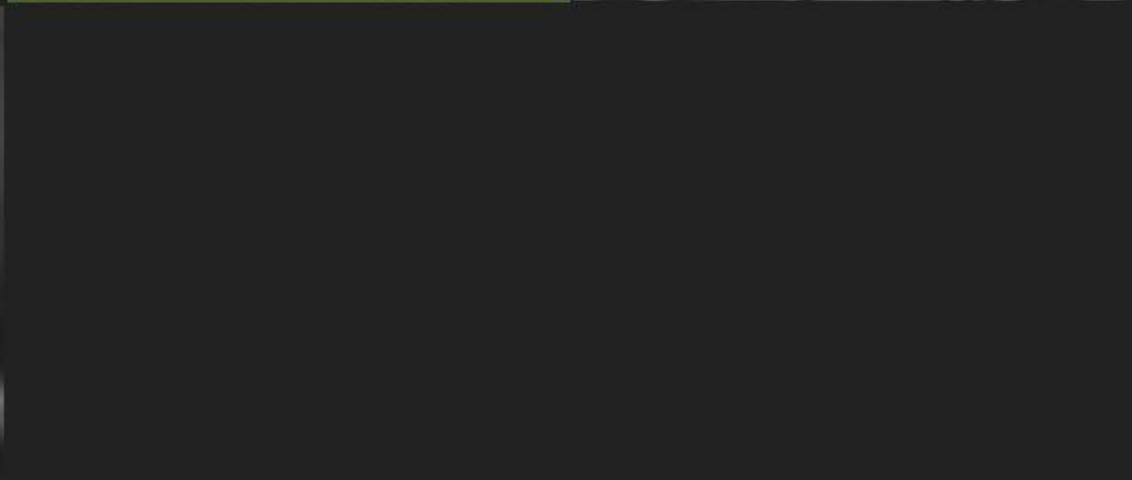

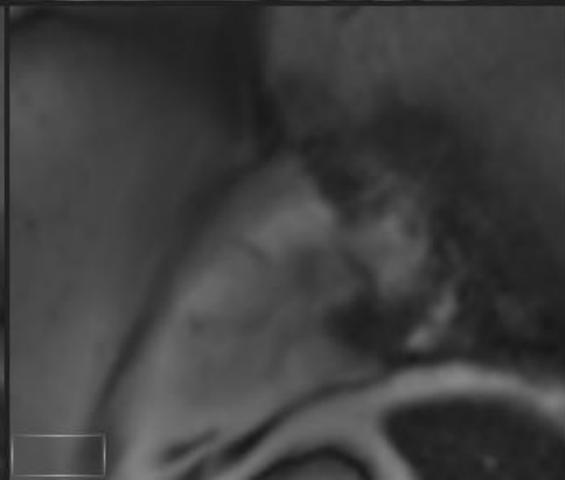

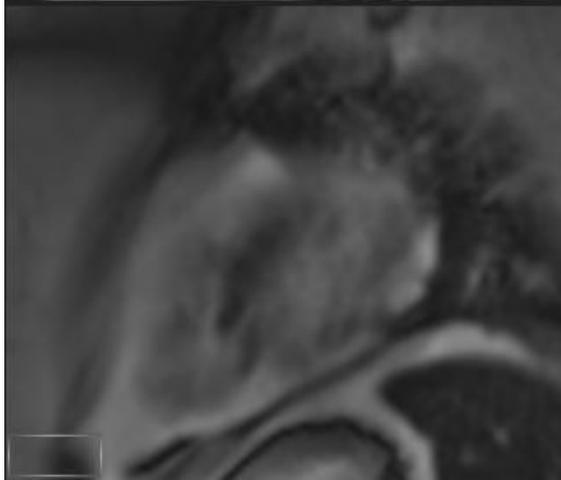

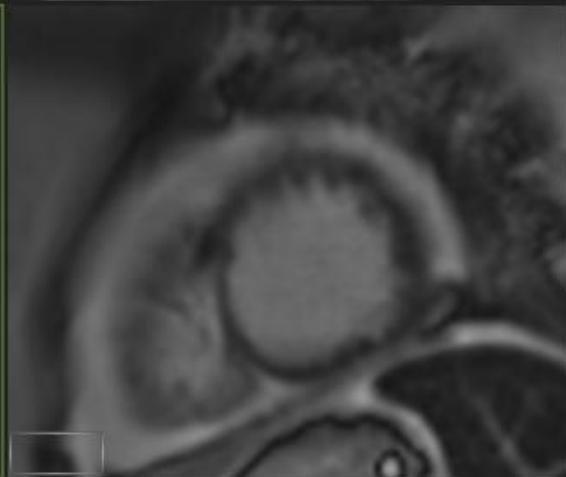

