

THE ENCYCLOPEDIA OF
**LITERARY AND
CULTURAL THEORY**

LITERARY THEORY FROM 1900 TO 1966
LITERARY THEORY FROM 1966 TO PRESENT
CULTURAL THEORY

VOLUME I, II, & III

General Editor

Michael Ryan

Volume Editors

I: Gregory Castle

II: Robert Eaglestone

III: M. Keith Booker

 **WILEY-BLACKWELL**

General Editor

Michael Ryan teaches in the Department of Film & Media Arts at Temple University. He is co-editor (with Amitava Kumar) of *Politics and Culture* (www.politicsandculture.org). His books include *Marxism and Deconstruction* (1982), *Camera Politica* (with Douglas Kellner, 1986), and *Politics and Culture* (1989). He is the editor of *Literary Theory: An Anthology* (with Julie Rivkin, 2nd edn. Wiley-Blackwell, 2004) and *Cultural Studies: An Anthology* (Wiley-Blackwell, 2008). His textbooks include *Literary Theory: A Practical Introduction* (2nd edn. Wiley-Blackwell, 2005), *Cultural Studies: A Practical Introduction* (Wiley-Blackwell, 2009), *An Introduction to Criticism* (Wiley-Blackwell, forthcoming), and *An Introduction to Film Analysis* (forthcoming).

Volume Editors

Gregory Castle is Professor of English at Arizona State University. His publications include *Postcolonial Discourses: A Reader* (Wiley-Blackwell, 2001), *Modernism and the Celtic Revival* (2001), *Reading the Modernist Bildungsroman* (2006), and *The Blackwell Guide to Literary Theory* (Wiley-Blackwell, 2007).

Robert Eaglestone is Professor of Contemporary Literature and Thought at Royal Holloway, University of London. His books include *Ethical Criticism: Reading after Levinas* (1997), *Doing English* (3rd edn., 2009), *The Holocaust and the Postmodern* (2004), *Derrida's Legacies* (with Simon Glendenning, 2008), *J. M. Coetzee in Theory and Practice* (with Elleke Hoehmer and Katy Iddiols, 2009). He is series editor for *Routledge Critical Thinkers*.

M. Keith Booker is the James E. and Ellen Wadley Roper Professor of English and Director of the Program in Comparative Literature and Cultural Studies at the University of Arkansas. He is the author of more than 30 books, including *The Science Fiction Handbook* (with Anne-Marie Thomas, Wiley-Blackwell, 2009).

The Wiley-Blackwell Encyclopedia of Literature

www.literatureencyclopedia.com

The *Wiley-Blackwell Encyclopedia of Literature* is a comprehensive, scholarly, authoritative, and critical overview of literature and theory comprising individual titles covering key literary genres, periods, and sub-disciplines. Available both in print and online, this groundbreaking resource provides students, teachers, and researchers with cutting-edge scholarship in literature and literary studies.

Introduction to the Encyclopedia of Literary and Cultural Theory

MICHAEL RYAN

“It is the theory that decides what can be observed.”

Albert Einstein

The word “theory” derives from the Greek word for vision. A theory proposes ways of seeing or envisioning the world that adds to our knowledge of it. In the physical sciences, a theory is a proposed explanation of the world that has to be confirmed through research and investigation. Theories about literature and culture are not that different. They explain the cultural world and they guide research in certain directions. Without a theory regarding the law of gravity that accounts for how it works, you would not know why you are able to leap only so far into the air. You observe the effects of gravity, such as the bending of light from distant stars, but gravity itself is nowhere visible for you to see; in order to account for its action in the world, you have to theorize about it. The study of literature and culture has a similar need for theories to explain cultural objects and events. Literature is about life, and in human life, forces similar to gravity are at work, making some bodies fall and others rise, making some beams of human light straight and true while bending and warping others. Those events would be inexplicable without a theory to account for them.

In this encyclopedia, you will encounter a rich variety of theoretical terms and ideas. Some will appear to you to be unimpeachably true, while others will only seem debatably so. That is in part because the study of human culture is in flux, moving slowly away from idealist philosophy and religion and toward science and history, and in part because cultural reality is complex in much the same way that physical reality is, bearing within it both the chemistry of emotion and the physics of social power, the biology of evolutionary imperatives and the architecture of human institutions. More than one method or theory is required to account for that complexity. Literary and cultural theory therefore draws on a range of disciplines, from history and economics to political science and sociology. Increasingly, as well, it draws on the physical sciences.

The encyclopedia spans the period from the late nineteenth century to the present. Some fields touched on here, such as cognitive studies and evolutionary studies, are so new that with time they will appear to be underrepresented. The concepts and ideas these fields rely on have not yet attained wide currency. Other schools of thought, such as neo-idealism, humanism, and aestheticism, have ceased to have the same resonance in contemporary discussions that they enjoyed in the past, yet we feel

they remain relevant nevertheless. In constructing the encyclopedia, we decided to make two divisions, one between literary theory and cultural theory and one between two eras of literary theory. Size requirements demanded that we locate some moment in the history of literary theory that would justify the separation between two volumes. We chose 1966–7, even though it places more historical time in one volume than in the other, because new kinds of thinking began to emerge in a rush during that year that would lead to a discarding of many old ideas and the fabrication of many new ones. Of particular note was the peaking of structuralism and the start of post-structuralism, but one might also point to the beginnings of feminism, ethnic studies, and global or postcolonial studies, as well as the emergence of a new Marxism and the general broadening of literary studies away from the previously popular text-centered approach of the new critics. We felt a separate volume on cultural theory was justified by the emergence of cultural studies over the past half-century. An entirely new field (adjacent yet connected to the study of literature), cultural studies comprises many of the themes, issues, and concerns that can be found in literary studies, from gender and politics to history and economics. Yet it also represents a remarkable broadening of concerns to include visual studies, popular music, advertising and magazines, subcultures, and the media.

From its inception in classical Greece, the study of literature has been concerned with meaning, form, and effect. Descriptions of meaning have ranged from “social reality” to “universal ideas that transcend specific historical social realities.” Oddly, even as literary study becomes more scientific and scholars turn increasingly to such schools of thought as evolutionary studies, the same range appears. Some think literature, even in an evolutionary sense, is about a basic

human nature that is universal and the same in everyone, while others note that epigenetic local adaptation across a variety of historically and socially specific niches means that human cultural forms and expressions are highly variable. Literature is also always a technical or formal exercise, an execution of formats and procedures such as perspective, narrative, and metaphor that constitute a kind of toolkit of familiar devices for constructing a literary work, much as one might use a normal box of tools to build a house. If the satiric mode hammers home a point, metaphor provides a ladder to higher-order meanings not normally attainable with ordinary literal images. Finally, literature is always directed to someone, an audience that takes it in and understands it in certain ways. Literature and culture are always interactive, an engagement across the reading or viewing experience that has to do with how we perceive and think as well as how we feel or how we experience reality around us. Those three concerns of literary study have remained constant, and they continue to demarcate the major fields of endeavor in literary and cultural theory.

But as the study of literature and of culture has advanced and expanded over the past two centuries; it has also become a much deeper and wider discipline. It has moved from intrinsic considerations such as the meaning of symbols or the function of formal techniques to the ideological ramifications in particular historical settings of literary and cultural works. Theory has also moved from fairly simple to much more complex concerns, from such issues as what rhetorical figures best represent supposedly transcendental ideas to the consequences of the systematic character of language for how we conceptualize culture. Much controversy has attended these changes. And you will find a record of it in the pages that follow.

We begin in the nineteenth century, although literary and cultural study reaches back to the Greeks and especially to Aristotle, who first studied literary form and the effects of literary works. The “aesthetic” tradition in philosophy initiated the consideration of literature as a vehicle of meaning, even an embodiment of universal ideas that somehow transcended material reality. Such “idealism” was common before the twentieth century, although it would soon be discredited by science and by more critical kinds of philosophy. The nineteenth century continues the tradition of considering literature in terms of form, meaning, and effect. Literature was largely seen as consisting of symbols that provide access to ideas that are of a universal character and exist outside ordinary reality. But it was also seen by aesthetes such as Walter Pater as having a positive effect on audiences by heightening their experience of life and bringing passion to mundane existences.

At the beginning of the twentieth century, a group of young scholars known as formalists, who were interested in language, challenged the idea that literature was largely symbolic. According to the symbolists, literature directly represented the world, and in its symbols it allowed an ideal, nonphysical realm of spiritual essences to express itself in physical form. Thinking about human culture was at the time still hostage to idealist assumptions about the world, which held to a distinction between spirit and matter. Formalists challenged the assumptions of symbolism and shifted the study of literature and culture toward the actual techniques and procedures that distinguish literary from other kinds of writing. The formalists studied what made literature radically innovative – the fact that it often disturbs our assumptions about the world – and what made it something worthy of scientific analysis.

In their turn, formalists were opposed by Marxists and sociologists of literature who felt attention to the formal elements of a literary work overlooked its place in a social and historical context. Literature, however it may be put together or constructed, is about life, and life is about the vexed struggle over how social resources will be divided between economic classes. The formalists were also opposed by neo-humanists, who felt literature was about enduring concerns in human life and should be studied as a whole (both meaning and form). Neo-idealists added another voice in favor of considering literature as the embodiment of universal spiritual meaning.

After World War II, American culture especially became more conservative. In the US, an attempt was made to merge the neo-idealist and the formalist strains into one. The dominant current in the study of literature became religious and idealist while also being exactly formalist. The so-called “new critics” considered literature to be iconic in a religious sense, and the “verbal icons” in which spiritual ideas were delivered to humanity by seer poets had to be given the attention divine ideas deserved; their complexity had to be elucidated carefully so that the higher truths would not be lost through misinterpretation by the unenlightened. A poem embodied spirit in paradoxical figures and images, and the business of literary study was to elucidate the unity of universal meaning and concrete formal elements. The new criticism was elitist, politically conservative, and phallographic. It avoided scruffy concerns such as the subordinate place of women in American culture or ignored the fact that an emblematic new critical seer-writer such as William Faulkner was a racist. That absence of social connection and concern proved costly, as the new criticism faded with the advance of changes regarding race

and gender in American culture and society after the 1960s.

Literary and cultural scholars in England took a more historically informed and politically sensitive approach to the relationship of literature to society after World War II. Writers such as Raymond Williams, cultural historians such as E. P. Thompson, neo-humanists such as F. R. Leavis, and cultural analysts such as Richard Hoggart studied literature in its real-world settings and attended both to its social effects and to its ethical and moral meanings. They contended that literature was about life, not universal spiritual truths that avoided the specifics of life. They added nuance to pre-war Marxism by attending more to the operations of culture considered as a realm independent of simple economic determination. And they created the modern field of cultural studies, whose importance is signified by the fact that it merits a separate volume of its own in this encyclopedia.

The 1960s are important for literary and cultural theory in both the US and Great Britain because the social and cultural changes that were initiated then reverberated through the Anglo-American academy, transforming everything from what works of literature were considered important and worth teaching to how literature and culture would be understood, discussed, and taught. American political leaders had behaved with reckless arrogance in the world during the period after World War II. They used military force to suppress pro-socialist democratic movements that were inimical to the financial interests of the wealthy businessmen who largely ran the country. That self-serving policy blew up in their faces in the 1960s when a tenacious Vietnamese population proved intractable in its resistance to the US's efforts to impose its will on them. That war spawned a student movement that was fueled by the aspirations for social justice around the world that arose

often in colonial or neocolonial contexts in places such as South America and Africa. Opposition to imperialism was easy to link to opposition to the capitalist economic system that often benefited most obviously from colonialism. At the same time, the aspirations for equality and fair treatment on the part of African Americans, women, and sexual minorities ignited movements that sought substantial change in business-as-usual in the advanced industrialized countries such as the US and the UK. Literature classes were places where students were offered the chance to reflect on their society, their values, and their cultural history. And literature became a focal point for the struggle between the old way of doing things and the new. In the US especially, the literary culture wars were part of a larger struggle between liberals and conservatives, between those who sought to bring about equality, justice, and fairness and those who clung to excuses for inequality and unfairness such as the ideology of "freedom" or elitist assumptions about "great" literature. At stake often were simple issues such as which books should be taught and how the study of literature should be conducted. Works by African Americans and women, for example, would as a result of these debates be taught more in literature courses than before. The so-called "canon," or list of "books worth teaching" changed, and one now finds Frederick Douglass and Kate Chopin taught beside Herman Melville and Ralph Waldo Emerson, something a new critic interested in "great" (implicitly white and male) works would never have countenanced.

The way literature and culture were studied also changed during this time. The 1960s were a mini-Renaissance in Paris especially. A number of influential thinkers, especially Jacques Derrida and Michel Foucault, wrote books that would transform how we think about literature and culture. Both were

influenced by Ferdinand de Saussure, a Swiss linguist whose *Course in General Linguistics* (originally given as lectures and collected and first published in 1916) changed a generation of French thinkers from phenomenologists, philosophers who considered human subjective awareness or consciousness to be the central concern of their work, to structuralists and then poststructuralists. The structuralists were concerned with the language systems that govern and facilitate knowledge, while poststructuralists were concerned with complexity, the way relations between terms are as important as the terms themselves both in knowledge and in reality. Derrida and Foucault exercised enormous influence in the American academy especially. A school of criticism called “deconstruction” arose in response to Derrida’s work, and Foucault was instrumental in inspiring a new field of historical research that focused less on events and people and more on discourses.

Both formalism and structuralism helped literary scholars to deepen their understanding of literary form, especially narrative. Using structuralist ideas, it became possible to describe the discrete elements of narrative more accurately. Other scholars linked the study of narrative to such issues as ethics. A new field devoted to “narratology” came into being.

Another consequence of the break with the past that occurred in the 1960s was the emergence of feminism and studies defined by the concerns of sexual minorities such as gays, lesbians, and transvestites. These new strands of thinking brought into focus hitherto ignored issues and concerns and expanded the canon to include works that had never been taught before.

We have also attempted to take note of the new directions that literary and cultural study are taking. Especially important in this regard are the new scientific approaches to literature, such as cognitive studies and

evolutionary studies. The former makes the traditional focus on effects more scientific, while the latter gives new meaning to meaning by moving away from ideas or social contexts and toward physical nature itself as a source of meaning for literature. The approach is not always reductionist, however, since it notices how culture and genetic evolution interact in the development of modern human civilization. The idea of “epigenesis” is especially fruitful because it explains how human culture can trigger genetic responses. Much good work promises to emerge along these lines of inquiry. Rather than dismiss social construction as a factor in shaping human nature, evolutionary scholars can now note how external or socially constructive features of the environment, such as the development of trade or of human institutions, can generate internal genetic modifications over time. In one argument, the Greek Enlightenment of the sixth century BCE was one such event that combined the influence of trade and migration with the clear emergence of a genetic adaptation in favor of greater cognitive abilities than had previously existed.

We have included an entire volume on cultural theory because cultural studies is a new field that partly emerged out of literary study. Many literary scholars have expanded their repertoire of interests and expertise to include such things as the media and film. The word “culture” has always had multiple meanings. In one sense of the word, culture is inseparable from human life. Everything, from how we dress to what we eat, from how we speak to what we think, is culture. Culture in this sense comprises the unstated rules by which we live, rules that regulate our everyday practices and activities without our thinking about them or noticing them. Culture as a way of life tends to produce a commonality of thought and behavior, as well as conformity with reigning standards, norms, and rules. It is what

allows us to live together in communities by giving us shared signs and signals whose meaning we know and recognize. We recognize fellow members of our culture by dress, speech, behavior, and look. In this sense of the word, “culture” means embedded norms all obey usually without thinking about it. Within this larger sense of culture, there can be regions and zones, institutional settings with subcultures of their own. High schools can have quite specific cultures, ranging from the San Fernando Valley to East High in Newark, New Jersey, from a “valley girl” cultural style to a “ghetto” style. Investment banks can have a culture of “cowboy capitalism,” in which men compete to make the most risky bets that make the most income.

A more familiar meaning of the word “culture” is the things we humans make when we translate ideas into objects. In the first sense of the word, culture comprised behaviors and institutions, such things as the norms by which we live, the practices in which we engage (everything from dress to bathing), and the institutions we inhabit and use, such as courts, marketplaces, and workplaces; the second meaning of culture comprises cultural artifacts, such things as the shape we give the built environment (the architecture of buildings, for example), the forms of entertainment we create (such as Hollywood or Bollywood movies), and the music we listen to (be it techno or rap). That list is far from exhaustive of human creativity or of the multiple ways humans create and develop institutions, activities, and things that are fabricated, artificial, and artistic and that count as culture in this second sense of the word.

One might say that culture in the second sense of artistic objects is only possible if culture in the first sense as a way of life gives permission. One cannot make good television shows if there is no television distribution system, for example, and that

presupposes a high level of prosperity of the kind found in such places as London and Hong Kong but not in the African or South Asian countryside. Similarly, to write novels, one usually has to be well educated, to know language well at least, and to be trained in how to write. Culture understood as a norm-guided behavior or as an institution is the house in which culture understood as an artifact occurs. What this means is that most cultural products or artifacts embody and express the norms of the culture in which they are made.

The culture in which one lives determines the culture that is created within it, but influence works in the other direction as well. One could even go so far as to say that the second meaning of culture as human creativity is our way of modifying the first meaning of culture as civilized normativity. Creative culture is often accused of being uncivil because it breaks existing norms and points the way toward the creation of new ones. When the bohemian movement started in Western Europe in the late nineteenth century, it was an attempt on the part of creative people to upset the reigning norms of the culture, which were perceived as being too restrictive, too allied with conservatism, commerce, and a narrow scientific view of knowledge. Women had been instructed throughout the nineteenth century to be prim and proper and to dress accordingly – tight corsets, body-covering dresses, and the like. The bohemians in the 1880s upset all that. They wore loose clothing that revealed their bodies. Women artists danced in free style instead of in the prescribed rote forms associated with “high” culture. Emotional expressiveness replaced formal rigor and reverie replaced objective scientific clarity. Drugs, of course, were part of the new bohemian scene, as was potent alcohol that altered the normal state of things. Commercial “bourgeois” culture’s hold on human possibilities was

shaken, and a new culture eventually was born. We still live with its legacy today when we dress informally or reveal our bodies without shame or embarrassment or dance in non-prescribed ways to music that no one in the nineteenth century would recognize as “legitimate” music. The bohemians were first perceived to be rule-breakers by the keepers of normative culture, but, with time, the changes they introduced into cultural life altered for the better the cultural house they and we live in.

To use a contemporary analogy, culture is the software of our lives. It is the program we live by, the rules that determine how we think and act. But it is also the malleable, rewritable script that we ourselves rework and recreate as we live and produce creative works and say and do creative things in our lives.

Cultural studies came into being in England in the 1950s and 1960s. Initially, it was concerned with working-class youth cultures, but, with time, it has expanded to become a wide diverse field that includes the study of visual culture, subcultures, the media, dress and fashion, space and geography, audiences and celebrities, body culture, the culture of material things, and music.

Literature – understood as the traditional genres of poetry, theater, and fiction – endures and is central to culture understood in this new larger sense. It is appropriate, therefore, that both literary and cultural theory should be explained in the same

place. Many ideas from contemporary cultural analysis such as “hybridity” had their first use in literary studies. It is helpful to consider both literary and cultural forms of expression as different modes of representation. While each has its specific contours, each also shares certain practices and forms such as narrative that allow for a common analysis and theorizing.

The Encyclopedia of Literary and Cultural Theory is a comprehensive resource for the reader who wants to explore the rich tradition of theoretical approaches to culture and its artifacts. Though literary theory dominates the approaches explored in volumes I and II, the broader issues of culture mentioned above will be found throughout, for the techniques and strategies described in the entries on theoretical approaches to literary can be used in analysis of other cultural artifacts. Conversely, the approaches in volume III, while focused largely on things like popular media, music, fashion, and new modes of representation, can be usefully applied to literary texts. In view of twenty-first-century trends toward digital media, in which literature and other art forms (both visual and aural) commingle in innovative forms of cultural expression, it is increasingly difficult to distinguish literature in the conventional sense from these new modes of expression. The *Encyclopedia* celebrates and documents this difficulty, while remaining attentive to the traditions that gave rise to innovations across the cultural spectrum.

The Encyclopedia of Literary and Cultural Theory

Volume I

Literary Theory from 1900 to 1966

Edited by Gregory Castle

 **WILEY-BLACKWELL**

A John Wiley & Sons, Ltd., Publication

Notes on Contributors to Volume I

Grey Anderson is a graduate student in the Department of History at Yale.

Paul B. Armstrong is a professor of English at Brown University. His most recent book is *Play and the Politics of Reading: The Social Uses of Modernist Form* (2005). He has also written books about Henry James, literary impressionism, and the theory of interpretation, and he has edited Norton Critical Editions of E. M. Forster's *Howards End* and Joseph Conrad's *Heart of Darkness*.

Patrick Bixby is an assistant professor of British literature at Arizona State University and author of *Samuel Beckett and the Postcolonial Novel* (2009). He has served as assistant to the editors of *The Letters of Samuel Beckett* (2009), and is currently writing a book on Nietzsche and Irish modernism.

Joseph Bristow is a professor of English at the University of California, Los Angeles. His books include *Oscar Wilde: Contextual Conditions* (2003), *Oscar Wilde and Modern Culture: The Making of a Legend* (2009), and *Sexuality* (New Critical Idiom) (2nd edn. 2010). He is the editor of the variorum edition of Oscar Wilde's *Picture of Dorian Gray* (2005).

Shelly Brivic is a professor of English at Temple University. He has written widely on Joyce and psychoanalysis, including *Joyce between Freud and Jung* (1980) and *The Veil of Signs: Joyce, Lacan, and Perception* (1991). He has also written *Tears of Rage: The Racial Interface of Modern American Fiction* (2008). He is currently writing on Joyce, Lacan, and Žižek.

Joseph Carroll is Curators' Professor of English at the University of Missouri-St Louis. He is the author of *The Cultural Theory of Matthew Arnold* (1982), *Wallace Stevens' Supreme Fiction: A New Romanticism* (1987), *Evolution and Literary Theory* (1995), and *Literary Darwinism: Evolution, Human Nature, and Literature* (2004). He has produced an edition of Darwin's *On the Origin of Species*. He is a coeditor (with Brian Boyd and Jonathan Gottschall) of *Evolution, Literature, and Film: A Reader* (2010), and he coedits an annual journal, *The Evolutionary Review: Art, Science, Culture*. A collection of his recent essays, *Reading Human Nature: Literary Darwinism in Theory and Practice*, is in press.

Gregory Castle is a professor of British and Irish literature at Arizona State University. He has published *Modernism and the Celtic Revival* (2001), *Reading the Modernist Bildungsroman* (2006), and the *Blackwell Guide to Literary Theory* (2007). He also edited *Postcolonial Discourses* (2000). He has published numerous essays on Joyce, Yeats, Wilde, and other Irish writers, and is currently working on *Inventing Souls: The Pedagogies of Irish Revivalism*, a study of misrecognition and aesthetic education in Irish revivalism.

James Walter Caufield is an extension lecturer at the University of California, Los Angeles, from where he received his PhD in 2008. His published work includes essays on Matthew Arnold, Thomas Hardy, Joseph Conrad, and James Joyce.

David Cerniglia is a PhD student in literary and cultural studies at Carnegie Mellon University. He works on nineteenth-century British literature and culture, the history of the book, and the relationship between political economy and the novel.

Ranita Chatterjee is an associate professor and graduate director of English at California State University, Northridge. She has published on the exchange between Luce Irigaray and Sarah Kofman, as well as many articles on 1790s British Jacobin writers.

Alexander Chirila graduated from New York University with a BA and from the State University at Albany with a PhD in writing and criticism. His work focuses on symbolic and mythic literary analysis and archetypal criticism.

John Claborn is a PhD candidate at the University of Illinois, Urbana-Champaign, with a focus on modern American literature, critical theory, and film studies. He is currently working on a dissertation on early twentieth-century African American environmental writing.

Gerard Cohen-Vrignaud is a doctoral candidate in comparative literature at the University of Chicago and a lecturer in the French language and in English and French literature in the undergraduate college, specializing in Romantic literature, historicism, and exoticism in French, English, and Arabic.

Paul Dahlgren is a PhD candidate at the University of California, Irvine who works in the history and theory of rhetoric as well as American literature to 1900. He has published in the *Journal of Cultural and Religious Theory*. His dissertation explores the interrelationship between rhetoric, literature, and theology during the nineteenth century

Stephanie DeGooyer is a PhD candidate in the English Department at Cornell University. Her dissertation examines the fictional structure of human rights claims in the eighteenth-century fiction of Samuel Richardson, Mary Shelley, and Laurence Sterne.

Matthew Dubord is a doctoral student in English literature at the University of California, Los Angeles. His dissertation analyzes the relationships between professionalism, intimacy, social systems, and narrative form in the sequence novels of Anthony Trollope, Margaret Oliphant, and Philip Meadows Taylor. He has an article under review for publication on the systematic production of individual choice in Henry James's *The Tragic Muse*.

Dotty Dye is a doctoral student specializing in twentieth- and twenty-first-century comparative literatures in the English Department at Arizona State University. Her focus is comparative literatures in the twentieth century. In 2006 she earned an MA in French literature for her work on André Gide's *L'Immoraliste* and Cheikh Hamidou Kane's *L'Aventure ambiguë*. Her research interests include identity studies, travel narrative, and postcolonial literature.

Lahcen E. Ezzaher is a professor of English at the University of Colorado, where he teaches courses on the history of rhetoric, stylistics, the essay, world literature, colonial discourse, and postcolonial criticism. His has published an Arabic-English translation in *Rhetorica* on Alfarabi's commentary on Aristotle's *Rhetoric*.

Peter Fenves is Joan and Serepta Harrison Professor of Literature, Northwestern University. He is the author of *A Peculiar Fate: Kant and the Problem of World-History* (1991), "Chatter": *Language and History in Kierkegaard* (1993), *Arresting Language: From Leibniz to Benjamin* (2001), *Late*

Kant: Toward Another Law of the Earth (2003), and *The Messianic Reduction: Walter Benjamin and the Shape of Time* (forthcoming).

Brigitte Flickinger is a lecturer in Russian cultural history and philosophy at Heidelberg University (Germany). Her current research is on cinema-going and urban experience in London, Berlin, and St Petersburg 1900–1930. Her publications include a book on Valéry Bryusov, essays on Russian cultural history, Soviet literature and film, as well as translations of books on philosophy, psychology, and history.

Anthony Fothergill is a senior lecturer at the University of Exeter, where he teaches English literature and cultural theory. He has also taught at the University of Heidelberg and at Kenyon College, Ohio. He has written widely on modernism and modernity. His most recent book is *Secret Sharers: Joseph Conrad's Cultural Reception in Germany* (2006). He has published a book-length study on Conrad's *Heart of Darkness* (1989; 2000) and has edited works by Conrad and Oscar Wilde.

Dustin Friedman is a doctoral candidate in the English Department at the University of California, Los Angeles. His dissertation examines the relations among aesthetic philosophy, negativity, and homoeroticism in late nineteenth-century British literature. He has presented studies of Mary Wollstonecraft, Walter Pater, and Oscar Wilde at various conferences, and his writings have appeared in *Studies in Romanticism* and *Textual Practice*.

Paul H. Fry is William Lampson Professor of English at Yale University. His primary areas of specialization are British Romanticism, the history of literary criticism, contemporary literary theory, and literature in relation to the visual arts. *The Poet's Calling in the English Ode* (1980)

received the Melville Cane Award of the Poetry Society in America. He has also published *The Reach of Criticism: Method and Perception in Literary Theory* (1984), *William Empson: Prophet Against Sacrifice* (1990), *A Defense of Poetry: Essays on the Occasion of Writing* (1996), *The Rime of the Ancient Mariner* (ed.; 1999), and *Wordsworth and the Poetry of What We Are* (2008).

Peter Gilgen is an associate professor of German studies and a member of the Graduate Field of Comparative Literature at Cornell University.

Geoffrey Green is a professor of English at San Francisco State University. He is the author of *Literary Criticism and the Structures of History: Erich Auerbach and Leo Spitzer* (1982), *Freud and Nabokov* (1988), and *Voices in a Mask* (2008). He is the editor of *Novel vs. Fiction: The Contemporary Reformation* (1981) and *The Vineland Papers: Critical Takes on Pynchon's Novel* (1994). He is the executive editor of the journal on contemporary fiction, *Critique*.

Chouki El Hamel teaches African history at Arizona State University. His research focuses on Islamic culture and the evolution of Islamic institutions in Africa. He has published widely on issues of slavery and intellectual life in Islamic Africa. He is the author of *The Internal African Diaspora: "Race/Color" and Gender in Moroccan Slavery* (forthcoming).

David Hawkes is a professor of English at Arizona State University. He is the author of *Idols of the Marketplace* (2001), *Ideology* (2nd edn. 2003), *The Faust Myth* (2007), and *John Milton: A Hero Of Our Time* (2009) and has edited John Milton's *Paradise Lost* (2004) and John Bunyan's *The Pilgrim's Progress* (2005). *The Culture of Usury in Early Modern England* is forthcoming. His work has appeared in such journals as the *The Nation*, the *Times Literary Supplement*, the *Journal of the History of Ideas*,

Studies in English Literature, English Literary History, the Huntington Library Quarterly, Milton Studies, Shakespeare Quarterly, Clio, and In These Times.

Joanne A. Hsu is a doctoral candidate at the University of Michigan. From 2007 to 2008, she was an exchange lecturer at the Johannes Gutenberg University of Mainz in Germany. Her research deals with architecture in a transnational context as well as with theories of textuality. She received a BA from Brown University.

David Jenemann is an associate professor of English and film and television studies at the University of Vermont. He is the author of *Adorno in America* (2007) as well as a number of essays on critical theory and mass culture. He is currently writing a book on the cultural history of ambivalence.

Jason B. Jones is an associate professor of English at Central Connecticut State University. His main interests are Victorian literature, psychoanalysis, and humanities computing. He is the author of *Lost Causes: Historical Consciousness in Victorian Literature* (2006).

Tim Kaposy is an assistant professor in the Cultural Studies Program at George Mason University. He is a coeditor (with Imre Szeman) of *Cultural Theory: An Anthology* (2010).

Joshua Kates, associate professor at Indiana University, is the author of two books that situate the work of Jacques Derrida in relation to phenomenology and contiguous fields: *Essential History: Jacques Derrida and the Development of Deconstruction* (2005) and *Fielding Derrida: Philosophy, Literary Criticism, History, and the Work of Deconstruction* (2008).

R. Brandon Kershner is Alumni Professor of English at the University of Florida. He is the author of *Dylan Thomas: The Poet and His Critics* (1977), *Joyce, Bakhtin, and*

Popular Literature (1989), and *The Twentieth-Century Novel: An Introduction* (1997). He is also the editor of the Bedford Books edition of Joyce's *A Portrait of the Artist as a Young Man* (2006) and of *Joyce and Popular Culture* (1996). He has published some 40 articles and book chapters on various aspects of modern literature and culture, and a similar number of reviews and poems. *Joyce, Bakhtin, and Popular Literature* won the 1990 award from the American Conference for Irish Studies as the best work of literary criticism in the field. Kershner was recently re-elected to the Board of Trustees of the International Joyce Foundation. He has just completed a book-length study entitled *The Culture of "Ulysses."*

Koonyong Kim is a James B. Duke Fellow and PhD candidate at Duke University. He has published on critical theory and post-modern global culture. He is also the Korean translator of Fredric Jameson's work.

Donald A. Landes currently holds a Social Sciences and Humanities Research Council of Canada Postdoctoral Fellowship in the Philosophy Department at McGill University, Montreal, Canada. He received his PhD in philosophy from Stony Brook University in 2010. His research engages with numerous figures in continental philosophy, including Merleau-Ponty, Bergson, Husserl, and Nancy, and focuses on issues in phenomenology of perception, language, and ethics.

Michael Levenson is the William B. Christian Professor of English at the University of Virginia. His many books include *A Genealogy of Modernism: A Study of English Literary Doctrine, 1908–1922* (1984), *The Fate of Individuality: Character and Form in the Modern English Novel* (1991) and *The Cambridge Companion to Modernism* (ed.) (1998). He has written many articles on figures including James Joyce, T. S. Eliot, and Joseph Conrad. His *Modernism* is forthcoming from Yale University Press.

Sharon Luk is a doctoral candidate in American studies and ethnicity at the University of Southern California. She has also worked professionally in community and youth development and holds an MA in education from the University of California, Los Angeles.

Michael Lundell is a PhD student in English literature at the University of California, San Diego, with an MFA in creative writing from San Diego State University. He is interested in late nineteenth- and early twentieth-century American, English, and Arabic literature, *The Thousand and One Nights*, psychoanalytic literary theory, and film.

Daniel M. Markowicz is a PhD student in literary and cultural studies at Carnegie Mellon University. He works on Marxist theory, the relationship between realism, naturalism, and financialization in late nineteenth- and early twentieth-century America, and twentieth-century insurrectionary narratives.

Tom McCall is an associate professor of literature and humanities at the University of Houston, Clear Lake. Author of numerous essays (including on Greek tragedy, Hölderlin, deconstruction, Spinoza, Freud, and Walter Benjamin), he is currently at work on *Ekplexis Ancient and Modern: On "Being Struck,"* which resurrects an ancient counterconcept to mimesis.

John McGowan is Ruel W. Tyson, Jr. Distinguished Professor of Humanities at the University of North Carolina, Chapel Hill. He is the author of five books, including *Postmodernism and its Critics* (1991) and *American Liberalism: An Interpretation for Our Time* (2007). He is also an editor of the *Norton Anthology of Theory and Criticism* (2001).

Mia L. McIver is a doctoral candidate at the University of California, Irvine. Her re-

search focuses on theories of sovereignty in twentieth-century British, Irish, and German narrative literature.

Brian Meredith is a PhD candidate at the University of Florida. His interests include Samuel Beckett and eighteenth-century literature. He has published in *Politics and Culture*. His career in literature was first encouraged by a new critic, Michael W. Raymond, in whose memory he would like to dedicate this entry.

Gerald Moore is a lecturer in French at Wadham College, Oxford, having previously taught at Université Paris-12 (Val de Marne). His book on poststructuralist politics, *Politics of the Gift* is forthcoming (2011). He has also published on Michel Houellebecq and has translated works by Henri Lefebvre, Michel Foucault, and Georges-Didi Huberman, among others.

Yasser Munif is a sociology PhD candidate at the University of Massachusetts, Amherst. He is currently conducting research on Afro-French youth and poor Parisian suburbs.

Tara Needham is a doctoral candidate in the Department of English at the University at Albany, SUNY, where she researches and teaches in the areas of global modernisms, transnational cultural studies, and critical theory. Her essay "Faux factory: Barthes walks in a Starbucks" appears in Mary Valentis (ed.), *TechKnowledgies: New Imaginaries in the Humanities, Arts, & Technosciences* (2007).

Matthew H. Pangborn received his PhD in English from the University at Albany, SUNY. He has written on American literature, transatlanticism, and film, and his interests include creative writing, literary theory, and philosophy. Currently, he is at work on a book project tentatively entitled "Specular Subjects: The Philosophy of

Vision in the Transatlantic Novel, 1719–1850.”

Cóilín Parsons is a lecturer in the Department of English Language and Literature at the University of Cape Town, South Africa. He received his PhD in English and comparative literature from Columbia University.

Paul Perron is a professor emeritus at the University of Toronto, a Member of the Royal Society of Canada, and former President of the American Semiotic Society. He holds a PhD in French literature from the University of Bordeaux. Associate editor of *Semiotica*, he is the author and co-author of numerous articles and books in literature and semiotics and his latest monograph is a co-translation and critical edition (with Jean-Patrick Debbeche) of Vladimir Propp's *On the Comic and Laughter* (2009).

Michael Peters is a PhD candidate at the University at Albany, SUNY. His dissertation is a study of “sound environment programming” in the post-1945 field of the literary arts. He has published on Charles Olson (Cambridge Scholars) and poetics (*Word for/Word*) as well as providing entries for Kostelanetz's *Dictionary of the Avant-Gardes* (2001) and a recent transcription of a 1971 Sun Ra lecture (*Hambone*). He has served as editor of the *Little Magazine* and *Xtant*. He is also the author of the sound-image poem, *Vaast Bin* (2007). His assorted language, art, and sound works have appeared in numerous journals (both print and online) and on recording labels like Atavistic and Luna Bisonte, in addition to galleries, installations, various anthologies, and special collection libraries like the Sackner Archive.

Petre Petrov is an assistant professor in the Department of Slavic Languages and Literatures, Princeton University. His research

focuses on Soviet modernism, Russian literary and cultural theory, socialist realism, and Stalinist culture.

