ΑΠΕΙΚΟΝΙΣΗ ΜΑΓΝΗΤΙΚΟΥ ΣΥΝΤΟΝΙΣΜΟΥ

(a) The internal rotation of a proton creates a magnetic moment, and so the proton acts as a magnet with north and south pole. (b) In the absence of a strong magnetic field, the orientations of the magnetic moments are completely random. (c) When there is a strong magnetic field present the magnetic moments must align at an angle $\theta = \pm 54.7^\circ$ with respect to the direction of B_0 .

$$\Delta E = \frac{\gamma h B_0}{2\pi}, \quad \frac{N_{\text{anti-parallel}}}{N_{\text{parallel}}} = \exp - \left[\frac{\Delta E}{kT} \right] = \exp - \left[\frac{\gamma h B_0}{2\pi kT} \right].$$

$$\frac{N_{\text{anti-parallel}}}{N_{\text{parallel}}} = 1 - \left[\frac{\gamma h B_0}{2\pi kT} \right]$$

$$N_{\text{parallel}} - N_{\text{anti-parallel}} = N_{\text{total}} \frac{\gamma h B_0}{4\pi kT}$$

torque created

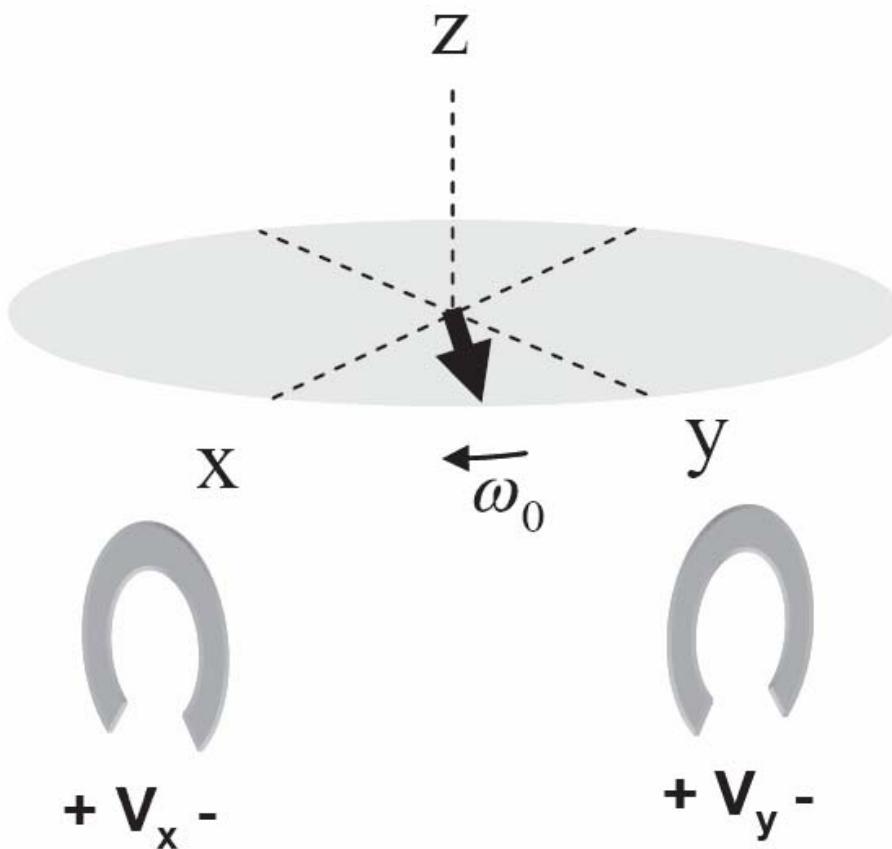

A proton in a magnetic field. (a) Using classical mechanics, the torque C acting on the magnetic moment, spinning about an internal axis, causes it to precess about the vertical axis, B_0 .
(b) A familiar analogy is that of a spinning top: in this case the vertical force is gravity.