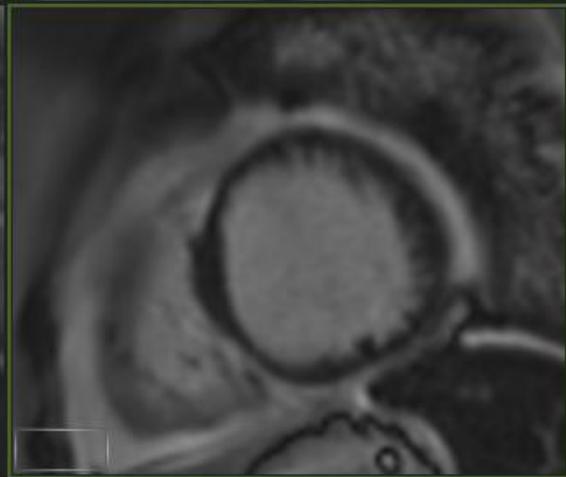

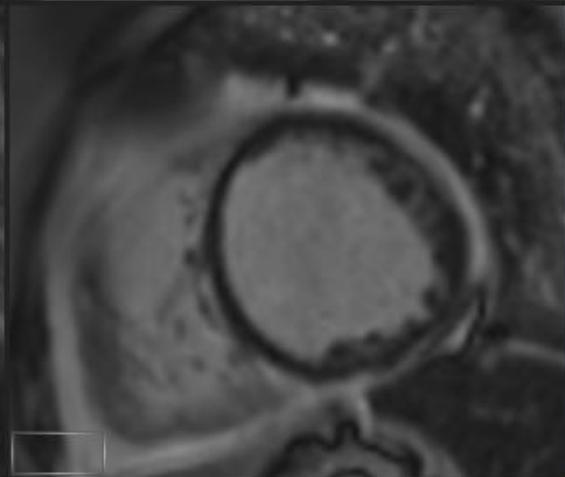

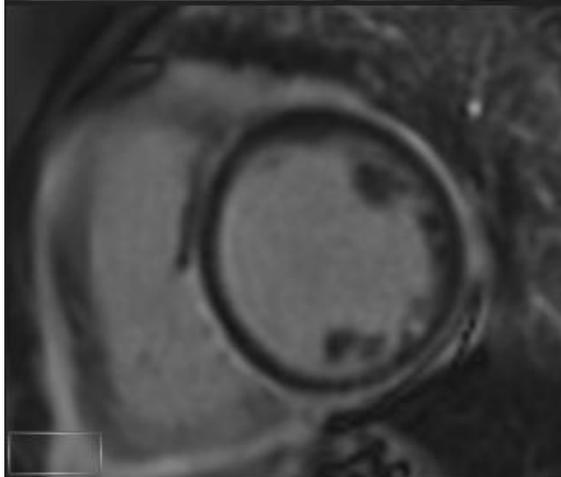

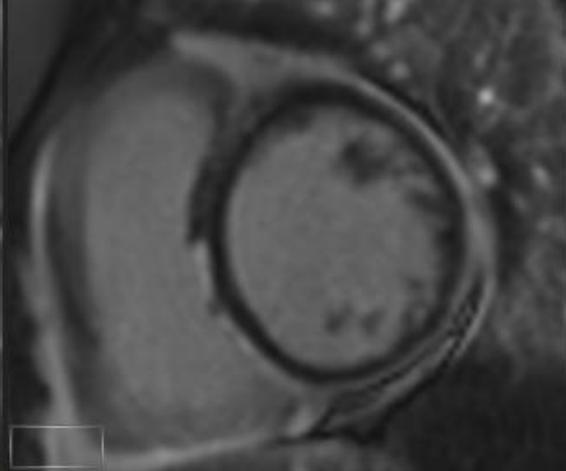

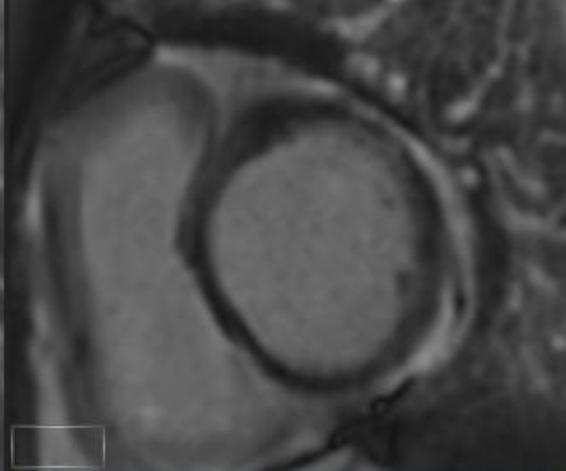