Matthew Potolsky is an associate professor of English at the University of Utah, where he teaches literary theory and Victorian literature. He is the author of *Mimesis* (2006), as well as articles on the literature and culture of the late nineteenth century. He is a coeditor (with Liz Constable and Dennis Denisoff) of *Perennial Decay: On the Aesthetics and Politics of Decadence* (1999).

Jean-Michel Rabaté is a professor of English and comparative literature at the University of Pennsylvania. He has written extensively on Joyce, Lacan, modernism, and literary theory. His books include *The Ghosts of Modernity* (1996), *Joyce and the Politics of Egoism* (2001), and *Jacques Lacan and Literature* (2001). He edited numerous collections of essays, including *The Cambridge Companion to Jacques Lacan* (2002) and *Advances in James Joyce Studies* (2004). More recent work includes *1913: The Cradle of Modernism* (2007) and *Given 1° Art 2° Crime: Modernity, Murder and Mass Culture* (2007).

Royal W. Rhodes is Donald L. Rogan Professor of Religious Studies at Kenyon College. His publications in religion and literature include *The Lion and the Cross: Early Christianity in Victorian Novels* (1995).

David Richter did his doctoral work at the University of Chicago, where his dissertation was directed by Sheldon Sacks and Wayne C. Booth. He is the author of *Fable's End* (1975) and *The Progress of Romance* and the editor of *The Critical Tradition* and *Falling into Theory* (1996), along with dozens of academic articles. He is currently a professor of English at Queens College and the City University of New York Graduate Center, where he teaches eighteenth-

century literature, biblical narrative, and contemporary literary theory.

Christopher Rizzo is a widely published poet and editor. He is currently a doctoral candidate in English at the University at Albany, SUNY.

Gayle Rogers is an assistant professor of English at the University of Pittsburgh and a scholar of British and Spanish modernist periodicals, novels, and poetry between the two world wars, including literature of the Spanish Civil War. He has published on such figures as James Joyce, Antonio Marchal, Waldo Frank, Victoria Ocampo, and José Ortega y Gasset.

Kathleen Ryan is a graduate student of English at Arizona State University. She is the editor of *What If? Collected Writings of Paolo Soleri* (2002) and *Itinerario di architettura: Antologia dagli scritti* (Architectural Itinerary: Anthology of Writings) (2003).

Carl B. Sachs is a lecturer in the Department of Philosophy and Religion Studies at the University of North Texas. He received his PhD from the University of California, San Diego in 2005. He writes predominately on pragmatism and critical theory, and his work has appeared in *Epoche*, *Contemporary Pragmatism*, the *Philosophical Forum*, and *Philosophy and Social Criticism*.

Marthine Satris is a doctoral candidate in the English Department at University of California, Santa Barbara. She received an MA in Anglo-Irish literature and drama from University College Dublin. Her dissertation analyzes the relationship between poetry and culture in contemporary Ireland.

Dawn Seckler received her doctorate in Russian cinema from the Department of Slavic Languages and Literatures at the University of Pittsburgh. Her research focuses on contemporary Russian cinema, with particular emphasis on film genre theory and

masculinity studies. She is a regular contributor to *Kinokultura* and an annual participant at the Russian Film Symposium held at the University of Pittsburgh.

Stefano Selenu is a PhD candidate in Italian studies at Brown University. His research interests include Antonio Gramsci and Marxism, Dante, Benedetto Croce, philosophy, theories of language, and history. In 2005 he received the Prize Antonio Gramsci.

Jack Solomon is a professor of English at California State University, Northridge, and has published widely on language and semiotics. His books include *The Signs of Our Time* (1988) and *Discourse and Reference in the Nuclear Age* (1988). He edited (with Sonia Maasik) *California Dreams and Realities* (1995) and *Signs of Life in the USA* (1999).

Heather M. Steffen is a PhD candidate in literary and cultural studies at Carnegie Mellon University. Her dissertation is a cultural materialist history of the criticism of and activism around the American university between 1900 and the mid-1920s. She is managing editor of the *Minnesota Review* and guest-edited its 2009–10 “Feral Issue.”

Justin Sully is a PhD candidate in the Department of English and Cultural Studies at McMaster University, Canada. His dissertation investigates the cultural politics of population aging in contemporary fiction and film.

Cecily Swanson is a doctoral candidate in the Department of English at Cornell University. A graduate student-in-residence (2009–10) for Cornell’s study abroad program in France, she is currently writing about Henry James’s reception of French naturalism. Her dissertation will consider American literary salons in Paris in the early twentieth century.

Sevinç Türkkan is a doctoral candidate in the Program in Comparative Literature at the University of Illinois, working in twentieth-century Turkish, German, and British literatures. Her research interests are theory and practice of literary translation, multilingualism, comparative and cross-cultural approaches to literary and cultural study, globalization and gender, psychoanalytic theory, and cinema.

Carrie K. Wastal is the Director of the Muir College Writing Program at the University of California, San Diego. Her

research interests include composition studies, writing pedagogy, writing assessment, nontraditional students, and plagiarism.

Steve Weber is a doctoral candidate at the University at Albany, SUNY. His dissertation studies North Africa as an important locus for postmodern fiction.

Jenny Wills is a doctoral candidate at Wilfrid Laurier University in Ontario, Canada. Her research interests include Asian North American literature and comparative race studies.

A

Abrams, M. H.

JOSEPH CARROLL

Meyer Howard Abrams (b. 1912) is one of the most respected scholar-theorists of the twentieth century. His special field is Romantic poetry and poetics, but he has done scholarly work that draws on an encyclopedic historical knowledge of literary theory from all periods, and he has engaged in major debates in contemporary literary theory. He has also played a pioneering role as an anthologist, serving, among other things, as founding editor of *The Norton Anthology of English Literature* (1962). Unlike Northrop Frye and Harold Bloom, two of the most prominent and influential of his peers who were also Romanticists and literary theorists, Abrams is not himself intellectually or imaginatively a Romantic, neither of the Blakean mystical cast, like Frye, nor of the Shelleyan hierophantic cast, like Bloom. His groundbreaking works on Romantic intellectual and aesthetic sensibilities – *The Mirror and the Lamp* (1953) and *Natural Supernaturalism* (1971) – focus on tradition and seek to unveil the dynamic structures behind the Romantic desire for infinity, transcendence, and “negative capability.” Abrams’s interest in tradition indicates an affinity with the Enlightenment and with neoclassical theorists like David Hume,

Samuel Johnson, and Edmund Burke, rather than with those more commonly associated with Romanticism, thinkers like Friedrich Schlegel, Samuel Taylor Coleridge, and Percy Bysshe Shelley.

In contemporary critical theory, Abrams has been most active and influential as an urbane but incisive critic of poststructuralism. In contrast to both Frye and Bloom, Abrams produced no distinctively original or idiosyncratic theory of his own. Instead, he occupies a commanding position as one of the most articulate spokesmen for traditional humanism and for “pluralism,” a stance that he associates with Wittgenstein and that also characterizes the work of R. S. Crane and Chicago School neo-Aristotelian literary theory and criticism. He believes that multiple alternative theories can give access to different aspects of a literary text but that no theory should be given precedence over the body of informed common understanding that constitutes the “humanist literary paradigm . . . a transaction in an enviroing world with a human being at each end” (Abrams 1997: 119). Humanism of this sort consists in a set of common-sense notions about literary meaning and a critical ethos corresponding to those notions. Abrams held that authors have definite intentions in creating structures of meaning and that those meanings have reference to

objectively recognizable phenomena within an actual world shared by authors and their readers. The ethos corresponding to these notions is that scholars and critics should conscientiously seek to identify determinate literary meanings grounded in authorial intentions, locate those meanings within a historical and theoretical context, and generously appreciate the imaginative qualities manifested in the works they study.

Jonathan Culler (1997) characterizes poststructuralism as a sustained philosophic critique of common sense. Abrams, in contrast, characterizes it as a programmatic but arbitrary departure from common sense, which he develops into a principled philosophical position that can serve as a credible alternative to poststructuralist conceptions of literature. The crucial poststructuralist strategy, he argues, is to invest language or discourse with quasi-autonomous status. In his late essays Abram contends that by thus detaching language from its natural function as an intermediary in human communication, poststructuralism falsely attenuates the power of authors to be the origin of their texts, the individuality of both authors and readers who share an "actual" world, and the distinct character of specific literary works as intentional communicative artifacts (1995, 1997). These late essays extend and culminate the theoretical work that Abrams had already collected in *Doing Things with Texts* (1989).

Abrams produced two landmark works that combine literary theory and literary history: *The Mirror and the Lamp* and *Natural Supernaturalism*. In the introduction to the former, Abrams constructs a taxonomic model that could, he suggests, encompass all possible forms of literary theory. He identifies four elements that constitute the natural environment in which literature is produced and read: an author, a reader, a shared world, and a text. All literary theories can be classified by the relative emphasis they

place on one of these four elements. Expressive theories emphasize the author; rhetorical or "pragmatic" theories emphasize effects on readers; mimetic theories emphasize representations of the world; and "objective" theories emphasize the formal organization of the literary work. As simple as this model is, Abrams makes a convincing case, documented in detail, that these four elements can effectively distinguish literary theories from the time of Plato and Aristotle up through the mid-twentieth century. Applying this model to his particular subject in *The Mirror and the Lamp*, Abrams argues that the transformations of aesthetic theory between the neoclassical and Romantic periods can best be described as a shift from mimetic to expressive theories.

In *Natural Supernaturalism*, Abrams interprets the Romantic poets, and especially Wordsworth, in terms of philosophical considerations that grew out of German Romanticism and flourished in England, especially in the work of the Victorian sage Thomas Carlyle and the Romantic poet Samuel Taylor Coleridge. The phrase "natural supernaturalism" comes from Carlyle's *Sartor Resartus* (1836), a generic hybrid that refashioned the *Bildungsroman* in terms of a spiritual quest. Carlyle in his turn got the concept from the German Romantics. In the final stages of the journey narrated in *Sartor Resartus*, in the period of the "Everlasting Yea," Diogenes Teufelsdröckh arrives at a renewed sense of spiritual connection and wonder, in which nature appears to him as the inalienable sign of the supernatural, the presence of a "deeper law." On this view, Nature, "whose Author and Writer is God," is a "Volume written in celestial hieroglyphs, in the true Sacred-writing" (1937[1836]: 256, 258) and only *partially* known by us.

Abrams uses the philosophical core of Carlyle's *Sartor* to read Wordsworth's poetry and to see there, as elsewhere in English Romanticism, a revolution in poetic style

and theme. Literary history becomes, in *Natural Supernaturalism*, as it had in *The Mirror and the Lamp*, a powerful theoretical tool that enables the author to draw conclusions about the nature of literature and of literary traditions. One of his most enduring contributions was “Structure and style in the greater Romantic lyric” (1965), which retains its persuasive power to this day in part because it so clearly and deftly characterizes a complex poetic style that is itself still a viable choice for lyric poets. This essay appeared in Abram’s third major work, *The Correspondent Breeze* (1984), a collection of meditations on the early Romantics, Wordsworth and Coleridge, and on dominant metaphors of Romanticism, like the “correspondent breeze” that links the shifting inspiration of the poet with the winds of the natural world.

Abrams was an innovative literary historian and theorist. His focus on the social, political, and artistic aspects of literary works made those works more accessible and relevant to the needs and concerns of modern readers. His common-sense humanism allows him to do this without ignoring the importance of literary and philosophical traditions to the Romantic worldview.

Actant/Actantial Grammar

PAUL PERRON

The term “actant” emerged in the conjunction of semiotics (the study of signs), and narrative semantics (the study of narrative in terms of its deep structures). It is chiefly used to describe narrative functions akin to Vladimir Propp’s “sphere of action,” the narrative “role” performed by an “actor,” which adheres to deep structural tendencies and patterns. The concepts actant and “actantial grammar” are both associated with Algirdas Julien Greimas, who borrowed the term from the French linguist Lucien Tesnière, who defined actants as “beings or things that participate in processes in any form and in any way whatsoever, be it only a walk-on part and in the most passive way” (1969: 102; translation mine). Tesnière considered that the verbal nucleus of a sentence represented a sort of minor drama in the theatrical sense, or a

process expressed by a verb whose dependants are substantives (actants are here considered as elements that perform or are subjected to an act) and adverbs (circumstances of time, place, goal, and cause in which the action occurs; “circumstants”). The actant designates a syntactic unit that is formal in character but has a distinct relationship to the predicate and the circumstants. For Tesnière only three actants were possible: the subject, the object of an active verb or the agent of a passive one, and the receiver. However, the number of circumstants can vary a good deal.

Greimas began by defining actant in *Structural Semantics* (1983) in terms of a performance linked to the distribution of a small number of actantial roles. For the ternary formulation of subject, object, and receiver he substituted two binary actantial categories:

Subject vs. Object
Sender vs. Receiver

Greimas and the Paris School of Semiotics redefined these binary categories in relation to the notion of a semantic universe, coextensive with the concept of culture that designates the ensemble of its value systems. Since describing the semantic universe as a whole would be an impossible exercise, Greimas proposed the concept of a micro-semantic universe that is articulated by means of actantial categories. Along with his researchers, he established the categories of predicate and actant, logical syntax and semantics in the description of signification, all the while stressing the modal character of the actantial categories, by which a subject, in order to perform, must actualize the modalities of competence: having-to, being-able, wanting, and knowing.

Greimas recognized the importance of Vladimir Propp’s *Morphology of the Folktale*

(1968[1928]), which gave him the idea for the syntactic component of a semio-narrative grammar; and of Claude Lévi-Strauss’s *Structural Anthropology* (1963), which provided him with its semantic component. He noted that Propp’s 31 functions – designating syntagmatic units of narrative that remained constant at the surface level – varied widely, as did the sequences that make up the structure of folktale; they could be reduced, Greimas thought, to a limited number of actants. He identified and elaborated an organizational principle subtending entire classes of narratives, for example figurative and abstract discourses (literary, philosophical, political, and sociological) as well as other semiotic systems not always expressed through natural languages (advertising, architecture, cinema, figurative painting, gesture).

The Paris School is further characterized by a coherent structured approach to developing a semio-narrative theory. Since each new concept, term, or element proposed was governed by the principle of hierarchy and interdefinition – that is to say, when they were introduced at one level it was necessary to redefine, reconceptualize, and make them operational at all other levels. Greimas & Rastier (1987[1970]) posited the existence of a generative trajectory that originated in a deep semiotic level and was then converted into an actantial syntax before being articulated as discourse. The semio-narrative structures at the starting point of the generative trajectory were represented by a semiotic and narrative grammar having a fundamental semantics and a fundamental syntax at the deep level, as well as a narrative semantics and a narrative syntax at the surface level. Moreover, discursive structures comprising the sub-components of actorialization, temporalization, and spatialization take up the surface semiotic structures and set them into discourse (see Perron 2003).

Actantial grammar establishes relations between subjects and objects, subjects and anti-subjects, subjects and senders and receivers. The first relation, founded on the establishment of the subject as a wanting subject and of the object as an object of value, was described in terms of modal utterances. "Wanting" is the first of a series of determined semantic qualifications that specify actants as virtual operators of an act; the second is "having." Other semantic qualifications, the introduction of the modalities of "being-able" and "knowing," constitute the being or the activity of the actant subject. The relation of subject and object is formulated syntactically in terms of conjunctive or disjunctive utterances of state. The second relation between subject and object is formulated syntactically in terms of conjunctive or disjunctive utterances of state; for example, the subject seeks either to conserve or to acquire riches or virtue as desirable objects of value. The third relation or operation between subject and object, subject and receiver, is recast as a general structure of exchange. Whereas in the second relation the attribution of an object of value was defined as a disjunctive operation (privation) and a conjunctive one, the third relation or structure of exchange now represents the two previous operations as places of transfers of objects of value from one place to another. A topological syntax of objective values was put in place that traced the logical operations at the level of deep grammar and organized narration as a process generating values. When examining the relations between operators – subject and sender or receiver – the Paris School noted that topological syntax governed the transfer both of the subject's ability to do and of the values, as well as establishing syntactic operators by subjects with virtual doing. Afterwards, the subject and sender were redefined by a dual contractual relation. Not only does the subject

actant have a contractual relation with the manipulating operator actant (sender) that establishes it as an operator subject, but its performance is also sanctioned by a final sender whose competence is presupposed.

Yet values must be converted into syntactic structures for them to be apprehended as signification. The notion of conversion of values from semantics into syntactic structures, on the one hand, led to defining narrativization as the syntagmatic articulation of values and, on the other, to perceiving it as a discursive organization that organizes the basic components of the elementary utterance. In addition, they developed two broad descriptive and modal categories of values. As the narrative organization of values guarantees the semiotic existence of actants it can be considered actually to found narrativity. Within actantial theory the object of value, one of the terms of the elementary utterance, represents a relation to the world in the form of a scene but is at the same time a syntactic concept. Endowing the subject with the modalities of competence led to the introduction of performance of the actant which, in turn, subsumed actantial roles defining the subject in terms of wanting-to-do, knowing-to-do, being-able-to-do, and having-to-do, the four states in its acquisition of modal competence. Actantial roles defined by their modal content and by the position of the actant in the narrative trajectory, were situated at the level of narrative syntax.

While continuing to evolve a theory of narrativity, the Paris School focused on constructing an actantial and semio-narrative grammar with modal and aspectual elements. Greimas and his colleagues reformulated narrative grammar by introducing modalities that informed and motivated the actants. Surface narrative syntax was rethought in terms of modalities that modalize the predicate of an utterance. The actant was redefined in terms of competence

and performance, with performance presupposing competence but not the inverse. In reformulating the act they developed a theory of performance in three directions: a semiotics of manipulation (or the manipulation of the subject by the sender), a semiotics of action (the acquisition of competence by the subject), and a semiotics of sanction (judgments on oneself and on other subjects). When defining the actantial subject at the level of the organization of pragmatic competence they identified four fundamental modalities: having and wanting, which virtualize the process, and being-able and knowing, which actualize it (Perron & Fabbri 1993).

For Greimas and the Paris School, the subject's semiotic existence was determined by its relation to the object of value, while the modalizing of being was considered as a modification of the status of the object of value. The modalities affecting the object (or rather the value invested therein) were constituents of the modal existence of the subject of state, defined by a relationship of junction with objects of value. A taxonomic network for modal syntax was worked out by projecting the modal utterances onto the semiotic square (wanting-to-be, having-to-be, being-able-to-be, knowing-how-to-be) related to the subject actant (see figure 1 in entry for Greimas, A. J.). They subsequently suggested that the investigation of passions was linked to the study of the subject's modal existence, and more precisely to the modal component of the actantial structures. In contradistinction to action, defined as a syntagmatic organization of acts, passions were considered as the syntagmatic organization of states of feeling, or the discursive aspect of the modalized being of narrative subjects (Greimas & Fontanille 1993[1991]). Simple or complex passions are expressed through actors and, along with actions, determine the actantial and thematic roles they assume. For the

Paris School, the opposition between action and passion represented the conversion on the discursive level of the deeper and more abstract opposition between being and doing, or more particularly between modalized being and modalized doing.

A comparable trajectory of the subject of state, presented as successions of "feeling states" made up of highs and lows, was identified parallel to the trajectory of the subject of doing made up of the acquisition of competence and the accomplishment of performances. Passions that are able to offer nomenclature for recognizable thematic roles, for example, the "spendthrift," the "jealous person," the "stubborn or opinionated person," became one of the elements contributing to actorial individuation. When passions were linked to actors and the exploration of the relations between thematic roles and actantial roles, a new area of investigation into passional typologies opened up. The meaning and definitions of passions can be described as structures, definable in terms of a modal syntax that establishes relations between at least two interdependent actants. For example: avarice = wanting to + conjunction/wanting to + non-disjunction. To analyze discourse in this way is to construct models that can account for the trajectory of the lives of subjects, of humans. The group focused on the subject's trajectories, realized by means of narrative programs in discourse, as well as in the lives of subjects. This enabled the Paris School to raise the issues of objects of value sought after by subjects, the organization of values into axiological systems, as well as the distribution of values into specific axiological discursive sequences.

Currently, the object of value, and not that of the subject, is the thorniest problem that needs to be addressed. Subjects must be defined by the values they acquire or lose in order to understand them as being, as mean-

ing. From this viewpoint the semiotics of passions becomes a semiotics of the values acquired, lost, or suspended by the subject. What must be done is to imagine and theorize a subject defined by its *protensivity*, or its minimal state when it is not yet fully formed, but simply a subject striving for something, faced with an unformed object of value, a shadow of the value that can be semanticized. One way of dealing with this is to consider the value as a valence, which leads to the question of the value of value. Whether attempting to come to grips with a semiotics of passions or a semiotics of aesthetics, the two major domains of current investigation, a daunting task facing the Paris School is to reconceptualize the role of value in semio-narrative theory, all the while respecting the fundamental principles of hierarchy and interdefinition, which corresponds to readjusting and rewriting the entire semio-narrative system.

Adorno, Theodor

DAVID JENEMANN

Musicologist, cultural critic, sociologist, philosopher: Theodor W. Adorno (1903–69) was an astonishingly interdisciplinary and penetrating critical theorist and a central figure of the Frankfurt School. Among his many contributions to a number of fields, perhaps most noteworthy was Adorno's analysis of the ever-tightening network of artistic production, social and economic administration, and the domination of human experience in modernity that is now widely known as "the culture industry."

When Adorno died, he was, within Germany at least, one of that country's most famous and controversial intellectuals. In terms of post-Nietzschean German

philosophers, he was also arguably one of the twentieth century's most influential, rivaling Heidegger, Gadamer, and Popper in importance. His *New York Times* obituary, however, was a testament to Adorno's relative obscurity in the Anglo-American academy, this despite the fact that Adorno had lived in exile in England and America for nearly 20 years and had been an active participant in the intellectual life of his adopted homes.

Not only does the *Times* neglect to mention Adorno's most important contributions to music theory or his monumental late work of philosophy, *Negative Dialectics* (1973c[1966]), but so too does it omit such crucial exile writings as *Minima Moralia* (1974[1951]) and *Dialectic of Enlightenment* (2002[1944], written with Max Horkheimer), where the critique of the culture industry receives its fullest explanation. Instead, the obituary makes passing mention of Adorno's contributions to *The Authoritarian Personality* (1950), a pathbreaking but nonetheless atypical example of Adorno's uneasy relationship with empirical social research, and his short but trenchant book on Wagner's aesthetics (Adorno 1981a[1952]). The remainder of the obituary is dedicated to describing Adorno's critique of "jitterbugging," which appeared – although the *Times* neglects to mention this – as a relatively insignificant part of his essay "On popular music," written early during his American years with the help of George Simpson.

The *Times* obituary, while astonishing for its myopia, is nevertheless indicative of Adorno's reception in the years following his death. Despite his importance in German intellectual history, to the English-speaking audience Adorno has long had the reputation of the "mandarin cultural conservative" (a phrase used by one Adorno's pre-eminent defenders, Martin Jay), the prickly European intellectual, dis-

dainful of popular culture, zeroing in on the kitschiest and most marginal fads in order to indict America in general. The reasons for this impression are manifold. Part of the fault lies with Adorno: much of his work is thorny and difficult, employing a strategy of immanent critique in which the form of the writing mirrors and reveals the contradictions of the object under study. Adorno's "intransigence," Fredric Jameson claims, "is precisely intended to be read in situation, against the cheap facility of what surrounds it, as a warning to the reader of the price he has to pay for genuine thinking" (1971: xiii). Further, Adorno was genuinely horrified by much of what he encountered in American mass culture, and he believed that the popular arts helped further, at an aesthetic level, the type of domination he had been forced to flee when he left Germany to escape Nazi persecution in 1934. He could be dismissive and judgmental when it came to some forms of contemporary music (see the "jitterbugging" passages of "On popular music"), an attitude that stems as much from his own training under Alban Berg, himself a student of Schoenberg, as it does from his training in philosophical aesthetics.

A difficult style and difficult subjects have led to charges of elitism, but this is a reasonable charge only if philosophy itself is elitist. However, part of the resistance to Adorno's ideas has to be laid at the feet of his English translators, readers, and critics. At the time of his death, there were very few of Adorno's works in translation, and those that existed were often unnecessarily turgid at best, shockingly inaccurate at worst. Even beyond the translation difficulties, the idea that Adorno was simply a sneering ivory tower docent was an oversimplification, perpetuated by readers who reacted viscerally to Adorno's suggestions in "The culture industry: Enlightenment as mass deception" (in Horkheimer & Adorno 2002[1944]) and

elsewhere that post-Enlightenment subjects were rapidly squandering the promise of rationality and free-will in their consumption of the mass media. Just as there can be no denying the traces of elitism in Adorno's writing, there is no small measure of anti-intellectualism in the American response to Adorno.

The reality of Adorno's works lies somewhere in between, and this is only fitting for a scholar who argued throughout his career for the productiveness of non-identity, ambivalence, and the notion that the utopian truth of ideas lives "in the cavities between what things claim to be and what they are" (Adorno 1973c: 149). Adorno's works are broadly interdisciplinary and, in a sense, uncategorizable. His writings are at times penetrating, at others withering, mordantly funny, and then melancholy. He laments the passing of genuine experience in favor of a manufactured pseudo-identity sold to individuals by media corporations and justified by the "science" of market research, yet he steadfastly avoids offering programmatic solutions for society's ills. Nevertheless, his heterodox Marxian critique refuses to blame capitalism's victims, nor does it entirely strip away Adorno's faith in humanity and the humanist tradition from the Renaissance to the Enlightenment, though in some essays he could be said to be singing its dirge. Like Walter Benjamin, Adorno can be read as a Marxian humanist, committed both to the analysis of social conditions and to understanding human existence in those conditions. At the same time, however, Adorno looks forward to a postmodern position where, in the age of mass culture and global capital, the era of human exceptionalism has passed, giving way to a "new type of human being" (Adorno 2009b).

This image of Adorno emerges in the first decade of the twenty-first century as new – and better – translations of his work appear, and Anglo-American scholars look afresh at

both well-known texts and newly rediscovered writings that had lain long-dormant and which have only recently been published. Additionally, three extensive biographies, timed to commemorate Adorno's centenary, have shed new light on a far different "American Adorno" than had previously been acknowledged. The result is that increasingly Adorno is seen less as a recalcitrant – and sometimes blinkered – critic of modernity and more as post-modernity's clear-eyed prophet.

Adorno was born Theodor Adorno Wiesengrund on September 11, 1903 in Frankfurt am Main. His father, Oskar, an assimilated Jew, was a wine merchant. His mother, Maria Cavelli-Adorno, a former professional singer, was a Corsican Catholic. It was from his mother that he took the name Adorno, which he would eventually adopt as his surname. It was also from his mother and her sister Agathe, a professional pianist who lived with the family when Theodor was a child, that Adorno gained his love and appreciation for music.

As a youth, Adorno studied Kant with Siegfried Kracauer and, as a number of his biographers have claimed, these meetings were to have a profound influence on his subsequent intellectual pursuits. (During his own exile in America, Kracauer would become an influential film theorist, authoring *From Caligari to Hitler* and *Theory of Film*.) Adorno enrolled at the University in Frankfurt in 1921 and received his doctorate in 1924, studying under the philosopher Hans Cornelius. He then traveled to Vienna where he stayed intermittently for three years, writing music criticism, studying composition with Alban Berg, and trying to insinuate himself into the circle of the composer Arnold Schoenberg. In 1927, he returned to Frankfurt to write his *Habilitationschrift* (the postdoctoral thesis required to obtain a professorship), the first of which was rejected by Cornelius; the second, on

Kierkegaard, was published in 1933 as *Kierkegaard: Construction of the Aesthetic*. It was during this time that Adorno began his association with Max Horkheimer and other members of the Frankfurt School of Social Research (Institut für Sozialforschung). It was also during this formative period that Adorno developed a friendship with Walter Benjamin, and their correspondence (published in English in 1999) paints an indelible portrait, both of their evolving intellectual relationship, but also of Adorno's growing ties to the Horkheimer Circle.

The study of Kierkegaard arrived at bookstores in Germany on February 27, 1933, the same day Hitler took control of the German Chancellorship (see Hullot-Kentor 1989). This momentous day would have profound effects on Adorno and other Jewish critics associated with the Frankfurt School. Adorno's fortunes with Horkheimer and the Institute were rising at a time when Germany was becoming unendurable for Jews. Nearly all of the members of the Institute were Jewish (albeit, in many cases, assimilated) and most practiced some form of Marxian cultural critique (though few were members of the Communist Party). Adorno, like other members of the Institute, could not last long in Frankfurt. In 1934, while Horkheimer, Friedrich Pollock, and other members of the Frankfurt School traveled to New York to reincorporate the Institute at Columbia University, Adorno fled to England, where he worked as a fellow at Merton College, Oxford. According to the Nazi's Nuremberg laws, Adorno was *Mischlinge*, or "half-Jewish," and so was able to return to Germany frequently during this period, both to visit his parents and to see Margarethe (Gretel) Karplus, to whom he was married in London in 1937. Adorno stayed in Britain until 1938, after which he followed the rest of his Frankfurt colleagues to New York.

Adorno's first duties upon arriving in the United States, indeed part of the reason why he received a visa to come to New York, were to serve as the music director of the Princeton Radio Research Project (PRRP) under the sociologist Paul Lazarsfeld. The Rockefeller Foundation-funded PRRP was a huge undertaking, designed to explore everything from radio propaganda to the startling effects of Orson Welles's infamous "War of the Worlds" broadcast. Through Lazarsfeld, the PRRP was able to cultivate the support – and draw upon the personnel – of the major broadcasting networks, CBS and NBC, and by virtue of the resources put at his disposal, Lazarsfeld used the PRRP to help pioneer and refine his development of "administrative research," including tools like mass market surveys. Adorno's job, ostensibly, was to discover how to bring the best possible music to the widest number of people. But this meeting between Adorno and empirical social science research methods was not a happy one; Adorno resented reducing "good music" to a series of poll data, and furthermore believed that, given the limitations of 1930s radio engineering, "the best music," such as symphonies, could not be heard over the radio in ways that would allow audiences to understand what was formally exciting about it. In the face of song-plugging, the marketing of popular singers and composers, and the overall commodification of the musical experience, Adorno quickly came to believe that audiences were fundamentally unable to understand what it was they were hearing over the radio and how their ears were being manipulated. As he famously writes in "On the fetish-character in music and the regression of listening," an essay no doubt in part inspired by his experiences with PRRP, "If one seeks to find out who 'likes' a commercial piece, one cannot avoid the suspicion that liking and disliking are inappropriate to the situation, even if the

person questioned clothes his reactions in those words” (Adorno 2002b[1938]: 288).

In opposition to poll data, Adorno proposed a theory of radio broadcasting as a “physiognomy,” a holistic, constantly changing web of relations that included radio producers and performers, the radio networks and their audiences, technology and marketing, all of which circulated within a given political economy at a given historical moment. It was an ambitious theory and one that ran utterly counter to the empirically driven work being performed by Lazarsfeld and the rest of the PRRP. The funds for Adorno’s section of the project were cut, and his mammoth book on radio was shelved. Only recently, this work has resurfaced with the publication of *Current of Music* (2009), but many of the ideas cultivated during Adorno’s early days on the radio project in the United States can be seen in Adorno’s other writings, both in early works such as the controversial essay “On jazz” (2002a[1936]), as well as in later works like “The radio symphony” (1941) and *Introduction to the Sociology of Music* (1976[1962]).

In 1941, Adorno followed Horkheimer to Los Angeles, where the two continued their collaboration on the “philosophical fragments” that would coalesce as *Dialectic of Enlightenment*. First appearing in mimeograph in 1944 and republished in 1947, *The Dialectic of Enlightenment* is perhaps the twentieth century’s most biting critique of modernity. In bold dialectical prose, with loosely connected chapters, excursuses, and fragments, Horkheimer and Adorno lay out the claim that, given the historical evidence confronting humanity on all sides, one can only conclude that science, reason, and logic have transformed into their opposite: mythic irrationality. The inevitability of this conclusion is demonstrated in the dialectical entwining of myth and reason from at least the time of Homer. More

dangerous than mythic irrationality was mythic reason, the tendency in fascism that displaces the human for a mathematical absolute. Instrumentalized reason, with its tendency to reify and level all subjects in the name of objective rationality, has permitted humanity to dominate nature at the expense of humanity’s place within the natural order of things. That alienation is further accentuated in the dehumanizing logic of industrial production, the pseudo-individuality marketed by the culture industry, and ultimately in the reduction of the human being to the status of an object, something to be entered as a data point on a ledger. In this view, the absolute atrocities of the Holocaust or Hiroshima were no anomaly, but rather the “logical” results of an Enlightenment that privileges the rational solution of human problems over human existence itself.

Despite its pessimism, *The Dialectic of Enlightenment* nonetheless contains within it a kernel of hope; it holds out the possibility that the modern subject will use the tools of Enlightenment against instrumental reason to divert humanity from its path toward destruction. This sentiment enlivens Adorno’s other great exile work, *Minima Moralia: Reflections from Damaged Life* (1974[1951]), neatly captured in the epigraph from the British philosopher F. H. Bradley: “When everything is bad it must be good to know the worst.” In an aphoristic style indebted to Nietzsche’s, Adorno meditates on the paradoxes of love and literature, the turmoil of exile, and the salvation of writing to communicate the hopeless wish that the fairytale of humanity might yet have a happy ending: “A man who is sorrowful and yet unbowed resembles the crinkled little old lady gathering wood, who meets the Good Lord without recognizing Him, and is blessed with bounty, because she helped Him . . . The frog prince, an incorrigible snob, stares at the princess

with eyes of longing and cannot stop hoping that she will rescue him” (Adorno 1974 [1951]: 88).

While in California, Adorno pursued a number of other projects, many of them associated with his work with Horkheimer on the Studies in Prejudice Project, sponsored in part by the American Jewish Committee. The most successful of these was the co-authored work, *The Authoritarian Personality* (1950). This widely influential text combined empirical social science methods with sociological and materialist theory to describe an administered society. It paints a picture of an America seething with repressed irrationality that is easily harnessed for nationalism, xenophobia, and racist thinking. Adorno’s own experience in Germany in the years running up to its takeover by the National Socialists prepared him to recognize authoritarianism in its many disguises. The innovation of *The Authoritarian Personality* was in its use of “indirect social research” designed to correlate a subject’s irrational beliefs with his or her latent prejudices. It goes without saying that this study, along with much of Adorno’s work owes much to an intimate familiarity with the writings of Sigmund Freud, an influence that likewise appears in Adorno’s essay “Freudian theory and the pattern of fascist propaganda,” an essay that can be read as a companion piece to *The Authoritarian Personality*.

Hollywood’s German exile community was likewise an important social network for the exiled members of the Frankfurt School, and Adorno’s social calendar included encounters with Bertolt Brecht, Hanns Eisler, Schoenberg, Lotte Lenya, and other displaced members of the European intelligentsia. This social circle overlapped in fascinating ways with the Hollywood elite, especially after Adorno and Horkheimer’s unrealized ambition to produce a film on prejudice brought them into contact with an

assortment of personalities ranging from future Hollywood Ten member Dalton Trumbo to future studio head Dore Schary. It was in this context that Adorno met and befriended Thomas Mann. While in southern California, Mann was working on a novel about a modern composer modeled after Schoenberg. Adorno showed Mann drafts of *Philosophy of Modern Music* (1949) and *In Search of Wagner* (1952), and as a result, Mann asked Adorno to be something like his informal musical advisor for what would become *Doctor Faustus*. In the novel, Adorno’s own words, describing the principles of modern composition or the genius of Beethoven’s late sonatas, are incorporated into the text. Adorno himself appears as one of the manifestations of the devil, and so too does his abandoned surname Wiesengrund.

In 1949, the Adornos went back to Germany, with Adorno assuming a post at the University in Frankfurt. In 1952 and 1953, Adorno returned to America, both to renew his passport (he had become an American citizen during his exile), and to work for the Hacker foundation on two projects, one on television, the other a study of the *Los Angeles Times* horoscope column that became *The Stars Down to Earth* (1994). By all accounts, Adorno’s return to Los Angeles was unhappy, and after 1953, he never returned to the United States.

Following his return to Germany, Adorno remained extremely productive. Many of the projects he had begun in America were published, including *Philosophy of New Music* and the collection of essays *Prisms*. In 1958, after Horkheimer’s retirement, he assumed the directorship of the Institute of Social Research yet still continued to publish at an amazing rate. Among the most important works written in the post-exile years were *Hegel: Three Studies* (1963) and the four volumes (two in English) of *Notes to Literature* (1991 [1958–1974]). Adorno was also an engaged

participant in the intellectual debates that characterized postwar Germany, with critical theory's variation on Hegelian dialectical materialism pitted against both logical positivism and post-Heideggerian existentialism. Adorno's contributions to these debates were reprinted in *The Jargon of Authenticity* (1964) and later in *The Positivist Dispute in German Sociology* (1976).