$$M_z(t) = M_0 \left(1 - e^{-\frac{t}{T_1}} \right)$$

$$M_y(t) = M_0 \sin \alpha \exp - \left(\frac{t}{T_2} \right)$$

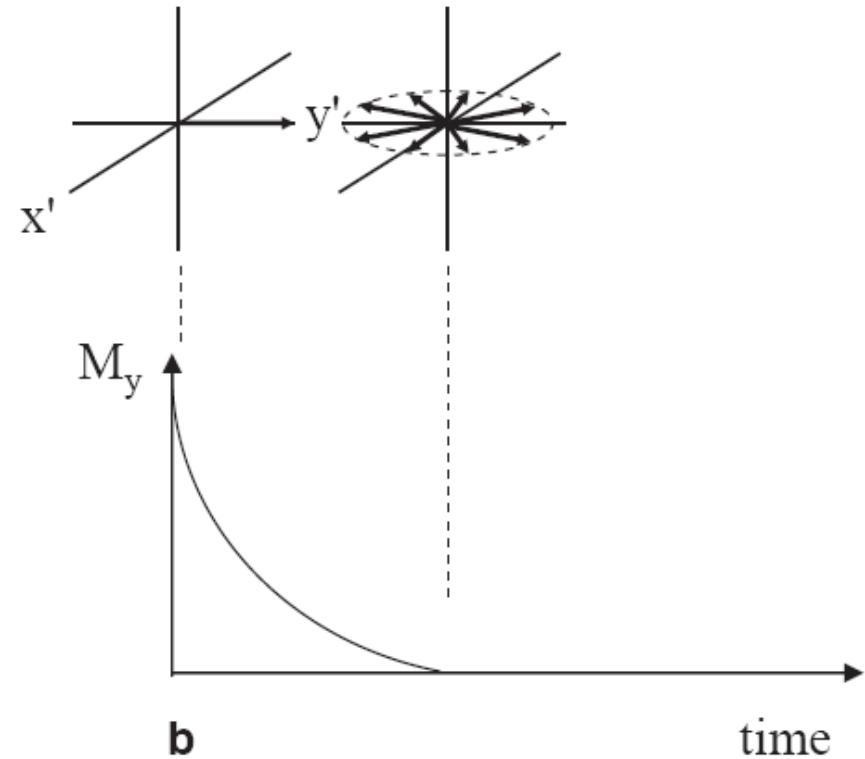

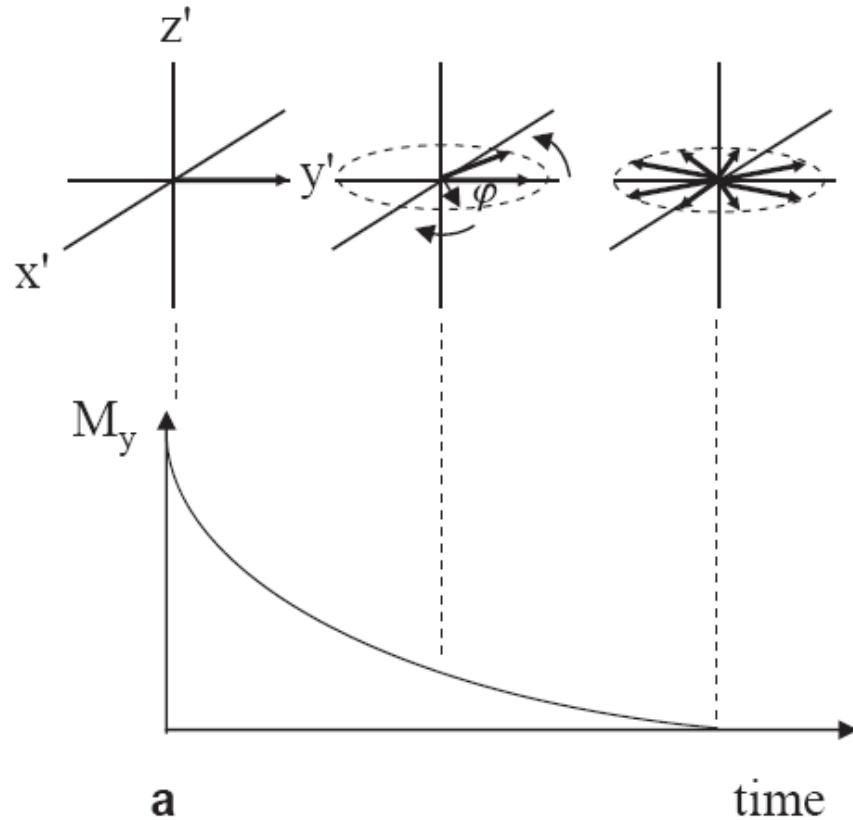

ΑΠΕΙΚΟΝΙΣΗ ΜΑΓΝΗΤΙΚΟΥ ΣΥΝΤΟΝΙΣΜΟΥ

The recovery of M_z magnetization as a function of time after a 90° pulse for a tissue with short T_1 relaxation time (solid line) and long T_1 relaxation time (dashed line).

ΑΠΕΙΚΟΝΙΣΗ ΜΑΓΝΗΤΙΚΟΥ ΣΥΝΤΟΝΙΣΜΟΥ

$$M_y(t) = M_0 \sin \alpha \exp - \left(\frac{t}{T_2} \right)$$

The time-dependence of the M_y component of magnetization for (a) a tissue with relatively long T_{2*} and (b) one with a shorter T_{2*}. The decrease in signal occurs due to the loss of phase coherence of the protons, i.e. protons precess at slightly different frequencies, thus acquiring different phases and reducing the net magnetization along the y-axis. The faster the dephasing process the shorter the T_{2*} relaxation time.