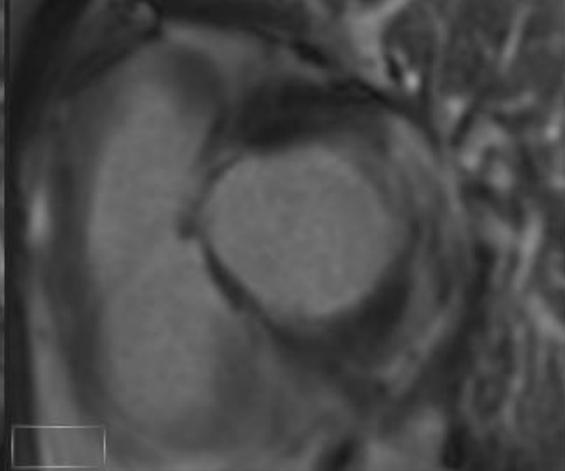

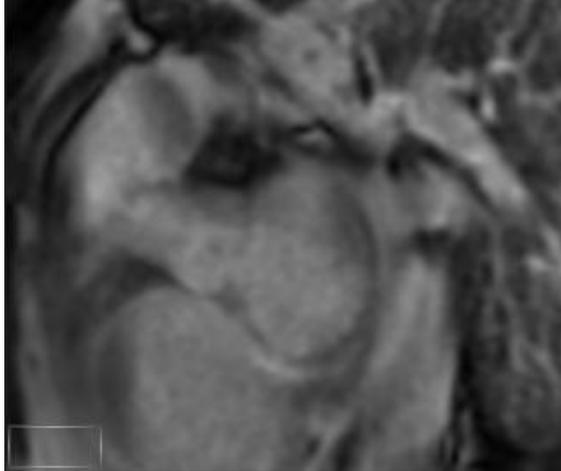

# Case 4

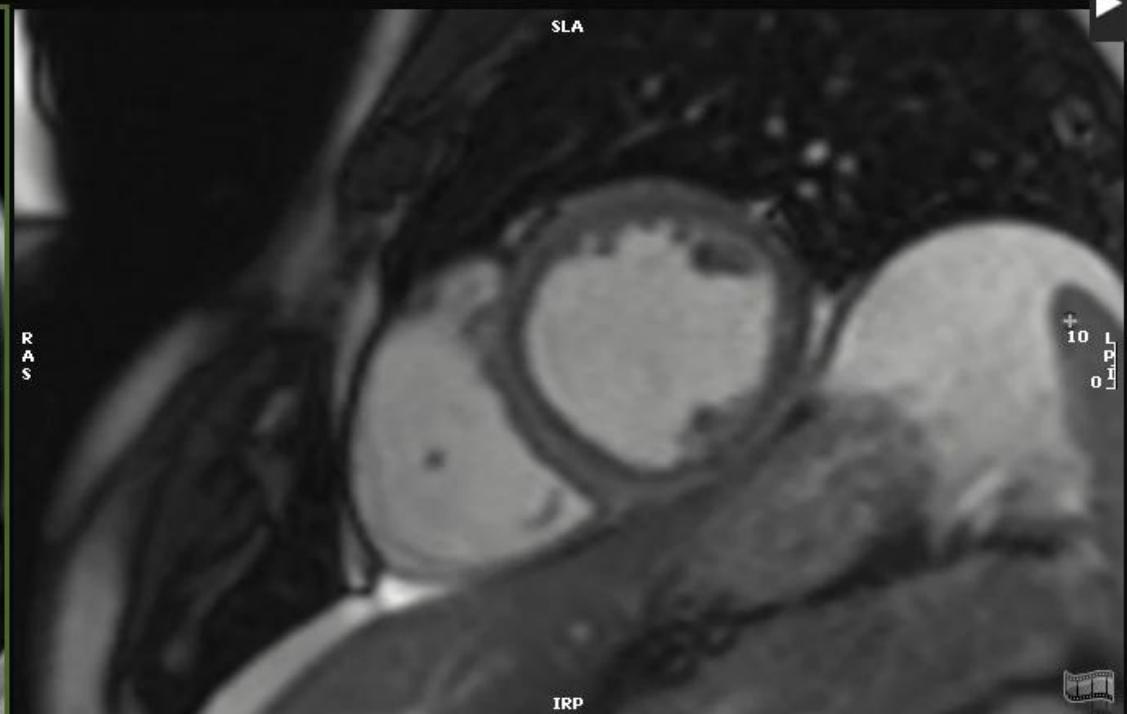

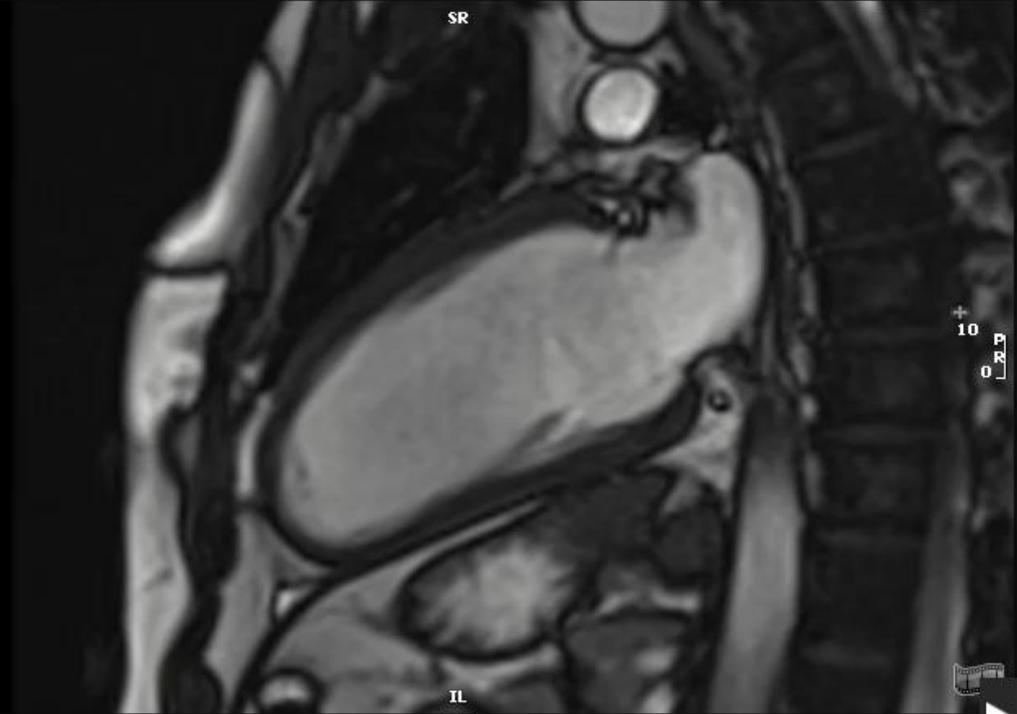