One of the most important works Adorno completed in the last years of his life was *Negative Dialectics*, a remarkable culmination of a lifetime of philosophical labor and an overview of the German philosophical tradition from Kant and Hegel to Nietzsche and Heidegger. In this work, Adorno rewrites the terms of Hegelian dialectics to describe a materialist epistemology that would break the idealist synthesis between subject and object, concept and particulars. "Identity," he asserts, "is the primal form of ideology" (Adorno 1973c[1966]: 148). Against this Adorno proposes a radical non-identity, a "togetherness of diversity," that would accord individuals and ideas their specificity.

The exacting refusal of prescribed identity in *Negative Dialectics*, coupled with his antipathy to any capitulation to a regimented politics, rendered Adorno at odds with the student movements of the 1960s. In contrast to the adulation heaped on his Frankfurt School colleague Herbert Marcuse, students protested Adorno's lectures and distributed leaflets declaring "Adorno as an institution is dead." For his part, Adorno stood by the primacy of intellectual freedom in the face of general lack of freedom. "I established a theoretical model of thought," Adorno claimed. "How could I have suspected that people would want to implement it with Molotov cocktails?" (quoted in Jay 1973: 279).

Adorno died in Switzerland in August, 1969. He left unfinished *Aesthetic Theory*, a work which applied the philosophical

insights of *Negative Dialectics* to the autonomous work of art. It was subsequently edited and published (Adorno 1984) and has since come to be known as a central text on aesthetics. Adorno crafts a sociology of art that simultaneously functions as a defense of art's autonomy, a history of art's role in the historical transformation of the subject, and a reformulation of philosophical aesthetics. His argument, full of dialectical reversals, makes the case for art's struggle to create a formal specificity or "autonomy" through which the work of art sets itself against the world. Since the artwork is always of the world, however, that autonomy is necessarily doomed, and the aesthetic object is rife with the same contradictions and tensions of the world which produced it. Since these contradictions are intractable, art's utopian function (at a formal level) is to provoke an imagination of material conditions in which these tensions could be resolved.

Adorno's *Gesammelte Schriften* (collected works) runs to 20 volumes, and his *Nachgelassene Schriften* (works published after death) incorporates another 35 volumes. He remains, by any measure, one of the indispensable critics of the twentieth century, and his work is of foundational importance in musicology, literary criticism, and interdisciplinary fields such as cultural studies. As the contemporary critic Antonio Negri has written, for defenders and detractors alike, one must acknowledge that "Adorno's model of cultural criticism genuinely uncovered the ontology of the new world" (Negri 2007: 48).

Aestheticism

JOSEPH BRISTOW

The *Oxford English Dictionary* states that the earliest usage of “aestheticism” appears in 1855 (see Brimley 1858). Aestheticism was a movement of critics, writers, and painters in the second half of the nineteenth century that emphasized the autonomy of art, the fact that it should be appreciated “for its own sake,” not for any social or moral purpose it might serve. The major antecedent theory of art at the time in England was that of John Ruskin,

who contended that the best art served a moral end. English aestheticism, which had the most influence on Anglo-American literature, from James Joyce to Kate Chopin, was born in reaction to Ruskin's moralism. The movement's legacy, particularly through the work of figures such as Walter Pater and Oscar Wilde, has profoundly shaped modern attitudes toward art and the artist.

A major influence on aestheticism was Immanuel Kant's *Critique of Judgment* (2009[1790]). Kant affirms that aesthetic judgments are not "cognitive judgments, and so not logical." They have "subjective purposiveness . . . exclusive of any end"; in other words, such aesthetic judgments constitute "delight" and "pleasure" in ways that are "apart from any concept" (2009[1790]: 35, 52): "An *aesthetic idea* cannot become a cognition, because it is an *intuition* (of the imagination) for which an adequate concept can never be found" (170). Perhaps Kant's most influential idea regarding art was that it constitutes a "purposiveness without purpose." It has no end other than itself. Moreover, the moral "symbol" of beauty, in its harmonizing effects on the mind, will accordingly cultivate "taste": "a faculty that judges of the rendering of moral ideas in terms of the senses" (183).

In subsequent decades, many writers followed Kant's lead to distance moral reasoning from aesthetic judgments. On occasion, commentators reacted so adversely to cultural pressures to make art teach morals that they repudiated any link whatsoever between aesthetics and morality. By the early 1830s, the French poet and novelist Théophile Gautier published his outspoken preface to his popular, if sexually controversial, novel, *Mademoiselle de Maupin* (2005[1835]), a narrative that focuses on a love triangle between a man and his mistress who both fall in love with the cross-dressed protagonist of the title. Gautier's

preface wholeheartedly attacks the "current affectation" to be "moral and Christian" when judging artworks (2005[1835]: 5). In particular, Gautier objects to the critical vogue that claims "a man is virtuous because he has written a moral book." "It is," he observes, "just as absurd to say that a man is a drunkard if he describes a drunken orgy." As a consequence, Gautier is impatient with critics who believe that art should express morals in an instrumental or utilitarian manner. "You fools, you imbeciles," Gautier loudly protests, "a book does not make jellied soup; a novel is not a pair of seamless boots." In his view, the "only things that are really beautiful are those which have no use" (2005[1835]: 18, 20, 23).

In subsequent decades, echoes of Gautier's formulations can be heard throughout many well-known French, British, and American works of criticism. A good example is Edgar Allan Poe's famous essay, "The poetic principle," where he condemns "the heresy of *The Didactic*," claiming instead that the "poem is written solely for the poem's sake" (Poe 1984[1850]: 75–6). Avant-garde French writer Charles Baudelaire praised Poe's condemnation of "the heresy . . . that the aim of poetry is a lesson of some sort, that it must now fortify the conscience, now perfect morals, now in short *prove* something or other which is useful" (Baudelaire 1966[1857]: 56). In turn, Algeron Charles Swinburne was among the first British commentators to speak in support of the aestheticism of Baudelaire's collections of poems, *Les fleurs du mal* (*Flowers of Evil*), which the French state censored, since it represented such sensitive topics as lesbian intimacy, in 1857. Vindicating the French poet, Swinburne makes it clear why Baudelaire's poems refuse to "redeem the age and remould society," refuse to address "the mass of readers [who] seem actually to think that a poem is the better for containing a moral lesson or assisting in a tangible

and material good work" (Swinburne 1862: 999).

In his 1868 book-length study of radical Romantic poet and artist William Blake, Swinburne elaborates his commitment to aestheticism at much greater length:

Art is not like fire or water, a good servant and bad master; rather the reverse. She will help in nothing, of her own knowledge or freewill: upon terms of service you will get worse than nothing out of her. Handmaid of religion, exponent of duty, servant of fact, pioneer of morality, she cannot in any way become; she would be none of these things though you were to bray her in a mortar. All the battering in the world will never hammer her into fitness for such an office as that. It is at her peril, if she tries to do good: one might say, borrowing terms from the other party, "she shall not try that under penalty of death and damnation." Her business is not to do good on other grounds, but to be good on her own: all is well with her while she sticks fast to that. (1868: 90)

Once he has emphasized that art cannot be made to impart morality, Swinburne declares that there is one principle by which all artists need to abide: "Art for art's sake first of all, and afterwards we may suppose all the rest shall be added to her" (91). Historians generally agree that this is one of the earliest English uses of the expression "art for art's sake," which soon became a catchphrase in writings associated with an aesthetic movement that repudiated the belief that art should moralize and thus "do good." Swinburne's mocking echo of Matthew 6:33 ("seek first the kingdom of God and his righteousness, and all these things will be added to you") suggests that he is advancing an aesthetic gospel that is implicitly sacrilegious.

In the same year as Swinburne's study of William Blake, the phrase "art for art's sake" made an equally important debut

in Oxford classical scholar Walter Pater's review of Pre-Raphaelite poet William Morris. Pater included part of this discussion in the "Conclusion" to his first book, *Studies in the History of the Renaissance*, which counts among the earliest British writings to designate the early modern revival of the arts as a "renaissance" or rebirth. In the "Conclusion," Pater draws on recent developments in chemical and physiological knowledge to discuss the ways in which our "physical life is a perpetual motion" of "natural elements" – "the passage of the blood, the waste and repairing of the lenses of the eye, the modification of the tissues of the brain under every ray or light and sound" (2010[1873]: 118). By dwelling on these "elements," Pater comments on the "flame-like" quality of human life that is always changing, in ways that throw light on the nature of consciousness in general, and of aesthetic perception in particular. He argues that when human beings reflect on their perception of the objects found in the phenomenal world, they discover that they receive "impressions, unstable, flickering, inconsistent, which burn and are extinguished with our consciousness of them" (119). To Pater, it is this "perpetual weaving and unweaving of ourselves" – both in the regeneration and degeneration of the cells that comprise our bodies, and in the "perpetual flight" that makes objects so hard to grasp in our flickering apprehension of them – that energizes the "finest senses" (188). In his celebration of the need for humankind to appreciate art, Pater draws on a vocabulary that to some Victorian ears sounded not only scientifically modern but also unduly sensual: "To burn always with this hard, gem-like flame, to maintain this ecstasy, is success in life" (120). Although Pater's readers knew that the "gem-like flame" related to the idea that fire thrives on the destruction of carbon atoms, several found the idea of

“ecstasy” questionable when related to his approbation of “the poetic passion, the desire of beauty, the love of art for art’s sake” (121).

Pater’s much-discussed “Conclusion” signaled to some readers that “art for art’s sake” was connected with what might be mistaken for potentially reckless, if not irreligious, hedonism. To radical politician John Morley, Pater showed courage in stating “that the love of art for art’s sake has most of the true wisdom that makes life full” (Seiler 1980: 69). As Morley saw it, Pater’s aestheticism was bold because such “aesthetic interest” was elevated “to the throne lately filled by religion” (Seiler 1980: 69). Perhaps unsurprisingly, in November 1873 Pater’s “Conclusion” was condemned by one of his former teachers, W. W. Capes, from the University pulpit. Capes stated that “any philosophy of life [such as Pater’s] that shrinks into a system of mere personal culture” is implicitly irresponsible because it turns away from social progress (Pater 1980: 447–8). Sidney Colvin, Slade Professor of Art at Cambridge University, had similar doubts about Pater’s phrasing. “By all means,” Colvin states, “let the people whose bent is art follow art . . . but do not tell everybody that refined pleasure is the one end of life” (Seiler 1980: 54). The problem is that an ill-educated public will misinterpret Pater’s advice: “By refined, they will understand the most refined they know, and the most refined they know are gross; and the result will not be general refinement but general indulgence” (Seiler 1980: 54). Very possibly, opinions of this kind discouraged Pater from including the “Conclusion” in the second edition of his book, now simply named *The Renaissance*, in 1877. In 1888, when he published the revised third edition, Pater reinserted the “Conclusion” and tactfully changed the earlier phrasing of “art for art’s sake” to “art for its own sake” (1980: 190; 2010: 179).

In their independent ways, Swinburne’s and Pater’s usage of art for art’s sake gained them notoriety. Swinburne had already shocked the public with his volume, *Poems and Ballads* (1866), whose sexually provocative contents, especially on classical themes, prompted John Morley (1866) to comment that the young poet’s “genius drives him pretty much in the direction of libidinous song” where “fleshly things are his strong part.” Other negative reviews encouraged Swinburne’s publisher, Edward Moxon, to withdraw the volume. Subsequently, the only publisher who proved willing to issue *Poems and Ballads* was pornographer John Camden Hotten. There is no question that Swinburne linked his delight in art for art’s sake with rebellious sexuality in works driven by pulsating rhythms. Particularly noteworthy in this respect is “Hermaphroditus,” a sequence of three sonnets that describes the Louvre’s magnificent second-century AD Roman replica of the much older Greek statue of the doubly sexed mythological figure. Swinburne’s poem is directly modeled on Gautier’s “Contralto,” which appeared in the French writer’s collection, *Enaux et camées* (Enamels and Cameos; 1852). Among the other striking contents of *Poems and Ballads* is “Anactoria,” a powerful dramatic monologue, which takes its title from the woman whose name is mentioned in Sappho’s fragment 16, spoken by this great classical lyricist. In “Anactoria,” Swinburne unleashes Sappho’s raging sadomasochistic desires, which, if true to the intense spirit of Sappho’s poetry, looked to some Victorian eyes as intolerably perverse. Such works certainly encouraged commentators to connect Swinburne’s advocacy of art for art’s sake with an unbridled, perverse libido.

By 1871 the connection between hedonistic aestheticism and uninhibited sexuality was strengthened when the charge against the “fleshly” quality of modern literature

arose once more in an assault on Swinburne's close associate, the Pre-Raphaelite painter and poet, Dante Gabriel Rossetti. In the *Contemporary Review* (a journal known for publishing signed essays) a writer calling himself "Thomas Maitland" denounced the repugnant sexuality of Rossetti's *Poems* (1870). In "The fleshly school of poetry," "Maitland" deplored the lascivious manner in which "a full-grown man [i.e., Rossetti], presumably intelligent and cultivated," put "on record for other full-grown men to read, the most secret mysteries of sexual connection" (Buchanan 1871: 343). Although he did not use the phrase "art for art's sake," "Maitland" censured "fleshly persons who wish to create form for its own sake" (Buchanan 1871: 348). He disdained Rossetti's erotic poetry because for him it had no evident moral or symbolic aim. As it turned out, this gratuitous attack was not by "Maitland" but publicity-hungry moralist, Robert Buchanan. This pseudonymous offensive on *Poems* led to one of the greatest literary furors of the Victorian period. Together, Rossetti and Swinburne made counterblasts against the attack on their "fleshly" immorality. Yet the charge that these two poets were unapologetically "fleshly" stuck to their reputations, particularly in popular culture.

In 1881, W. S. Gilbert and Arthur Sullivan launched their sixth collaboration in comic opera, *Patience* (1881), whose protagonist is a "fleshly" poet named Reginald Bunthorne. This entertaining work, whose first London production ran for 578 performances, makes it plain that the "fleshly" poet, in the words of one of its songs, is "A most intense young man, / A soulful-eyed young man, / An ultra-poetical, super-aesthetical, / Out-of-the-way young man!" (Gilbert & Sullivan 1996: 345). The object of many adoring maidens, who vie for his attention, Bunthorne's "super-aesthetical" style is

highly theatrical. In another song, he tells the audience that "you will rank as an apostle in the high aesthetic band, / If you walk down Piccadilly with a poppy or a lily in your mediaeval hand" (293). Later, when Bunthorne reveals that his reputation as a "fleshly" poet has simply been a pretense so that he might win the heart of his beloved milkmaid, Patience, he resolves to change his attitude: "I shall still be aesthetic; but my aestheticism will be of the most pastoral kind" (347). For the first time, the term aestheticism – which recurs three times in *Patience* – had gained popular currency.

Although Bunthorne's "fleshly" poetic performances are loosely based on Swinburne and Rossetti, his long hair, "mediaeval" affectations, and languid love of lilies have much to do with numerous caricatures of the young Oscar Wilde, who in the late 1870s had quickly transformed from an outstanding Oxford undergraduate to the flamboyant, self-styled "Professor of Aesthetics," who moved in London's fashionable circles. Wilde's unconventional dress included donning *outré boutonnières* (such as lilies or sunflowers) at public events. Wilde made his mark as a distinctly "aesthetic" young man at the opening of the Grosvenor Gallery, New Bond Street, in 1877, where he attracted attention by wearing a coat shaped like a cello (Ellmann 1988: 79). By the spring of 1880, when he had published adoring poems in honor of actresses Ellen Terry and Sarah Bernhardt, the magazine *Time* satirized him as a slender, somewhat languid, long-haired "Bard of Beauty," whose fanciful praise of female celebrities was held up for mockery (Holland 1997: 58). Surrounding his somewhat wilting figure are sundry swirling leaves and flowers, along with two smiling cherubs. These details suggest that Wilde is an ethereal, if not effeminate, young man who is touting a modish aestheticism.

Gilbert and Sullivan were clearly responsive to Wilde's celebrity. The fact that they named Bunthorne's rival aesthetic poet Grosvenor not only registers Wilde's unforgettable presence at the opening of the gallery but also acknowledges that its exhibitions attracted attention because they included the work of unconventional artists associated with the aesthetic movement, such as Edward Burne-Jones, Walter Crane, and Albert Moore. Equally significant at the Grosvenor was American painter, James Abbott McNeill Whistler, whose distinctive coiffure was copied onstage by actor George Grossmith, who played Bunthorne in 1881. Such artists produced works that belonged either to the later phases of Pre-Raphaelitism or were affiliated with the emergence of impressionism. Their diverse styles were united insofar as they did not exhibit their work at the long-established and conservative Royal Academy. Much of the humor that was targeted at the aesthetic movement derived from memorable caricatures that George Du Maurier contributed to *Punch*. Du Maurier's women often resemble exaggerated versions of Dante Gabriel Rossetti's models, particularly Jane Morris. Meanwhile, his men are pretentious aesthetes whose interests have some bearing on the works that gained Swinburne much infamy in the 1860s. Du Maurier's aesthetic poet, Jellaby Postlethwaite, for example, has published a volume titled *Latter-Day Sapphics*. In 1880, the caricaturist started to introduce Wilde's facial features into some of his drawings.

For Wilde, this kind of attention had mixed effects. On the one hand, in 1881, when Wilde's first book, *Poems*, met with poor reviews, *Punch* depicted his now famous face in the middle of a sunflower placed in a narrow vase, as if to suggest that he was an oversized flower that was about to topple over. Beneath this derogatory image there is this unfavorable quatrain: "Aesthete

of Aesthetes! / What's in a name? / The poet is WILDE, / But his poetry's tame" (Gere & Hoskins 2000: 28). On the other hand, his notoriety provided Wilde with an entrée to a circle of established artists and writers in London. Moreover, Richard D'Oyly Carte, who produced Gilbert and Sullivan's comic operas, took the initiative to exploit Wilde's reputation as a fashionable aesthete. Carte signed Wilde up to present a series of lectures on aestheticism to help publicize the North American production of *Patience*.

In December 1881, Wilde sailed to America to begin his year-long, coast-to-coast tour. In New York City, the studio of celebrity photographer Napoleon Sarony took 27 pictures of Wilde in a striking aesthetic costume (fur coat, velvet jacket and knee-breeches, silk stockings, and leather pumps), which were sold in three different sizes at his lectures. This costume, which bore strong similarities to Bunthorne's stage garb, could not for many years be dissociated from Wilde's name. Before thronging crowds, he lectured on "The English renaissance of art," "The house beautiful," and "The decorative arts." The first of these derives, as its title suggests, from Pater's work; the contents praise many nineteenth-century writers – from Keats, Shelley, and Tennyson to Baudelaire and the Pre-Raphaelites – whose "devotion to beauty and to the relation of beautiful things" inspires him to tell his American audience, in words that resemble Swinburne's: "Love art for its own sake, and then all things that you need will be added to you" (Wilde 1908, XIV: 268). Wilde's phrasing, like Swinburne's before him, suggests that his advice enshrines his aesthetic gospel. His more "practical" lectures bear comparison with works such as Mary Eliza Haweis's *Art of Beauty* (1878), *Art of Dress* (1879), and *Art of Decoration* (1881). Few of the ideas that Wilde advanced in his presentations were original (see Cohen 2006: 62–88).

In *The Aesthetic Movement in England*, published in 1882, Walter Hamilton traces the ways in which aestheticism has regrettably become a target for caricaturists and satirists, particularly with regard to Wilde, whom he attempts to treat respectfully. In his conclusion, Hamilton strives to create a distinction between a “higher Aestheticism,” which he associates with great art such as Rossetti’s, and the “affected and superficial Aestheticism” that has been mocked by the likes of Du Maurier and Gilbert and Sullivan (Hamilton 1882: 142). In the end, he stresses that “Real culture is a hardy plant, it will thrive where it has once taken root” (Hamilton 1882: 142). Hamilton’s thoughtful defense of the need for beauty in modern life compares with the inquiries that Vernon Lee (Violet Paget) pursued in a series of essays and fictions that seek to find a *via media* between the “utilitarians” who “turn art into a drudge” and the “aesthetic folk” who “make her into a pander and prostitute” (Lee 1887: 147). Lee expresses her impatience with the hypersexual tendency among male aesthetes in her novel, *Miss Brown* (1884). In “A dialogue on poetic morality” (1880), the main speaker, Baldwin, tells his interlocutor, Cyril, that it is not “the poet’s object . . . to moralize mankind” (Lee 1887: 273). Instead, the poet labors under a moral obligation to express “moral feeling far stronger and keener than that of any other man” because good art requires it (274). In Baldwin’s view, great art involves “the creation of good” rather than setting out “to create good” (241). Later, Lee defended Pater’s commitment to aesthetic criticism because she believed he did not uphold the mistaken catchphrase “art for art’s sake” but promoted instead a principled “art for life’s sake – art as one the harmonious functions of existence” (Lee 1896: 209). For much of her long career, Lee returned, in works such as *The Beautiful* (1913), to the psychological

and physiological conditions in which human beings perceive the harmonizing, and thus morally good, effects of beauty.

Long after he had given up his guise as “Professor of Aesthetics,” Wilde made his mark as one of the leading critical theorists of his time. He followed Lee by adapting the Platonic dialogue as the form in which to generate debate about the longstanding view that art must never moralize. He articulated this belief most clearly in “The critic as artist” (1890, 1891), in which his protagonist, Vivian, informs his companion, Cyril, of his perspective on the ways in which the aesthetic critic not only perceives but also produces the beauty in the artwork:

It is through its very incompleteness that art becomes complete in beauty, and so addresses itself, not to the faculty of recognition nor to the faculty of reason, but to the aesthetic sense alone, which, while accepting both reason and recognition as stages of apprehension, subordinates them both to a pure synthetic impression of the work of art as a whole, and, taking whatever alien emotional elements the work may possess, uses their very complexity as a means by which a richer unity may be added to the ultimate impression itself. (Wilde 2007, IV: 160–1)

The careful phrasing of this passage shows that Wilde understands the critic’s aesthetic sense, that it is an active intuition, that it creates beauty in art. This idea can be traced back through such writings as Pater’s *Renaissance* to Kant’s *Third Critique*, whose work Wilde mentions in his essay (Wilde 2007, IV: 176). Similarly, in the Preface to his novel, *The Picture of Dorian Gray* (1891), he evokes heirs to the post-Kantian aesthetic tradition, such as Gautier, by emphatically stating that “All art is quite useless” (Wilde 2005, III: 168). Nowhere, however, in his later works does Wilde employ either the term “aestheticism” or the phrase “art for art’s sake.” By 1890, such

language was too contaminated to be worth employing.

For much of the twentieth century, the phrase “art for art’s sake” remained a politically discredited one, resulting in studies that view the category of the aesthetic as ideological (Eagleton 1990). Yet, more recently, there has been a turn toward a “new aestheticism” that reassesses the position of “art’s ambivalent location within the philosophical project of modernity,” especially in light of Kant’s separation of aesthetic judgment from epistemology and ethics (Joughin & Malpas 2003: 8). This “new aestheticism” revisits afresh the post-Kantian consequences of exploring aesthetics as a philosophical realm that is not determined by either morality or the faculty of reason.

Aesthetics

PETER GILGEN

Although aesthetics is ostensibly preoccupied with beauty and art, there has been much contestation regarding its proper object among philosophers and artists. The first step toward understanding this debate is to distinguish between aesthetics and the philosophy of art. Not all aesthetic phenomena are art, and not all art is aesthetic. In practice, however, the two terms have been used more or less interchangeably for most of the history of the modern system of the arts and the philosophical discipline of aesthetics, both of which were established in the eighteenth century in close connection with the articulation of a unified theory of art (see Kristeller 1951/2). Mimetic (representational), expressive, and formalist theories share the assumption that art aims at beauty or, at least, at certain aesthetic qualities that it conveys in a more concentrated, intense, and complex way than other objects in the world. Yet it is apparent that even the

traditional theories of art were not exclusively concerned with the aesthetic value of its objects. They often posed questions concerning the metaphysical, epistemological, ethical, political, and semiotic status of art, the arts, and individual works of art. However, it would be a mistake to conclude from this that the theory of art is simply more comprehensive than aesthetics, or that aesthetics is a subfield of the philosophy of art. For it is equally true that aesthetics has from the beginning been concerned with phenomena other than art, most notably, natural beauty and the sublime.

That the philosophy of art and aesthetics have significant overlaps was never in question. But it became apparent in the artistic practices and theoretical debates in the early twentieth-century modernist and avant-garde movement that they do not necessarily coincide. Dadaism and Duchamp showed that a work of art need not possess beauty or any other privileged aesthetic qualities. Similarly, modern attempts to “politicize” art or to draw moral insights from art qua art indicated that certain non-aesthetic qualities could in fact determine what constitutes art. How we respond to an object to which we ascribe aesthetic value may thus be significantly different from the way we attend to a work of art. This recognition – which eventually ushered in non-aesthetic definitions of art – marks the beginning of new artistic modes that could not easily be accommodated to cultural traditions that had emerged during the Italian Renaissance and that determined art and its institutions well into the twentieth century.

In the seventeenth and eighteenth centuries, art and aesthetic theory had to come to terms with sweeping social, political, and economic changes. Under the conditions of modernity, art and the aesthetic had to be defined anew and took on an autonomous social function. Nonetheless, it took the

larger part of the nineteenth century – and a veritable aesthetic education – to separate the reverential encounter with works of art that was premised on the proper aesthetic distance (as demanded by aesthetic theories of the late eighteenth century) from the more popular modes of involved sensuous enjoyment.

Toward the end of the century, art became its own subject in aestheticism, which insisted on autonomy, on the dissociation of art and, by extension, the aesthetic from life and society. Formulated against restrictive demands of utility as well as the reduction of art to mere ornament, the aesthete stance, often blatantly paradoxical, of radical artistic autonomy became “the necessary precondition” of the avant-garde objective to reintegrate art into life – a new and better praxis of life that would be completely absorbed in the praxis of art (Bürger 1984 [1974]: 49). But once the link between art and aesthetic experience could no longer be taken for granted and was, in fact, severed by the claims and practices of the avant-garde movements, art required a different justification.

EXPRESSION THEORIES OF ART

Romantic poets, from Novalis to William Wordsworth, had regarded the work of art as the expression of powerful feelings and an embodiment of preconceptual knowledge. In Benedetto Croce’s (1992[1902]) updated speculative aesthetics (to which R. G. Collingwood’s bears more than a passing resemblance), these two issues are closely intertwined. Croce claims that feelings can be understood and clarified only through their artistic externalization.

In a gesture that recalls the beginnings of modern aesthetics in Alexander Gottlieb Baumgarten’s *Aesthetica* of 1750, Croce points out that intuition has not yet been

assigned its proper place in science and philosophy where logical thinking dominates. Intuition possesses its own kind of cognition. Rather than aiming at the universal, it grasps the individual. And in lieu of concepts, it produces images. What becomes objective in an expression is intuition itself. In fact, the two terms cannot be separated. Expression in Croce’s sense is an ideal act of forming an intuition. Its material externalization is of no consequence. Successful works of art are complex expressions and differ from quotidian expressions only in quantity or intensity, not in quality. For Croce, the content of an expression is less important than its form. For this reason, he rejects both mimetic and materialist accounts of art. In keeping with his larger neo-Hegelian project of a “philosophy of the spirit,” Croce understands form exclusively as a spiritual activity.

Like Croce, the pragmatist philosopher John Dewey aimed at dissolving the distinction between art and the everyday. That life and art have not been integrated strikes Dewey as “a pathetic, even a tragic, commentary on life as it is ordinarily lived” (1958[1934]: 27). He believes that the sources of art can be discovered first and foremost in ordinary experience. For Dewey, all aesthetic experience contributes to feeling alive. But unlike the aesthetic transformation of life that Friedrich Nietzsche advocated, Dewey’s aesthetic experience is conceived in profoundly democratic terms – including his choice of examples such as “the tense grace of the ball-player” and “the fire-engine rushing by” (5). Experience occurs continuously in a living being. But often it is inchoate and cannot be united into a whole. In contrast, having *an* experience amounts to the completion and consummation of the material of the experience. No experience achieves such unity without aesthetic quality. For Dewey, art is a privileged object of such experience and

offers “the best proof of the existence of a realized and therefore realizable, union of material and ideal” (27). Unlike Croce, Dewey resists the separation of spirit and matter, and the consequent downgrading of matter. Instead, like Marxist aesthetic theories, his notion of expression includes the material conditions of social life.

Representational theories of art had begun to lose their dominance by the time of Immanuel Kant in the late eighteenth century and the rise of Romantic theories of expression, even while novelistic realism and other forms of representation became more popular. Expressive theories came increasingly under pressure with the emergence of formalism in the late nineteenth century. But these changes should not mask significant lines of continuity. For example, as Benjamin Constant made clear, the formalism of “art for art’s sake” could convincingly claim to be of Kantian descent. Writers as different as Théophile Gautier, Charles Baudelaire, Walter Pater, and Oscar Wilde enthusiastically subscribed to the idea that art could be judged by inherent criteria only, and that no external function – moral, political, religious, or educational – ought to be imposed on it. Like Nietzsche’s philosophy, aestheticism aimed at nothing less than a thoroughgoing transformation and elevation of life through art. At the same time, both Wilde’s aestheticism and Nietzsche’s demand to aestheticize life insisted on the separation of aesthetic and moral (or, for that matter, political) judgments.

FROM FORMALISM TO HEIDEGGER

Expressive theories of art continued to be influential well into the twentieth century and even regained some prominence by virtue of debates, in the late twentieth and twenty-first centuries, that revisited the question of artistic intention. However, by

the end of the nineteenth century, formalism had established itself as the predominant modernist aesthetic theory, a position it maintained arguably until the early 1960s. Formalism, in all its variations, focuses expressly on the work of art, its qualities, structures, and integrity, without admitting the conditions of its production (including the author’s intention) or its reception into the picture. In his influential book *Art* (1914), Clive Bell drew a firm distinction between works of art and all other objects. He proposed “significant form” as the name for the essential property that makes art different from everything else by eliciting a phenomenologically unique experience. “Significant form” combines unified organization and regional qualitative intensity, as the formalist aesthetician Monroe C. Beardsley noted approvingly.

In two influential essays that became central theoretical statements of the new criticism and which he co-authored with the literary critic William K. Wimsatt Jr., Beardsley took aim at romantic views of the artwork as an expression of the artist’s subjectivity as well as at “romantic reader psychology” that focuses on what a poem *does*, instead of adhering to “classical objectivity” as the standard of the critical analysis of what a poem *is* (Leitch 2001: 1398). Beardsley’s subsequent *Aesthetics: Problems in the Philosophy of Criticism* (1958) presented the first systematic philosophy of art in the analytic tradition. Beardsley argues for a strong conceptual link between art and the aesthetic. In his account, aesthetic experience is distinguished by its unity, intensity, and complexity. However, Beardsley fails to show that these qualities are necessary, let alone sufficient, conditions of aesthetic experience. Nothing in his account speaks against nature as a possible source of aesthetic value. In fact, Beardsley rarely speaks of “works of art,” preferring instead the more inclusive category “aesthetic objects.”

Expanding on Bell's notion of "significant form" and Beardsley's postulated link between art and the aesthetic, Clement Greenberg, the leading formalist in art criticism, developed a highly influential theory of art that was anchored in a comprehensive historical narrative. He read the history of art as a series of erasures. The end-point was pure, nonobjective, abstract art that had purged itself from all "literary" reference and instead foregrounded its own material medium. There were "no breaks in the continuity of art" (1999: 185). The experiments of cubism as well as those of Jackson Pollock were significant landmarks in this development. At the same time, Greenberg dismissed surrealism and Dadaism as "literary" regressions. His theory could not accommodate art that had become untethered from aesthetic considerations. Duchamp and his heirs in the 1960s, pop art and conceptual art, fit neither into Greenberg's conception nor into his history of art. He viewed them as merely paradoxical attempts "to make art vanish and stay at the same time" (184).

For Greenberg, objects that do not elicit aesthetic responses are not art, and non-aesthetic judgments on art merely use the object to be judged as pretext. With dismay Greenberg noticed that in the art of the 1960s "phenomenal novelty" and "artistic novelty" had begun to separate (1999: 179). For earlier art, including the art of modernist innovators such as Picasso or the constructivists, the coincidence of these two aspects of aesthetic objects had been constitutive. Greenberg recognized that the precedents for the new anti-aesthetic tendency were Duchamp's ready-mades – a bicycle wheel mounted on a wooden stool or a snow shovel entitled "In Advance of the Broken Arm" – which he shunned as "idea art" (133).

The tradition of "non-aesthetic" art to which Greenberg reacted so strongly can be traced back in one direction to the French symbolist poet Arthur Rimbaud, whom

many later avant-gardists claimed as their forerunner, one of the first to transform the making of art into an act that forms reality. In the period around World War I, all avant-garde movements, regardless of the diversity of their programs and politics, aimed at "the abolition of autonomous art" and its integration into the praxis of life (Bürger 1984: 54). But only Dadaism completely abandoned aesthetic claims and severed the ties between art and aesthetics. For some time to come, aesthetic theory qua theory of art had no answer to the provocations of Dada and Duchamp. Duchamp's ready-mades sought deliberately to uproot the concept of the "work of art." Until the nineteenth century, he claimed, art had been "literary or religious" and "at the service of the mind" (1989: 125). In formalist aesthetics, art is largely appreciated for its sensuous qualities. For Duchamp, Dadaism constituted "an extreme protest against the physical side of painting" and thus was "a metaphysical attitude" (125). Dada art was philosophical art; it insistently posed the philosophical question of its own status as art and shifted the attention away from the "retinal or visual" aspects (136).

Increased reflection on the role of the artistic medium in aesthetic experience as practiced by the Russian formalists led to theoretical advances in aesthetic formalism. Structuralism refined and expanded these methods of reading. Thus, in keeping with Roman Jakobson's analysis of linguistic patterns which in turn was based on Saussurean semiotics, structuralism regarded cultural artifacts as texts that were constituted in and by their contextual relations. The semiotic complexity that was generally regarded as a sign of aesthetic value, was shown to be equally present in primitive mythology and in such artifacts as a new car design or the face of Greta Garbo.

Similarly impressed by aesthetic indiscernibles, philosophers of art proposed con-

ventionalist approaches that challenged Greenbergian formalism in the early 1960s. Arthur Danto introduced the concept of the “artworld” in 1964 (Margolis 1987: 155–67). The “artworld” provides the theories of art that are tacitly assumed by all its members in order for there to be objects considered as art. Eventually, Danto’s essay gave rise to a full-fledged historicist account of art that attempted to meet Duchamp’s (or, in Danto’s telling, Andy Warhol’s) challenge to all aesthetic theories of art. George Dickie, who published an essay attempting to expose the “aesthetic attitude” as a myth in the same year (Margolis 1987: 100–16), used Danto’s concept of the artworld as the basis of his own institutionalist account of art. In both theories, art was shown to possess aesthetic qualities only as a result of social conventions. Anything could be art as long as an object’s specific place within the tradition of art (Danto) or the declarations of the institutions in charge of “art” (Dickie) made it so. Duchamp and his neo-avant-garde successors had questioned the institution of art from the inside out – a point that could not be appreciated by a formalist like Greenberg who remained adamant in his insistence on “the experience of art as art” (1999: 63).

In a rather different vein, Martin Heidegger’s theory of art is also concerned with overcoming the aesthetic tradition. This task is an integral part of his larger project of overcoming the Western metaphysical tradition. Heidegger claims that the rise of aesthetics coincided with the dying of art. From being an object of *aisthesis* or sensuous apprehension, art has been reduced to being an experience; “Yet perhaps experience is the element in which art dies” (1971: 79). It is not clear, however, whether the concept of art can indeed be freed from the aesthetic tradition or whether the simultaneous rise of a unified concept of art and of aesthetics in the eighteenth century

betrayed a mutual implication. (After all, even Duchamp and Warhol need traditional aesthetic art as a background against which they can present their art as “art.”)

Works of art, argues Heidegger, are not just aesthetic things. Rather, like the Greek temple, art sets up a “world” in which an entire culture, including its natural surroundings, is gathered and everything is assigned a meaningful place. At the same time, art presents the resistance of the “earth” – the element that invisibly penetrates and transcends the world. For Heidegger, the representational, expressive, formalist, and conventionalist theories of art largely miss the phenomenon they are meant to elucidate. Art is a comprehensive and holistic “setting-into-work of truth” and happens as “poetry” (*Dichtung*) in the sense of a historically unique foundation (1971: 77).

Although Heideggerian readings of artworks had some impact, especially in literary and architectural criticism, Heidegger’s difficult and unique thinking (in spite of obvious debts to the phenomenological and hermeneutic traditions) posed more questions about the status and meaning of art than it answered. His thinking continues to pose a challenge for the theory of art.

MARXISM AND CRITICAL THEORY

Regaining popularity in the 1960s, Marxist and other materialist accounts (such as psychoanalysis and feminism) viewed art as historical testimony or as a mode of social production. Thus they resisted the reduction of all representational and expressive content to mere “form.” They stressed the primacy of the excavated meanings that, for formalists like Greenberg, had nothing to do with art *qua* art. In these theories, it mattered who produced art and for whom it was created. However, as the debates between Georg Lukács and Bertolt Brecht, Walter

Benjamin and Theodor Adorno had made clear, the sociopolitical emphasis on the history and materiality of art and the aesthetic consciousness does not necessarily exclude considerations of expression and form. Although Lukács did not subscribe to the official doctrine of socialist realism with its overt didacticism, he championed an aesthetics of realism. Art was to mirror social and economic reality. Lukács disagreed with fellow Marxist Ernst Bloch's defense of expressionism and rejected subjectivist modernist aesthetics, in which he merely detected the aesthetically encoded and sanctified fragmentation and alienation of life under capitalism. He took realist art to represent reality objectively as the totality of social relations and saw it as the true avant-garde of progressive politics. Brecht pointed out dryly that Lukács, in his insistence on a *form* of realism that was derived from Balzac, had committed himself to an untenable formalism.

Walter Benjamin's most influential contribution to aesthetics is his brief history of art and its media in "The work of art in the age of mechanical reproduction" (1968: 217–52). For him, the arrival of new media like photography and film changed aesthetic perception and, by extension, the function of art profoundly. With increased reproducibility the "aura" of the artwork was lost. However, the new technologies led, as Benjamin speculates, to a deepened apperception and comprehension of the optical unconscious. Moreover, in the reception of film, the masses become the revolutionary subject – a potential that may be abused, as Benjamin was well aware, when politics is aestheticized, as it was by fascism. In keeping with the liberation of art from aesthetics, Benjamin proposes a politicization of art instead. Adorno, Benjamin's friend and occasional opponent, held a very different view of the promise of mass art. To him the mass media were instruments of the

capitalist "culture industry" and their output consisted of an admixture of aesthetic stimulation and propaganda that provided endless entertainment while leaving the sociopolitical and cultural status quo unquestioned. Only the autonomous art of modernism could resist this consumer culture with its splendid aesthetic veneer.

Adorno worked on his *Aesthetic Theory*, which was published posthumously in 1970, throughout the 1960s. Like Heidegger, he engages art and aesthetics at a comprehensive level that transcends and draws on modern aesthetic theories and the development of modern art, especially in music and literature. He begins by stating that "It is self-evident that nothing concerning art is self-evident anymore" (1997[1970]: 1). Like Heidegger, Adorno finds art to be true precisely in its "enigmaticalness": artworks are a kind of writing, "hieroglyphs for which the code has been lost" (124–5). If art is not reducible to its aesthetic qualities, its own particular function may lie nonetheless precisely in these qualities.

Adorno's theory combines modernist aesthetics with sociopolitical critique and historical consciousness. A defense of formalism, it nonetheless insists that art lend suffering a voice and embody the promise of something better to come. At the same time, Adorno is fully aware that the close connection between art and aesthetics as it had been codified by Hegel was severed with the arrival of modernism. In a recuperative Kantian gesture, he brings the beauty of nature and the sublime, both of which had been banished by Hegel, back into the purview of aesthetic theory and thereby adumbrates many of the positions of subsequent postmodern theories of culture.

Affective Fallacy

JOHN CLABORN

The concept “affective fallacy” refers to a confusion between two elements of a literary text: what the text *is* (its linguistic and rhetorical elements) and what it *does* (its effects on the reader). William K. Wimsatt & Monroe C. Beardsley first introduced it into literary criticism and theory in a 1946 article in *Sewanee Review*. The concept was later developed in their seminal study *The Verbal Icon: Studies in the Meaning of Poetry* (1954). In some respects, “The affective fallacy” was a follow-up to another important 1946 work, “The intentional fallacy” (which was also revised in *The Verbal Icon*), in which Wimsatt and Beardsley argue that in this particular “error” of reading, one locates meaning in the intentions of the author. Both concepts were fundamental in the development of the new criticism, the name given to various schools of criticism stressing formal analysis and close reading that gained prominence in the 1940s and 1950s.

New criticism, generally speaking, does not mean to forbid *all* discussion of emotion, but rather to place literary criticism more solidly in an objective position with respect to the literary text. According to Wimsatt and Beardsley, reading affectively violates the tenets of critical objectivity and substitutes impressionistic and relativistic emotional response for formal effects. Though often criticized as polemical in its attack on emotion, “The affective fallacy” presents the case for a reconsideration of the role of affect in a complex and challenging fashion. The first half of the essay consists of a critique of various kinds of affective criticism; of particular importance is the attention paid to the relation between language and emotion as conceived in such disciplines as semantics, anthropology, affective psychology, and aesthetics. Each of these fields tends to isolate a word’s connotative meaning or “emotive import” (what it *suggests*) from its denotative meaning (what it *means* or *describes*). The scientific or objective warrant of these disciplines necessitated such practices, which the new criticism sought to emulate in order to develop, within literary criticism, something like the analytical rigor possessed by the physical and social sciences.

According to Wimsatt and Beardsley, the affective fallacy has taken a number of forms in the history of literary criticism, from Aristotle’s theory of catharsis to contemporaneous Book-of-the-Month Club reviews of novels (1954: 30). Such criticism typically measures the value of a literary work by gauging the intensity of feeling it produces in the audience. A historical critic might focus on an Elizabethan audience’s affective impressions of a Shakespeare play as an index of its meaning; in a similar fashion, a critic attuned to psychological nuances might be concerned with the individual emotional responses of a reader to a lyric poem. An extreme variant of the latter

response would entail the critic equating the meaning of the work with a psycho-physiological reaction (e.g., the “hair-raising” effect of gothic fiction). All of these instances have in common readers mistaking their emotional response for the text’s meaning; the resulting criticism lacks substance, since its claims can be neither refuted nor proven: “The purely affective report is either too physiological or it is too vague” (32).

After presenting examples of unproductive affective criticism, Wimsatt and Beardsley seek to develop a way of evaluating a poem’s emotive import by drawing on T. S. Eliot’s notion of the “objective correlative,” which involves tracing subjective impressions back to their objective cause. The crucial point the authors seek to make is that the emotional valence of a work of literary art can be identified without confusing it with the meaning of that work. By changing the focus of analysis – from the reader’s experience of the text to the text’s transformation of the author’s or speaker’s experience – the critic is able to achieve, if not scientific exactitude, then certainly a form of disciplined (i.e., “objective”) exploration of the relationship between an emotional starting point and a linguistic or rhetorical effect. The ultimate goal of the critic, however, is not the emotional starting point but the process itself that leads from this point to what Eliot (in a 1919 essay) called a “new art emotion” (Eliot 1950: 10). Like Eliot’s, Wimsatt and Beardsley’s complaint has to do not so much with the emotion *as such* but with the lack of rigor and critical distance with which it is often discussed. Indeed, they champion the emotive value of poetry towards the end of the essay. “It may be granted at least,” they concede wryly, “that poets have been leading expositors of the laws of feeling” (1954: 39). Their charge to the literary critic is to perform the task of producing “translatable

emotive formulas,” for the “more specific the account of the emotion induced by a poem, the more nearly it will be an account of the reasons for emotion, the poem itself, and the more reliable it will be as an account of what the poem is likely to induce in other—sufficiently informed—readers” (34).

In some ways, “The affective fallacy” reflects its historical context. First published the year after World War II ended, the essay can be read as a caution against criticism that depends on the analysis of excessive displays of pure emotion; in addition, its implied critique of mob reaction and the aesthetics of fascist political rallies serves as a bulwark against totalitarian propaganda. Objectivity, for Wimsatt and Beardsley, therefore, is put in the service of a balanced and rational assessment of emotion in literary work. Like so much of the new criticism, “The affective fallacy” proposes the methods and strategies for such assessments.

Later critics have engaged with Wimsatt and Beardsley’s polemic, either by expanding on or calling into question the authors’ basic assumptions about emotion and its role in criticism. Raymond Williams’s concept of “structures of feeling” makes similar claims about the literary text as a form of historical knowledge about emotion in social contexts. With its focus on meaning as an event that takes place in mental acts of reading, reader-response criticism directly challenges the idea that readers’ emotions are not pertinent to the making of meaning; but here, it is important to note that reader-response criticism is not really concerned with the fallacy that Wimsatt and Beardsley describe. Rather, a critic like Stanley Fish, in his theory of affective stylistics, redefines the reader’s affect as something far more complex and linguistically grounded than the common notion of psycho-physiological emotional response. The first decade of the twenty-first

century has seen a number of innovative developments in the growing interdisciplinary field of affect theory. Affect theorists like Sianne Ngai and Jane Thrailkill draw on cognitive psychology, neuroscience, and philosophy in order to analyze rigorously a literary text’s emotive import. Eve Kosofsky Sedgwick’s late work forges connections between performance theory and affect, suggesting that the conjunction has pedagogical and political as well as critical implications. In this work we see the legacy of new criticism, which, far from being superseded, has provided the foundation for new, interdisciplinary theories of reading and criticism.

Alienation

SHARON LUK

The concept of alienation has two meanings in cultural theory. It refers to the way human productive activity is converted into objects or things in the capitalist production process with the result that the products of human labor belong not to the producers but to the owners of the means of production. The products of human labor are thus “alienated” from the producers and converted into private property, by which Karl Marx meant property that belongs to the owners of capital rather than to the collective public made up of productive workers who actually make that property. Alienation is the taking away of the product of labor from its producer. As a consequence, the products of creative human labor come to appear to be things or objects that exist independently of such labor. Human creative activity is thereby alienated from its source; its products cease to belong to the producers or workers who made them and become the property of capitalists. Commodities as a result appear to have no connection to human life or social relations. According to Marx, “private property” consists of the theft of the product of labor from workers and its conversion into the private wealth of the owners of capital.

Alienation also refers to changes in the totality of the social structure as a result of living within the power relations of capitalism, colonialism, and racism. In the service of producing and reproducing capital and preserving the structures that generate it, producers feel disconnected from their own minds, bodies, and labor, as well as from each other and the social world at large. These transformations in the relations between producer and product both emerge from and facilitate the structures of capitalism – how it organizes, appropriates, and

exploits workers’ labor power to produce and protect private property. Because capitalism necessarily expands globally, reaching for raw materials and markets, it fostered the colonial domination of other countries by the major capitalist countries from the eighteenth century through the end of the twentieth. Such global colonialist capital expansion thus also extended the reach, magnitude, and permutations of economic and social alienation, particularly through the ways that racism began to structure human relations, from the local to the global.

Marx first describes the economic concept of alienation in his early philosophical manuscripts. There, he characterizes human life as creative productive activity. People make things – their own food, clothing, homes, tools, and so on. Early in human history, people fully controlled what they made. Under capitalism, a relatively new economic form that emerged full-blown after the Renaissance (roughly 1300–1660), revolutionary changes in the organization of human activity transformed its creative potential. Capitalists’ invention of private property, understood as the conversion of human social labor into something owned and controlled by a few private parties, displaced rural workers from common land, common tools, and the fruits of nature and their own labor. This alienation from the means of their own subsistence forced workers to move to industrializing centers and sell their labor to capitalists in order to survive. As a result of workers having to sell their labor for wages, their creative energies and activities become themselves commodities that, once sold, no longer belong to them. Thus, like the products manufactured in the factory, workers’ energies and activities become converted immediately into a commodity to be sold on the market for profit. According to Marx, the essence of capitalism is this process of alienation, whereby

individuals are forced to surrender their labor and its products to a small class of owners who then profit from it and reap the wealth that others produce.

In the first volume of *Capital* (1867), Marx analyzes the commodity form in order to clarify further how, and to what effect, alienation and capitalism work. A commodity is a product of human labor, such as a table or a car that, under capitalism, is sold on the market for profit. In and of itself, the constructed object is useful (it has a “use value”); but in the marketplace it is changed into something that has an “exchange value,” that is, an equivalence in money. In critical dialogue with classical political economists such as Adam Smith, John Stuart Mill, David Ricardo, and Thomas Malthus, who view capitalist models of economic, political, and social organization as natural or rational, Marx instead focused on how the relations of material production are forged in and through historically specific struggles between capitalists and producers. According to Marx, capitalists arrange the production process in ways that qualitatively transform relationships among individuals. Within this framework, commodities embody the labor that produced them; yet only through the “complete alienation” of commodities – which suffer “a divestiture or transformation of their real shapes as objects of utility . . . and of the particular kind of useful labor to which they owe their creation” (1990[1867]: 204) – can they appear in capitalist circulation as a form of money or some other exchange value. This “metamorphosis” of commodities, from useful objects into capitalist values, changes the products of human creative activity into generators of private wealth. It is this displacement to which Marx refers as alienation.

The alienation of the commodity also reflects the alienation of the worker in the capitalist labor process. From this perspec-

tive, formal changes in the process of production, from manufacturing to large-scale industry, maximize the mass production of commodities by intensifying the dehumanization of those who make them. Marx argues that capitalist mechanization and the division of labor require less skill from the worker, which leads to a severance of workers from the labor process and to a reduction of their vitality through increased exploitation of their labor. It also conceals the inherently cooperative nature of labor and commodity production. By denying people access to their own creative and social capacities, the capitalist labor process “attacks the individual at the very roots of his life” (1990[1867]: 484). Furthermore, the system of private ownership of the means of production – raw materials, machinery, physical plant, distribution networks – deprives workers of the tools, products, and knowledge of their own labor, and therefore they cease to have access to their own productive capacities. The transformation of labor power into capitalist value thus ritualizes a particular form of social life, structured around the production and accumulation of private wealth for capitalists, that deprives workers of their time, energy, and the products of their labor.

As Marx’s predictions about the proliferation of large-scale industry came to fruition in the first part of the twentieth century, critical theorists of the Marxian tradition began to examine how capitalists secured the social and political conditions necessary to maintain their ways of organizing production, and by extension, society. The most important figure at this time was Georg Lukács, who elaborated on the phenomenon of alienation, particularly the interaction of the objective world of commodities with the subjective estrangement of human beings from themselves. Lukács examines how the economic divi-

sion of labor that alienates and exploits people and the political structure that rationalizes and bureaucratizes that division of labor work together to make a capitalist world order seem natural, inevitable, and eternal. This produces a “reification” of both things and people, in which capitalist alienation and commodity exchange appear as the only possible or imaginable way of life itself, thus profoundly obscuring, to the point of destroying, the organic, human relationships at the basis of societies:

Reification requires that a society should learn to satisfy all its needs in terms of commodity exchange. The separation of the producer from his means of production, the dissolution and destruction of all “natural” production units, etc., and all the social and economic conditions necessary for the emergence of modern capitalism tend to replace “natural” relations which exhibit human relations more plainly by rationally reified relations. (Lukács 1971[1967]: 91)

Alienation is therefore as much an economic process as a psychological or existential one. Another distinct line of critical theory appearing at the turn of the twentieth century examines how capitalist alienation, exploitation, and commodity exchange occur through the systematic practice of racism. This perspective incorporates the social effects of the initial phases of capitalist (primitive) accumulation, in which Marx asserts that “The starting-point of the development that gave rise both to the wage-labourer and to the capitalist was the enslavement of the worker” (1990[1867]: 875). Developments in the early twentieth century, for example in the work of W. E. B. Du Bois explore the formal transition from enslaved to wage labor in the United States in which capitalists, often motivated by a deeply sublimated racism, reorganized the division of labor and the production

process, and reframed their political rationalities. He and others, such as Ida B. Wells-Barnett, explain how the social construction of race functioned to preserve alienation and reproduce its radical exclusions at a time of capitalist crisis. This led to and justified the targeting of specific groups of workers for premature death in order to maintain capitalism.

Starting in the 1950s, at the beginning of the decolonization period following World War II, the analysis of this form of racialized alienation was further developed by a number of theorists, particularly early postcolonial thinkers like Albert Memmi and Frantz Fanon, who were concerned with the alienation of colonial subjects and the processes by which imperial forces used ideologies of race and sexuality to subjugate and dehumanize them. Memmi’s *The Colonizer and the Colonized* (1957) and Fanon’s *Wretched of the Earth* (1961) explore forms of psychological alienation from a perspective informed by Hegelian dialectics. Their analysis of the links between individual psychology and the politics of colonial domination uncovered a similar link between alienated labor and alienated subjectivity. Though the postcolonial concept of alienation, grounded in psychoanalysis, differs from the Marxian concept and is used in social and historical contexts that differ widely from those of European capitalism, both concepts, especially in the late twentieth century, describe mechanisms of displacement that produce social and economic inequalities in the pursuit of global capitalist domination.

Anglo-American New Criticism

BRIAN MEREDITH

The “new criticism” is a general term for a diverse group of writers and scholars distinguished by their emphasis on formalist literary criticism. From the early 1920s, when I. A. Richards published his first works, to the 1960s, the new criticism dominated academic writing and teaching

about literature, in part because its methodologies – a reliance on close reading (or “explication”) and the exclusion of most extratextual influences – both framed and delimited the object of criticism and made the most complex works of literature accessible to students. More important than these pragmatic concerns, however, was the new critic’s assertion that the literary work was autonomous, free from the influences of politics, ideology, biography, and other historical forces. Poetry was a privileged genre for many new critics, because its verbal and rhetorical complexities were particularly well suited to close reading. The poem thus came to resemble, in William K. Wimsatt and Monroe C. Beardsley’s phrase, a “verbal icon,” a self-contained object the appreciation of which constituted for the reader a unique aesthetic experience. Two assumptions follow from this conception of poetry: one, that poetic language was distinct from “everyday” language and, two, that the poetic use of language was a worthy human activity in its own right. Thus the formalism of the new criticism at the same time sustained Matthew Arnold’s belief that literature could provide a means of moral and aesthetic enrichment in a spiritually impoverished world.

Though some of the earliest practitioners of new critical formalism were English – pre-eminently I. A. Richards and William Empson – it is in the US that the new criticism developed its most important and enduring principles. Of critical importance was the Southern Agrarian school of poets and critics, grouped around the scholar and poet John Crowe Ransom, who later taught at Kenyon College and founded the *Kenyon Review*. Scholars like Cleanth Brooks, Ransom’s student and one of the most successful at popularizing new critical ideas, accelerated the institutionalization of new criticism’s signature practices by publishing popular textbooks and anthologies.

While the new criticism no longer enjoys the dominance it once held in US universities, the work of critics like Brooks, and later, Wimsatt and Beardsley, continues to exert its influence in high school and college classrooms and in the pages of journals devoted to the close analysis of poetry.

The new criticism was noteworthy in the degree to which it sought an autonomous field for literary criticism. There was little room in university curricula of the 1920s and 1930s for a discipline that treated literature aesthetically, that is, as something whose formal and technical qualities could be analyzed and discussed. As Ransom (1984[1938]) explained, such work in English departments was either condemned as a mere exercise in taste or passed over in favor of other disciplinary approaches like literary history. Early figures like Ransom, Allen Tate, and Brooks, by making practical criticism a respected feature of literary study, made it easier for readers, who may not have ready access to contextual knowledge, to engage with the sophisticated language of literary works. Indeed, one of the presuppositions of new criticism's method of close reading was that the reader's reliance on "secondary" disciplines was not only unnecessary to the attainment of a fulfilling and rigorous understanding of literary works, but even positively harmful, to the extent that such extratextual influence diluted the reader's aesthetic experience. Rather than situate a text in literary history or the biography of the author – or to use it to exemplify general features of humanism – the critic's first and last task should be to lay the text open for the reader.

To be sure, the formalist orientation of most new critics led some to complain that they were dismissive of the material conditions of literary production and consumption. Such complaints register a dissatisfaction with the text itself and point to the lingering influence of an Arnoldian

model of the critic as a purveyor of moral and ethical truth, as well as to a nostalgia for the kind of criticism that ranged over historical and biographical contexts but ignored the formal elements of the literary work. This was especially true of the new humanism, an academic movement championed by Irving Babbitt and Paul Elmer More that emphasized core moral and ethical values inculcated in cross-disciplinary study. Tate, however, doubted that any general value system existed and argued instead for the "specific morality" of works that were created under specific "conditions," claiming that these conditions left their imprint as a unique "quality" in the text (Tate 1936). The new criticism believed that literary value lay not in contexts but in objects, in the texts themselves. Indeed, for Wimsatt and Beardsley, it is an important function of the mind to focus on objects to the exclusion of context: "there is an action of the mind which cuts off roots, melts away context – or indeed we should never have objects or ideas or anything to talk about" (1954: 12). This conceptual necessity became, for the new critics, a virtue and a guiding principle. If the new criticism possessed any kind of disciplinary unity, it was located precisely in the tendency of most practitioners to defend literature and practical criticism from historical and neo-humanist dogma.

For the new critics, the aesthetic experience of the literary work was linked to its linguistic, rhetorical, and formal elements. Form therefore became as important as content or theme; indeed, it was through formal strategies (especially rhetorical tropes like irony, ambivalence, and paradox and prosodic features like rhyme and meter) that content and theme found their most effective expression. Meaning, as well as aesthetic quality, became increasingly associated with formal elements of the work.

Though the new critics came from a variety of backgrounds, there arose a common, more or less formal lexicon for their analyses. In a recent study of new critical methods, John Paul Russo (2005) noted over a hundred terms, many of which would be familiar to students of literature: image, metaphor, irony, tension, and so on. Even more important than the terms themselves was the discipline of reading that they were meant to represent in critical terms. Practical criticism, however much it was associated with elite figures in the academy, was primarily oriented toward making literary study and analysis available to university students. Its formalist orientation in fact raises a significant point concerning the new criticism's place in the institutional history of literary studies. English departments in the first part of the twentieth century were still quite young and poorly defined in purpose, especially compared to older disciplines like philosophy and history. And however much new critics differed from each other, their work conveyed a degree of methodological unity that provided the emergent discipline of English studies with a unique set of problems and literary objects.

MAJOR FIGURES IN THE NEW CRITICISM

The origins of the new criticism lie, arguably, in the literary criticism of T. S. Eliot, whose work tended to focus on the autonomy of literary art and on practical criticism rather than on psychological or historical reflection. Eliot's claim, in "The function of criticism" (the title of which echoes Arnold's "The function of criticism at the present time"), that the critic ought to deal with facts, to transform "nebulous" reflections into "something precise, tractable, under control" (Eliot 1950c[1923]: 20),

provided a foundation for theories of criticism grounded in the close analysis of literary language. Eliot's interest in formalism was motivated in part by a desire to overcome a historical problem, the "dissociation of sensibility" that he located in the seventeenth century (Eliot 1950a[1921]). In his analysis of Renaissance and seventeenth-century poets, Eliot observed a demonstrable shift in sensibility whereby reason had grown increasingly more divided from the other faculties of experience, particularly sense perception and emotion. The work of poets prior to this shift demonstrated an entwining of the various faculties, and the poet's gift was the ability to gracefully draw thought from perception and feeling so that thought was nearly indiscernible from immediate experience. By contrast, for Eliot, the "ordinary man" resorted instead to reflection, a process that rigidly divided thought and impression. The increasing prevalence of this "dissociation" of faculties resulted, by the twentieth century, in a mentality refined in thought but arid in emotional capacity. The "new art emotion" that Eliot advocated in "Tradition and the individual talent" (1950b[1917]) was in part an attempt to retrieve an "associated" sensibility for a modern age.

For Eliot, as for the new critics who followed him, the Romantic ideal of a reflective, expressive self was no longer tenable. He was not interested in poetry which reflected in a direct and mimetic fashion the feelings or personality of the poet. Rather, he sought to describe, in "Tradition and the individual talent," a process by which the poet's emotional experience could be transformed, by means of a catalytic process, into something quite distinct from that experience, even as the poetry produced was necessarily grounded in it. This theory of "impersonality" paradoxically requires the very personality that it seeks to expunge. The "impersonal" poet enters into a relation

with a tradition of other poets that both alters and is altered by the contributions of new, “great” writers. In a rather mysterious process of selection, new works that become part of the tradition embody artistic departures from the works already in it; yet at the same time the new writer evinces an awareness and affinity for those who have come before.

One of the first to develop a theory of practical criticism was the Cambridge University professor I. A. Richards, whose *Principles of Literary Criticism* (1925) pioneered a form of “empirical semantics and aesthetics” (Russo 1982: 743) that relied on phenomenological and psychological methods. In many respects, his work was an attempt to develop the kind of “specialist” criticism that Eliot called for in “The function of criticism.” In his appendix to the *Principles of Literary Criticism* on “The poetry of T. S. Eliot,” Richards explains the precise way in which technique and feeling intersect: “the most characteristic feature of Mr. Eliot’s technique” is the creation of a “music of ideas.’ The ideas are of all kinds, abstract and concrete, general and particular, and, like the musician’s phrases, they are arranged, not that they may tell us something, but that their effects in us may combine into a coherent whole of feeling and attitude and produce a peculiar liberation of the will” (Richards 1925: 293). Richards’s critical methodology combined a concern for the affective dimension of language with a method of close reading that relied exclusively on the text itself. Richards’s interest in the psychology of reading and of language usage gave his work a scientific bearing and allowed him to make a distinction between two uses of language that proved particularly influential for the development of new criticism in Britain and the US. Language, Richards claims, is either “emotive” or “referential.” Poetry uses language in an emotive fashion

in order to create a mood or to provoke a particular affective response. Scientific discourse, on the other hand, uses language referentially to state a truth that can be “verified.” Richards’s goal was to establish the place of emotive language in a modern consciousness firmly governed by the referential relation to language. In other words, he wanted to argue for the continuing value of poetry in an age of science. In this he was not unlike another English critic closely associated with the new critics, F. R. Leavis, who developed Eliot’s ideas into a “Great Tradition.”

The human mind, Richards believed, had been deprived of an important necessity with the decline of religious belief, a need science was ill-equipped to supply. Science was valuable to the extent that it provided answers for utilitarian purposes, but, as Matthew Arnold had noted more than 50 years before, it could not satisfy moral and spiritual requirements. Poetry, however, could stimulate certain habits of mind and “feelings” that approximate religious experience. But poetry is restricted to the emotive and the affectual levels of human experience and thus does not make the kind of universal claims that are at the foundation of religious doctrine. This proved to be poetry’s unique advantage, for religion had presented itself as truth and had lost to science. Unlike Arnold, who saw the moral and spiritual effects of poetry in terms of how it reflected the conditions of the external world, Richards believed that the emotive function of poetry is far more important for its ability to reorganize the reader’s mental operations. Because the poem is a privileged case of emotive language it is able to stimulate a broader range of “impulses” and then to arrange them in an aesthetically consistent and pleasing form. The poem thus reflects the capacity of the author to organize psychical life, and Richards concluded that in reading the

poem, the reader could acquire the same capacity.

Richards's affective formalism required, as a necessary corollary, a practice of close reading. His *Practical Criticism: A Study of Literary Judgment* (1929) was the first major study in the Anglo-American tradition to advocate a practice that ultimately came to define the new criticism and unify its various intellectual factions. Close reading entails a scrupulous attention to textual detail and to the contradictions, ambiguities, and tensions that constitute the poem as a self-contained "verbal icon." It also invites virtuoso performances, in which the critic's facility in identifying significant details and linguistic and rhetorical effects begins to approximate the creative performance of the poet. No detail or effect was insignificant; indeed, the new critic could insist that counting the exact number of times a particular image, idea, or color appeared was itself significant. But for Richards, literary criticism was not an entirely technocratic exercise, in which only language on the page had any validity. He realized the fundamental importance of the reader in making meaning, and he did not reject, as Wimsatt and Beardsley would some 25 years later, the author's intentions. In this, Richards resembles William Empson, another English critic who had a powerful effect on the new criticism. His *Seven Types of Ambiguity* (1930) focused on close rhetorical readings of poetry, but it also emphasized the importance of the reader, in whose mind the author attempted to communicate a "compound" or unified sense of the poem, one that resembled the author's state of mind at the time of composition. Nevertheless, and despite their emphasis on extratextual influences in the determination of meaning, Richards and Empson are typically included by literary historians among the new critics.

The work of Richards and Empson might suggest that the new criticism was essentially apolitical. Certainly, one strong reason for its gaining wide acceptance was an indifference to the political position of the critic. The charge of political indifference, however, rests on an assumption that political engagement can be gauged only by the critic's explicit and tendentious statements and positions. Critical practice and institutional affiliation tell a different story. Critics like Richards and Empson, as well as later new critics like Cleanth Brooks, might well be regarded as ideologically committed to a way of reading that upholds existing social divisions and conditions, particularly the central role the university plays in educating a nation's elite; so regarded, these critics join Arnold and Eliot in espousing an essentially conservative theory of culture and its relation to the political and social spheres. In some cases, as with the Southern Agrarians, a more explicitly polemical dimension emerges. Ransom and Tate, the most influential of this group, were connected to *The Fugitive*, a literary journal founded at Vanderbilt University. From 1922 to 1925, it garnered international acclaim with complex and erudite poems clearly influenced by Eliot's work. But it was also expressly political, dedicated to the defense of a Southern social order in precipitous decline. The Southern Agrarian movement grew out of disaffection with the contemporary world, a perspective that was, for the most part, unique to the American South, a region that had suffered tremendous social and political transformations and that lagged economically behind other parts of the country. The Scopes trial in 1925, together with the national media attention it attracted, had the effect of exposing the South's cultural backwardness to the nation at large.

In active resistance to this state of affairs, the Agrarians published their manifesto, *I'll Take My Stand* (Ransom et al. 1930). Turn-

ing disparaging views of the South on their head, the contributors to this volume valorized the South precisely because it had not undergone the modernization that corrupted the North. They openly attacked both capitalism and scientific discourse, decrying the impoverishing effect they have had on the vitality of human experience. The South became for them an idea, a system of values and, most important, a way of life; in effect, their vision of the South was a profoundly *aestheticized* one. In many ways, the literary criticism that came out of the Agrarian movement conveyed a similar vision of art as an aesthetically embattled sphere in need of defense and explanation. These political and critical points of view converge on the single belief that an aesthetic vision provides spiritual sustenance to individuals struggling against political and economic modernization (Fekete 1977).

In the end, the Agrarians' reactionary program failed to become a broader movement. In the wake of this disappointment, Ransom changed strategies and turned his energies to promoting the Agrarian aesthetic in a mode of criticism firmly embedded in English studies and cut off, for the most part, from other disciplines or schools of thought. Its political project was abandoned and its hostility to science disappeared. This last was a particularly telling change, one that aligned Ransom's new critical approach with Richards's scientifically inflected practical criticism. Though no longer hostile to scientific points of view, Ransom nevertheless asserted that the new criticism stood apart from science because of the unscientific object it set out to study.

The general orientation of new criticism in the US might be described as "ontological" – as Wimsatt and Beardsley put it, "A poem should not mean but be" (1954: 81). US new critics tended to concentrate on formal elements almost exclusively, and paid scant attention to the

affective dimension that we see so prominently in Richards's work. This meant that the formalism of new criticism found fewer affinities with a scientific methodology. For critics like Brooks and R. S. Crane, the most influential of the neo-Aristotelian Chicago School, the poetic use of language, its formal playfulness, captured reality in a way unique to poetry (Krieger 1956). Aesthetic unities and a classical ideal of harmony supplanted the kind of assurances that an "objective" approach based on scientific analysis could provide. Thus a praiseworthy poem brought semantic reverberations, ambiguities, and contradiction into a unified, harmonious tension that defined the autonomy of the literary work. The method of close reading best suited to explaining this aesthetic unity promoted a particular kind of reader, one whose attentiveness to linguistic and rhetorical features constituted the substantial meaning of the work. To reinforce this mode of interpretation, several new critics issued doctrinal statements. In "The heresy of paraphrase," Brooks (1947: 192–214) warned against reducing the significance of a poem to a statement or idea, for doing so would suggest that poetry could be grasped using a referential critical language, which, for Brooks, could only distort the actual experience of reading a poem. For similar reasons, Wimsatt and Beardsley (1954) argued that lending too much attention to details from the author's life and intentions, or alternatively to the responses of the reader, distracted the critic from the proper focus of criticism, the autonomous work itself. This led them to theorize, in two famous essays, the "intentional" and "affective" fallacies.

Wimsatt and Beardsley's pronouncements inspired fierce disagreement. R. S. Crane, whose work with the Chicago School was once championed by Ransom, challenged the idea of the poem's autonomy. He also pointed to the tendency among new

critics to read poetry solely through rhetorical tropes like irony or tension. Crane wanted a more “pluralistic” critical framework that could account for the fact that different poems had been written for diverse ends. William Empson, whose virtuoso readings in *Seven Types of Ambiguity* provided a model for many new critics, attacked the idea that the critic must not speculate on an author’s intentions. Indeed, he was suspicious of any doctrinal prohibition, which he feared would breed a religiously minded orthodoxy among critics eager to assert authority over the nonprofessional reader (Norris 1993).

By the time Wimsatt and Beardsley published *The Verbal Icon* in 1954, the new criticism had become an integral part of university English departments. Many of its theoretical formulations left it vulnerable to polemical assaults, however, as we see in the heated responses to Wimsatt and Beardsley’s essays on the fallacies. Though the new criticism developed in some ways parallel to structuralism, by the mid-1960s, its emphasis on poetic unity and the harmony of rhetorical effects was criticized by emerging poststructuralist theorists and the ideological critique associated with post-Marxism and British cultural materialism. While the narrow limits of new critical practice could prove invaluable in the classroom, where close readings of literary works served a pedagogical function, those same limits hampered the literary critic addressing an audience increasingly influenced by political and poststructuralist theory and increasingly skeptical of the idea that the artwork existed in an autonomous relation to the world.

Though the new criticism suffered a permanent reduction in prestige and influence, its methodology of close reading could be found in deconstructionist criticism as well as in the archetypal criticism associated with Northrop Frye. Indeed, as Mark Bauerlein (2007) has pointed out, the theoretical

sophistication of many critical practices to emerge out of structuralism and poststructuralism owes something to the fact that the new criticism made it possible to pose problems concerning the language of literary texts. By making literature an object of study worthy in itself, by championing the autonomy of the literary work, the new criticism had helped free interpretation from disciplinary restraints and thereby encouraged the practice of active and attentive reading.

Archetypal Criticism

ALEXANDER CHIRILA

Archetypal criticism is a form of analysis based on the identification and study of recurring symbolic and mythic patterns.

Although most commonly associated with the analysis of literature, art, and popular culture, archetypal criticism was originally employed in the discipline of anthropology by Sir James George Frazer in a compilation entitled *The Golden Bough*. First published in 1890, Frazer's seminal work comprised 12 volumes of extensive research into the myths, beliefs, and practices of various cultures and peoples. Nearly two decades later, C. G. Jung would pioneer analytical psychology, based on the hypothesis that inherited psychical images influenced human consciousness on a personal and collective scale. His work brought archetypal analysis into the realm of psychoanalysis, a field developed by Sigmund Freud during the turn of the century. For many years thereafter, Jung's work would continue to gain acclaim, and even today remains active in modified form. Archetypal criticism moved into the sphere of literary analysis following Maud Bodkin's groundbreaking *Archetypal Patterns in Poetry* (1934).

Northrop Frye would later ensure that archetypal criticism remained in the forefront of literary analysis with his *Anatomy of Criticism*, published in 1957. Moving away from psychology and Jung, Frye was primarily concerned with the recurrence of universally familiar characters, landscapes, and narrative structures within genre and text. A figure of singular importance to the continued proliferation of archetypal analysis and comparative mythology was Joseph Campbell, author of *The Hero with a Thousand Faces* and *The Masks of God*. Campbell's work earned popular acclaim and was instrumental in opening archetypal discourse to larger audiences inside and outside academia.

Archetypal analysis relies on several primary hypotheses, the most fundamental of which is that the entire range of human culture, history, and consciousness shares an inherited body of universal myths, beliefs,

and symbols. Jung took this theory a step further by positing the existence of a collective unconscious, a domain of symbols and archetypes that can be accessed only indirectly by means of the personal unconscious and that can exert a sublime and potentially dangerous influence on social groups. While differences in archetypes and symbols are acknowledged between peoples of disparate geographic regions, states of development, and systems of practice, it is understood that certain characteristics remain fairly consistent and recognizable. Modified by increasingly sophisticated contexts and adapted to continuous developments in culture, archetypes are found in their purest and most familiar form within folklore, magical practice, and the spiritual dimensions of religion. Thus archetypal analysis can be said to begin with the study of myth and folklore, and it is for this reason that any survey of this critical lens necessarily starts from an anthropological perspective. Following the evolution of a particular archetype or archetypal theme within a changing literary or social context can yield significant insights into the changing values and ideologies of a given community.