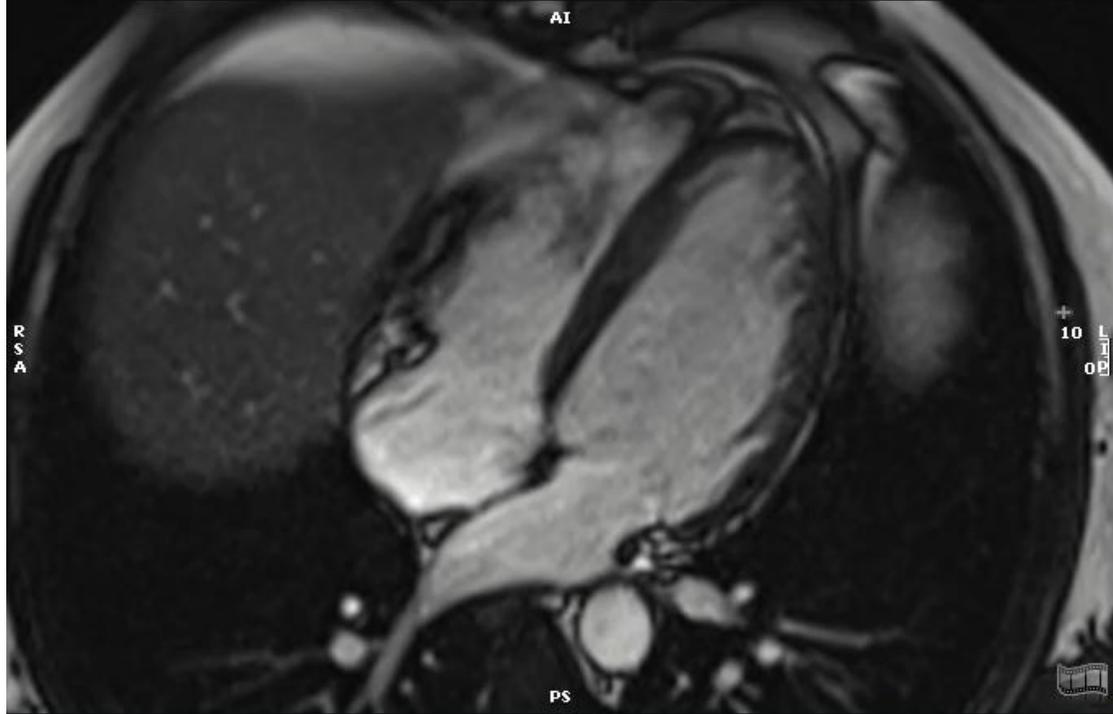

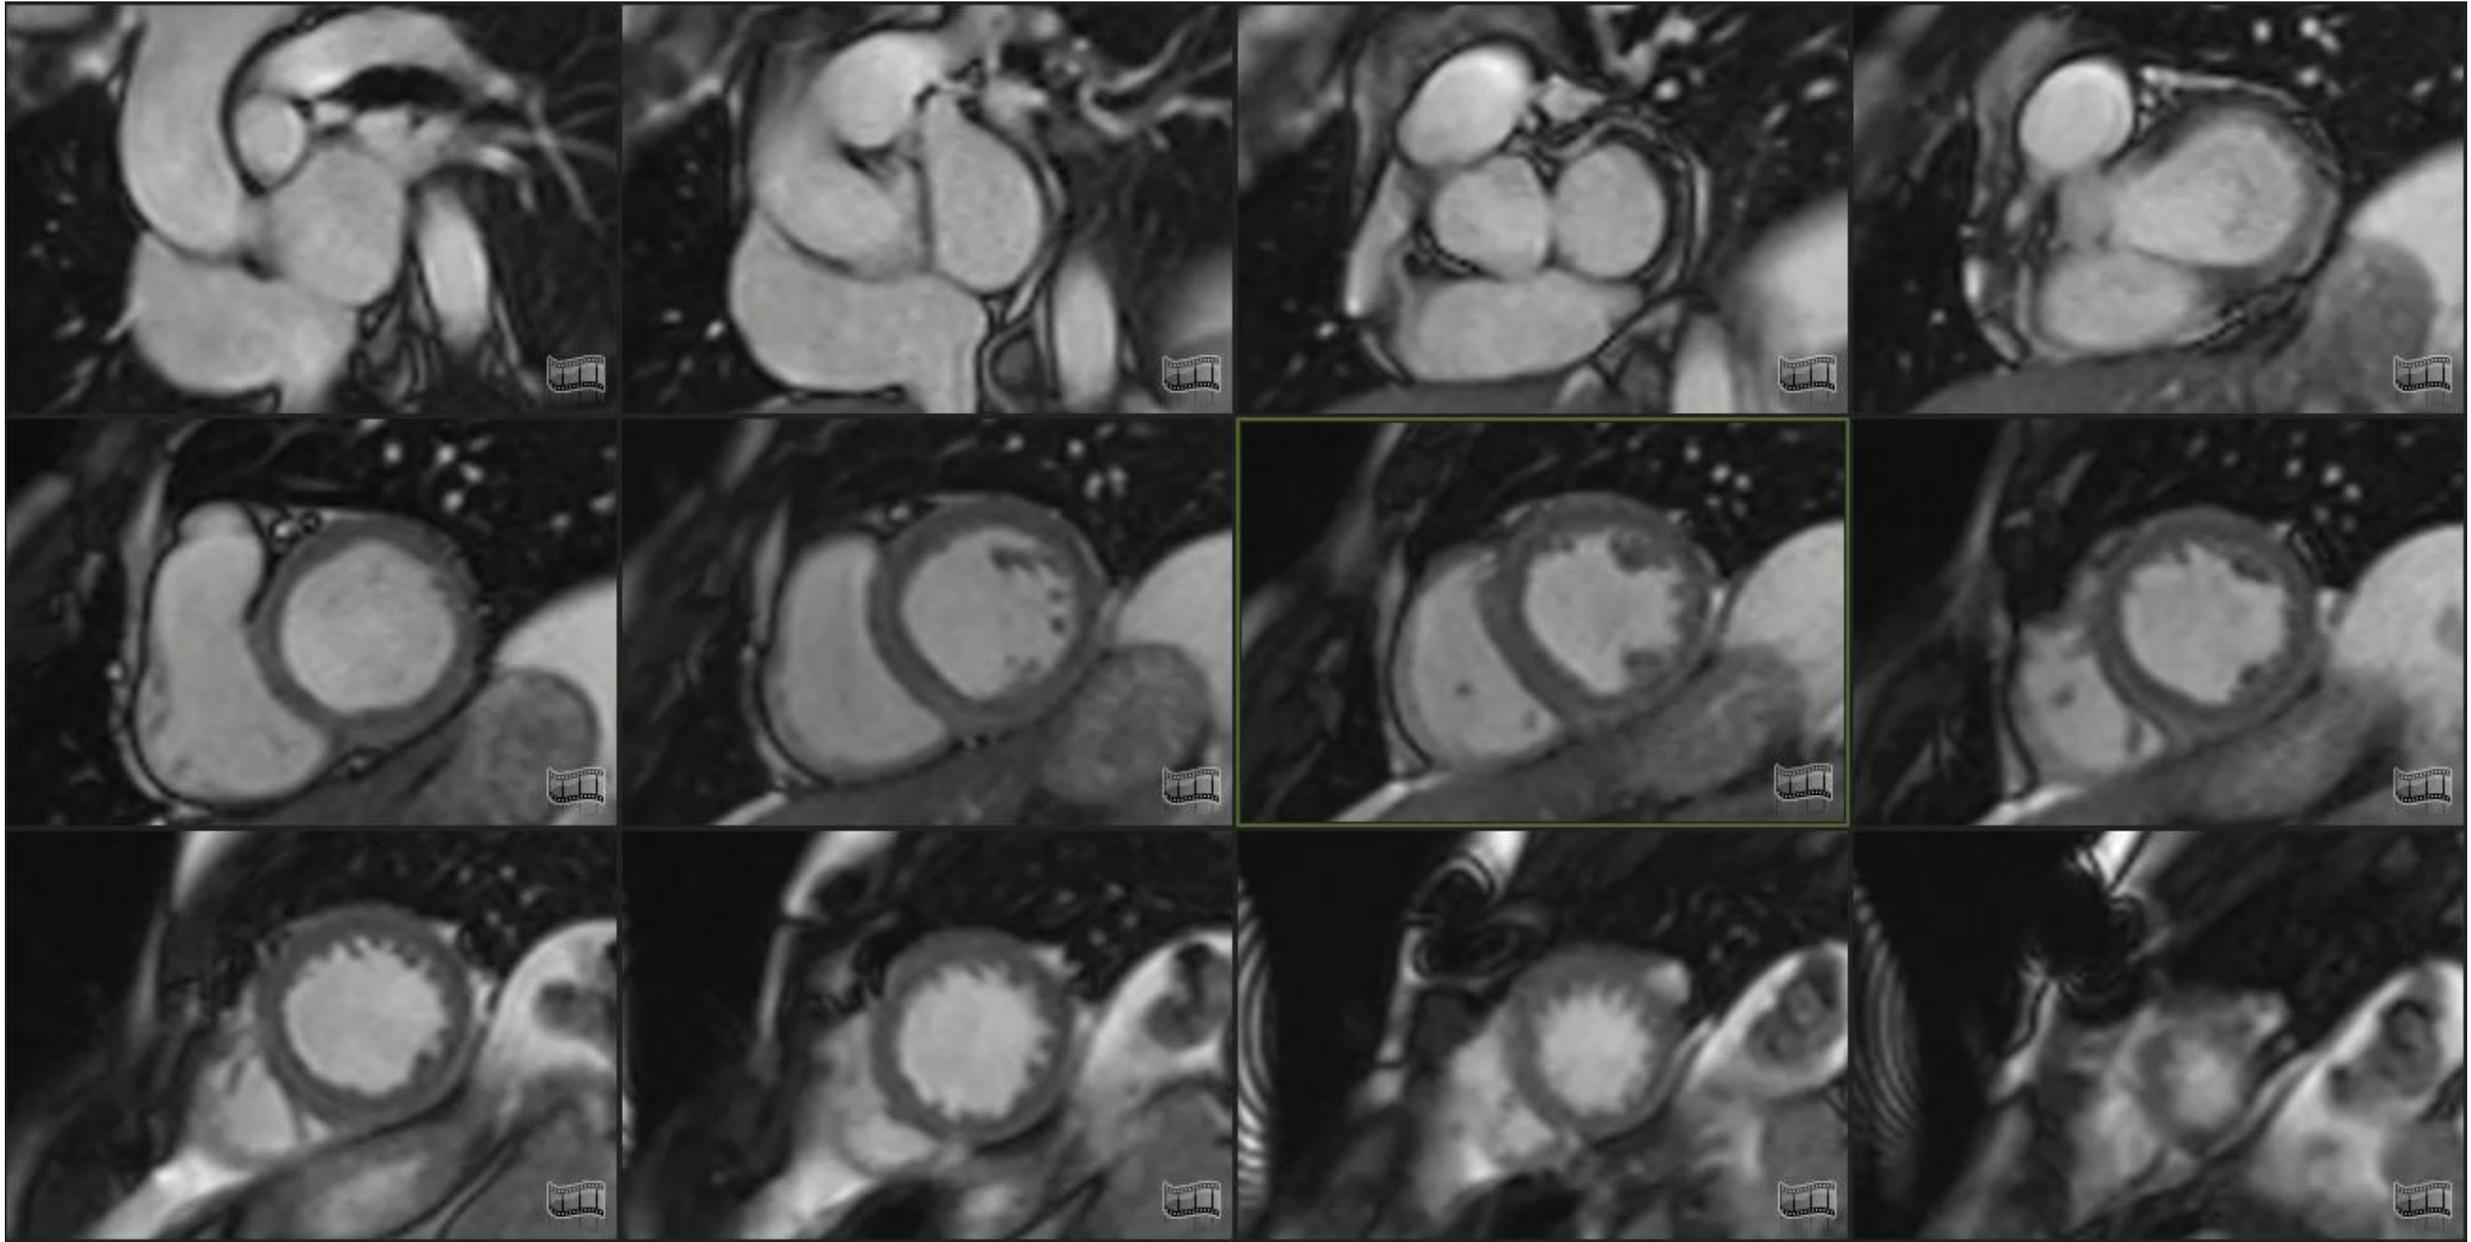

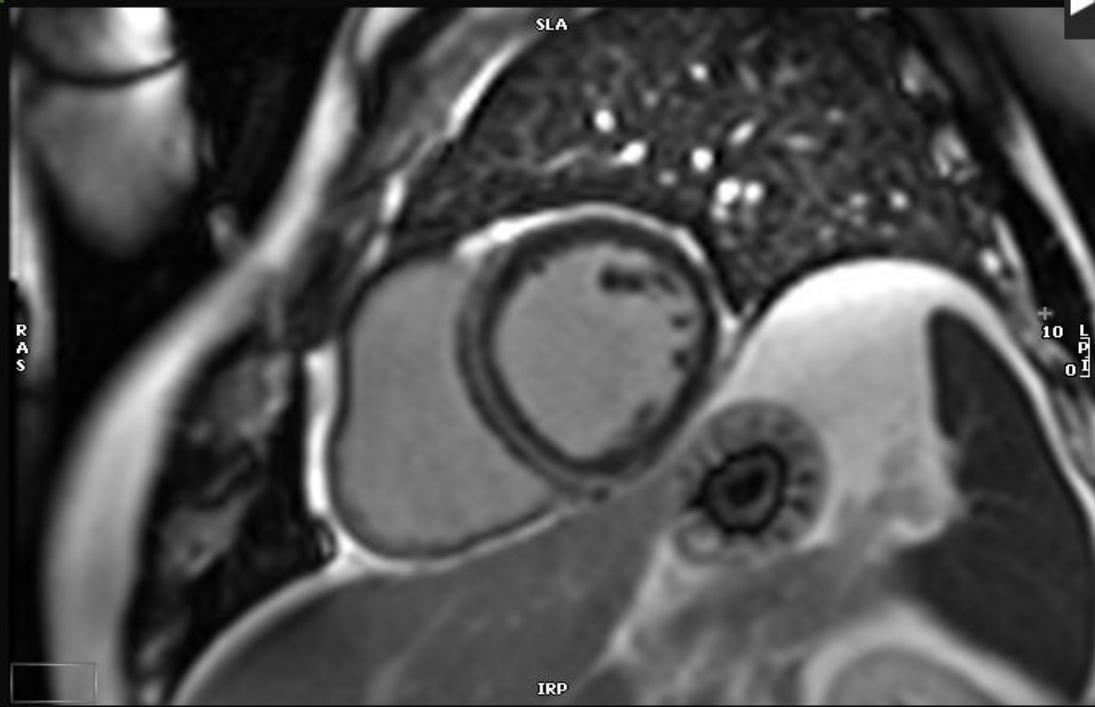

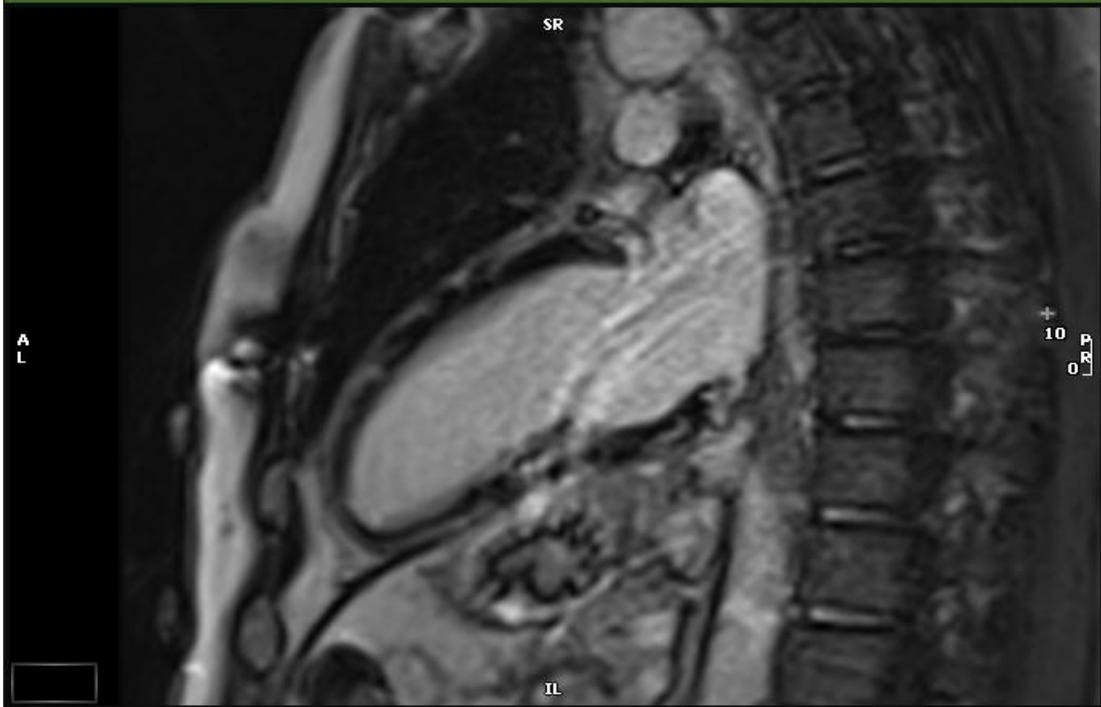