JAMES FRAZER AND *THE GOLDEN BOUGH*

Written more than 100 years ago, Frazer's work has since been superseded by radical changes in the field of anthropology. Still, his masterpiece not only represents a landmark in the study of religion and culture, it lays the foundation for a method that permits the critic to find similarities amid a labyrinth of differences. Frazer's work explores the human need to construct a socially binding mythos. The sheer ubiquity of certain archetypal patterns in mythic structures suggests psychic parallels between otherwise disparate languages and

cultures. Evolving from a sequence of experiences that imprinted themselves in the collective psyche of a prehistoric humankind, archetypes blossomed into the complexity of an unending narrative. And although obscured by the translations of telling and retelling, the original power of the imprint ensures the preservation of the archetypes that represent it.

At the heart of humankind's social evolution are the unspoken laws of the physical world, and *The Golden Bough* appropriately begins with a study of humankind's exploration and interpretation of its relationship to the forces of nature. Central to this relationship is the paradoxical belief that humanity is both threatened by a universe rife with powers beyond its understanding, and able, by virtue of intellect and imagination, to command these powers. Frazer makes references to sorcerers and magicians who believed themselves able to master the winds, guarantee a good harvest, and even usher the sun on its path across the heavens. Driven by a need to bring order to chaos, such figures developed rituals to maintain the natural balance so crucial to survival. Frazer often notes that individuals projected into the mystery of natural phenomena a vast array of dangers and wonders: within every tree dwelt a spirit; maladies were the product of malevolent sorcery; the stars themselves guided destiny while phantoms thronged the night.

Beset by so many perils on every side, early communities drew strength and comfort from their collective, and united themselves behind a figure or group of figures on whose shoulders rested the responsibility of protecting the community against their unseen enemies: "The belief that kings possess magical or supernatural powers by virtue of which they can fertilize the earth and confer other benefits on their subjects would seem to have been [widely] shared" (Frazer 1959: 15). However, the divine person of the god-

man or king was as much a source of danger as the evils his power purported to hold at bay; he was “contagious”: a fire that could destroy what it touches. The god-king, as the embodiment of spiritual power and authority, represents the dichotomy between good and evil in human form, even as the earliest gods themselves were imagined in the likeness of men and women.

The mortality of the gods is indivisible from their immortality, and arising out of this tension are the myriad divinities of death and rebirth – of which Jesus Christ is but one example. Early in human history, certain “more thoughtful” individuals realized that their “magical rites” were not responsible for seasonal alterations. “They now pictured to themselves the growth and decay of vegetation, the birth and death of living creatures, as effects of the waxing and waning strength of divine beings, of gods and goddesses, who were born and died, who married and begot children, on the pattern of human life” (Frazer 1959: 52). C. G. Jung would later acknowledge that archetypes reflected cyclical patterns in consciousness that mirrored larger cycles in the natural world – cycles from which he believed modern humanity to have been alienated by an insistence on science and technology at the expense of a deeper and more intense relationship with a mythic and largely unconscious origin. Humanity has ever been preoccupied with altering the parameters of life: with chasing immortality, with commanding those forces that would endanger human life, with seeing in the patterns of the natural and supernatural some semblance of the human condition. So in the Hindu *Upanishads* we find references to food both spiritual and material, sustenance of the body as well as the immortal *atman*; and in Christianity the sacrament of the Eucharist, the partaking of purity and redemption as sustenance.

“But,” Frazer writes of humankind, “though he knew it not, these glorious and awful beings [i.e., the gods] were merely . . . the reflections of his own diminutive personality exaggerated into gigantic proportions by distance and by the mists and clouds of ignorance upon which they were based” (Frazer 1959: 59). The rituals Frazer describes were likely designed to express emotional reactions to the traumatic impact of life on early humanity. They both recall the initial trauma and confront it. This confrontation is a redemption and an assimilation, a cathartic push toward self-realization that is the goal of tragedy and analytical psychology, storytelling and meditation.

Archetypal criticism is directly concerned with this confrontation, which typically marked a transgression of the boundary between the sacred and the profane. Frazer’s expansive description of magical acts and rites is an ambitious testament to a universal language of ritual acts designed to communicate with a psychical realm known in some fashion to every culture around the world.

MAUD BODKIN AND *ARCHETYPAL PATTERNS IN POETRY*

First published in 1934, Maud Bodkin’s work bridged the spheres of literary criticism and analytical psychology. *Archetypal Patterns in Poetry* moved the language of archetypal analysis away from the purely anthropological and psychological while retaining the most important feature of Frazer’s and Jung’s work: an emphasis on the enduring ability of archetypes to engender an emotional and potentially transformative response in an individual or group. Whether this response is the product of archaic beliefs and ritual practices, or the dynamics of a collective unconscious exerting a subtle yet penetrative influence on a

personal and social level, the emotional resonance of archetypal patterns represents a meeting point among the diverse views of archetypal critics. Bodkin argues that archetypal patterns evolve through literature, especially in poetry. Their recurrence encourages a type of recalled emotional response, Bodkin maintains: "Through such recall one feels the kind of life one shares with plants and animals and the earth itself, present as a factor in the imaginative experience, together with the life shared with the poet as master of words and thought" (1934: 22).

Experiencing the emotional impact of an archetypal pattern is an encounter of significant psychological magnitude, especially when the archetype in question remains unconscious. However, when brought into the light of the conscious and rational mind, the archetypes become symbols, capable of entering into dialogue with the psyche and providing insight into the deeper meaning behind their presence. In this sense, the archetypes are encounters with one's ancestors, as the patterns they embody are ancient. Understanding the past, tracing backwards in time an archetypal narrative shared by a collective of individuals, awakens the self to an ongoing process of mythologization. "In poetry," Bodkin writes, "we may identify themes having a particular form or pattern which persists amid variation from age to age, and which corresponds to a pattern or configuration of emotional tendencies in the minds of those who are stirred by the theme" (1934: 18). This idea of correspondence is crucial; for Frazer, it may be identified as the magical principle of "like produces like," wherein a ritualized symbolic action promotes an external response tangible to the community. For Jung, this correspondence was interpreted as a synchronicity between internal and subjective dynamics and the seemingly objective world, a phenomenon that dem-

onstrated the reality of an exchange between the psyche and a larger system of meaning. This exchange is conducted in symbols, and these symbols are in turn couched in language. The presence of an archetypal pattern can be revealed according to the language employed to represent it, and this is a point Bodkin explores in her study. Words and thought, she suggested, need not damage the archetypal resonance they naturally carry; rather, when in the hands of a skilled poet, they preserve and project this resonance through language by virtue of an emotional and psychical sympathy.

Through the analysis of dreams, automatic writing, and a variety of other techniques, Jung sought to reveal the workings of archetypal forces hidden among spontaneous actions and unpremeditated creation, to make conscious what was unconscious, the better to subject it to the rational will of the subject. In this way, the unconscious assumed a role analogous to the mischievous spirit bound to the sorcerer by virtue of his art. According to many legends, such spirits were commanded by the sorcerers to provide them with information concerning the past, present, and future – all accessible to an entity unfettered by time. The poet similarly facilitates a communion between an audience and this "collective heritage." As Bodkin notes, "if we would contemplate the archetypal patterns that we have in common with men of past generations, we do well to study them in the experience communicated by great poetry that has continued to stir emotional response from age to age" (1934: 22). She identifies these patterns as those of rebirth, heaven and hell, the feminine, and the hero – archetypal images and characters that operate by evoking a particular sympathy in the reader. Jung maintained that these forces could, when discerned, be adapted to support the creative and progressive endeavors of the individual.

Like Jung and Frazer, Bodkin linked symbols and archetypes in poetry to the earliest human experiences; thus, for her, Shakespeare's tragedies conveyed an "emotional meaning that belonged to ancient rituals undertaken for the renewal of the life of the tribe" (Bodkin 1934: 35). But Bodkin here joins the two by suggesting that it is literature – and poetry in particular – that promotes healthy development in the symbolic life of an individual or community and that unites the ancient and modern, solidifying the bond between past and present so necessary to the continued relevance of archetypal symbols. It is through the inheritance of poetry and literature that we are able to ignite vestiges of archaic experience in our own consciousness; and it is through literature that we are able to adapt the emotional experience of these encounters to the social needs of our communities in the present. We are able to remember our cultural selves through stories that have been told in varied form throughout history, stories that find expression in the rituals and dreams of our lives. And just as dreams and ritual visions were considered prophetic and oracular in nature, so is literature a medium of prophecy and promise, a means of ensuring the immortality of our most ancient stories. Moreover, it is possible that, as Bodkin points out, the rhythms of nature and human life are so well mirrored in poetry, because the rhythms of poetic language are, for Bodkin at least, coincident with those of memory and experience.

For Bodkin, the symbolic character of a hero's journey is decided by the nature of his psychic "inversion," an ability to plunge into "untried resources of character" (1934: 26). Bodkin is speaking of the heroic quest, an archetypal progression central to traditional archetypal criticism; but she is also pointing to something deeper in her description. The process of "plunging into

the depths" of the mind is directly analogous to the individuation process described by Jung, directly analogous to ancient rituals of initiation and transformation, and is in the *Aeneid* poetically expressed through a context unique to a particular culture and time yet transcending both.

Like the magic of contagion described by Frazer in *The Golden Bough*, the poetic experience spreads throughout a sensitive audience, moving the individual members of that collective to personal introspection – a plunge into the depths of the past conducted in the solitude of individual recollection and in the communion of a social gathering. For Bodkin, this form of "conquest over the dark powers" is made through a gift, "a deeply probing participating vision" (1934: 28), that functions as a socially binding tool: a means by which mythic patterns are repeated from age to age and a means by which that pattern is used to generate and sustain the belief system of a community. Mythology, transmitted through the vision of poetry, is so culturally pervasive that it can be used to support the justification of a war; it can be used to project an ideal toward which each individual might strive; and it can reify a collective belief in certain values in order to ensure the survival of the whole.

Bodkin's hypothesis concerns not only the individual reader but a general audience as well; in this way she addresses the communal experience of myth initially explored by Frazer. Myth is brought into the sphere of collective and material life by the poet and novelist, Bodkin suggests, both objectified through analysis and yet revealed as an abiding source of emotional significance. In this, she brings a Romantic sensibility that sees the poet as a hypersensitive observer together with a Jungian conception of how symbols function in communities. The poet transforms experience for the community and, at the same time, reveals "a certain

tension and ideal reconciliation of opposite forces in present in actual life” (Bodkin 1934: 17). Her emphasis on psychoanalysis and archetypes, together with a highly affective poetics, make Bodkin’s *Archetypal Patterns in Poetry* a compelling application of Jungian ideas and the model of a form of theoretically driven literary criticism that reached a decisive threshold with the publication, a generation late, of Northrop Frye’s *Anatomy of Criticism* (1957).

NORTHROP FRYE AND THE NEW SCIENCE OF ARCHETYPES

Northrop Frye’s innovation was to create distinct archetypes for literary narrative and to construct a form of literary history that was grounded on the traversal of archetypes through the development of a form. Though he does not cite a Jungian influence, his theory of archetypes, and the models he developed to exemplify archetypal forms, resembles the Jungian one of a universe dominated by *anima* and *animus*, the archetypes of soul and personality. Frye is far more the formalist than Jung, and rarely strayed into the mystical. In one sense, then, Frye sought to formalize archetypal criticism, without robbing it of its inherent belief in universal forms. Because he managed this so successfully, Frye’s influence on literary studies was widespread, well into the 1960s, when poststructuralism arose precisely against formalist criticism.

The *Anatomy of Criticism* addressed what Frye believed was a deficiency in the discipline of criticism: the lack of a central hypothesis that could organize and unify the materials of the literary critic. “Criticism,” he writes, “seems to be badly in need of a coordinating principle, a central hypothesis which, like the theory of evolution in biology, will see the phenomena it deals with as parts of a whole” (Frye 1957:

16). This whole, he goes on to say, is impossibly large, composed of innumerable parts that if considered as purely separate entities will mire the analyst in endless and fruitless efforts. It is only upon discerning patterns within the whole that analysis becomes meaningful as a social science capable of making assertions. These patterns are recurring and representative of a common origin, a source-point of image, character, and form that anchors the diversity of literature and poetics to a specific order: “We begin to wonder if we cannot see literature, not only as complicating itself in time, but as spread out in conceptual space from some kind of center that criticism could locate” (1957: 17).

The idea of this center is distinctly modernist in flavor, and preserves a vital tenet of archetypal criticism since Frazer: when abstracted from context, archetypes and archetypal patterns reveal a universal quality underlying the infinitely varied expressions of humanity. Literature, for Frye as for Bodkin, best exposes the underlying correspondence between imagination, human experience, and archaic memory. This correspondence is of an ancient and mythic nature, best expressed in stories and fairytales. Indeed, Jung’s work is supported by many references to folk tales and legends, and Frye follows suit by acknowledging a universality of patterns extant among the varied forms and genres of literature. “The criticism which can deal with such matters,” Frye maintains, “will have to be based on that aspect of symbolism which relates poems to one another, and it will choose, as its main field of operation, the symbols that link poems together” (1957: 96). This is the warrant of archetypal criticism as Frye understands it. An archetype is “a communicable unit . . . a typical or recurring image . . . a symbol that connects one poem with another and thereby helps to unify and integrate our literary experience”

(99). Unlike signs, Frye argues, the archetypes are “associative clusters” of a complex and variable nature, rooted in cultural representation and convention; consequently, they are “most easily studied in highly conventionalized literature” (104). Frye believes that archetypes are more readily visible, and lend themselves more readily to interpretation, in popular literature. Popular genres, highly conventional in structure and theme, not only reach large audiences, they also convey archetypal images in simpler, more explicit ways than in classical or “high” literary forms. In any case, archetypes serve to unify the literary experience, to bring the reader, through a given text, into dialogue with the wealth of experiences that literature communicates. Frye focuses on several modes, including the symbolic, mythic, and rhetorical, and identifies patterns in literature that convey meanings based on genre and form, structure and language.

One of Frye’s most important contributions to archetypal criticism is his claim that myth functions as a narrative and that archetypes function as units of meaning within that narrative. And in a claim that looks forward to radical affective or “libidinal” approaches to texts, genres, and discourse that will arise at the “poststructuralist turn” (from the mid-1960s), Frye suggests that in narrative “myth is the imitation of actions near or at the conceivable limits of desire” (1957: 136). At one end of the mythic scale is pure mythic narrative, wherein the archetypes are active in their purest state – as gods and heroes, devils and sorcerers. Frye explores several narratives of this kind: the apocalyptic, or heavenly, the demonic, and the analogical. At the other end of the scale, as myth approaches and becomes subordinate to the constraints of realism, the archetypes become increasingly displaced by metaphor. Characters or landscapes in realist representations often take on archetypal significance

based not on mythic personages or forces but rather on moral and ethical concepts. Thus, the archetypal Hero may be submerged within a narrative of contemporary events and themes in which the mythic substratum emerges only indirectly. In Frye’s system, the principal modalities – romance, tragedy, irony, and comedy – characterize the general narrative thrust of archetypes and it is theoretically possible to find one embedded within another. Frye suggests that these modalities “are all episodes in a total quest-myth,” and suggests further that, for example, “comedy can contain a potential tragedy within itself” (1957: 215).

CONCLUSION

While structuralist and poststructuralist methodologies by and large have surpassed archetypal criticism as dominant modes in the academy, the latter has by no means been discarded as a valid method of criticism. On the contrary, it has adapted to changes in scholarship and methodology, and the fundamental concepts that define the language of archetypal analysis continue to circulate in a variety of mediums. The work of post-Jungian critics like Leslie Fiedler, Richard Slotkin, and Andrew Samuels remain relevant, while new challenges arise to provoke growth and revision. Such an approach offers an alternative to Jung’s distrust of language. By combining Frye’s approach to archetypes as structural components of narrative patterns and Jung’s approach to archetypes as numinous psychic entities, one can appreciate the malleability of archetypal analysis, its multiplicity of interpretation, and also the extent to which a text can be seen as a reflection of larger patterns in a given culture. Today, symbols circulate more freely than ever before across cultural and national boundaries in ways unimaginable to either Frazer or Jung. In an era of

globalization, archetypal criticism offers an interpretive model that can discern larger patterns amid a chaos of disassociated fragments. The prevalence of symbolic imagery in postmodern literature, across genres, invites an analytical method designed to interpret the relationship of symbols and archetypes to one another and to the larger communities in which they are produced and consumed.

Archetype

ALEXANDER CHIRILA

Archetypes, understood as universal symbols of psychic reality, were first described systematically by the Swiss psychoanalyst, C. G. Jung. In their simplest and most familiar forms, archetypes are character images (e.g., the Hero or Father), but they can take a variety of more abstract forms (e.g., Anima and Animus). They are commonly found in myths, parables, fairytales, and a wide range of literary texts of primordial human experience. They are landmarks on the path of human evolution, and their interactions express the dynamics of a changing mind. According to Jung, archetypes can be found in the unconscious and conscious minds, where they take on stylized and ritualized forms, far removed from the realm of actual experience. In their primary form, they are signs composed of two distinct and intertwined elements. The first is a stable, universal and primordial core of meaning, and the second is a surrounding flux of signification and association that adapts to social, cultural, and ideological contexts. Although universally familiar, archetypes are promethean; although transcendent by definition, they are rarely seen out of context. Post-Jungian George H. Jensen has written that "Archetypes, which Jung says evolve over time, are constantly being transformed and reinterpreted by the individual's consciousness, and they are inseparable from language, history, and culture" (2009: 4).

During the first decade of the twentieth century, Jung developed a system of analysis based on the premise that neuroses and

other behavioral patterns were caused by the influence of inherited psychological images that possessed a universal and instinctual character. Jung went on to argue that these images could not have been consciously appropriated by the individual, but were rather pre-existent in the psyche, and moreover, were directly analogous to images, symbols, and characters found in virtually every world myth canon. The earliest stories, according to Jung, were the purest repositories of archetypal images, inasmuch as archetypes were among the first classifications to have been created, the first to be shared and communicated, and the first elements of any oral or written literature that would serve to frame the history of a given community. Embedded in the collective memory of the human being, archetypes are propagated on a personal and communal level, appearing in the individual psyche as well as in the collective. On the collective level, archetypes evolve to reflect the input of multiple storytellers.

In a clinical setting, archetypes are identified symptomatically. Jung wrote that “The symptomatic contents are in part truly symbolic, being the indirect representatives of unconscious states or processes whose nature can be only imperfectly inferred and realized from the contents that appear in consciousness” (Jung 1969b[1954]: 175). Initially, archetypes constellate as embodiments of instinct, rising from the lower levels of the unconscious mind toward consciousness in response to certain needs and desires. Interacting with the conscious mind, they influence and interact with the psyche in a positive or negative way, depending on the extent to which the individual is able to interpret and command the energies released by the archetypes.

This activity of interpretation and command is contrasted to what Jung calls “archetypal numinosity”: “a dynamic agency or effect not caused by an arbitrary

act of will. On the contrary, it seizes and controls the human subject, who is always rather its victim than its creator . . . The *numinosum* is either a quality belonging to a visible object or the influence of an invisible presence that causes a peculiar alteration of consciousness” (Jung 1969a: 6). The greater the numinosity belonging to an archetype, the more power it has, the greater its potential to project, possess, and influence consciousness. In literary and cultural texts, numinosity functions as a centralization of specific qualities that actively influence the trajectory of a narrative. Archetypes infuse text with symbolic associations that can be traced back to earlier patterns of mythic representation, threading a stratum of influence that highlights the development of an icon from one context to another. The archetype of the warrior, for example, can be found in the *Epic of Gilgamesh* as well as in the *Red Badge of Courage*; though it is the difference in context and form that reveals the deeper significance of the similarities between those texts on an archetypal and unconscious level. Through archetypal comparison and analysis one might trace the evolution of the archetype in the collective psyche and thereby observe the differences and similarities in culture and era that are expressed by the appearance and function of that archetype.

Jung identified several major archetypes: the Hero, Mother, Father, Shadow, Anima/Animus, and the Self. The Hero is the most familiar archetype, normally coupled with the myth-pattern of the heroic cycle. For Northrop Frye, the elements of the heroic cycle are birth, conflict, death, rebirth, and triumph. The Hero is a figure of movement and change, typically the focus of a quest narrative, but also an embodiment of the evolving mind in pursuit of individuation, which for Jung was the goal of human development, the union of the conscious and unconscious mind. Linked to the Hero

archetype is the Shadow, the repository of impulses that are repressed or deemed dangerous or subversive to the “balanced” psyche. It is also the focal point of traumatic experiences that provoke fear and terror in the individual mind, and is veiled in defense mechanisms ranging from bigotry and superstition to the more aggressive responses of conflict and victimization. The Shadow is also the nemesis, the doppelganger, a dark mirror to the archetype of the Self. In its transcendent aspect, the Shadow is the battlefield of psychological conflict and resolution, the hope of evolution and growth through struggle and suffering.

The Mother archetype, true to the dualistic and contradictory aspects of the prime archetypes, can be nurturing and devouring, beautiful and terrible, merciful and pitiless. She is the sacred feminine incarnate, the Mother Earth, as well as the central representative of the deepest levels of the unconscious mind, the womb of thought and memory. In this respect she is a synthesis of dualities, an emergent figure of unfathomable proportions. In a psychological context, the Mother can represent the focal point of an abandonment neurosis, or she can indicate the adoption of a maternal role with respect to a relationship. This archetype can also promote idealization, a host of symbolic qualities projected onto an individual or idea that are only later displaced by the conscious mind. The Mother, in her destructive aspect, can signal a cathartic purging of emotional trauma potentially followed by growth and rejuvenation, a period overseen by the Mother in her nourishing aspect.

By contrast, the Father is the archetypal symbol of order, authority, and kingship. He is the lawgiver and judge, provider and punisher; he is more closely associated with language and consciousness and for this reason is linked to the higher levels of the unconscious psyche. He can be a central

figure, commanding the focus and attention of the conscious mind – an almost godlike icon of absolute power – or he can be a liminal figure, the hermit dwelling exiled and alone, possessor of hidden and occult knowledge. In his destructive aspect, he is the tyrant and dictator, fierce and harsh. In his benevolent aspect, he is a dispenser of wisdom, caretaker, and source of strength. In his transcendent aspect, he is a deity, unapproachable and inscrutable.

The Anima/Animus archetype represents the liaison between the conscious and unconscious mind, facilitating dialogue between the desires of the Self and the ego. Jung maintained that the Anima/Animus was a balancing archetype, ultimately serving to encourage individuation. As a balancing figure, the Anima is often taken to embody an opposing or complementary characteristic; thus, Jung posited that she was a feminine icon to the male psyche (Anima), and a masculine icon to the female psyche (Animus). However, it is possible to see in this figure, regardless of gender, a source of life-breath, inspiration, and direction as well as a guide and lover, friend and counselor. In its darker aspects, this archetype is a tormentor and dark messenger, bearer of despair and ill news. In its transcendent aspect, the Anima/Animus is a messianic icon, and for this reason a juxtaposition of masculine and feminine characteristics exist in many images of messiah figures, as well as an absence of gender markers in divine figures charged with the conveyance of messages and omens between the sacred and profane worlds.

The Self is the archetype of totality. Jung found this concept expressed most clearly in the mandala of Eastern spirituality, generally comprising balanced figures and colors circumscribed by a circle. The Self is infinite, autonomous, and ever in search of transformative experience; it is the most malleable and mercurial of archetypes, able to

transform into many of the other primary and secondary archetypes, most notably the Hero and its counterpart, the Shadow. In many ways, the Self can be said to contain the latent potential of transformation, and so contains within itself all other archetypes. In this sense, the Self is the ultimate transcendent archetype, a perfect union of opposing qualities harmonized and represented by the symbol of a balanced mind. The Self is the fulfillment of promise and prophecy, the Enlightened spirit of both Western and Eastern systems of belief and religion.

There are a considerable number of secondary archetypes, many of which are associated with the major arcana of the tarot deck and the many gods of classical mythologies. In many cases, however, these secondary archetypes are more detailed manifestations of a base archetype, whose richness leads to the secondary manifestations an almost infinite variety. Tracing secondary archetypes back to their sources can provide a basis for understanding the inherent similarity between cultural and literary symbols, and also the differences that distinguish them from their universal origins.

Arnold, Matthew

JAMES WALTER CAUFIELD

Matthew Arnold (1822–88) was one of the most influential literary critics and cultural theorists in the nineteenth century. In the 1860s and early 1870s, he was a much admired poet, and he encouraged his contemporaries to practice the “grand style” in poetry and to aim, as he said the classical poets had, at “unity and profoundness of moral impression” (Arnold 1960–77, II:5, I:12). In Arnold’s view, “poetry is at bottom a criticism of life,” and “the greatness of a poet lies in his powerful and beautiful application of ideas to life” (IX:46). He began his career as a school inspector, in part so that he could marry Frances Wightman, and by the 1860s had turned from poetry to literary and cultural criticism. Though his

poetry is still widely anthologized, his criticism had become, by the late twentieth century, less a source of inspiration and insight than an object of controversy. As a literary critic, he focused on the ameliorative quality of literature and engaged in a vigorous debate with Thomas Huxley on the role literature should play in education. Arnold's provocative claim that great literature could fill the void created by the diminishing role of the Church of England, and thus serve as a source of social and moral guidance, influenced criticism well into the twentieth century, particularly the work of T. S. Eliot and F. R. Leavis. Despite the obscurity into which his criticism fell after the 1960s, Arnold's conception of culture had a profound effect on late twentieth-century cultural studies (Young 1990; Said 1993; Pecora 1998).

Arnold's family background to some extent predisposed him to think deeply about education, religion, and culture. His father, the Reverend Dr Thomas Arnold (1795–1842), was a headmaster of Rugby School, and the reforms he instituted there eventually became standard throughout the British public school system. Like his father, Arnold devoted his career to the improvement of education, particularly for the middle and working classes. As a government inspector of schools, he produced reports on the elementary and secondary school systems in England, on teacher training, and on higher education on the Continent. He was also an unflinching opponent of the payment-by-results method of allocating school funding, which the British Parliament first imposed in the 1860s. Along with these professional duties, Arnold held the poetry chair at Oxford from 1857 to 1867. His own uniformly melancholy, even despairing verse – “Dover Beach” (1867) is emblematic – contrasted strongly with the triumphalism that characterized much mid-nineteenth-century English poetry. As

one of his twentieth-century critics noted, “At a time when official thought was announcing the Englishman's ascent to the heights of human possibility, Arnold declared that the modern man was crippled and incomplete” (Trilling 1939: 79).

Like his contemporaries Thomas Carlyle and John Stuart Mill, Arnold was painfully aware of the moral and material uncertainties that characterized the transitional era of mid-Victorian Britain. He first made note of this uncertainty in the “Preface” to *Poems* (1853), in which he lamented the “bewildering confusion of our times,” an “age of spiritual discomfort” that was “wanting in moral grandeur” (Arnold 1960–77, I:14). His inaugural address as Oxford professor of poetry in 1857, “On the modern element in literature,” called for an “intellectual deliverance” from the “impatient irritation of mind” that arises in the face of the “immense, moving, confused spectacle” of the modern age, a spectacle that “perpetually excites our curiosity” even as it “perpetually baffles our comprehension” (I:20). Arnold looked particularly to the literary masterpieces of classical antiquity for “adequate models” of the “grand style” that the modern mind required (I:136). The “grand style,” as he described it in *On Translating Homer* (1861), should be “rapid in movement, simple in style, plain in language, natural in thought,” and “above all, *noble*” (II:127). Criticism, for its part, must aim “to see the object as in itself it really is” (I:140).

Arnold's first collection, *Essays in Criticism* (1865) brought him immediate notoriety, not least for his attention to philosophers, religious mystics, and French, German, and Italian literary figures, to the exclusion of all English-language authors. “The function of criticism at the present time,” often read as Arnold's critical manifesto, describes the relation between criticism and literature. “The critical power,”

Arnold writes, “is of lower rank than the creative.” Above all, it must be able to recognize the nature of literary art in relation to the era in which it is written. “For the creation of a master-work of literature two powers must concur, the power of the man and the power of the moment, and the man is not enough without the moment” (Arnold 1960–77, III:261–2). Arnold distinguished two moments: an “epoch of expansion,” fostered by “a certain intellectual and spiritual atmosphere, by a certain order of ideas” (III:261) in which the “creative literary genius” can produce great works; and an “epoch of concentration,” in which the critical power predominated, slowly preparing the ground for an eventual expansion (III:260–1, 268–9). “Criticism first,” Arnold said, “a time of true creative activity, perhaps, – which, as I have said, must inevitably be preceded amongst us by a time of criticism, – hereafter, when criticism has done its work” (III:269).

Arnold believed that criticism must aim “to see the object as in itself it really is” (1960–77, I:140). It is, moreover, the

disinterested love of a free play of the mind on all subjects, for its own sake . . . it obeys an instinct prompting it to try to know the best that is known and thought in the world, irrespectively of practice, politics, and everything of the kind; and to value knowledge and thought as they approach this best, without the intrusion of any other considerations whatever. (III:268)

The critic should remain independent of what Arnold called the “practical spirit” – by which he meant politics and political discourse – and maintain a “simple lucidity of mind” when contemplating “fresh and true ideas” (III:280, 271). Criticism must be “sincere, simple, flexible, ardent, ever widening its knowledge,” and critics must cultivate “simple lucidity of mind” and “the

Indian virtue of detachment” in their “disinterested endeavor to learn and propagate the best that is known and thought in the world” (III:285, 274, 283).

In one of his most important and substantial essays, “On the study of Celtic literature” (1868) (first delivered as a lecture in 1865), Arnold made the case for the cultural and historical importance of Celtic language and literature, particularly the Welsh bardic traditions. But he did so in the context of a discussion of the proper place of the Celtic nations in the British Empire. “Let the Celtic members of this empire consider that they too have to transform themselves,” he wrote. “Let them consider that they are inextricably bound up with us, and that . . . we English, alien and uncongenial to our Celtic partners as we may have hitherto shown ourselves, have notwithstanding, beyond perhaps any other nation, a thousand latent springs of possible sympathy with them” (III:395). Celtic energy and feminine sensitivity to the natural world could best flourish when combined with the solid practicality of the Teutonic strain in the English people and its culture. Though Arnold’s argument with respect to Celtic literature and culture was hedged by his belief in their proper place within the empire, the essay nevertheless earned him the scorn of xenophobic critics.

The concern for culture, particularly as it constituted a bulwark against social and political chaos and philistinism, dominated Arnold’s later works. He was a tireless opponent of middle-class English chauvinism, provinciality, and complacency. In *Culture and Anarchy* (1869), Arnold mounted the most sustained assault on the unthinking sectarianism and class-bound partisanship of the “Barbarians,” “Philistines,” and “Populace,” his memorable terms for, respectively, the English upper, middle, and working classes (Arnold 1960–77, V:137). He analyzed England’s moral and intellec-

tual culture in terms of two distinct qualities, "Hellenism" and "Hebraism," his names for the Greco-Roman and Judeo-Christian traditions that formed European civilization (V:90). In Arnold's view, England's overzealous pursuit of Hebraism's "strictness of conscience" had produced widespread "vulgarity and hideousness," an imbalance best corrected with the beauty and intelligence of Hellenism or, in his famous words, with "sweetness and light" (V:165, 125, 90). Arnold defined culture in terms strikingly similar to those he used to define criticism: culture is "a pursuit of our total perfection by means of getting to know, on all the matters which most concern us, the best which has been thought and said in the world" (V:233). He also called it "the *social idea*," which "consists in becoming something rather than in having something" (V:113, 95). Culture conceives "of true human perfection as a *harmonious* perfection, developing all sides of our humanity; and as a *general* perfection, developing all parts of our society" (V:235). Where class-bound English society has the effect of "materializing our upper class, a vulgarized middle class, and a brutalized lower class," culture "seeks to do away with classes" and "is not satisfied till we *all* come to a perfect man" (VIII:299; V:113, 112).

Arnold's influence on late Victorian, Edwardian, and Georgian critics was considerable and appears plainly in the works of Walter Pater, Arthur Symons, John Addington Symonds, Leslie Stephen, F. H. W. Myers, George Saintsbury, Oscar Wilde, Walter Raleigh, and Arthur Quiller-Couch. T. S. Eliot never entirely escaped his shadow, and the critics I. A. Richards and F. R. Leavis were faithful Arnoldians. The American neo-humanists Irving Babbitt and Paul Elmer More claimed critical descent from Arnold, although they did not share his liberal political views. Today Arnold's ideas occupy at most a rather minor place within the disciplinary spheres of literary and cul-

tural theory, and his "residual influence," according to Edward Said, is "more or less negligible" (2004: 33). Sharp criticism of Arnold arose in the New Left movement in Britain in the 1960s and 1970s and in the emerging schools of cultural studies and postcolonial studies in the US and Britain in the 1980s and 1990s. Particularly during the so-called culture wars of the 1980s, Arnold's name became virtually synonymous with rigid Anglophone canonicity and a byword for highbrow cultural authority. To conservative defenders of the Great Books tradition, Arnold became a bulwark against the rising tide of barbarism; indeed, Stefan Collini has argued that Arnold wielded "an immense, perhaps decisive, influence over our whole way of talking about 'culture'" (1988: 46). However, to progressive advocates of cultural studies, Arnold was the stereotypical "dead white European male." His claims for culture and criticism can still prompt fierce debate; and while his ideas demonstrate a remarkably tenacious (if largely unacknowledged) hold on the modern cultural, political, and ethical imaginary, he is today an object of study primarily for the historian of ideas.

Arnold's ideas exerted a pervasive influence on the formation of modern literary criticism in the nineteenth century and on academic English studies in the twentieth. When the congenital heart defect that had prematurely killed both his father and grandfather finally claimed him in April 1888, Arnold was universally acknowledged to be Britain's foremost man of letters. Raymond Williams called him a "great and important figure in nineteenth-century thought" and said that that we shall, "if we are wise, continue to listen to him, and, when the time comes to reply, we can hardly speak better than in his own best spirit" (1958: 128). The contemporary student of literary and cultural theory will find in Arnold a fierce defender of the idea of

culture and of criticism as a disciplined engagement with the most important ideas of the day.

Auerbach, Erich

GEOFFREY GREEN

Erich Auerbach (1892–1957) was one of the most important literary historians and comparativists of his generation. Though his work was grounded in philology and the close analysis of texts, he introduced into comparative studies a crucial historical dimension that has gained renewed importance in the wake of new historicist modes of criticism and theory. His ideas about mimesis and the development of a “mixed style” have proven useful to émigré, diaspora, and postcolonial theory, to postmodern literary and cultural theory.

Auerbach was born in Berlin in 1892, the son of middle-class Jewish parents, and studied in Berlin, Freiberg, and Munich. He received a doctorate in law in 1913 and soon thereafter served in the German army. After the end of World War II, he changed disciplines and obtained a PhD in philology. Employed first as a librarian, he was appointed Chair of Romance Philology at the University of Marburg in 1929; in 1935, he was forced into exile by the Nazi regime. During his exile, first in Turkey and then in the United States, Auerbach produced his most important work, *Mimesis* (1953). After teaching in a number of US universities, he was appointed Professor of Romance Philology at Yale University in 1950.

The foundation of Auerbach's literary history was a tradition of historicism that included the work of G. W. F. Hegel and,

pre-eminently, the philosophy of Giambattista Vico, who believed in “the concept of the historical nature of men. He identified human history and human nature, he conceived human nature as a function of history” (Auerbach 1984: 198). The case for the primacy of human history is particularly evident in *Dante, Poet of the Secular World* (1929), in which Auerbach argues that Dante’s *Divine Comedy* is “a picture of earthly life. The human world in all its breadth and depth is gathered into the structure of the hereafter and there it stands . . . Doctrine and fantasy, history and myth are woven into an almost inextricable skein” (Auerbach 1961[1929]: 133). It is this very secular dimension of Dante’s work that led Auerbach to read it in terms of a “mixed style,” one that violated the “separation of styles” (e.g., a sublime or “high” style for aristocratic subjects, a vulgar or “low” style for common or mundane themes) that had been the norm in ancient and medieval literature. In “Figura” (1939), he developed a mode of interpretation that included both scriptural influences and images as well as the concrete reality of human experience. Auerbach defines the concept of *figura* as “something that is real and historical that announces something else that is also real and historical. The relation between the two events is revealed by an accord or similarity” (Auerbach 1984: 29). His illustrations of this concept – involving passages of biblical prophecy – underscores the extent to which sacred texts were touchstones for his theoretical reflections. As in *Dante, Poet of the Secular World*, in “Figura,” he made religious subjects available to historical interpretation and representation and deepened his ongoing exploration of the interconnectiveness of ancient and medieval literature with present historical circumstances (e.g., the rise of Nazism in Germany).

Auerbach’s vision of a secular criticism that respected religious contexts and influ-

ences was sharpened under the conditions of exile, which forced him to rely, in the absence of library resources, on his own understanding of a cohesive and integrated Western literary history. He managed, while writing *Mimesis* in Istanbul, to reconstitute that history in a series of close readings of texts based largely on the short passages of works he was able to acquire through Istanbul State University, where he taught during his time in exile. In addition to the challenge posed by his lack of research materials, Auerbach set himself the additional challenge of developing a new method of composing literary history. He assembled a collection of short passages from Homer to Virginia Woolf, reading each in such a way that the exemplary passages provided a key to the historical period from which it was derived; taken together, these interpretations illustrate the evolution of Western literature. As a response to the threat posed by World War II to European literature and culture, *Mimesis* upholds both the “uniform illumination” of Homer’s style and the more suggestive ambiguity of Old Testament narrative; it conveys the consistency of a Western tradition in which the principle of mimesis unifies what are only apparently separate strands of secular and sacred literature.

Linked to this vision of history is a belief in the union of plain and elevated styles. Auerbach praised depictions of the “common man” especially when the “general human quality” was subjected to “serious,” “problematic,” or even “tragic representation.” Auerbach affirmed the achievement of Dante, in whose strategies of “figural interpretation” we find elevated and plain styles unified in a single intermediate style that combines humanistic and sacred elements. For Auerbach, the culminating moment of our literary tradition took place when humanistic and historicist values supplanted the supreme position of

Christianity, which had itself undermined the fixed hierarchical values of ancient literary depiction. Throughout *Mimesis*, Auerbach reminds his readers of the political and historical circumstances that contributed not only to the creation of the literature he discusses, but also to his own ideas, his own conceptual methodology, his own choices and interpretive readings.

Auerbach's view of literary history accords with his general view of historicism, grounded in the work of Vico, "according to which the nature of thing is to be found in its history" (Ankersmit 1999: 54). Through Vico, Auerbach was able to arrive at a theory of historical relativism that does not induce "epistemological panic and despair" (Ankersmit 1999: 54). He thought it wrong, he argued in "Vico's contribution to literary criticism," "to believe that historical relativism or perspectivism makes us incapable of evaluating and judging the work of art . . . Historical relativism has a twofold aspect: it concerns the understanding historian as well as the phenomenon to be understood. This is an extreme relativism, but we should not fear it" (Auerbach 1967: 262). This late essay, published in the year before the author's death, revisits the concerns articulated in "Figura." It also presages the trend towards historical criticism that would accelerate in the 1970s, in which historical relativism is reconceptualized as a problem of textuality, specifically the indeterminacy and unreliability of historical representation.

One of Auerbach's last works, *Literary Language and Its Public in Late Latin Antiquity and in the Middle Ages* (1965), was, as he put it, a "supplement to *Mimesis*." Just as he used short passages from a wide range of works in *Mimesis* to reflect on the representation of reality in Western literature, in *Literary Language* he took distinctive words or phrases as points of origin for interpretations that resonated outward

from the text into philosophical meditations on society. Like his other later works, this one displays a spectral tonality, a suggestion that the world as we understand it within history can change at any time or come to an end, a sense of stoicism in the face of resignation, which both reflects upon and reproduces the perspective of exile.

Throughout his career, Auerbach elaborated on the concept of a *Weltliteratur* (world literature), which arose during the time of Goethe and referred to the exchange of ideas and texts across national boundaries. In this respect, Auerbach could be said to have sustained a tradition of cosmopolitanism that Goethe inaugurated in eighteenth-century Weimar and that continues to flourish in contemporary postcolonial literary traditions. His experience in exile has been an inspiration to present-day theorists of diaspora and the new comparativism of transnational and transborder studies. Auerbach struggled to unify ethical and moral considerations with the extreme historical relativism that for him was the true ground for such considerations, and are a vital part of our historical "earthly life." He is one of the very few authors who conceived of his task in terms of the renovation of priorities and institutions of humanistic literature. His work has expanded the scope and purpose of literary and cultural theory and stimulated new attentiveness to the intersection of text and context, representation and historical reality. Though rooted in an "old world" tradition of comparative literature, Auerbach's historicism ultimately aspires to the same goal as the new historicisms of the late twentieth century: to understand human experience and cultural practice as fundamentally historical phenomena.

Austin, J. L.

JOHN MCGOWAN

J. L. Austin (1911–60), a philosopher who taught at Oxford University, introduced the concept of the “performative” into the philosophy of language as an alternative to the “correspondence theory” of language. Austin’s work became increasingly impor-

tant to literary theorists in the 1980s and 1990s and is now widely accepted as providing the best account of the nature of literary utterances.

Austin spent his whole working life at Oxford, except for a very distinguished stint working for British Intelligence during World War II. He published little during his lifetime, and died at the age of 48 from cancer. The lectures posthumously published as *How to Do Things with Words* offer his fullest discussion of the “performative” and were delivered at Harvard University in 1955.

The correspondence theory of language holds that a word’s meaning is secured by its relationship to the thing in the world to which it refers. Tying meaning to reference is closely related to traditional Aristotelian accounts of “mimesis” that claim the literary text mimics or mirrors the world. But such realist theories run into some obvious and notorious difficulties. The words “the” and “freedom” point to no obvious or simple real-world object, while various fantasies, such as a “chimera” or the planet Tlön in the Jorge Borges story, also lack a referent.

Austin notes these anomalies, but is even more interested in the cases where an utterance is best described as a “speech act” because it serves to bring something into existence. For example, when the referee in a basketball game calls a foul, then – and only then – a foul exists. Austin stresses that speech acts or performatives are usually dependent on social conventions and even on constituted authority within established institutions. The minister can marry a couple, the judge sentence a defendant, and the referee call a foul because of the authority invested in them. In each case, the utterance of certain words changes the context in which the various parties are embedded and the relationships in which they stand to one another. Promises are the quintessential speech act. They are central to

political and social relationships; they depend on established conventions; and they highlight the ways in which what we say establishes the relations in which we stand to others. A speech act is null and void – or “infelicitous” in Austin’s terms – when the speaker does not have the authority, or the context is inappropriate, or the words are not uttered seriously or sincerely.

At first, Austin seems inclined to dismiss literary language as nonserious. When a couple is married on stage during the course of a play, they are not “really” married because the minister who marries them does not utter the words “I now pronounce you man and wife” seriously. But Austin introduces a distinction among the “locutionary,” “illocutionary,” and “perlocutionary” components of an utterance that appears to be an attempt to sort out the complexities of what utterances can accomplish, what they can be used to do. (“Appears to be” because the distinctions themselves are far from crystal clear, and what Austin was using them to clarify is also not clear.) Locutionary points to the use of words to state something: “the fire engine is red.” Illocutionary indicates the use of words to achieve or create something: “I name this ship the *Queen Elizabeth*.” Perlocutionary attends to the use of words to elicit some reactions or response from the listener. When I ask a question, I expect a response. But, also, when I insult someone, I can usually expect a rejoinder. In other words, Austin was trying to get us to pay attention to three different dimensions of utterances: their relation to the world (reference); their ability to be creative (performatives); and their participation in establishing and maintaining relations among the human parties to a conversation (the perlocutionary).

If we adopt this more inclusive viewpoint, then the key fact about literary language is not its failure to refer to real things (a whale named *Moby Dick* never existed) or that its

performatives are not serious. Rather, we can focus on the perlocutionary effects of imitating locutionary and illocutionary speech acts on stage and in the pages of a novel. Thus interest shifts from asking for a correspondence between words and some things that they name to an interest in what words achieve or create within the intersubjective settings in which they are uttered or written.

Jacques Derrida wrote an essay on Austin entitled “Signature, event, context” (in Derrida 1998) that sparked a debate with American philosopher John Searle, who had earlier introduced Austin’s work to American philosophers in a book called *Speech Acts*. Derrida argued that Austin had underestimated the extent to which meaning is dependent upon pre-existing conventions. In particular, Austin relied too heavily on the notion of individual intention to secure meaning. What mattered to Austin, Derrida argued, was whether speakers were serious, whether they intend their words to be taken seriously. But a promise is understood by its auditors to bind the speaker even when the speaker is insincere. Anyone who makes a promise “cites” the conventions of promise making – and will be held accountable to them even if he or she is not sincere. Similarly, anyone who writes a novel will be read in relation to prevailing conventions of what constitutes a novel. The argument is not that individual variation is impossible, but that variations are only meaningful in relation to the convention, and that some conventions (although hardly all conventions) are rigorously enforced. There are costs to flouting the rules.

In her tremendously influential *Gender Trouble* (1990), Judith Butler adapts Derrida’s understanding of performatives to the issue of gender. There are conventions about how to be a girl, Butler argues, and subjects in a society characterized by “compulsory heterosexuality” must perform the role of girl according to prescribed ways. But no such repetition, no given

performance, will exactly reproduce the normative ideal. There is a slippage, and Butler famously argues that parodic performances can call attention not only to these gaps, but also to the conventional (as opposed to natural) status of the norms and thus to their possible revision.

Derrida and Butler's work brought the concept of the performative square into literary theory. Questions about the effectiveness of words to bring about social change, about the nonreferential character of literary language, the perlocutionary force of the literary, and the tension-filled relationship between the conventional and the idiosyncratic are often addressed today through an engagement with literature as a species of the performative.

B

Bakhtin, M. M.

R. BRANDON KERSHNER

Mikhail Mikhailovich Bakhtin (1895–1975) was a Russian literary scholar and philosopher of language whose work would eventually have a profound influence on Western literary criticism as well as on linguistics, classical studies, sociology, and ethics. Working as the dominant member of several study groups on ethics and aesthetics, Bakhtin developed several concepts that became influential in Western literary studies during the late 1970s and the 1980s. These included what later critics, like Gary Saul Morson and Caryl Emerson, have called “prosaics,” a term meant to point both to his theory of literature that privileges prose, especially the novel, over poetry and to his emphasis on the importance of the prosaic details of everyday life. Many of Bakhtin’s most influential concepts—dialogism, heteroglossia, and carnivalization—can be understood in the framework of a theory of prosaics that encompasses the structure of prose narratives as well as the impact of ideology on language and discourse.

Bakhtin’s work was first introduced to French intellectual circles in *Théorie d’ensemble* (1968), and was quickly picked up by other Western theorists, pre-eminently Tzvetan Todorov and Julia Kristeva, in the

1970s and ’80s, in a rather more structuralist and less political form than it was later to assume. Todorov called him the most important Soviet thinker in the human sciences and the greatest theoretician of literature in the twentieth century. Often associated with the “Russian formalist” theoreticians such as Roman Jakobson, Bakhtin nevertheless launched a serious critique of formalism. Despite his later recognition as a significant intellectual figure on the world stage, almost all of his life passed in total obscurity, not only from the perspective of the “free world” but from that of the Soviet Union: when his work was discovered by a group of young Russian critics in the 1960s, they believed he was long dead.

Bakhtin was the son of a bank manager who belonged to a family of the old nobility. He was born in Orel, south of Moscow, and went to Petersburg University to study classics along with his older brother Nikolai during the period 1913–17. In response to the difficulties of living in Petersburg during the Civil War, he and his family moved to Nevel, where the first “Bakhtin circle” soon gathered. The group at this point included the Jewish philosopher M. I. Kagan, the philosopher and literary critic Lev Pumpiansky, and the musicologist and linguist Valentin Voloshinov. After some of the group moved to Vitebsk, they were joined by the literary

critic Pavel M. Medvedev, who was well connected with governmental circles and was to be helpful in protecting Bakhtin. In 1920 Bakhtin married the woman who would become his lifelong caretaker and nurse, Elena Aleksandrovna Okolovich. During the 1920s he was plagued by osteomyelitis of the left leg and suffered a typhoid infection of the right. His health remained precarious, and his mobility was further restricted when his left leg was amputated.

During the 1920s Bakhtin was quite productive. He wrote a number of essays on aesthetics and moral philosophy, some of which have been lost; some of the surviving essays are included in the translated volume entitled *Art and Answerability* (1990), others in the volume *Toward a Philosophy of the Act* (1993). As he began working on an early version of *Problems of Dostoevsky's Poetics* (eventually published in 1929), his notebooks show him moving gradually away from the neo-Kantianism of Ernst Cassirer and Hermann Cohen and developing the key concept of “dialogism.”

In 1929 Bakhtin was arrested, probably because of the radical Russian Orthodox affiliations of his friends. He was originally sentenced to a Siberian prison camp, but his influential friends, including Maxim Gorky, were able to have the sentence commuted to “internal exile” in Kazakhstan. He held a number of menial jobs during the early 1930s, until a teaching position was found for him at the Mordovia Pedagogical Institute in Saransk. He completed a manuscript on the eighteenth-century German “novel of education” (*Bildungsroman*) that was accepted for publication but vanished during the German invasion. The destruction, loss, and suppression of his work was to become a theme of Bakhtin’s life, and at one point he is said to have burned large parts of a unique manuscript by using it piece by piece for cigarette wrapping paper.

Bakhtin moved to Savelovo in the late 1930s, in fear of a faculty purge at his former institution. By 1940 he was living in Moscow, where he worked on a doctoral dissertation on Rabelais for the Gorky Institute, which he was ready to defend, but the war forced a postponement. This work was eventually to be published as *Rabelais and His World* (1984 [1965]). In 1945 he returned to the Pedagogical Institute. He attempted to reschedule his defense, but the repressive political atmosphere made this unfeasible until 1952, and even then the unorthodox and politically dubious nature of his writing – which some interpreted as a veiled protest against Stalinism – led to his being awarded only a candidate’s degree. Still, in 1957, when the Pedagogical Institute became a university, he became chairman of the Department of General Literature. By 1961 his poor health forced him to retire, and he moved back to Moscow in 1969. His wife died in 1971.

Bakhtin’s *Problems of Dostoevsky's Poetics* (1984 [1965]) was both seminal and influential; indeed, both Viktor Shklovsky and Roman Jakobson made note of it in the late 1950s. By 1960 several young Russian scholars who had wanted to republish the book discovered that Bakhtin was still living and convinced him to revise it for a new edition. During the 1960s Bakhtin’s recognition within Russia increased greatly, as did his material comforts. Ironically, he was praised both by Russian Orthodox scholars on the right and, on the left, by formalists and the Tartu semioticians who were best known for expanding textual semiotics to the study of culture in general. His breadth of appeal reflected the popularity his work would find in the West with critics as different as Wayne Booth and Julia Kristeva, neo-Marxists, and Christian existentialists. During his last years Bakhtin reworked the Rabelais monograph, which was published in 1965, continued working in his notebooks, and revised a group of early manuscripts. In

some of his later writings Bakhtin expanded his work on the novel to address broader issues of language and culture, and some of this work has been published in translation as *Speech Genres and Other Late Essays* (1986).

A critical furor was ignited in 1973 when the semiotician Vyacheslav Ivanov made the claim that Medvedev's book *The Formal Method in Literary Scholarship*, a critique of formalism published in 1928, was actually written for the most part by Bakhtin. So, he claimed, were *Freudianism: A Critical Sketch* (1927) and *Marxism and the Philosophy of Language*, both signed by Voloshinov. Medvedev and Voloshinov were both dead, and Bakhtin did not conclusively either affirm or deny the charge; within two years he was himself dead. Since Ivanov's claims were made, the weight of scholarly opinion has shifted toward the belief that Medvedev and Voloshinov were primarily responsible for the books published under their names, although given the way Bakhtin dominated intellectual circles, it is also undeniable that he had a great influence on the ideas expressed in them. Indeed, it is a fundamental principle of Bakhtin's thought that no single person is fully "responsible" for his or her own words, since a host of voices can be heard to sound in any living utterance.

For Bakhtin the "self" is radically dependent upon others; it is described as an act of grace, the gift of the other. Thus selfhood is fundamentally social, and consciousness can be formed only in perpetual dialogue with the "languages" of others. And a language in Bakhtin's definition includes not only a characteristic vocabulary and syntax but an ideological grounding that is inseparable from any formal characteristics. Instead of inhering within the unique self, language "lies on the border between oneself and the other" (Bakhtin 1981[1975]: 293). There can be no finalizing vision of any self, because there are always further perspectives made available by others. In Bakhtin's

view a person, like a successful character in a novel, always betrays a surplus, and "never coincides with himself" (1984[1963]: 59).

Bakhtin writes that "our speech, that is, all our utterances (including creative works) is filled with others' words, varying degrees of otherness or varying degrees of 'our ownness,' varying degrees of awareness and detachment. These words of others carry with them their own expression, their own evaluative tone, which we assimilate, re-work, and re-accentuate" (1986[1979]: 89). Language in the real world is thus almost always "double-voiced," embodying both the language of the speaker and that of any immediate or anticipated addressee, toward whom the speaker may assume various postures through his or her language – contestation, seduction, partial agreement, mockery, and so forth. Speech that anticipates a particular response and attempts to disarm or foreclose it in advance, Bakhtin memorably terms "the word with a sideward glance" (1984[1963]: 196).

As a literary critic, Bakhtin inverts most classical assumptions about what constitutes formal excellence and the hierarchies of literature. He is perhaps best known for championing the novel and its proto-novelistic forms, such as Menippean satire, the dialogue, and the symposium, over the conventionally valued genres of drama, epic, and lyrical poetry. He argues that the prose forms are "dialogic," founded upon and constituted by dialogue, whereas poetry always tends toward the "monologic," the state of a single, authoritative voice. For Bakhtin even the apparently idiosyncratic voice of an original lyric poet suggests the voice of authority and therefore assumes a position similar to the institutional voice of, for example, the church in the medieval period. Bakhtin argues that Dostoevsky is the novelist who best realized the potential of the form in an aesthetic process he calls "polyphonic," referring to the interplay of the

author's narrative speech and the fully realized, powerful languages of his protagonists. In the fully developed novel, Bakhtin argues, "the 'depicting' authorial language now lies on the same plane as the 'depicted' language of the hero, and may enter into dialogic relations and hybrid combinations with it" (Bakhtin 1981 [1975]: 27–8). At times several important speakers share this kind of fully embodied linguistic presence, while the "author's own" speech may tend to vanish. By contrast, Bakhtin denigrates Tolstoy, whose novels he finds insufficiently dialogical.

A term introduced by Bakhtin into literary criticism that has gained wide currency is "carnival" and its derivative "carnivalization." Especially in *Rabelais and His World* Bakhtin develops the idea that certain important novels embody a folk perspective on the world epitomized in the medieval ritual of carnival, in which a certain "licensed misrule" held sway during the designated period and ordinary social hierarchies were inverted. The body, especially the "bodily lower stratum" concerned with sexuality and eating, is celebrated, the church and political notables are mocked, and a fool is crowned and a king uncrowned in what Bakhtin calls "a pageant without footlights and without a division into performers and spectators" (1984 [1963]: 122). For Bakhtin carnival celebrates the joyful relativity of all structures and order, and (in a somewhat utopian vision) brings to the fore birth and death, ingestion and excretion, sexuality and violence, accompanied by joyous blasphemy and profanation. In a revision of the traditional history of the novel, Bakhtin points to two separated lines of development of the contemporary form. One originates in the monologic language of the "Sophistic novels" and runs through medieval fictions of gallantry, the baroque novel, the work of Voltaire, and the Victorian novel of manners, while the second line is rooted in

dialogues, Menippean satire, the works of Apuleius and Petronius, and culminates in literary oddities like the books of Rabelais, Sterne, and Dostoevsky. Not coincidentally, the first line tends toward objectification and monologism, while the second shows the novel's fundamentally dialogized relationship to "heteroglossia," the celebratory mixing of languages.

Another concept of Bakhtin's that has gained wide currency in critical discourse is "chronotope," a coinage that literally denotes "time/space." Bakhtin uses this to refer to the characteristic qualities these fundamental modes of orientation assume in various novelistic genres, along with some concomitant parameters such as causality and selfhood. Neither is paramount for him, and different genres call for a great variety of senses of spatiality and temporality. For instance, he uses the chronotope to distinguish between the Greek "adventure novel of the ordeal" and the "adventure novel of everyday life" such as Apuleius's *Golden Ass*. Apparently in his attempts to distinguish genres in works that most Western criticism had ignored or regarded as uninteresting variants, Bakhtin found himself drawn to explore unfamiliar aspects of fictional form in their interaction with human consciousness. Although he anticipates their work by decades, some of Bakhtin's discussions of chronotopes bring to mind the work of the European "critics of consciousness" of the 1960s.

The idea of genre runs through most of Bakhtin's work, and in his late essays he seemed on the verge of expanding the idea even further by inverting the traditional valuation accorded to poetry and the novel and giving intellectual license to the cultural preferences of contemporary Western literature. But this emphasis on genre may mislead some readers into regarding him as simply another formalist. On the other hand, the question of his status as a Marxist figure is still an open one, especially given the status of the disputed texts; Bakhtin is

clearly a materialist, but may not be as orthodox a Marxist thinker as, say, Medvedev. In many ways, he fits more easily among Western thinkers influenced by Marxism, such as Bertolt Brecht, Walter Benjamin, Theodor Adorno, and Ernst Bloch, who were a great deal more sympathetic to aesthetic experimentation than were orthodox Marxists (some of whom would not call thinkers like Benjamin Marxist in any meaningful sense). He carefully distinguishes *dialogism* from *dialectics*, but in the process roots dialogism even more firmly in the material world, thus implying that he is even more of a materialist than many Marxist thinkers. He has been criticized by feminists for failing to see theirs as an important voice and for his comfortable acceptance of apparent misogyny in Rabelais. His notion of carnival has been critiqued as overestimating the revolutionary potential of a limited ritual release allowed by highly repressive regimes. But he has served the Anglo-American academy as a liberating figure, and a transitional figure between allowing for the cross-fertilization of the semiotics of the 1960s and 1970s and the more historically oriented criticism of the 1980s and 1990s.

Barthes, Roland

STEVE WEBER

Roland Barthes (1915–80), French literary theorist and semiologist, was one of the most prominent and innovative structuralist thinkers. His analysis of narrative

structure in literature and film established a framework for narratologists who followed him, while his semiological investigations of cultural phenomena – from advertising to cookery to toys – provided a theoretical basis for the study of popular culture. Barthes's career is unique insofar as he became, in the last 15 years of his life, one of the most important and perhaps the most widely influential poststructuralist at a time when poststructuralism dominated academic humanities departments in Europe, the UK, and the US.

Barthes recognized the importance of the rich intellectual epoch in which he found himself working, and noted in his autobiography, *Roland Barthes* (1975), the trajectory of his own theoretical education, through four distinct phases. A first phase explored social mythology and theater, which drew upon the Marxism and existentialist philosophy; there followed a period of work on semiology, which was influenced by the linguist Ferdinand de Saussure. The third and fourth phases correspond to Barthes's shift to poststructuralist ideas and methods; after a period that saw the publication of works like *S/Z* (1970) and *Sade/Fourier/Loyola* (1971), when he was strongly influenced by Jacques Derrida, Julia Kristeva, Jacques Lacan, and Pierre Sollers, Barthes entered a phase in which he focused on morality, particularly as it was reframed and critiqued by Friedrich Nietzsche. This latter period saw the publication of *The Pleasure of the Text* (1973) and his autobiographical writings, including *Camera Lucida* (1980), which combines a study of photographic representation with a meditation on his late mother.

Barthes's first book, *Writing Degree Zero* (1968b[1953]), began a career-long focus on writing per se; to a significant degree, he responded at this time to Sartre's work, specifically to his 1949 essay "What is literature?", and sought to rework Sartre's

conceptions of language and style, though at this stage his conception of language was largely that of an unchanging substratum. He proposed a tripartite structure consisting of language, style, and writing. Language and style he regarded as two polar opposites. Language was common to all writers of a particular period; it was something they were born into and over which they had no control. As Susan Sontag notes, in her preface to *Writing Degree Zero*, "Barthes was to adopt a different and far more complex view of language in later books – when he came under the successive influence of Saussurean linguistics, then of the ahistorical methods of 'structural' analysis" (Sontag 1968: xii). For Barthes at this stage, style – unlike language – is unique to each writer, but like it, the writer has no control over style, for it is bound up inextricably with the writer's very being. "A language and a style are blind forces," he argues in *Writing Degree Zero* (1968b[1953]: 14). Writing is what happens between language and style, and this is where the writer has not only control but access to history, for writing is "an act of historical solidarity" (14). Barthes considers language and style to be constants, "blind forces," whereas writing is a function. Therefore, writers who are separated by time and styles can have similar modes of writing, while contemporary writers who make use of the same language can have very different modes of writing. The zero degree of writing is then a neutral, colorless mode of writing. This neutral mode is not to be confused with realism, which is commonly understood to be natural and innocent, a transparent medium through which one can discern, undistorted, the object of representation. For Barthes, "language is never innocent" (1968b[1953]: 16); there is nothing neutral or natural about realism, which Barthes understands to be a highly contrived mode of writing grounded in "bourgeois consciousness" and characterized by "the

most spectacular signs of fabrication" (1968a[1964]: 68). Rather, neutral or inert writing is much closer to "basic speech" than literary, social, or mythical language; and, as much as possible, it would have no style. Barthes mentions Albert Camus's *The Stranger* (1941) as an example of writing that approaches the zero degree.

Barthes devoted a number of subsequent essays (reprinted in Barthes 1972a[1964]) to the novels of Alain Robbe-Grillet, who presumably was even closer to the zero degree than Camus. In "Objective literature" (1972a[1954]: 13–24), Barthes praises Robbe-Grillet for his purely visual description of objects, which lacks depth and focuses purely on surfaces. Robbe-Grillet's antirealism describes the object world without allusion, association, suggestion, or reference, and appears to be satisfied simply with the *Dasein* – the "being-there" – of the object. In "Literal literature" (1972a[1955]: 51–8), Barthes makes the same point about Robbe-Grillet, noting that the story itself disappears by virtue of an intense focus on objective space that illustrates a "blinding literalness." Following in the same vein, "There is no Robbe-Grillet school" (1972a[1958]: 91–6) argues that Robbe-Grillet's novels are unique because they contain no anthropomorphized objects – that is, Robbe-Grillet's objects are void of the human dimensions that are usually attached to them in traditional literature. Finally, in "The last word on Robbe-Grillet?" (1972a [1962]: 197–204) Barthes counters the argument that Robbe-Grillet is actually a "humanist" and uses the dispute to indicate that it is human nature to find significance, no matter how rhetorically neutral a work of literature may appear to be. For Barthes, the role of literature is to ask questions about the meaning of things, but not to supply answers. If there are answers, they are supplied by the reader and the critic.

But it is not only literature that is capable of asking these kinds of questions. In *Mythologies* (1972b[1957]), a collection of essays written from 1954 to 1956, Barthes examines various phenomena of contemporary French life, including striptease, margarine, detergents, steak, the brain of Einstein, plastic, wine, wrestling, and the face of Greta Garbo. These aspects of everyday life were called "myths" in that they were "falsely obvious": bourgeois ideology passing itself off as simple and natural. Barthes's endeavor was to demystify each of these myths, refuting its "naturalness" with an analysis of its artificial construction. For example, the essay "The Romans in films" examines Joseph Mankiewicz's film version of *Julius Caesar* (1953), starring Marlon Brando. Barthes focuses on the fact that fringes are found on the head of every character, and that there is not a single bald man. The reason for its ubiquity is that the fringe is a sign of "Roman-ness" (Barthes is using "sign" here in the sense of sign/signifier/signified outlined by Saussure); and it is being used to convince the audience of the natural authenticity of the historical setting and its characters. However, the use of such a sign on "Yankee mugs" leads to an incongruity that Barthes finds laughable.

"The Romans in film" does more than analyze film, however; it outlines an "ethics of the sign." Barthes begins by identifying two ethical signs and one unethical sign. The ethical sign is either highly abstract or it is a "deeply rooted" sign that does not designate a concept but a specific moment. The unethical sign is the intermediate sign; it avoids both "total artifice" and "simple reality." That is, it is unethical because it hides the fact that it is a sign while trying to appear natural and, as such, this intermediate sign is "both deceitful and reprehensible" (Barthes 1972b[1957]: 28). The intermediate sign treats the signified and the sign as if

they were the same thing, and therein lies its deceit and its failure. Barthes sees the use of fringe in film as an intermediate sign because Mankiewicz equates Roman-ness (the signified) with the fringe (the sign), hiding the sign's role behind an aura of naturalness. In general, we can understand most – if not all – of Barthes's work to be dedicated to an ethics of the sign.

Due to the popularity of *Mythologies*, Barthes was asked by Canadian filmmaker, Hubert Aquin, to write the text for a documentary called *Le Sport et les hommes* (1961), focusing on five national sports: bullfighting (Spain), car racing (USA), the Tour de France, hockey (Canada), and soccer (England). A translation of this text was recently published as *What is Sport?* (2007). Barthes argues that spectator sport is not about one team defeating another, or one person besting another, or one person killing an animal. These spectator sports are not about who wins, but about humanity's victory over the "resistance of things" (Barthes 2007: 37), whether these things be nature, inertia, or time. The spectators then are not just watching this victory, but participating in it. Such a victory is a celebration of humanity's dominance over its environment, and as witnesses to this domination, spectators participate in it. Barthes's emphasis on the spectator qualifies the question in his title – *What is Sport?* – in a way that provides the answer.

The last essay in *Mythologies*, "Myth today," is in Barthes's opinion, the foundation of his semiological analysis. He describes myth as a "second-order semiological system" (Barthes 1972b[1957]: 114). The first-order system is the unity of signifier and signified forming the sign in language. This first-order sign, the "language-object" (115), becomes the signifier of the second-order sign. Myth then is a language on top of a language: myth makes use of the language-object as its signifier, to

which a mythological signified is attached, creating a mythological sign or signification. While the first-order sign is unmotivated and arbitrary, the second-order sign is motivated and "never arbitrary" (126). The transformation into a mythological sign is a "deformation" (122) of the language-object in question: the meaning of the language-object is partially emptied, then filled/distorted with a mythological concept. Barthes's analyses of cultural phenomena underscore the extent to which myths are deformations motivated towards naturalizing, universalizing, and eternalizing bourgeois ideology.

The notion of higher-order semiological systems outlined in *Mythologies* becomes central in the second, semiological phase of Barthes's career, which saw the publication of *Elements of Semiology* (1964) and *The Fashion System* (1967). The former outlines a general method of semiology, while the latter, composed in the period 1957–63, exemplifies the semiological method of reading systems of cultural signs. In the introduction to *Elements*, Barthes indicates that the term "semiology" derives from Saussure's *Course in General Linguistics* (1916). Saussure proposed a "general science of signs" (Barthes 1968a[1964]: 9) called semiology that would include linguistics (linguistics would only be one object of study for semiology). Semiology then could look at any system of signs (verbal, pictorial, musical, and so on). For this reason, Barthes's semiology applies equally well for traffic signals, fashion, and language, since nonverbal systems signify through "linguistic admixture" (10). That is, all systems of signs are reliant upon language, for there is a second-order language on which nonverbal systems rely in order successfully to signify.

Semiology, then, always has higher order language as the focus of its study. For this reason, Barthes proposes an inversion of

Saussure's theory of the relation of semiology to linguistics: in Barthes's view, semiology would be a *part* of linguistics because any system of signs is a part of language. For Barthes, the first order of language *as such* is understood as a system of signs that is primarily denotative. Two kinds of second-order sign systems – connotation and metalanguage – incorporate this first-order level of denotation as a constitutive element. Connotation takes the first-order sign as its second-order signifier, whereas metalanguage takes the first-order sign as its second-order signified. Metalanguages form “the majority of scientific languages” including semiology itself, and are “operations . . . whose role is to provide a real system, grasped as signified, out of an ensemble of original signifiers, of a descriptive nature. As opposed to metalanguages, connotations pervade languages which are primarily social, in which a first, literal message serves as support for a second meaning, of a generally affective or ideological order” (Barthes 1990 [1967]: 28).

The interrelationship of linguistic orders creates complex sign systems that operate on multiple levels. In *The Fashion System*, Barthes illustrates how this complexity operates on four distinct levels: on the first level, we find the garments themselves, which function within a system of signs; on the second level, “written clothing” operates at the level of denotation – the language of fashion magazines describing the photographed garments; on the third level, we discover the various connotations (rhetorical, stylistic) that animate the language of fashion. It is the fourth level, that of the analyst's metalanguage, that most occupies Barthes's semiological analysis and constitutes the discursive space of reflection on, and critique of, sign systems.

Barthes's interest in textuality dovetails with this interest in cultural sign systems, in part because the latter makes dramatically

evident the function of language *as a system* in determining the features we conventionally attribute to authors. He had already demonstrated, in the landmark essay “Introduction to the structural analysis of narrative” (1966), that literary meaning, in literature and film, was the function less of an author's intentions or personal “stamp” than of structural relations. In other works of this period, Barthes focused on writing and reading, which he linked, in innovative ways, to his developing sense of literary structure as a system of practices. In 1965, following French literary critic Raymond Picard's critique of Barthes's *On Racine* (1963), Barthes found himself in the middle of an intellectual debate. Picard had singled out Barthes as a representative of a new kind of criticism and objected to Barthes's psychoanalytic and structuralist criticism of the works of Jean Racine (1639–99). Picard's main point is that Barthes's failure to adhere to a tradition of criticism invalidates his approach to Racine. Barthes's response to Picard, *Criticism and Truth* (1966), an essay that brings together key elements of his thinking throughout the 1960s, examines the traditional criticism extolled by Picard and concludes that the chief problem is that it does not acknowledge itself as a form of criticism, but claims to be the *only* form of criticism, the locus of truth, clarity, universality, honesty, and so on.

Barthes takes the opportunity in *Criticism and Truth* to look beyond Picard and focus on the general status of contemporary criticism and literature and to advance a new theory of the “writer” that will find full expression in “The death of the author” (1968). He argues that the distinction between poet, novelist, and critic disappears once we posit the figure of the writer who has a “certain awareness of discourse” (Barthes 1987[1966]: 64) and sees language as inherently problematic. The literary work cannot help but have multiple meanings due

to the very nature of the language that constitutes it; therefore, the work's ambiguity can never be resolved. Traditional criticism had used the author to "guarantee the meaning" of the work (76); that is, it relied on finding out the author's intention by recourse to biographical and historical context. However, Barthes wants to free the text from authorial intention, "erasing the author's signature" (77), and allow the interpretation of the text to be contingent upon its reading in the present, rather than upon a construction of the past. Once the text is freed from the guarantee, provided by the author, of a single meaning, it is open to multiple interpretations. It is this multiplicity that traditional criticism of the sort championed by Picard attempted to limit and control and that poststructuralism, which Barthes was coming increasingly to exemplify, sought to theorize.

The reader assumes an increasingly important role in Barthes's work at this time, for "to read is to desire the work, to want to be the work, to refuse to echo the work using any discourse other than that of the work" (Barthes 1987[1966]: 93). "The death of the author" (1968) returns to this argument and calls explicitly for a "removal of the Author" (Barthes 1977a [1968]: 145) – who is also characterized by Barthes as dead or "absent" – and for an end to the belief in the author as the origin and authority of the text, as the guarantor for a single meaning of, or a "final signified," for the text. Classical criticism's belief in such an author was an imposition of a limit on the text. Barthes's poststructuralism put forward the vision of a text as a "multi-dimensional space" composed of numerous writings – "none of them original" – whose cultural sources are "innumerable" (1977a[1968]: 146). In contradistinction to an original author (something of a mythological construct) who organizes, delimits, and controls multiplicity, Barthes posits the

reader who becomes the "destination" of the text and all of its effects. In a famous pronouncement, Barthes concludes: "The birth of the reader must be at the cost of the death of the Author" (148).