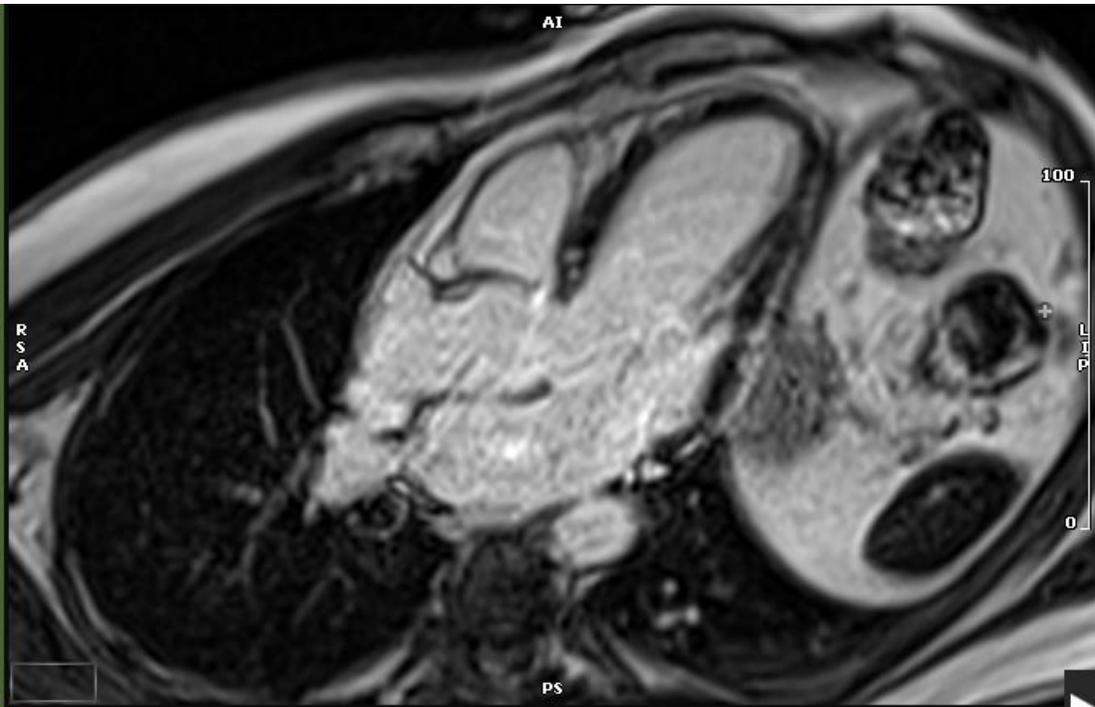

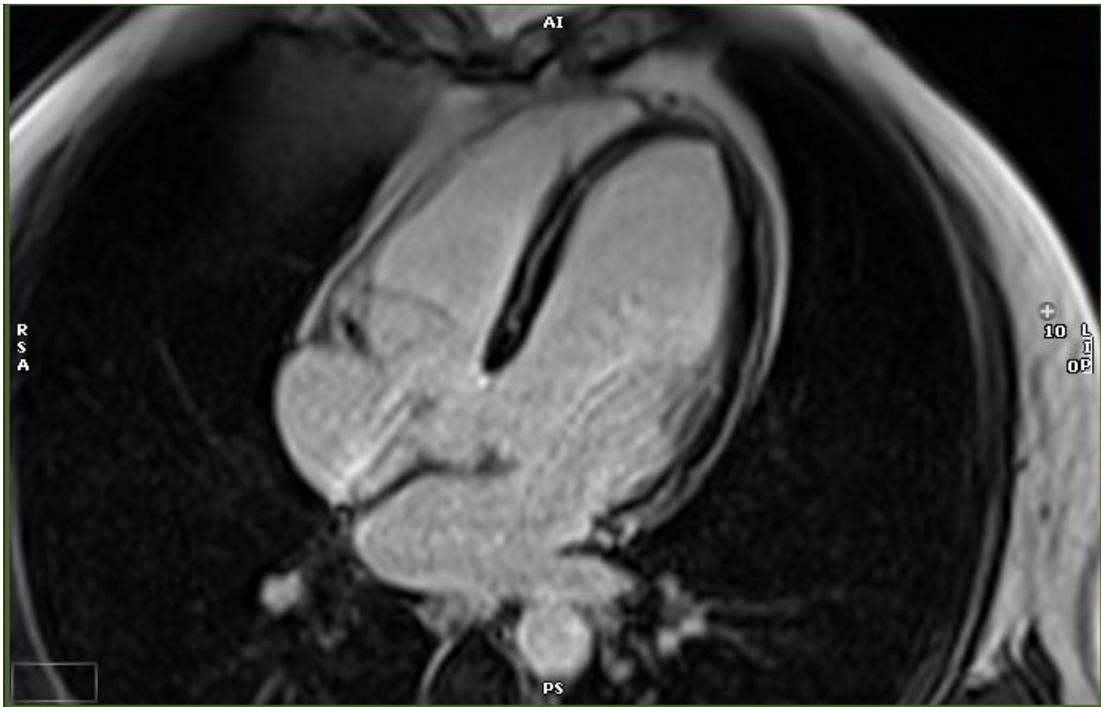

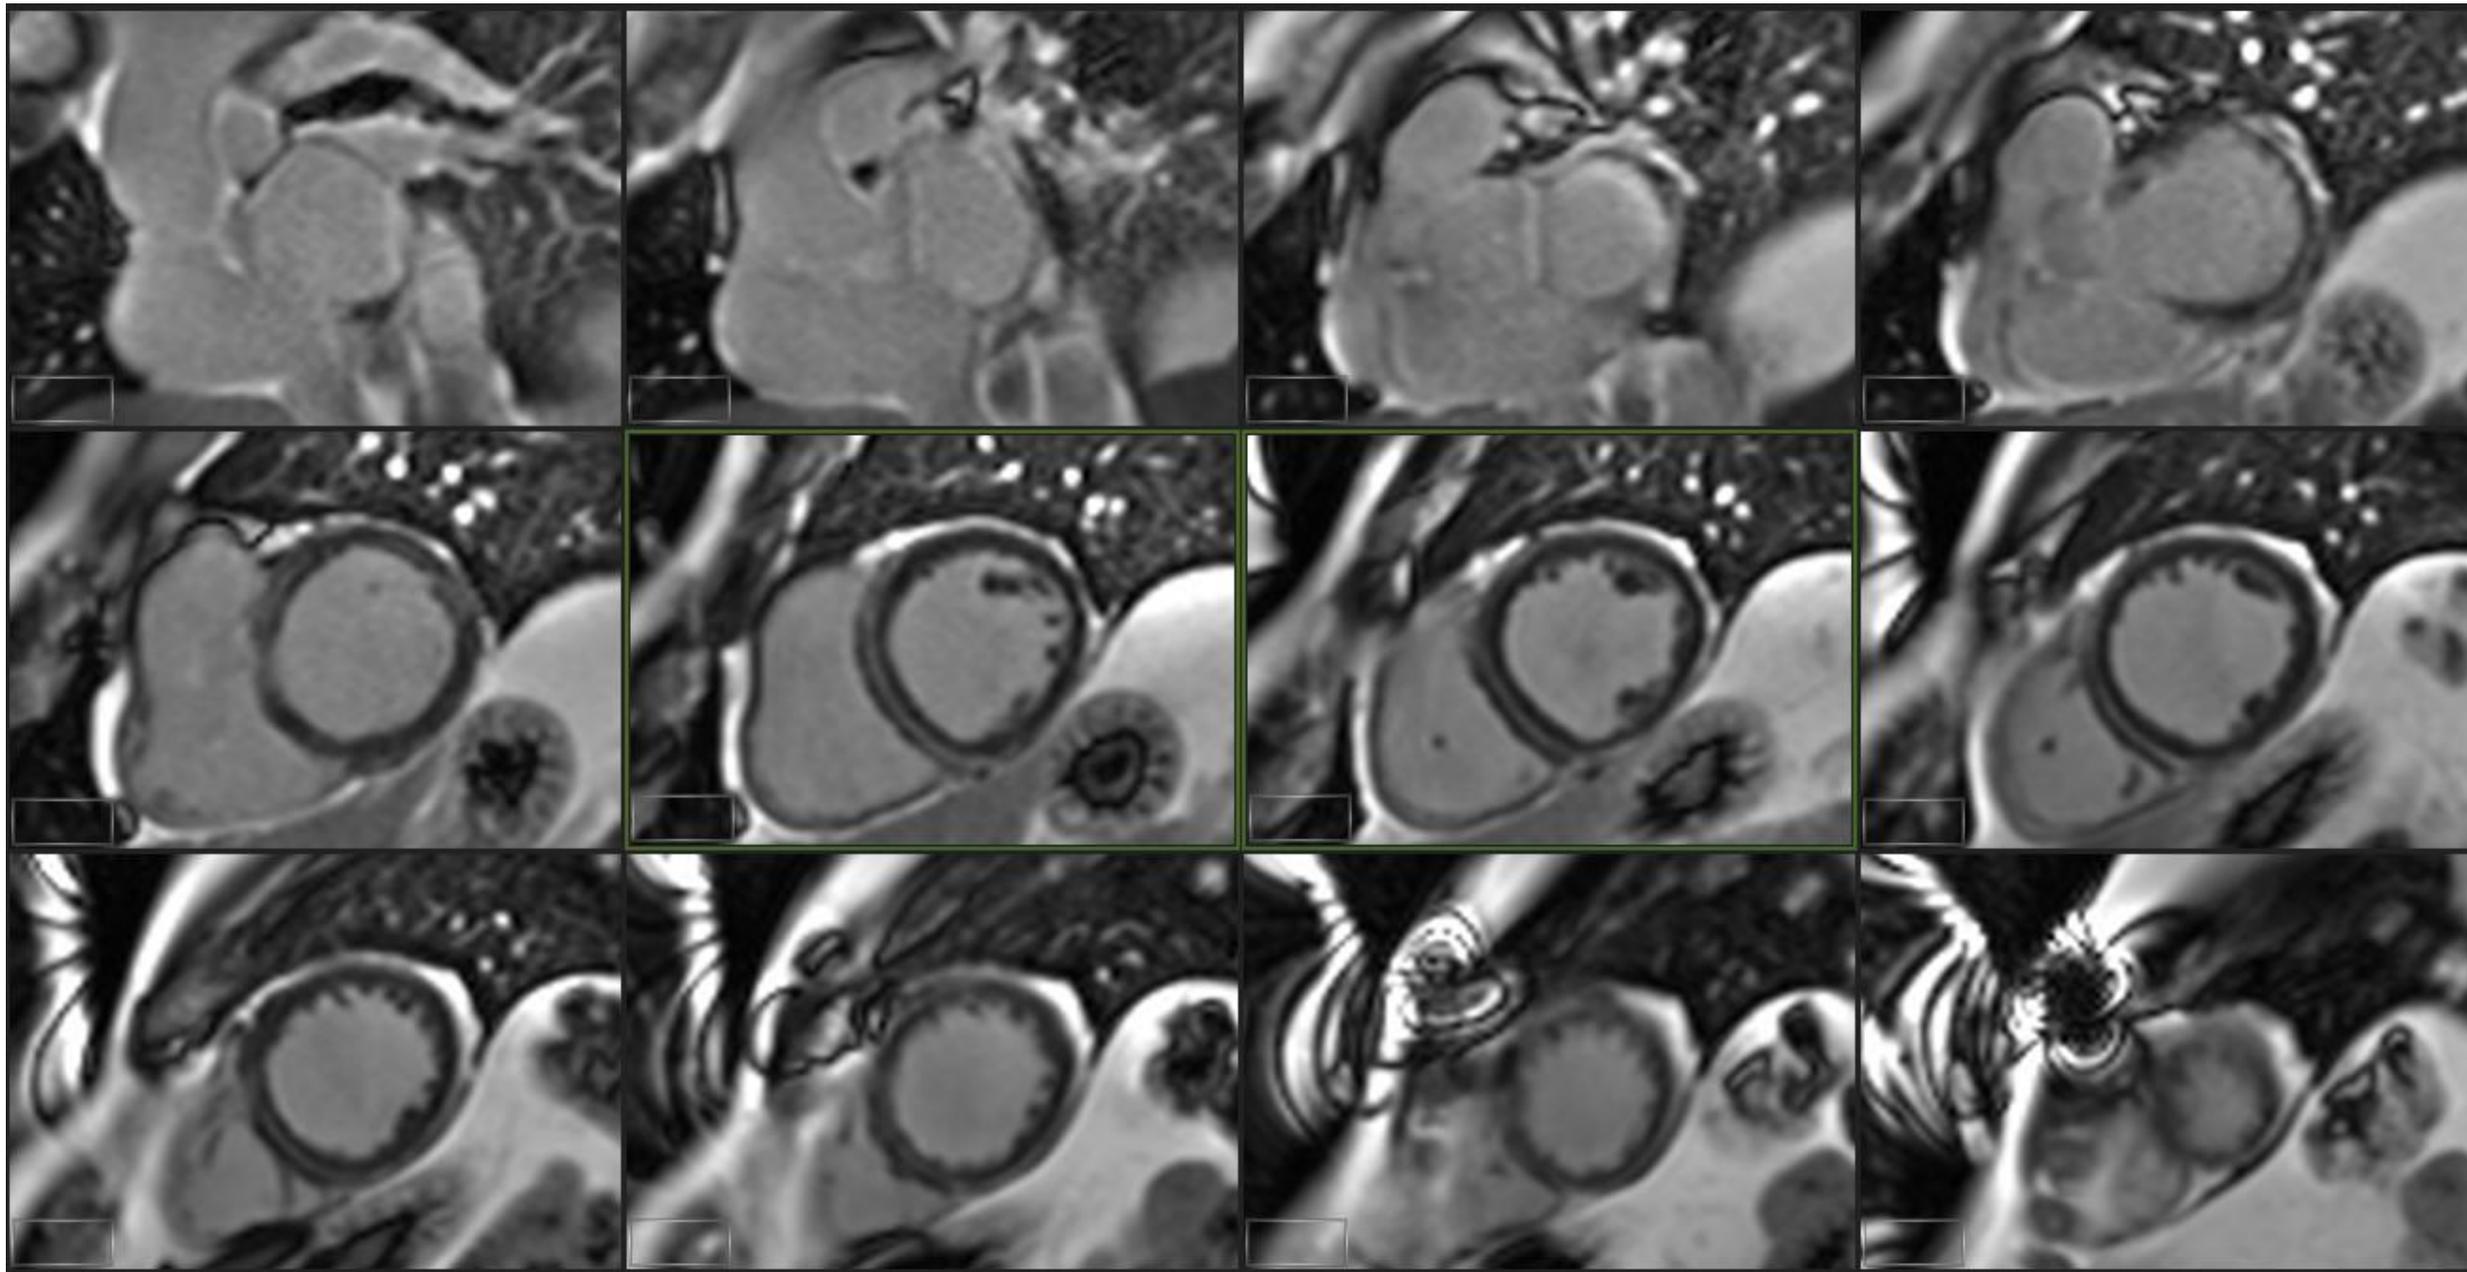

# Case 5

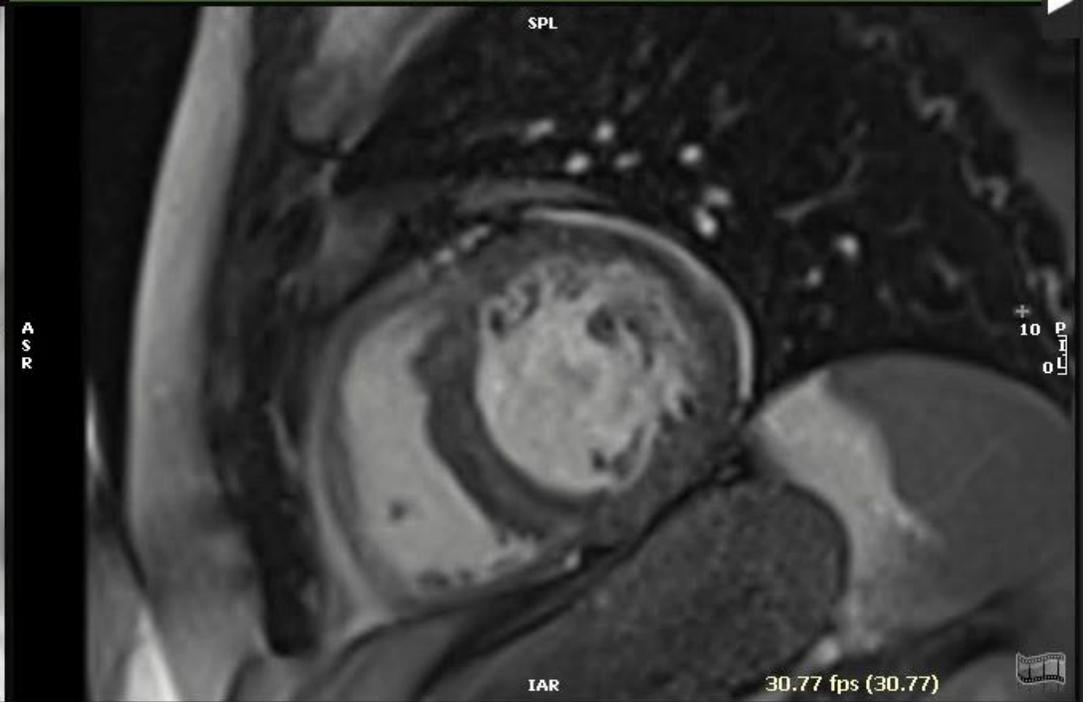

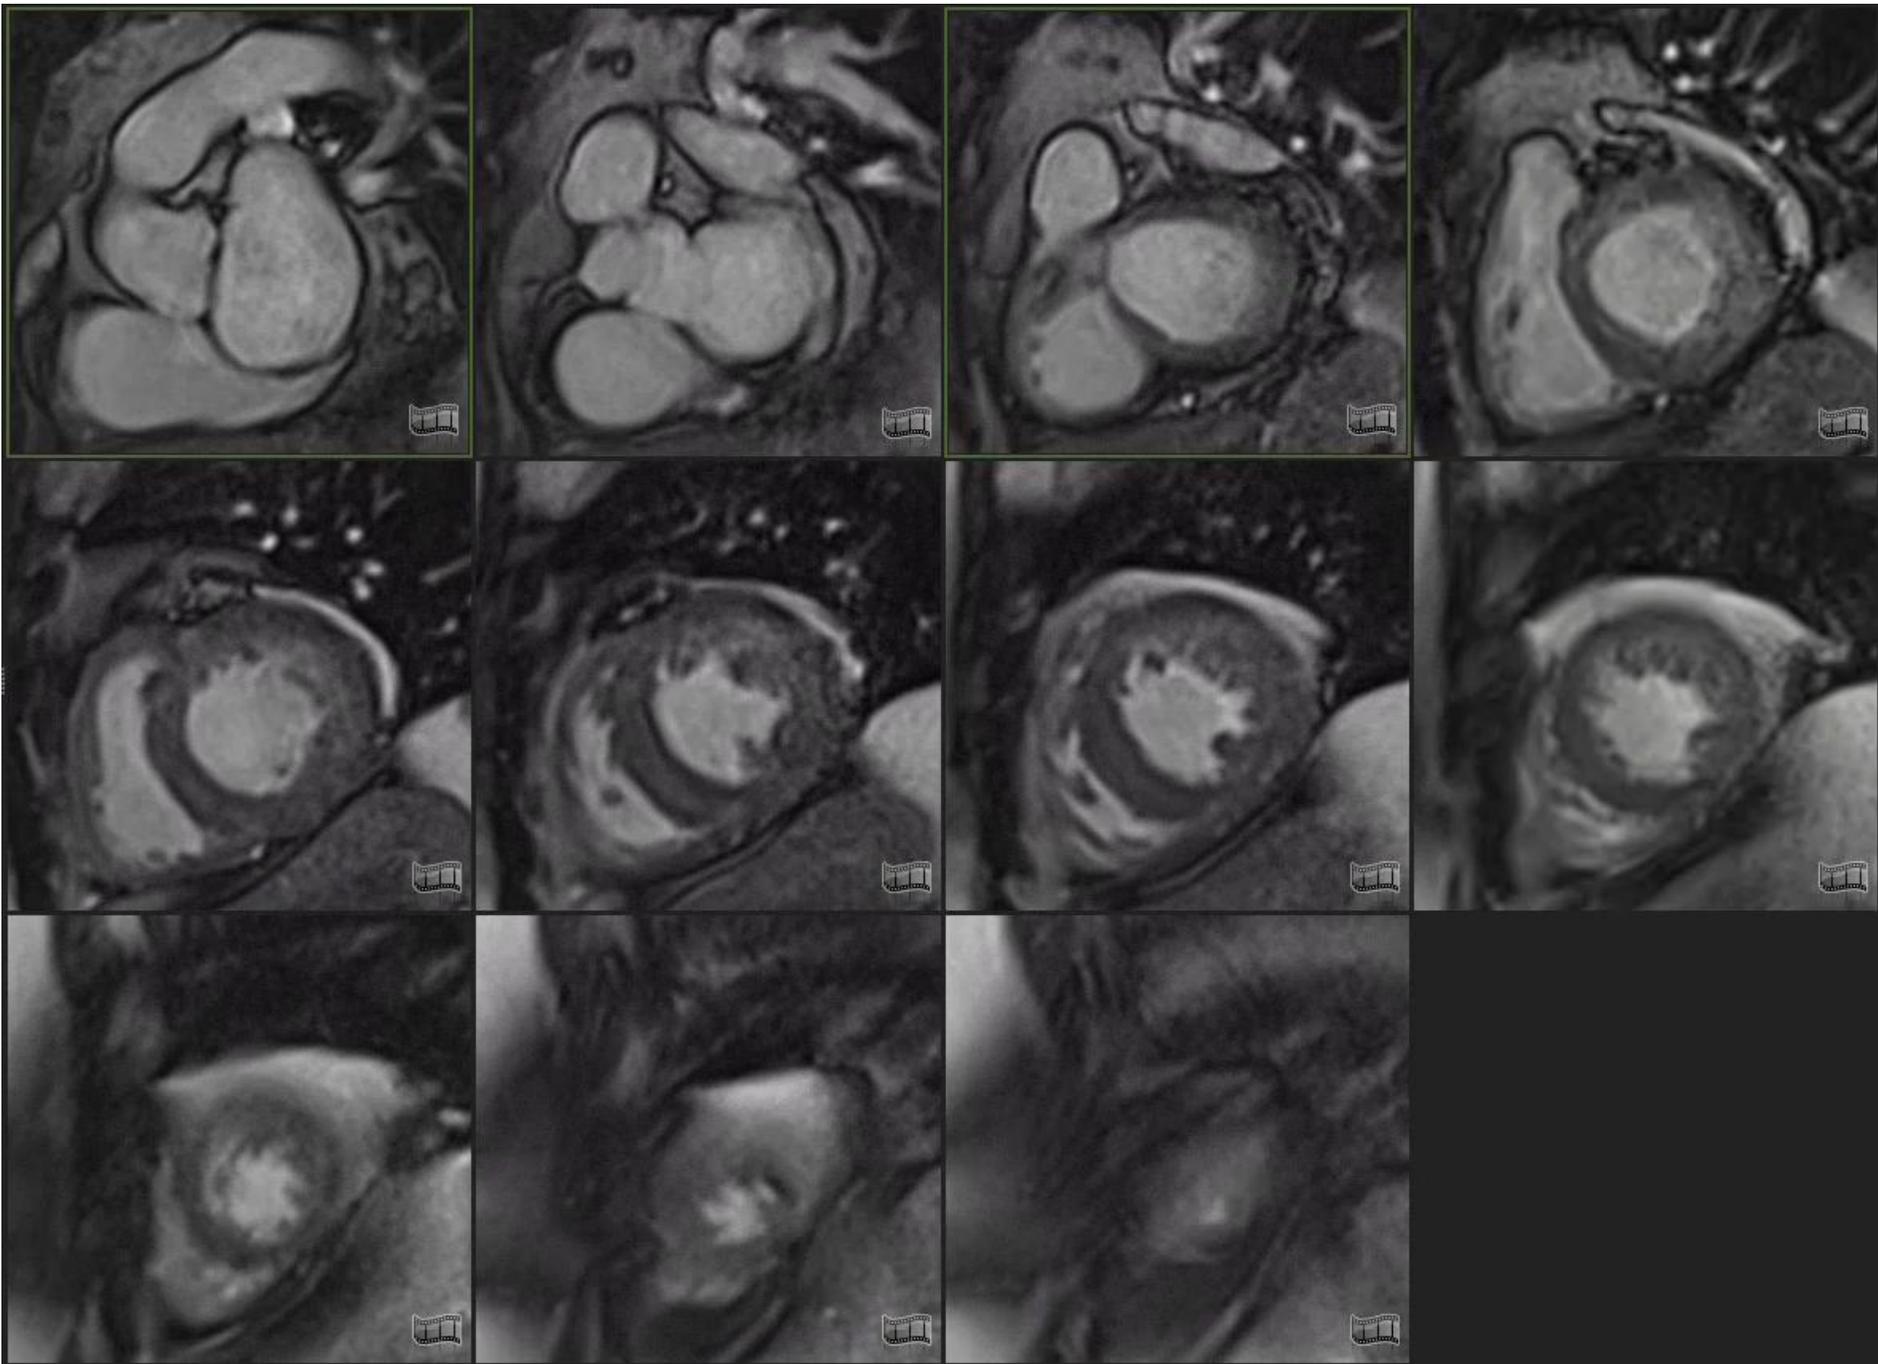

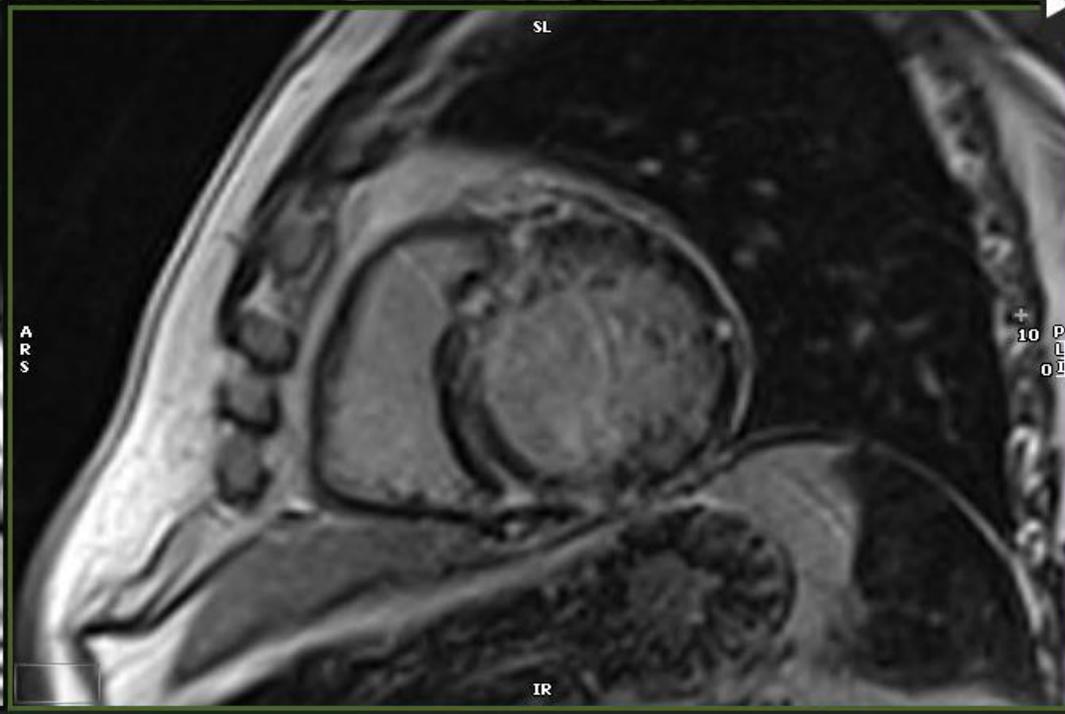

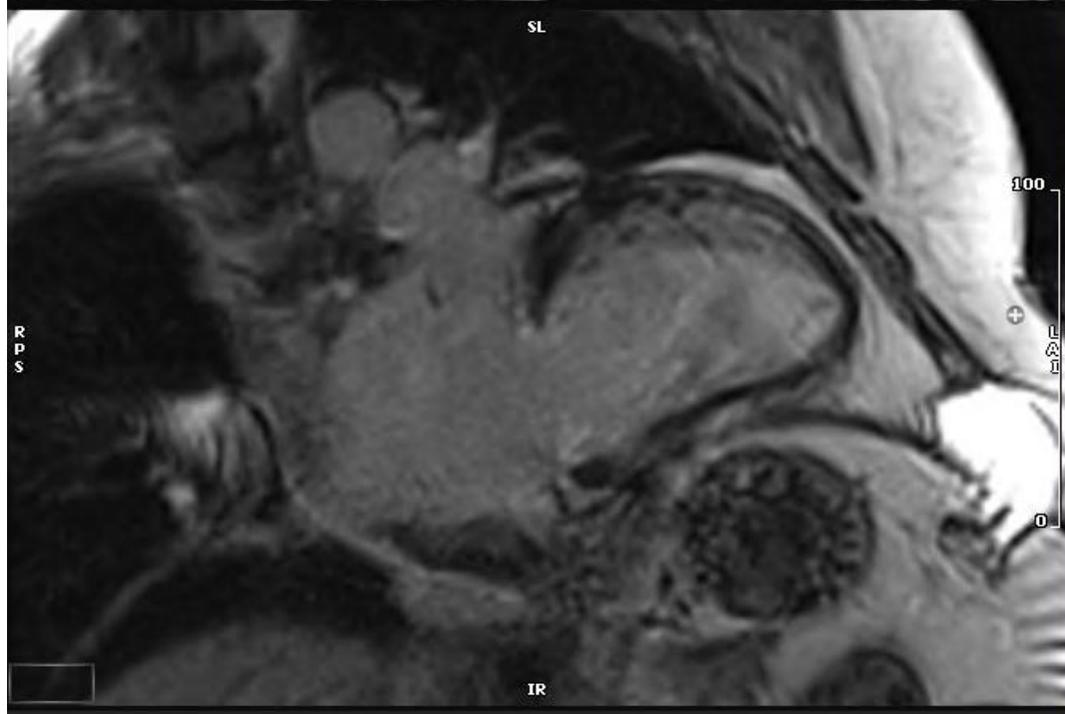

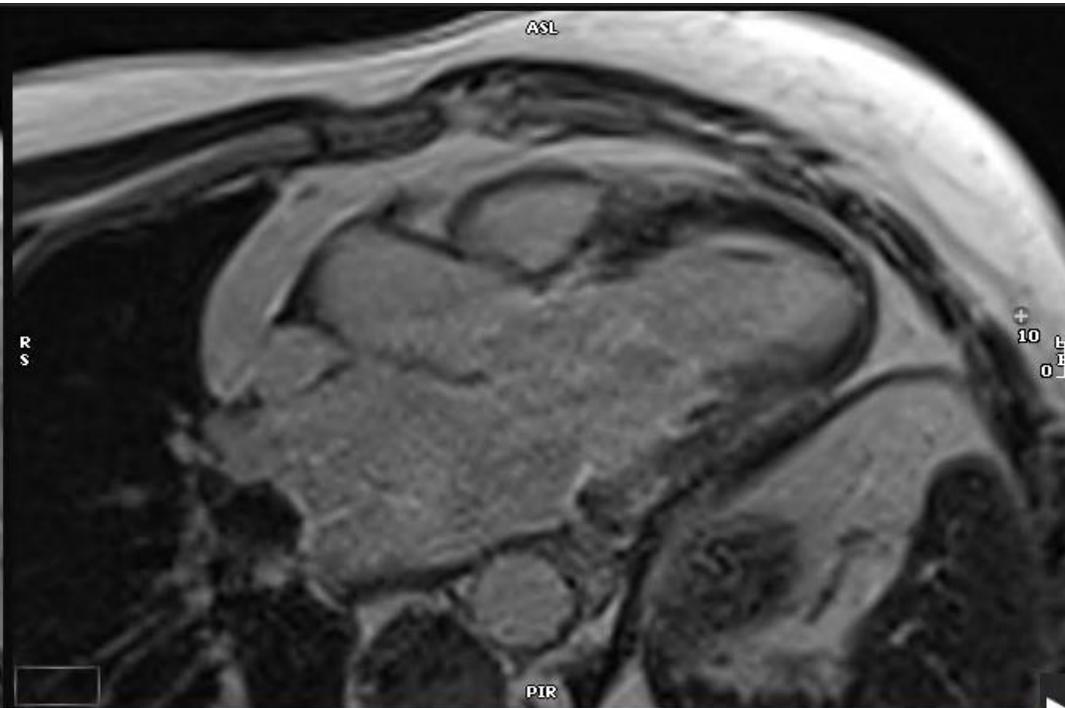

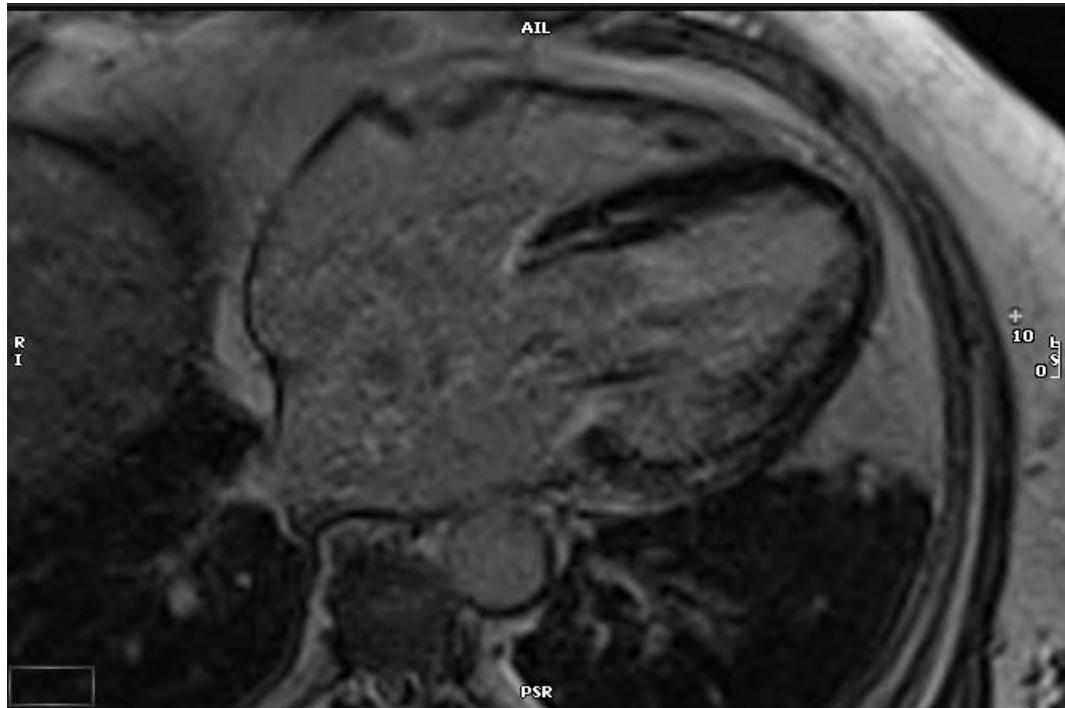