Barthes's work in the 1970s, the last decade of a very productive life, completes the "poststructuralist turn" he had begun when he started to think of structure and semiology in terms of practices of reading and writing. Indeed, in a text like *S/Z* (1970), a close analysis of "Sarrasine" (1830), a short story by Honoré de Balzac, Barthes combines the structuralist's emphasis on systems with the poststructuralist's emphasis on difference and "play." He argues that textual function yields a typology of elements that constitutes the text's meaning under the pressure of a reading. He then draws a distinction between the "readerly" text (which demands little of the reader, who merely conforms to conventions and is in the process made comfortable) and the "writerly" text (which demands much of the reader, whose expectations may be frustrated and who may feel discomfort with the responsibility of constituting the text's "destination"). Barthes clearly privileged the writerly text, which is, necessarily, rewritten by the reader; that is, the reader does not "consume" the writerly text, but produces it. The readerly text can only be read because it is "classic," it comes down to us already complete and requiring only acquiescence to its immanent demands, which are, at bottom the demands of a bourgeois class that regards the book as both a self-contained object and a piece of personal property. The writerly text, however, exists in "a perpetual present" that the reader writes, which keeps the plurality of the text open. Crucial to this perpetual present is the operation of "rereading," which stands in direct opposition to the reading function of the readerly text, which is a product that one "throws away" once it

has been consumed. Barthes demonstrates the writerly process of rereading as rewriting by dividing “Sarrasine” into 561 pieces, each one quoted in the body of his own text, *S/Z*. In this way, *S/Z* effectively rewrites “Sarrasine.” It is of course significant that he makes his argument by analyzing the work of a notorious French realist, thereby demonstrating that any work of literature has the potential to become a “writerly” text.

The Pleasure of the Text (1973) begins the fourth phase of his work which Barthes understood in terms of “morality” – “the precise opposite of ethics” because it thinks “of the body in a state of language” (Barthes 1977c[1975]: 145). In it, Barthes identifies two different kinds of enjoyment for the reader: pleasure and bliss. This enjoyment is drawn from the contradictory multiplicity of the text, from a difficulty that sharpens the reader’s sense of his or her own complicity in a “writing.” Indeed, the text of pleasure “comes from culture and does not break with it” (Barthes 1975 [1973]: 14). Bliss, on the other hand, is “intransitive” – that is, bliss is “asocial” and “for nothing”; the text of bliss “unsettles the reader’s historical, cultural psychological assumptions” and “brings to a crisis his relationship with language” (14).

The final phase marks a distinct shift in his writing toward an autobiographical style, not the historical subject in a narrative of past time, but “the body in a state of language.” In texts like *Roland Barthes* (1975), Barthes explores the limits of an autobiographical discourse, in which “it must all be considered as if spoken by a character in a novel” (1977c[1975]: 1). The text that follows is broken up into fragments dedicated to his personal relationship with writing and to topics central to his career – effectively doing away with the linear narrative of life events that one would expect from an autobiography. In a similar fashion, *A Lover’s Discourse* (1977) does not focus on

love itself, but on love *as it is written* (Barthes includes famous literary examples as well as a few drawn from his own life). *Camera Lucida* (1980), written after the death of the author’s mother, is as much a reflection on his relation to her, mediated by the photographic image, as it is an investigation of photography as an art form. In the last years of his career, Barthes served as chair of the Department of Literary Semiology at the Collège de France. He also enjoyed considerable mainstream media attention (such as interviews with *Playboy* and *Elle*, which followed the publication of *A Lover’s Discourse*). Undoubtedly, this success, influence, and remarkable intellectual contribution would have continued well past 1980 had Barthes’s life not been cut short by a street accident. The continued international interest in his work to this day is a testament to the power and the continued relevance of his thought.

Base/Superstructure

TARA NEEDHAM

The concept of base/superstructure, which first appears in Karl Marx's *A Preface to The Critique of Political Economy* (1859), models

the relationship between economic and productive forces in society and legal, cultural, educational, religious, and political forces. Because individuals must meet their material needs before anything else, and because they accomplish this in association with other people, these relations form the foundation – or base – of society on which all other forms of life – the superstructure – are built. The base/superstructure model is a cornerstone of Marx and Engels's materialist philosophy, which claims that social relations determine consciousness, in contradistinction to Hegelian idealism, which privileges immaterial and transcendent concepts such as Thought and Spirit as the driving forces of human civilization. Despite tremendous variation and debate regarding what actually constitutes the categories base and superstructure and the nature of their interaction, most Marxist thinkers agree that cultural analysis must adhere to a historicist methodology, a necessity famously summed up by Fredric Jameson's imperative, in *The Political Unconscious*: "Always historicize!" (Jameson 1981: 9). The base/superstructure model is part of a method that rejects any purely formal critique. Instead, culture, as an element of the superstructure, must be understood in relation to the material conditions of its production, distribution, and consumption, as well as its engagement with the social relations of production.

In an "orthodox" Marxist framework, the distinction between the two terms is quite clear. The base comprises the mode of production, which is the manner in which a society is organized to provide for its material needs, including the production of goods and reproduction of life itself. A particular mode of production – such as slavery, feudalism, or capitalism – comprises in turn particular means of production (buildings, technology, raw materials). Each mode of production generates a

specific set of social relations, a division of society into classes whose antagonistic relationship leads to a struggle over material resources and social power. For example, under industrial capitalism, the proletariat class, consisting of individuals who sell their labor, come into conflict with the capitalist class of owners and managers who buy this labor; antagonism emerges from this asymmetrical relationship in which the workers' labor produces "surplus value," while the workers themselves receive a subsistence wage (enough for food, clothes, and shelter). The superstructure, by contrast, encompasses all other social institutions, political and cultural practices, and forms of consciousness (including religion and philosophy) and constitutes the realm of "ideology." Ideology refers to the ways in which individuals within a particular class make sense of, manage, and represent the social relations of production and class struggle to themselves; *dominant* ideologies are those formed by the ruling class and can be coercive and repressive in nature. The superstructure, though it often appears neutral, natural, or universal, predominantly serves the interest of the dominant economic class. For example, laws protecting private property may appear to be "universal" expressions of abstract or natural principles of justice, when in fact they are particular and historical consequences of the superstructure, which functions to maintain the class privilege of the few who own the means of production. The process by which the proletariat seeks to overturn this social structure is the prime motivation of class struggle. This struggle can be understood from a variety of viewpoints, including literary and cultural analysis. As Jameson argues (echoing Marx in *Capital*), all history is the history of class struggle, and all narrative bears the traces of this unifying narrative, either covertly or overtly. To analyze narrative is to analyze both the formal

conventions and the ideological moves and motives that confront, conceal, or resolve class struggle.

In their most direct treatment of art as it relates to the base/superstructure dyad, Marx and Engels explain formal qualities of epic poetry, such as repetition, as a consequence of the material and rather mundane need for stories to be orally transmitted. The decline of epic as the dominant mode of literature is as much a result of the invention of the printing press as it is of formal innovation or evolution. A Marxian or materialist perspective would tend to emphasize the mode of production, regarding formal innovation as a secondary effect. In some cases, this results in uneven development, as in ancient Greece, a society that was economically "backward" (in this instance, a slave society) but was able to produce sophisticated and enduring cultural forms. This demonstrates that the superstructure is not a mere reflection or reaction to the base, and can manifest achievements in society that may seem on the surface out of sync with the level of material progress or development as a whole.

Several key aesthetic concepts come under fire in subsequent reinterpretations of base/superstructure, including the "theory of reflection," the status of reality, and the role of representation in art. If great art reflects or reveals reality, what comprises that reality and how does art represent it? In an attempt to address these issues, Georg Lukács, Hungarian Marxist literary critic and philosopher, adapted the base/superstructure model for literary analysis, specifically in works such as *History and Class Consciousness*. Lukács argued that base and superstructure are already concepts – or abstractions – and, most important, they point to a relationship between seemingly separate spheres of society that in fact comprise a totality, which is a principle object of analysis in dialectical materialism. One of

the illusions of advanced capitalist society is the apparent separation of spheres of life, which are, in the end, interconnected and interdependent, and cannot be understood except in complex relation to one another. Examples of apparently separate spheres are work and leisure, public institutions and private domestic spaces. The task of literature, according to Lukács, is to reveal the complete human personality – that is, the individual as part of a community – through the depiction of character types. A character type expresses all the necessary historical determinants bearing on human experience without succumbing to biological determinism (as in naturalism) or the extreme subjectivity of psychological realism (as in modernism). Lukács was a champion of literary realism as practiced by writers such as Balzac, and reviled German expressionism as a bourgeois art that represented an internalized or distorted reality that had little relation to the social totality. Bertolt Brecht and Theodor Adorno, arguing in different ways against theories of reflection, insisted that fragmentation was *the definitive lived experience* of modernity and that art should seek to engage that experience.

If Lukács regarded great art as restoring the individual to the social totality, Theodor Adorno and other Frankfurt School theorists regarded it as one of the last remaining spheres “outside” of a thoroughly commodified culture. In *The Dialectic of Enlightenment* (1944), Adorno and Max Horkheimer analyze the rise of mass and popular culture and its role in numbing the critical sensibilities of individuals, thereby reducing the potential for independent thought and resistance to oppression and the status quo. They argue that once the artwork becomes a commodity, it becomes dependent on the mechanisms of economic exchange and circulation. In this way, mass entertainments take on a new and, for Horkheimer and Adorno, regrettable

relation to the means of production. The danger for critical theory was the subordination of culture to economic and political institutions. Adorno in particular responded to the conflation of the economic and cultural by arguing for the autonomy of high art, assigning it a strictly aesthetic function that allowed individuals to glimpse “freedom” (from necessity) despite the material reality of exploitation.

In its most reductive treatments, the base/superstructure model has been interpreted as a form of mechanical or economic determinism, sometimes called “vulgar” Marxism. Marxists and non-Marxists alike have resisted strict economic determinism because of the limits it places on both the act of interpretation and the possibility of change and progress being initiated or achieved through superstructural elements, such as reforms in government or the dissemination of radical ideas through culture. As British cultural theorist Raymond Williams has observed, the base/superstructure model has at times been so simplified that “base” becomes synonymous with “reality” and the superstructure with so many echoes or reiterations of it. By reconsidering the base as a set of dynamic social and productive processes, rather than a static economic system, Williams was able to recognize the complexity, richness, and material effects of cultural practices and to regard them as part of humanity’s productive activity and not a mere reflection of it. In doing so, Williams aligns himself with the concept of hegemony as developed by Italian Marxist Antonio Gramsci, and which designates all of the complex relationships which make up the experience of domination and subordination in society. Influenced by the structuralism of Jacques Lacan and Ferdinand de Saussure, French Marxist Louis Althusser also reworked the dyadic model of base/superstructure in favor of the concept of practices. For Althusser, the

mode of production essentially subsumes both base and superstructure. Economic and social relations cannot be discretely separated from superstructural activities; rather all “practices” contain both dimensions. This move allows for the “semi-autonomy” of layers of society, moving further from any sense of a mechanistic cause–effect relationship. More recently, Terry Eagleton reasserted the basic premise of the base/superstructure model: that it defines a hierarchy in which the economic takes priority over the cultural. The irony is that socialism projects a future in which humans are free from necessity to be purely “cultural”; but, Eagleton maintains, we are simply not there yet. He also adds that *only* when art is *thoroughly economic* (i.e., participating in the market, rather than serving the church, state, or law) can it appear “autonomous” (i.e., modernism, “art for art’s sake”) and perform critique, echoing Adorno’s argument for the autonomy of art. This is a good example of how one cannot understand the function or place of art in society without understanding its relationship to material conditions.

Georges Bataille

TIM KAPOSY

Georges Bataille (1897–1962), novelist and critic, flourished in Parisian intellectual circles in the period between World Wars I and II. Known for his erudite approach to eroticism and his iconoclastic writing style, Bataille focused his attention on a wide variety of themes and problems in anthropology, philosophy, literature, sociology, and economics. Although he was

involved in contemporary literary and political groups in Paris throughout the 1920s and '30s, his writings did not have the kind of impact they would have on poststructuralists in the 1960s and '70s. He was in this sense an intellectual heir of Friedrich Nietzsche, whose own writings were not fully appreciated until after his death. In many ways critical of the French avant-garde in his lifetime, Bataille nevertheless managed posthumously to redefine it through his influence on writers like Roland Barthes, Jacques Derrida, and Julia Kristeva.

Born in 1897 in Billom, in central France, to predominantly secular parents, Bataille struggled through a traumatic childhood, the end of which saw his conversion to Catholicism in 1917, when he was 20 years old. Educated predominantly in Rheims, he entered the seminary at Saint-Fleur at this time, but soon abandoned his vocation and renounced his faith. Bataille's biographer Michael Surya interprets this sequence of decisions – the “unlikely” trajectory of his life – as the result of two tragic events: his mother's descent into insanity and his father's slow death from syphilis, which left him blind and paralyzed. These events had a profound impact on Bataille's writing, which tended from the start to focus on the body, on disease and death, and on the obsessive and violent elements of sexuality.

Leaving behind his native Rheims and its provincial norms in 1918, Bataille enrolled at the *École des Chartes* in Paris, where he studied medieval history and literature, eventually writing a dissertation on thirteenth-century verse. After leaving the *École*, he gained employment as a librarian and archivist, specializing in numismatics and paleography. He soon became familiar with the Parisian *demimonde*, a world of brothels, cafés, and art studios. His intellectual development began in isolation; the early 1920s found him reading deeply the works of

sociologist Marcel Mauss and the philosophers Friedrich Nietzsche and Lev Shestov. Not long after leaving university, Bataille had gained the reputation of being a mild-mannered *habitué* with a penchant for the city's lurid nightlife that created two far-reaching consequences for his thought: it contributed to his combative and iconoclastic critique of philosophy and it informed and reinforced his interest in bodies and their pleasures.

Bataille was a formidable presence in the city's numerous literary and political groups. Gradually making the acquaintance of Salvador Dalí, Alexandre Kojève, Jacques Lacan, Michel Leiris, Pablo Picasso, and Simone Weil, he initiated debates whose topics included the fate of communism, the nature of the unconscious, and European politics. Bataille's close friend Roger Caillois described him as a “strange, placid, almost awkward man, but his gravity had something fascinating about it” (Surya 2002: 246). Throughout his life, Bataille's most persistent criticism was directed at the practice of philosophy. He reiterated in various ways that the *de facto* legitimacy of philosophical thought is perpetuated by a spurious separation of its truths from “non-knowledge.” Accordingly, the particular experiences that philosophy deems inadmissible or “nonsense” became the basis for what Bataille called “heterological thought”:

If thought and the expression of thought have become [the philosopher's] privileged domain, this is only after he had, to the limit of his resources, multiplied the apparently incoherent experiences, whose intolerance indicates his effort to embrace the totality of possibilities – more precisely, to reject untiringly any one possibility exclusive of others. (Quoted in Sasso 1995: 41–2)

Sudden intimations of mortality, ineffable perceptions, incommunicable or stray

affects, “all too human” fallibilities, involuntary or seemingly trivial compulsions such as laughter: a host of human experiences considered inconsequential to or uncategorizable within philosophy became, for Bataille, the objects of serious, disciplined inquiry. Staking his claim for a form of writing that would counter this tendency in philosophy to reject entire fields of human experience, he argued consistently that “thought,” as it was viewed conventionally through philosophical rationalism, took an active role in perpetuating “a homogeneous and servile world” (Botting & Wilson 1997: 64). Heterological thought needed, in a sense, to be written into existence, for Bataille believed that such thought had of necessity to create both its own cognitive basis in language and a style suited to the “irruption” of the heterological in discourse. Above all, it had to resist erasure by philosophy’s claim to truth. Bataille’s writing and editorial work, therefore, sought not only to confront philosophy with what was regarded by it as nonphilosophic, but also to treat the latter with the same discipline and rigor accorded to the former.

Bataille’s bohemian personality and combative writing style attracted conflict as well as admiration. His most sustained intellectual dispute was sparked in 1929, days prior to his initial appointment as a journal editor at *Documents*. As associate editor, he gathered together artists, art historians, curators, and librarians in order to mount a concerted critique of bourgeois culture. Bataille’s intent was to present Parisians with “[t]he provoking and the unusual, if not the disturbing” (Surya 2002: 559). *Documents* soon became the premier publication for polemics against André Breton’s faction of the surrealist movement. Although Bataille avoided intellectual and artistic partisanship, his attack on Breton was exceptionally confrontational; in

addition to his own writings, he published ripostes by André Masson, who drew the cover for the first issue of Bataille’s *Acéphale* journal and led a group that challenged surrealism. The critique of Breton and surrealism arose from disagreements concerning the nature of aesthetics and, more important, from Bataille’s belief that painting, poetry, prose, and sculpture ought to express libidinal and social forces curtailed by daily life. Bataille accused surrealists of harboring an ideal of “the marvelous” that, when encountered in an artwork, purportedly would liberate observers from their illusions and habitual states of mind. Thus, his participation in Parisian political and literary debates – particularly his contribution to journals such as *Genesé*, *Critique*, *Critique Sociale*, and *Acéphale* – fomented a dynamic skepticism, the target of which was the European intellectual who believed that art and philosophy could counter the rise of reactionary social and political movements like fascism.

The second consequence of Bataille’s life in Paris entailed a reversal of his youthful renunciation of the human body. His affinity for bodies and pleasures should not be mistaken, as it often is, as mere philistinism or decadence. An interest in erotic passions and its representation led Bataille to examine the contradictions between one’s animality and the bodily norms of human civility. In this sense, he developed erotic imaginary in ways that went well beyond the limits of human sexuality. Eroticism is described by Bataille as a trembling fear, as the desire both to negate and to transform a given erotic convention or situation (a process not unlike the Hegelian *Aufhebung* or “sublation”). Bataille published stories that extol the unique power of eroticism to pursue, as Jürgen Habermas (1990) describes it, “the traces of a primordial force that could heal the discontinuity or rift between the rationally disciplined world

of work and the outlawed other of reason” (99–100).

Transformative and transgressive narratives of primordial powers have a well-known precedent in the writings of the Marquis de Sade (1740–1814), which Bataille heralded for their opposition to economies of value, exchange, and utility. Bataille’s early novellas, *Histoire de l’oeil* (1928) and *L’Anus solaire* (1931) – both published under pseudonyms – narrate a fascination, if also solemn perplexity, for the mortal, excretory, and enervated body of their characters. Bataille’s stories are distinct from de Sade’s in that they symbolize the human body in cosmic rather than exclusively courtly contexts. In *L’Anus solaire*, erotic scenes are framed within nonhuman surroundings and their cycles of growth, decay, and regeneration:

Beings die only to be born, like phalluses leaving bodies to be able to enter them. Plants rise up in the direction of the sun and then collapse in the direction of the ground. Trees ruffle the terrestrial ground with an immeasurable amount of flowered shafts raised towards the sun. The trees that forcefully soar up are finally burned by lightning, cut down, or uprooted. Returned to the ground, they rise again, identical with another form. But their polymorphous coitus is a function of uniform terrestrial rotation. (Bataille 1985: 7)

Against the symbolic hierarchy of the planet, humanity, and God in an ascending degree of value, Bataille’s novels are replete with images and scenarios undermining the purported equilibrium offered by humanism, religion, and “common sense.” Describing the rudimentary or “lowly” material of daily life – carcasses, dirt, excrement, insects, refuse – he focuses our attention on the abject, on that which lacks intelligibility, both sensibly and symbolically. What Bataille describes as “formless” is not, strictly

speaking, a concept within his writing. He consistently redefines the meaning of this term and, as with most of his concepts, he subjects his writing to the same mode of critique he employs when interpreting other writers. Ontological claims are made possible when forms of representation simplify and dissipate potentially troubling interpretations; for Bataille, undermining metaphysical claims with terms such as “formless” was a primary aim of heterological thought. In this sense, he helped set the stage for post-structuralist critiques of representation and future avant-garde artistic movements, both of which fully emerge in the 1960s.

Although Bataille did not write a study of Friedrich Nietzsche’s writings until 1945 (*Sur Nietzsche*), he was deeply influenced by the German philosopher’s critique of morality and religion from as early as 1923. Bataille was one of the first modern French thinkers to study Nietzsche with an acute sense of his relevance for interpreting the ethical and political ramifications of contemporary bourgeois European culture. Anarchistic in its opposition to all forms of power, Bataille’s critique of “sovereignty” is reminiscent of Nietzsche’s critique of servility; both ideas conceive of social relations as detrimental to human experience, inattentive to individual desires and drives, and ultimately easily manipulated by political forces. For Bataille, sovereign experience renounces, or is indifferent to, the process by which meaning is related to truth as well as the coherent self and universe implied by this process.

From 1933 to 1939 – during the time of his involvement with the Collège de Sociologie – Bataille attended Alexandre Kojève’s lectures on G. W. F. Hegel’s *Phenomenology of Spirit* at L’École des hautes études. For an interwar generation of Western European intellectuals, these lectures constituted no less than a reinterpretation of modern consciousness based on Kojève’s reading of

Hegel's master–slave dialectic; they renewed the viability of practicing philosophy as a system and not simply a collection of disparate topics. Although he rejected Kojève's "end of history" thesis, Bataille emerged from the seminars with a desire to test the parameters of Hegelian dialectics. In his late writing, he reinterprets a constellation of distinctly Hegelian concepts, including animality, death, economy, sacrifice, and writing. His influential essay "Hegel, Death, and Sacrifice" revisits Hegel's epistemology, especially paradoxical aspects of subjectivity, in terms of the knowledge of one's mortality:

In order for Man to reveal himself ultimately to himself, he would have to die, but he would have to do it while living – watching himself ceasing to be. In other words, death itself would have to become (self-)consciousness at the very moment that it annihilates the conscious being. (1990[1955]: 19–20)

Bataille's revision of Hegel was part of a general turn in his writing after World War II, in which he subverted categories such as subjectivity, sociality, aesthetics, and political economy. At this time, the problem of community became paramount, for Bataille had come to believe that community was not based on person-to-person relations but rather on the presence of that which impedes all social relations, pre-eminently, the consciousness of one's death. Interpreting the political and psychological forces of fascist and authoritarian political movements employed to legitimate and sustain their own authority, Bataille wrote extensively about community and friendship, authority and economics, in order better to grasp how human relations are shaped by spontaneous forces and histories that conventional academic disciplines often failed to acknowledge. In his investigation of the concept of

"expenditure," Bataille rewrote the argument in traditional Western European social theory – especially Marxism – that production is at the root of social necessity and the movement of history. Bataille argues that capitalist norms and structures are reproduced as a result of their expenditure of energy and their excessive consumption. Texts like *The Accursed Share* (1991[1949]) and his posthumously published essays attracted a generation of thinkers such as Derrida, Michel Foucault, Kristeva, Jean-Luc Nancy, and Giorgio Agamben, who learned from Bataille's multifaceted oeuvre.

In 1971, nine years after Bataille died in Paris, Roland Barthes published a brief essay pondering the future study of written forms. Mid-argument he pauses to consider what he believed were major shifts in the formal and institutional categories of modernist French and European thought. Singling out a writer who defied such categories and thus typified an undercurrent of revolt against perfunctory written expression, he asked: "How would you classify a writer like Georges Bataille? Novelist, poet, essayist, economist, philosopher, mystic? The answer is so difficult that the literary manuals generally prefer to forget about Bataille who, in fact, wrote texts, continuously one single text" (1977[1971]: 157). Barthes confirms a lesson that Bataille's works teaches us – that despite the will to exhibit knowledge and the aspiration toward authority, writing must exceed specialist propriety and all manner of idealism to be "the sum of the possible, in the sense of a synthetic operation, or it is nothing" (Bataille 1986[1957]: 254).

de Beauvoir, Simone

RANITA CHATTERJEE

Simone de Beauvoir (1908–86), French philosopher, essayist, novelist, autobiographer, and political activist, is best known for her contributions to the women's movement and feminist theory. Her celebrated claim that “one is not born, but rather becomes, a woman” (1989[1949]: 267) stems from her existentialist theories of “being” that reject an intrinsic human nature. Beauvoir offers a social constructionist critique of essentialist feminist theories that laid the foundation for the contentious debates between essentialist and antiessentialist theories in the 1980s and '90s. Her feminism and her lifelong relationship with existentialist philosopher Jean-Paul Sartre tend to overshadow her other works, which include six novels, short stories, a play, several books of philosophy and cultural criticism, and extensive autobiographical writings.

Beauvoir graduated in 1929 with a degree in philosophy from the Sorbonne University in Paris. Her thesis was on the German philosopher and mathematician Gottfried Wilhelm Leibniz. She took further classes at the prestigious Ecole normale supérieure (ENS), the elite institution that trains the professoriate, the third woman to be allowed to do so (there were separate ENS institutions for men and women in the 1920s). At ENS, she met Sartre as well as the theologian and mystic Simone Weil, the cultural anthropologist Claude Levi-Strauss, and

the phenomenologist Maurice Merleau-Ponty. At this time, she began a sexual and intellectual relationship with Sartre that lasted until his death in 1980. Beauvoir and Sartre developed a philosophy of existentialism that explores the role of human freedom in a world where human existence has no transcendent meaning. Not only do humans exist *in* themselves, what Sartre described as the plant- and animal-like “Being-in-itself,” but they also consciously exist *for* themselves, “Being-for-itself.” Beauvoir explored the dialectical relationship between “Being-in-itself” and “Being-for-itself” in human interrelationships and considered the socioeconomic factors that restrict individual freedom. Whereas Sartre regarded this dialectical relationship as occurring within the individual, for Beauvoir it transpired *between* individuals. For example, women and the working class might be regarded as the “Being-in-itself” required for men to experience “Being-for-itself.” In 1945, Beauvoir and Sartre, with Merleau-Ponty, started the highly influential left-wing monthly literary and philosophical journal *Les Temps Modernes*, whose editorial board included the French author and philosopher Albert Camus.

Beauvoir’s first philosophical novel, *L’Invitée* [*She Came to Stay*], was published in 1943. Acknowledging the stylistic influences of D. H. Lawrence, John Dos Passos, William Faulkner, and Ernest Hemingway (Bair 1990: 229), Beauvoir’s novel explores the Hegelian dialectic of self and other, as well as the relationships between freedom and responsibility and love and violence. Her 1944 philosophical essay “Pyrrhus et Cinéas” (2005: 77–150) written as a series of dialogues, presents her theory of existentialism, with an emphasis on the relationship between one’s desire for freedom and the same desire in the “other” whose sympathy one requires for one’s freedom. True freedom is possible only when one recognizes

and accepts this same pursuit of freedom in another. Beauvoir also uses Voltaire’s *Candide* as an analogy for the reciprocal relationship between one’s freedom to cultivate one’s self, and one’s responsibility to help others do the same.

For Beauvoir, 1945 was an enormously productive year. In addition to writing several lengthy philosophical articles and book reviews for *Les Temps modernes*, she also published her second novel, *Le Sang des autres* [*The Blood of Others*], which applies existentialist theories to the fictional account of two lovers in the French Resistance. She also finished writing her third novel, *Tous les Hommes sont mortels* [*All Men Are Mortal*], which uses the same technique of double narration that she had successfully used in *The Blood of Others* but this time to explore loneliness and alienation. In the same year Beauvoir also saw the opening of her only play, *Les Bouches inutiles* [*Useless Mouths*], which dramatizes the power struggle in a besieged town with dwindling food supplies between the ruling men and the elderly people, women, and children they intend to sacrifice. Finally, she wrote her only essay on literary criticism, “Littérature et métaphysique” (2005 [1946]: 261–78) which argues that the experience of writing fiction is true freedom. For Beauvoir, as for Roland Barthes and Michel Foucault later, the author is associated with authority. In the creative process, when the author succumbs to her characters’ desires, the author’s will is not the final word but one of many. It is this sympathy with characters, with others, that constitutes freedom. This essay led to her second major book of philosophy *Pour une Morale de l’ambiguïté* [*The Ethics of Ambiguity*] (1949[1947]).

The Ethics of Ambiguity is Beauvoir’s articulation of an existentialist ethics that is partly influenced by Sartre, G. W. F. Hegel, Edmund Husserl, Marxism, and psycho-

analysis. Beauvoir explores the development of human consciousness, the “Being-for-itself,” in terms of Hegel’s resolution to the master–slave dialectic whereby both the oppressor and the oppressed recognize their mutual dependency. That is, I recognize my consciousness, my “Being-for-itself,” only through my acknowledgment of another’s consciousness. This relationship of reciprocity between myself and another human being implies my reliance on and use of another for my own mastery of my “being” and, more importantly, reveals my own insufficiency or lack. In choosing the conscious “Being-for-itself,” I, therefore, choose my own individual freedom, but also work to insure the same freedom for others whom I require to confirm my own conscious existence. Because of this shared need, Beauvoir advocates that humans reject authoritarian dictates and develop themselves through ethical acts that guarantee freedom for all.

In her feminist masterpiece, *Le Deuxieme Sexe* [*The Second Sex*] Beauvoir applied this existentialist theory to male–female interactions. Selling 22,000 copies in one week, *The Second Sex*’s groundbreaking and detailed critical analyses of woman’s position as the positive male norm’s inferior – his negative and his “Other” – is rightly regarded as the first book of philosophical feminism. Beauvoir explores the sexualized oppression of women in philosophy, literature, history, anthropology, biology, psychoanalysis, and Marxism. She notably attacks Sigmund Freud for his insistence on women’s biological destiny, and Karl Marx and Friedrich Engels for their marginalization of women’s labor and their failure to acknowledge women’s presence in history and their material needs. Beauvoir emphasizes that the apparent male master–female slave dialectic is not a natural given, but is constructed by a socioeconomic patriarchal power structure heavily invested

in perpetuating what she called the myth of the “Eternal Feminine.” Similar to Virginia Woolf’s *A Room of One’s Own*, *The Second Sex* concludes that women need economic independence in order to produce an autonomous subjectivity.

The Second Sex has had an enormous influence on subsequent feminist and gender theorists. American feminists Shulamith Firestone in *The Dialectic of Sex* (1970) and Betty Friedan in *The Feminine Mystique* (1963) adopted Beauvoir’s existentialist theory of woman as “Other.” French feminists Luce Irigaray, Hélène Cixous, and Julia Kristeva have all challenged Beauvoir’s ambiguous depiction of the maternal body. Recently, philosopher Judith Butler in *Gender Trouble* (1990) has taken Beauvoir’s notion of “woman” as a social construction to its radical limit by arguing that so-called normative femininity and masculinity are, themselves, ritualized dialectical performances that are produced and maintained by the social rules and power structures of a heterosexual society. Thus, in foregrounding the sociopolitical hierarchies of gender formations in both men and women, Butler brings this discussion back to its philosophical roots in Beauvoir’s work.

Benjamin, Walter

MARTHINE SATRIS

Walter Benjamin (1892–1940) was a literary critic associated with the Institute for Social Research in Frankfurt (the “Frankfurt School” of critical theorists), and he is best known for his idiosyncratic blend of culture critique, Marxist philosophy, and Jewish Kabbalah mysticism. He was born in Berlin, the eldest of three children in a Jewish family assimilated into the bourgeoisie of the German Empire. His early life was quite privileged, and though he refused to follow his father into business, he depended on financial assistance from his parents until 1922. In his twenties, Benjamin lived the precarious life of a man of letters and literary critic. He became involved with the widespread German Youth Movement, founded in 1900, which embraced the idealism of youth and sought freedom from the tradi-

tions of German culture through reconnecting with nature. Benjamin wrote multiple articles for a journal of the movement, *Der Anfang*, in which he advocated schooling that encouraged active contribution from students rather than passive acceptance of frozen traditions. These articles impressed others in the movement and he began to gain a reputation as a writer in this period. He was also a university student at the universities of Berlin, Freiburg, and Munich between 1912 and 1917, attending lectures on art, philosophy, and philology.

During World War I, Benjamin was excused from military service for medical reasons, and he split with those in the Youth Movement who supported the war. Having found the cultural environment in Germany during the war years to be stifling, he moved to Bern, Switzerland, in 1917 to finish his studies. In the same year, he married Dora Kellner, and their only child, Stefan, was born in the following year. After receiving his doctorate in philosophy from the University of Bern in 1919, for which he wrote a dissertation entitled *The Concept of Art Criticism in German Romanticism*, Benjamin returned to Berlin with Dora and Stefan in 1920.

During the first half of the 1920s, at the urging of his father, Benjamin endeavored to develop an academic career. He found a mentor for his second dissertation, or *Habilitation*, at the literature department at the University of Frankfurt in 1922, under whose auspices he wrote a critical assessment of baroque German tragedy, or *Trauerspiel*. It was at Frankfurt, in 1923, that he first met Theodor W. Adorno. During these years, which saw the rise of the Weimar Republic and German modernist and avant-garde art, he was at the peak of his career, writing articles and working on his *Habilitation*. His criticism was being published and reviewed regularly, building up his reputation in Germany as a man of letters.

The Benjamins' marriage lasted officially until 1930, but by 1924 the couple had separated. Benjamin spent the latter half of 1924 writing while living with friends on the island of Capri. There he made the acquaintance of other European intellectuals and some of the Italian futurists; he also read Georg Lukács's *History and Class Consciousness* (1923) and began what would become a serious, lifelong engagement with Marxist philosophy, encouraged by Asja Lacis, a Latvian communist to whom he grew close while in Capri. Benjamin cited 1924 as the time of a great shift in his thinking, as he moved away from a purely philosophical engagement with art to a political consciousness of its position in society.

Benjamin presented *The Origin of German Tragic Drama* to the University of Frankfurt in his application for *Habilitation* in 1925. However, his determination not to be bound by traditional methods of criticism led to Benjamin's work being rejected; indeed, the aesthetician Hans Cornelius found it to be "an incomprehensible morass" (Steiner 1998: 11). After this final rejection by academia, which he met with some ambivalence, Benjamin went on to become an independent scholar and freelance writer living a peripatetic life throughout Europe.

In the first years after the rejection of his *Habilitation*, Benjamin made his home in Moscow, Frankfurt, and Paris, where in 1927 he began his never-finished masterwork on nineteenth-century urban modernity, *The Arcades Project* [*Passagen-Werk*]. Returning to Germany, Benjamin published many pieces of literary criticism in German newspapers and journals while also working in radio in Frankfurt. In 1929, Lacis introduced him to the radical Marxist dramatist Bertolt Brecht in Berlin, initiating a friendship that would provide him with great intellectual and material support over the

next decade, including a place to live in Denmark for months at a time after 1933, when he and Brecht, facing persecution as communists and intellectuals by the Nazi party (who would of course also target Benjamin as a Jew), became exiles. Fleeing internment in March of 1933, Benjamin went back to Paris, which was his preferred place of residence, although he periodically moved in with friends elsewhere in Europe. Throughout this period, he maintained an extensive correspondence with his now far-flung circle of friends and fellow intellectuals, which included people of many political and religious persuasions. Max Horkheimer and Theodor Adorno of the Institute for Social Research, itself in exile in the US, provided some commissions to Benjamin, for he shared many of their political and intellectual sympathies. They supported him with a monthly stipend for the last six years of his life.

Despite his much reduced circumstances and the limited hope of finding venues for publication – no publisher in Germany would dare print the work of a left-wing Jewish intellectual – Benjamin wrote some of his best-known works during these years of exile, including "The work of art in the age of mechanical reproduction," which was published in French in 1936. During the long periods he spent in Paris between 1935 and 1940, he accumulated research and quotations for the *Arcades Project* and continued his work on Baudelaire, whose poetry he had translated into German in 1923. Benjamin and Adorno had lengthy philosophical disputes during this period, conducted by mail, about Benjamin's application of Marxism in his essays on Paris, Baudelaire, and the mechanical reproduction of art, disputes that held up the publication of his essays in the Institute's journal.

The Nazi regime stripped Benjamin, as it had other refugee Germans, of his citizen-

ship in 1939, leaving him stateless. He had no success at applying for citizenship in France and, when war was declared in the fall of 1939, he was interned for two months with other German immigrants. After his release, he returned to Paris, where he continued to write and to seek out emigration possibilities. His last work, "Theses on the concept of history," was sent via Hannah Arendt to Adorno in 1940. In June of 1940, on the eve of the invasion of Paris by German troops, Benjamin finally left his adopted city, having been promised a visa to the United States, thanks to Horkheimer. That September, he tried to escape over the French-Spanish border with a small band of refugees, but was refused entry into Spain. Fearing return to Nazi-occupied France and the hands of the Gestapo, Benjamin took an overdose of morphine pills and died on September 26, 1940.

Benjamin's intellectual path traced an evolution from an early metaphysical aesthetics to a theory of art grounded in the social, political, and economic contexts in which art is made and in the possibilities that art opens up for critical, as for reactionary, projects. His early interests in aesthetic philosophies and Jewish theology were never abandoned, and even his most political writing reflects the molding effects of his aesthetic and theological interests.