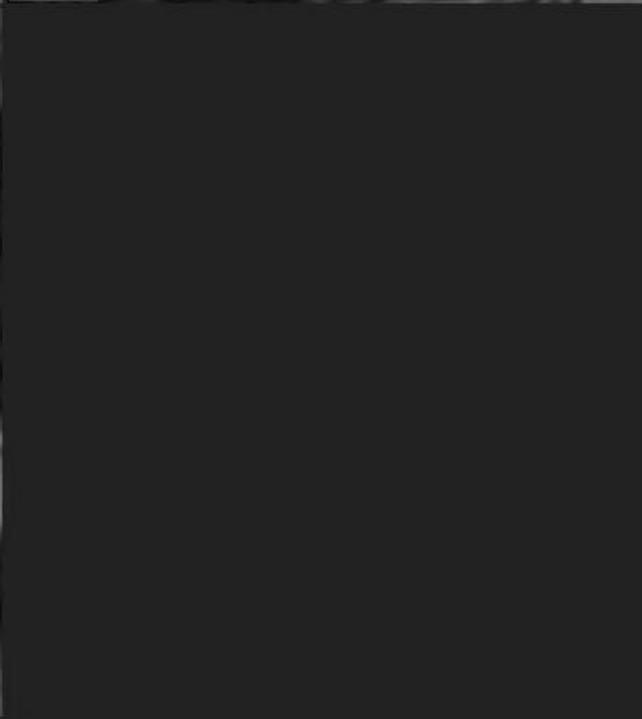

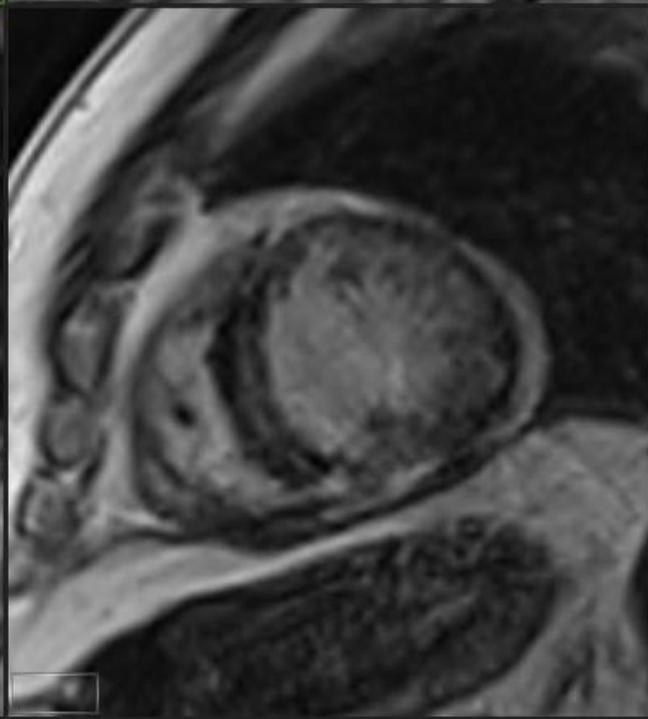

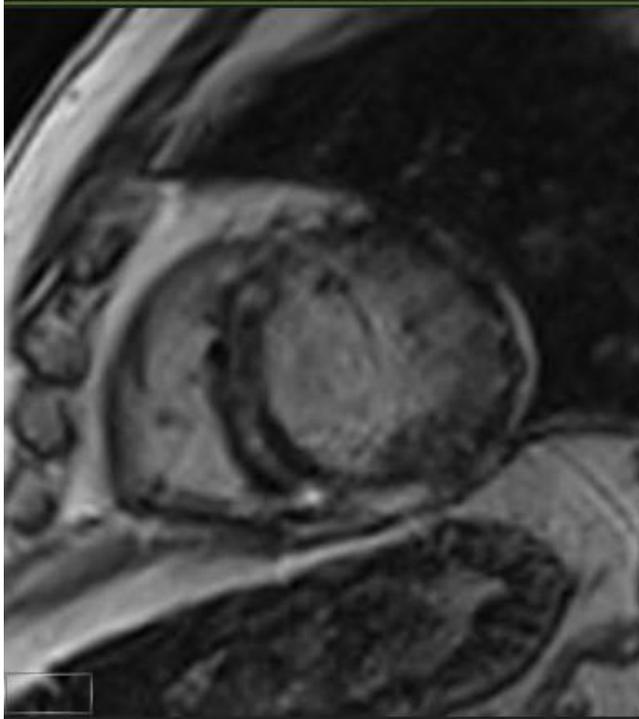

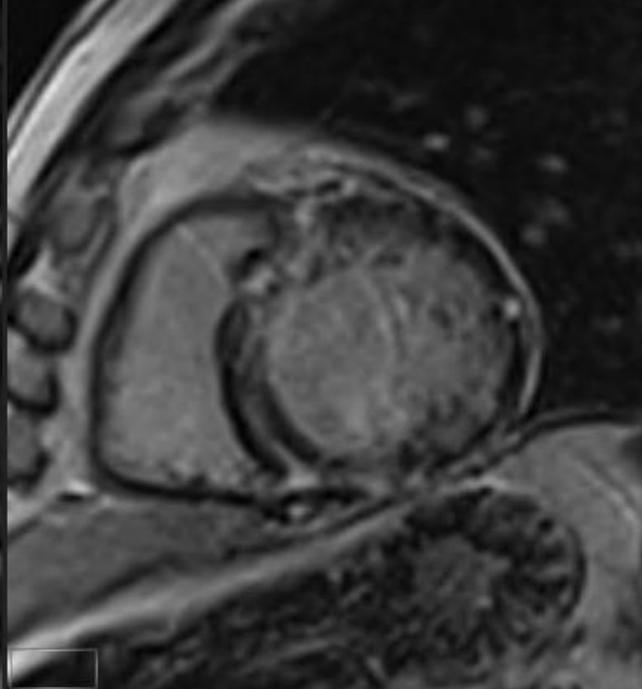

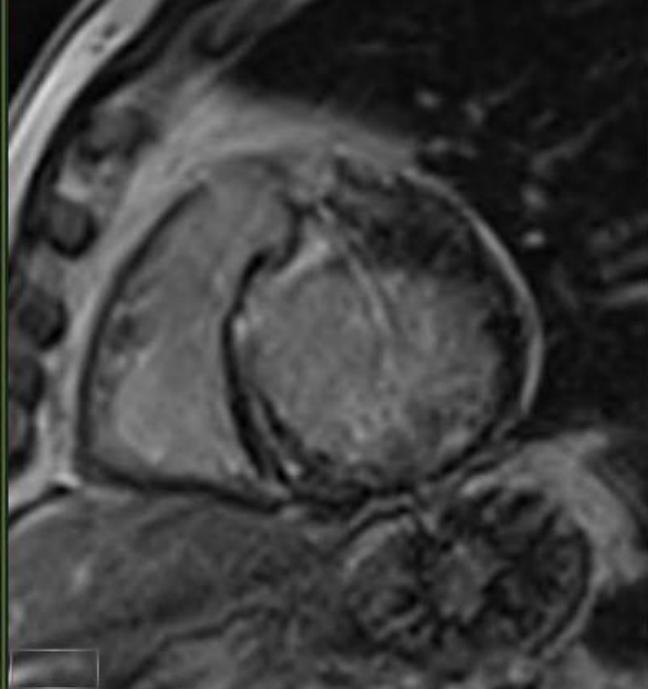

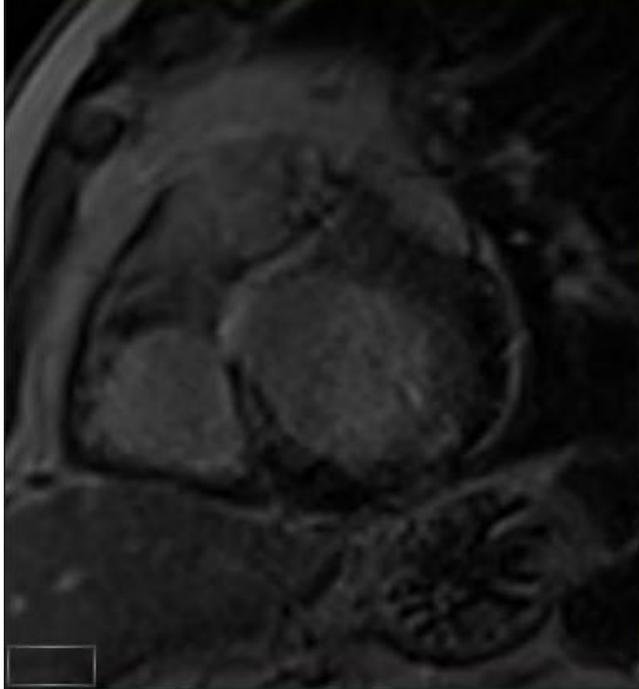

# Case 5

# Diseases mimicking ACM

- Myocarditis
- Sarcoidosis
- DCM
- Athlete's heart
- Uhl's disease