Throughout his life, Benjamin's work revealed his conviction that the critic plays a vital part in bringing the work of art to reveal its fullest meaning. From the time of his dissertation on German Romanticism, Benjamin regarded the critic as more than just a commentator, but as someone who could reveal the "truth content" in the subject matter or material of the artwork itself. The critic, he argued, can analyze art to address the same kind of questions that we see in philosophy. His essay "Goethe's *Elective Affinities*" (2004[1924-5]), built on the theoretical principles that guided his

doctoral thesis (which included an afterword on Goethe). In this essay he emphasized that critics should not compare a work of art to expectations of its genre already put in place, but rather that it should be judged as an autonomous work of art. Critics should bring forth the significance of the work by looking only at the text or piece of art itself. One other essay that Benjamin wrote in this early period that has since been influential for literary and linguistic scholars is "The task of the translator" (1968[1923]: 69-82), which was initially published as a preface to Benjamin's translation of the poetry of Baudelaire. In it, he developed the theory that languages do not all hold the same relationship to the objects they use different words to represent, and that what translation reveals is the relationship between languages, not the relationship between the original language and what it purports to describe. In other words, he acknowledges the gap between how we conceive of something and the thing itself, an idea that continued to have significance for Benjamin in his early, metaphysical writings. Some of his ideas about the role of the critic and his descriptions of the concept of language have their basis in the Kabbalah.

Benjamin's last early work of significance was his unsuccessful *Habilitation* piece, *The Origin of the German Tragic Drama* (1998 [1928]), which was well received by reviewers at the time of publication. He began to develop in this work the method of organizing extensive quotations in compendium or collage forms, in lieu of traditional argumentation, a method that reached its apotheosis in the *Arcades Project*. His work on the seventeenth-century *Trauerspiel* argued that the genre was reflective of the cultural context in which the form developed, and that it should be considered as an art form unto itself and not compared to its detriment with nineteenth-century

neoclassical ideals of what a tragedy should be. As he had done elsewhere, Benjamin claims that art should be judged for itself, not with any pre-established expectations. He also began to develop the theory of allegory that would continue to be an important concept throughout his career, returning to it again to characterize Baudelaire's poetry in some of his last works. Allegory, which establishes an arbitrary relationship between an object and an idea, like the color green and renewal, in these baroque dramas was, he claimed, just as valid an aesthetic form as the symbolism venerated by the Romantics. In fact, because its arbitrariness more accurately represented the relationship between our always flawed understanding and the ideal, allegory was to be preferred.

From 1924, Benjamin's work became greatly influenced by Marxist theory, despite his avid interests in theology and metaphysics, and a developing interest in psychology. Influenced by Brecht and Adorno, Benjamin moved between their different views on the work of art in society: Brecht was committed to art as a political intervention, while Adorno believed that the autonomous work of art should still be the focus of criticism, because it could still reveal the circumstances (the substructure) in which it had come to be. Both these tendencies are present in Benjamin's most widely read work, "The work of art in the age of mechanical reproduction" (1968[1936]: 219–53). This piece, with its discussion of media, the history of art, and Marxist theory, has become a foundational text for critics in many fields, including film studies, literature, and cultural studies. Benjamin argued that the ability to reproduce art by means of lithography and photography led to a degradation of the aura that surrounded traditional art objects. "Modernity" here means the culture that emerged out of the Enlightenment in

Western Europe in the phase of industrial capitalism. Benjamin argued that the aura existed initially because art objects were traditionally part of rituals and religious ceremony, and it was maintained by later cults of beauty, such as we see in some forms of Romanticism, that held the art object apart as pure, authentic, original, and without function. In this essay, Benjamin took the idea of the aura from his reading of Marx on value and commodities and was influenced too, as is evident in the *Arcades Project*, by the idea of commodity fetishism. To Benjamin, the aura has been stripped away from artworks in the modern era because the distance between the masses and art has been closed by the availability of easily made, cheap reproductions; he saw this as a positive development in one sense, because when the consumer is close to art, it becomes a potential tool with which to communicate directly with the masses, and therefore could serve progressive political ends. But Benjamin always regarded forward progress as a destructive force, and believed that the kind of historical narrative, like Marxism, that depicts civilization as always improving is forced to ignore or conceal many moments of violence and rupture.

The second half of the essay focuses on cinema and its potential as a mass art form that could offer an alternative to fascism's aestheticization of violence and politics (i.e., mass rallies and other forms of spectacle). Cinema also represented the modern experience for Benjamin, with its constant movement that does not allow for lengthy contemplation and its replacement of unitary substance by a continual succession of disparate images. Cinema also actively shaped the modes of perception of the mass audiences, who then took this experience back out into the world. Adorno criticized this essay for its assumption that technical progress in art necessarily served

both aesthetic and political progress and for too easily abandoning the power of the autonomous work of art to contribute to political change. Yet they both fundamentally agreed that art is fundamentally changed in late modernity by what Max Weber calls “rationalization,” the idea that the personal and emotional are replaced with efficiency and the quantification of value.

Many of literary theory’s key concepts for understanding what it means to be modern come from Benjamin’s pages of quotations and notes that were collected by the author as the *Arcades Project*. One of the dominant motifs in this text is the progress of the flâneur, who is the epitome of the modern subject, who understands and appreciates shock as the sensation of the new and modern, and negotiates the overwhelming presence of the urban crowd. The *Arcades Project* is organized into 36 “convolutes,” labeled according to themed topics (e.g., “Idleness,” “Fashion,” “Baudelaire”). His 1935 exposé of the project, “Paris, the capital of the nineteenth century” (1999: 3–13) outlined his intentions for Max Horkheimer, his financial backer. This final project, which Benjamin had been researching for 13 years at the time of his death, would study the Parisian shopping arcades as a method of revealing the impact of the fetishization of commodities inherent in nineteenth-century bourgeois culture, and it would address the way his own time was shaped by this history. He brought Freud’s idea of erotic fetishization to bear on the Marxist concept of the commodity fetish, in an innovative and provocative fusion that attempted to describe our psychological and emotional relationship with objects.

Influenced by surrealism and avant-garde art, Benjamin did not make specific arguments, but rather accumulated fragments of material into constellations in order to allow the present to intersect with the past, continuing an innovative style of criticism and

argumentation that had many literary and artistic analogues among the work of European and Anglo-American modernists. These fragments were not just about the shops in the arcades, but brought together high culture and modern mass culture with references to topics such as street lighting, prostitution, nineteenth-century French literature, and the diorama in order to illuminate the interconnection of art and architecture with the economic system of industrial capitalism. He hoped this would allow the reader to experience moments outside the inexorable progress of time – “homogenous empty time,” as he put it in the “Theses on the philosophy of history” (1968[1940]: 253–67) – for only by looking at historical works could we learn how the culture of another time influences our own. Two of the most important images to find their shape in the collage of accumulated material were the idea of the nineteenth century as a dream, which is made of the illusions of commodity culture, and the flash of awakening, the dialectical image that comes about through critical historicization and that might redeem us.

In the poems of Baudelaire, Benjamin discovered a poetry that he felt to be truly modern in form as well as addressing many of these elements of modernity. He wrote about Baudelaire both in the *Arcades Project* and in essays drawn from his archive of material, all of which he intended to pull together into a book-length study, *Charles Baudelaire: A Lyric Poet in the Age of High Capitalism*. He submitted one essay, “Paris of the Second Empire in Baudelaire” to the journal of the Institute for Social Research in 1938, and they published a rewritten and revised version as “On some motifs in Baudelaire” in 1940. Benjamin (1968: 155–200) argued that Baudelaire’s poetry is shaped and driven by the shock that is the experience of the overstimulated individual in the crowd that makes up the

modern city. Baudelaire's poetry embodied that form of experience, and Benjamin saw that in its turn away from the pure, beautiful aesthetic and from the aura of the work of art, Baudelaire's poetry was a fitting representation of the modern age. Benjamin's interest in the urban crowd led him to Edgar Allan Poe's detective stories, which he saw as another form that reflects and responds to nineteenth-century ways of life. In these works, Benjamin continued the task he set for critics at the beginning of his career: to find within texts their own immanent meaning, which for him often coincided with the structure of modern existence.

The last piece that Benjamin was able to finish before his death brought him back to some of his earliest concerns, and continued to link his seemingly opposed interests in art, metaphysics, and materialism. In "Theses on the philosophy of history" (in some translations, "On the concept of history"), Benjamin wrote short, aphoristic texts that mix the languages of theology and historical materialism to create a conception of history that is based on a recognition that progress is not a linear historical process, but is reconstructed as such by the historians working for the victors to justify the latter's positions. Benjamin offers a new form of historical materialism: "Only that historian will have the gift of fanning the spark of hope in the past who is firmly convinced that *even the dead* will not be safe from the enemy if he wins. And this enemy has not ceased to be victorious" (Benjamin 1968: 255). The concept of the flash of recognition – the dialectical image – provides the only way to conceive of the idea of *now*. It is, like the awakening in the *Arcades Project*, a fleeting point of rupture, and Benjamin characterizes these interruptions as "messianic time." As the arrival of the Messiah spells the end of history in Jewish theology, these are moments when

history stops, but they are ruptures, not endings.

Despite the blows dealt him by the vagaries of life and the rise of fascism, Benjamin's wholehearted commitment to art and the intellect stood firm; he was a man of letters who believed art could impact life and that criticism could lead to revelation, even in the midst of the deepest oppression.

Blanchot, Maurice

JOSHUA KATES

Maurice Blanchot (1907–2003), often referred to as an “invisible” or “shadowy” figure (the subtitle of his definitive French

biography is *Partenaire invisible* [Invisible Partner]), had an enormous impact on intellectual life in France, from the time of World War II until his death. Blanchot often removed himself from active social life; from 1948–58, for example, he dwelt exclusively in the small town of Eze. And despite holding an advanced degree in philosophy, he kept apart from the academy, making a living instead as a writer – at first of news and political columns, then of fiction and of critical and philosophical essays. The diversity of his interests, as well as his removal from scholarly institutions, left a clear mark on his work. His writing increasingly lessens or effaces the differences among genres, culminating in a late style (after he almost wholly abandoned the writing of fiction proper in 1962), in which fragmentary philosophical meditation and literary criticism are combined with second-person address, reminiscent of a dialogue.

Blanchot experienced all the major changes that his native country, France, underwent in the final three-quarters of the twentieth century. He was profoundly engaged in such political turning points as the rise of Vichy, the installation of the Fifth Republic, and the events of May 1968. Just as the relations among Blanchot's writings pose problems – knowing which works are philosophy, which literature, which literary criticism – so do the relations between his life and his work. The life and work are deeply intertwined. Blanchot not only conceived, but lived, the paradoxes of the disappearance of the subject later thematized by poststructuralism. (Michel Foucault thus claimed that, during the 1950s, he wanted *to be* Blanchot.) These paradoxical stances entered the texture of Blanchot's life in a way that proved exemplary for an entire generation. Nevertheless, *how* his life and work finally relate remains less clear.

Given the nature of these paradoxes, of the notorious “death of the subject,” the

idea that negotiating Blanchot's life and work should pose a problem is fitting, perhaps even expected. From his earliest literary and critical writings, Blanchot focused on the excess, implicit in the act and materiality of writing, over individual identity, personal beliefs, indeed the totality of world and human life. A version of this signature problem succinctly emerges in one of his discussions of Flaubert. (In his most important critical writings, Blanchot returns time and again to the same literary figures: Kafka, Mallarmé, to some extent Flaubert, and a handful of others.) Faced with Flaubert's lament "too many things, not enough forms," Blanchot insists that it is not things but forms of which we have too many, and thus that "there is always too much of what we never have enough of" (Blanchot 1993 [1969]: 336). He recognizes, that is, the gap between language and the world, which may be seen negatively, as by Flaubert, or valorized, as by poststructuralism, as entailing language's ability to construct reality, to carve out and identify beings. Yet, conceived either way, what language in itself may be, what this power itself is – how to name it, think it, relate to it – for Blanchot remains mysterious. Language is itself a lack, a nothing, in regard to the world itself, toward which it also functions as an excess, a too much. And though language may instantiate a power, somehow standing beyond the world, to make a world, access to this impossible possibility, to transcendence in this technical sense, for Blanchot can never be assumed or taken for granted.

In all of his work, Blanchot investigates this power of writing, and its transient potential to upset and reverse our relations to things, to existence, and to everyday life. Nevertheless, while his work thus veers away from his own and all individual existence, the question of his biography cannot simply be avoided. It furnishes a central site both for discussions of the work and the person.

When Blanchot came on the scene as a writer, in the turbulent period of the 1930s, he initially did so as a journalist, sometimes of far right polemics. (He originally covered foreign affairs for the daily paper *Journal des Débats*, and worked as a political columnist and editor for small weeklies; the latter, in particular, and the stances Blanchot took in them, belonged to the extreme right.) Over time his politics decisively changed. After an ambiguous involvement with Vichy, and a hiatus of some 20 years in which no political work or writing appears, Blanchot emerged in 1958 as a figure on the far left. He signed (and in fact authored) a petition supporting soldiers who refused to fight in Algeria, signaling his opposition to the Fifth Republic. He was especially active in the events of May 1968, drafting political statements and manifestos that circulated anonymously. His early, right-wing political stance coincided with the emergence of his philosophical and aesthetic thought, making the question of the latter's relation to his politics unavoidable. His literary efforts and critical writings showed less discontinuity, though the intersection of politics and his literary and philosophical writing indeed ignites speculation about their relation, further fueled by the influence of Martin Heidegger on Blanchot's work, especially during this period.

Blanchot's first published literary work, *Thomas the Obscure*, remains a bellwether for innovations in the form of the novel, inaugurating a radically new direction in its conception. *Thomas* appeared in 1940 (and was later slimmed down in a revised version in 1950). It famously begins with a description of its main character, Thomas, swimming. Divided into 12 sections, the book features a number of such scenes, in which Thomas struggles with variously elusive and metamorphosing landscapes and settings: oceans, forests, a room of strange guests, a

meadow, and again the ocean. At the same time, *Thomas* also contains a more straightforward narrative: across these extraordinary scenes – including a roomful of talking animals, and Thomas’s confrontation with his death at his own graveside – the narrator relates the story of Thomas’s affair or friendship with one Anne. As made evident in this story, which shows Heidegger’s influence, Blanchot assigns a fundamental importance to the theme of death. Death uproots everyday existence from the actual and the practical in order to resituate it in the possible, on the vertiginous plane proper to human existence in its singularity. Blanchot concurs with Heidegger in giving death this leading role; at the same time, as the interplay between Thomas and Anne in *Thomas* attests, he further insists that my own death also escapes me, and that my experience of finitude is as much a function of the death of another as of me. As his good friend Georges Bataille had also insisted, the death of someone else institutes the relation to this possibility (or impossibility), such that death, “my death” (the property of, and proper to, no one) never fully successfully manifests itself at all. As Blanchot puts it in “Literature and the right to death,” perhaps his most famous early essay, which appeared some years after *Thomas*: “to die is to shatter the world . . . and so it is also the loss of death, the loss of what in it and for me, made it death; . . . my impending death horrifies me because I see it as it is: no longer death, but the impossibility of dying” (Blanchot 1995b [1949]: 337).

As in his treatment of Flaubert’s lament, where what was not enough becomes that of which there is too much, death here becomes “the impossibility of dying.” Such reversals, as well as the “without” formulations to which they tend, such as “death *without* dying,” arguably revealed to an entire generation – Foucault, Jacques Derrida, and others – a path toward a

new kind of writing and thus of thinking. In his expressions, as Foucault memorably put it, Blanchot remains “attentive to the signs which only signify in the movement that effaces them” (Foucault 1979). Blanchot, thereby, pioneered a syntax that adapted and transformed something like a Heideggerian style of meditation into a uniquely French idiom.

In *Thomas*, along with death, Blanchot reworks other central Heideggerian themes, placing them in a specifically literary context. In an extraordinary early scene, the narrator of *Thomas* recounts how Thomas, in a forest, faced with “absolute night,” discovers his eye becoming the whole of the external landscape. This eye, infested by darkness, which monstrously extends out and fills the horizon of that which it is to see, gestures toward a catastrophe of the work of understanding, a radical inversion of the relation of being and Beings, resonant with Heidegger’s thinking. On the one hand, the absence of vision, absolute night, here stands as “the culmination of sight”; on the other hand, such seeing undergoes a radical self-alienation and externalization. Sight, standing in for the capacity to apprehend beings in general, blotting out all there is, in effect turns round on itself and becomes the entire outward horizon. At once everything and nothing, blinded but also having become the entirety of the external world, the understanding makes contact with Being as such – the condition for all apprehension of beings, the background nothingness required for any act of apprehension – and at the same time loses its own location and becomes other, radically foreign to itself.

Blanchot, in *Thomas* and other early works, confronts the Heideggerian themes in all their uncanniness, even as he decisively resituates them, setting them in a distinctively literary context. In both his literary and critical works, Blanchot removes Being

from those sites in history (the history of philosophy, as well as that of nations and peoples), to which in Heidegger it remains tied, instead connecting it to a set of mobile, self-fragmenting situations – to occasions more “proper” to literature and language. He in fact invents new techniques for prose, analogous to those that his master, Stéphane Mallarmé, had pioneered for poetry, in which the story and narration highlight their own performativity – in effect turning around on themselves in order to reveal the matter of language, the act of writing in its anonymous singularity.

Friendship, which Blanchot thematizes in one of his works (*L’Amitié*), especially intense intellectual friendship, played a pivotal role in Blanchot’s life and thought. Besides Bataille, this is most true of his friendship with the great Lithuanian-born French Jewish thinker Emmanuel Levinas, with whom Blanchot was close from the early 1930s on and whose family Blanchot helped during the occupation (thus further complicating the issue of Blanchot’s biography and politics at this epoch). One of the themes they shared, though they understand it somewhat differently, is the “*il y a*” (“there is”), which surfaces at a similar time in both of their works. In Levinas’s thinking, the “there is” represents an experience of the being of things in their smothering foreignness to beings like ourselves – as in insomnia, where the self feels itself handed over and confined to an essentially alien milieu from which it cannot escape. This feeling, of the sheer factuality of the everyday world becoming unremittingly oppressive, appears in many of Blanchot’s stories – in scenes, such as in *Thomas*, where the protagonist suddenly experiences some facet of everyday life (dining with guests, sleeplessness), as radically intolerable. Its thrust is to move the understanding of human being away from the Heideggerian solitary individual faced with his or her own

possibilities in the world toward a more specifically ethical direction, in which nothing offered by the world, no achievement, no form of immanence, can satisfy the person as such.

Another significant intersection of Blanchot’s thought with Levinas’s occurs with the publication in 1969 of Blanchot’s *The Infinite Conversation*, a work that inaugurates the final phase of his writing career (a phase, as already noted, marked by the absence of the production of literature and his invention of a mixed genre, both philosophical and critical, including fictitious or phantom conversations). The subject matter of this work clearly corresponds to Blanchot’s new style and the formal innovations toward which he had been building since the early 1960s. In a section that describes the character of his own prose, the texture of his own text, called “Plural speech,” Blanchot takes up the notion of a personal other (*Autrui*) that Levinas pioneered in his 1962 magnum opus *Totality and Infinity*. As Blanchot says, Levinas there located the now classic poststructuralist (and post-Heideggerian) theme of alterity and difference specifically in the otherness of the person, the human being, the stranger: “only man is absolutely foreign to me . . . he alone the other” (1993[1969]: 60). Blanchot follows Levinas in seeing the human being as the strange itself and he finds in discourse, speech, the radical asymmetric difference between myself and the other, necessary for the other to be a radical, nonreciprocal other. Yet Blanchot also brings this notion into contact with his already existing preoccupations, declaring that “*Autrui* [Other] is a name that is essentially neutral” (72). Though aimed at persons, this radical unknowability confuses itself, traces and effaces itself, within the otherness that Blanchot had previously assigned to the impersonality, or now the neutrality of writing. He insists that this

medium, writing, rather than speech, most successfully embodies the asymmetrical relation to the other that Levinas sketches (73). Blanchot thus charts a course in which difference, being, nothing, death, and the ethical (including a re-envisioned history and politics) become ineluctably interwoven.

In the very last phase of his thought, after *The Writing of the Disaster*, a work which extends his philosophical and literary concerns while making specific reference to the Holocaust, Blanchot sketches a novel horizon for political speech and action that overlaps with his ongoing meditation on friendship. Friendship and politics become intertwined in part because Blanchot's reflection on politics includes a meditation on the politics of his friends, notably that of Georges Bataille, who, like Blanchot, stood on the far right in the 1930s. Blanchot in the early 1960s had previously argued that the role of intellectuals was to resist the reasonableness and pragmatic calculation defining of liberal-democratic politics. In this latter phase, in the 1980s, intervening in an ongoing debate begun by Jean-Luc Nancy in his *Inoperative Community*, Blanchot now affirms that the momentary coagulation of a dissymmetrical, singular, anonymous community (such as took shape in May 1968) represents the defining political instance, even though this can necessarily never directly lead to new stable political forms, such as the nation-state or a set of codified laws. Instead such communities gesture toward a future, for once, authentically futural, open to a repetition in difference that is deeply ethical and as such genuinely historical.

Blanchot's legacy remains partially shrouded, glimpsed only in the middle distance. Such indeterminacy stems from Blanchot's radical resolve to think seriously about "an experience of the obscure in which the obscure offered itself in its obscurity" (Blanchot 1993[1969]: 51), as

well as from both the intensely private and the intensely public portions of his life. What remains today clearer than ever, however, are not the outlines of what Blanchot has left us, but the vastness of this legacy, its massive impact on the literature, writing, and thinking of those who immediately followed after him and doubtless also of those who are still to come.

Booth, Wayne

PAUL DAHLGREN

Wayne Booth (1921–2005) had a profound impact on both literary criticism and on the re-emergence of rhetorical studies in the twentieth century. He worked on subjects as diverse as narrative technique, theories of irony, and the nature of assent in argument. While Booth began his career as a specialist in eighteenth-century British literature, trained by the neo-Aristotelian critic R. S. Crane, his work regularly transcended historical and methodological categorization. At the time of his death he was the George M. Pullman Professor Emeritus of Distinguished Service for the Department of English Language and Literature for the University of Chicago.

Booth is widely known for his seminal work in narrative theory, *The Rhetoric of Fiction* (1983[1961]), in which he developed

a number of ideas that would become fundamental for literary criticism in the later twentieth century, including the distinction between implied authors and real authors as well as between reliable and unreliable narrators. Perhaps most importantly, Booth argued that all works of fiction necessarily have rhetorical devices, and that authors cannot avoid these techniques but only use them more or less effectively. *The Rhetoric of Fiction*, originally published in 1961 and republished with a new afterword in 1983, argued against a variety of dogmatism, from formalism to symbolic form, proffered by literary critics in the first half of the twentieth century. Booth inveighed against claims that an author must be objective, that showing is always better than telling, that novels should be realistic, and that authors should ignore their audiences. The techniques that support these claims may have contributed a great deal to aesthetically challenging and enduring work; however, as Booth points out, when critics mistake technique for meaning they leave out of account an entire rhetorical dimension that requires a relation between author and reader.

Booth never lost sight of the fact that works of fiction are always interactions between readers and authors, and *The Rhetoric of Fiction* does much to codify this relationship. He made a number of distinctions that have become essential to contemporary literary criticism. Perhaps the most important concept to come out of his work was the implied author. Essentially, an implied author is the subject position constructed by the reader from textual evidence and generic expectations and should be distinguished from the narrator in a text (who may or may not be reliable) and the flesh-and-blood author of the work. This concept allowed Booth to discuss authorship without recourse to “the intentional fallacy,” the idea that it was a mistake to substitute an

author's intentions for the meaning of a work. *The Rhetoric of Fiction* concluded with a controversial chapter on the morality of impersonal narration which prefigured Booth's foray into ethical criticism. He claimed that impersonal narration might be morally inadequate when a narrative traces the life of a morally reprehensible character. Although Booth later retracted elements of this argument (see the afterword of the second edition of *The Rhetoric of Fiction*), both the argument and the retraction bring us to the heart of his theory of narrative. For Booth, the task of narrative is to create a bond between the implied author and the implied reader of a text, something he explored further throughout his career, especially in *The Rhetoric of Irony* (1974a) and *The Company We Keep* (1988). These works participated in the "ethical turn" in literary theory which swept the humanities in the late 1980s, a movement which included not only Booth but figures as diverse as J. Hillis Miller, Emmanuel Levinas, and Martha Nussbaum. In *The Rhetoric of Irony*, Booth explores how authors and readers share irony (and why they sometimes fail), while in *The Company We Keep* he explores how the exchange between authors and readers works as an ethical system in which readers learn to take the perspective of a total stranger.

Booth often proclaimed himself a methodological pluralist, and his work touched a number of fields outside of narrative theory. Perhaps most significantly, Booth participated in the revival of rhetoric that emerged across disciplinary lines in the 1960s. This aspect of his work is best represented by *Modern Dogma and the Rhetoric of Assent* (1974b), in which he argued against the positivistic rejection of rhetoric (and helped pave the way for the now flourishing rhetoric of science). Booth rejects the idea that facts and values must be separated and uses rhetoric both to produce and analyze an

agreement between them. His final book, *The Rhetoric of Rhetoric: The Quest for Effective Communication* (2004), continues his work in the revival of rhetoric by redefining and defending rhetoric against its critics.

Booth's rhetorical and generic approach to fiction is very much indebted to R. S. Crane and the Chicago School of criticism, rooted in Aristotelian rhetorical and critical traditions. In many respects, he is a new critic, focusing as he does on the formal aspects of fiction and a theory of formalist criticism. Like the new critics, he was not without his detractors, most notably deconstructionist and reader-response critics, who question the very nature of genre, the text, and the ontology of author and reader. Booth's allegiance to humanism and his tendency toward rhetorical and formal analysis made him a unique figure in narrative theory, given that from the 1970s the field was moving well away from generic and rhetorical approaches. When theory in the US became politicized in the 1980s Booth was accused of paying too little attention to politics, but this accusation only makes sense if one excludes from the domain of the political the rhetorical nature of public communication. For his work has always tended toward an ethical reading of the relation between author and reader, between reader and text – an ethics of reading grounded in a traditional humanism and in innovative theories of pluralism and communication.

Despite these various criticisms, Booth's work has been positively extended across a number of fields. For instance, James Phelan and Peter Rabinowitz have relied on and revised Booth's ideas in their work on narrative theory. Just as Booth suggested that all narrative functions rhetorically, a number of scholars have used Booth's ideas to think about rhetoric in areas where it is typically not discussed. Most notable in this regard is

Deirdre McCloskey's work in the rhetoric of economics (1998). Indeed, there are a number of avenues of research still open. Little work has been done using Booth's rhetorical model to analyze internet and other "virtual" media, such as video games, or multiauthored texts, such as interactive fiction, which complicate Booth's understanding of narrative as relationship between a implied author and an implied reader, for the concepts of "author" and "reader" have undergone massive changes in the past 50 years. Scholars like Jim Phelan, who is the most prominent of Booth's intellectual heirs, continue to explore the implications of his theories of narrative, the reader, and the ethics of reading in an age in which texts and the act of reading present new formal and ethical challenges.

Brooks, Cleanth

CARRIE K. WASTAL

Cleanth Brooks (1906–94) was one of the most influential and innovative writers in what has come to be known as the "new criticism." Though he is best known for his collection of essays, *The Well-Wrought Urn* (1947), in which the new critical emphasis on irony and paradox find eloquent expression, he was also a scholar of southern US writing, particularly the work of William Faulkner, and his *William Faulkner: The Yoknapatawpha Country* (1963) is still widely read today.

Born in Kentucky, Brooks graduated from Vanderbilt University, attended Tulane University for graduate work, and later Oxford University as a Rhodes Scholar. He graduated from Oxford and began his teaching career at Louisiana State University in Baton Rouge in 1932. In 1947, he moved to Yale University and held the prestigious post of Gray Professor of Rhetoric until his retirement in 1975. While at Vanderbilt University, Brooks met future collaborators and fellow literary critics Robert Penn Warren and John Crowe Ransom. Brooks and Ransom served as managing editors, and later coeditors, of *Southern Review* from 1935 to 1942. During their stewardship, the journal, housed at Louisiana State University, promoted the editors' vision of the southern states' cultural contributions, which included the work of new and established writers.

During his tenure at the *Southern Review*, Brooks began to formulate the methodologies that would later become associated with the new criticism. He focused mainly on poetry, which he thought offered readers a metaphorical and symbolic vision of life. In the opening chapter of *The Well-Wrought Urn*, “The language of paradox,” Brooks argues that while the language of science requires the use of objective language free of rhetorical figures like paradox, “paradox is the language appropriate and inevitable to poetry” (1947: 3) – indeed, the truth of poetry can emerge *only* through paradox. Even William Wordsworth, who tends to make a “frontal attack” on his subject matter, can be read, as his friend Samuel Taylor Coleridge did, as a poet grounded in paradox, who was to “give the charm of novelty to things of every day, and to excite a feeling analogous to the supernatural, by awakening the mind’s attention from the lethargy of custom” (Coleridge 1905[1817]: 145). As Brooks points out, Coleridge understood Wordsworth’s project in *Lyrical Ballads* to consist in the attempt “to show his audience that the common was really uncommon, the prosaic was really poetic” (Brooks 1947: 7). Paradox depends on irony, which transforms the “wonder” of revelation into something both more complex and more grounded in everyday experience. For Brooks, the paradoxical quality of poetry “springs from the very nature of the poet’s language: it is a language in which the connotations play as great a part as the denotations” (1947: 8). His masterful reading of John Donne’s poem “Canonization” demonstrates that paradox – specifically, the treatment of “profane love as if it were divine love” – precisely by virtue of its indirection allows the articulation of a truth, where a direct presentation would “enfeeble and distort what is to be said” (1947: 11, 17). Like religious discourse, poetry creates through paradox a “well-wrought urn” that balances, like John Keats’s

Grecian Urn, eternal beauty and the “human passion” that strives to transcend human mortality.

As *The Well-Wrought Urn* demonstrates, the job of the critic is to discover the formal unity of the text through an examination of its rhetorical effects. One of Brooks’s most important “articles of faith” was that “the primary concern of criticism is with the problem of unity – the kind of whole which the literary work forms or fails to form, and the relation of the various parts to each other in building up this whole” (1951: 72). Form, for Brooks, could not be separated from content. The premise that literary criticism ought to concern itself with formal unities rather than contextual influences underwrites his belief that poetry cannot be paraphrased: “to deny that the coherence of a poem is reflected in a logical paraphrase of its ‘real meaning’ is not, of course to deny coherence to poetry; it is rather to assert that its coherence is to be sought elsewhere” (Brooks 1947: 206). These other modes of coherence lay in the “illogical” tropes of paradox, irony, and ambiguity – the elements of formal unities that it is the critic’s job to describe.

Brooks published the articles of the critic’s faith in his 1951 essay, “My credo” published in the *Kenyon Review*, another leading organ of the new criticism, founded by John Crowe Ransom in 1939. The focus on formal unities has led many opponents of the new criticism to charge its practitioners with neglecting the importance of authorial intention in the composition of literature. However, critics like Brooks were well aware that texts produced by authors are products of their intentions – that is to say, of their experiences, desires, feelings – but he understood equally that to undertake a textual reading based on psychological, biographical, or historical evidence forces the reader to make critical assessments based on subjective interpretations of evidence that may

be incomplete, incorrect, or incoherent. Consideration of contexts extraneous to what Brooks regarded as the poem's ultimate meaning diverts the reader's attention from the object of criticism itself, the literary work. The emphasis on the work's coherence and unity, then, is a formalist solution to a problem of interpretation. For Brooks, critical analysis should be devoted to examining the literary work in order to describe the precise ways in which its linguistic, rhetorical, rhythmic, and sonic features cohere into an artistic whole.

According to Brooks, the organic unity of the text is best illustrated by focusing on the workings of irony, which is "the obvious warping of a statement by the context" (1998[1949]: 758). A tension is created between what Brooks called the "standard meaning" of the statement and the distorted meaning that derives from the specific context in which the statement is made; it is this tension that the reader recognizes as ironic. The contemplation of an ironic statement leads to a heightened perception of how the statement and the text affect each other. This, in turn, leads to the unity of the literary work. For Brooks, irony holds the key to the deeper truth offered by the text – a truth that is "many-sided, three dimensional" and that enables the literary work "to render accurately and dramatically the total situation" of the human experience (765).

Perhaps the most salient feature of the new criticism is emphasis on the "close reading" of texts. Close reading involves an attentiveness to formal and rhetorical features of the text, particularly instances of irony, paradox, ambiguity, and contradiction, which create dynamic linkages and patterns in the work; the connotative meaning of words, what they might imply or suggest, is also of interest, insofar as it underscores the potential for ambivalence in conventional denotative meanings. Close reading enabled students to read and ana-

lyze literary works from the perspective of their constitutive parts, but also to read these parts in terms of the unified whole that they constituted. This way of analyzing literature proved useful not only for critics, who found it a congenial method for virtuoso interpretations, but also for teachers who faced the daunting challenge of presenting difficult poems to students who often did not have the technical skills for close analysis; moreover, the method was also useful because it provided an alternative to "contextual" or biographical methods that required substantial social and historical background knowledge. The pedagogical commitment of new criticism was demonstrated in college textbooks co-authored by Brooks and Warren, including *An Approach to Literature* (1938), *Understanding Poetry* (1938), and *Understanding Fiction* (1943). These textbooks proved especially useful in the decades following World War II, which saw a dramatic increase in college enrollments, in part because the Servicemen's Readjustment Act ("the GI Bill") of 1944 enabled thousands of veterans to acquire higher education. After 40 printings, beginning in 1938, and with nearly 300,000 books sold, *Understanding Poetry* has advanced new critical methodologies (Golding 1995: 104). Though the new criticism was rejected by poststructuralists, who nevertheless often excelled at the practice of close reading, its characteristic methods continue to exert influence in the classroom and in literary criticism – for example, in the work of Helen Vendler and others dedicated to the close analysis of poetry, who, like Brooks, remain persuasive advocates of the power of literary works to cohere around the ambiguities and instabilities of language.

Burke, Kenneth

JOHN MCGOWAN

Kenneth Burke (1897–1993) was an American polymath whose work offered an alternative to the new criticism by focusing on the pragmatic ways that literature serves as “equipment for living.” His resolute refusal to understand the literary as a distinctive use of language or literary criticism as a disci-

pline separate from wider sociological analyzes anticipated the move away from formalism and a return to context characteristic of literary theory in the 1980s and ’90s.

Ever the maverick, Burke never graduated from college. He quit Columbia after a year and took up residence in Greenwich Village in the early 1920s, where he associated with American modernists such as William Carlos Williams. He served as editor of the important modernist “little magazine” *The Dial*, wrote poetry, novels, and criticism, and also took up various social science research jobs to pay the rent. His work is influenced by such an eclectic assortment of figures – from medieval theologians like Duns Scotus to Nietzsche and the social psychologist G. H. Mead – that it comes as no surprise that he has proved uncategorizable. He belongs to no discipline and founded no school, even though his books are endlessly suggestive and have proved particularly important to academics in rhetorical and communication studies. Burke never held a formal academic position although he did teach for many years at Bennington College and lived long enough to bask in the acclaim when a new generation of literary theorists discovered him at the end of the twentieth century.

Burke’s work relevant to literary theory is best divided into three phases. This division is somewhat artificial, but it helps to organize an overview of his long career. The first phase encompasses his work during the 1920s and ’30s, particularly the key texts *Permanence and Change* (1935) and *Attitudes Toward History* (1937), as well as the essays collected under the title *The Philosophy of Literary Form* (1941). During these years, Burke did not offer a term for the kind of work he was doing, but he can be seen groping toward a dynamic account of literature that can do justice to its expressive and social power. Burke argues that literature allows for the hypothetical examination

of “attitudes,” of possible ways of relating to the self, to others, and to the world. Attitudes, Burke insists, are “incipient actions.” To take a stance toward the world is to relate to it in a particular way and, subsequently, to act on the premises embedded in that relation. Literature offers the fullest possible play for an imagination of possible actions and their potential consequences. What particularly catches Burke’s attention – and defines his genius as a literary critic – is the way literary texts “convert upwards and downwards” by changing names and contexts. Hence, for example, by conversion downward, Aschenbach’s desires in Thomas Mann’s *Death in Venice* can be rendered as the lust of an old man for a young boy. But conversion upward would read his desire as a love that opens up to him realms of insight previously unavailable.

Crucially, the “logic” of literary texts is never straightforward, but rather tied to the development of tropes, doubling of fictional characters, associations triggered by puns, and flights of fancy that often defy explanation. Thus literature illustrates how people create values and “reasons” (motives) for action, while also providing the means for personal and social transformation. The various metamorphoses and associational pairings in texts extend outward from the author or the protagonist to include the audience and, through them, the social. Partly through his affiliations with “Popular Front” leftists who were trying to forge mass political movements in the 1930s, Burke became interested in “rhetoric,” in the ways that artistic works can serve to constitute communities. Literature has a real-world impact both by priming individual selves to act and by creating groups that cohere through “identification” with the same goals, same leader, or same overarching vision (i.e., ideology). By 1941, partly through his famous essay, “The rhetoric of Hitler’s battle,” on *Mein Kampf*, Burke had

become fascinated by the plot and figurative dynamics through which a text identifies (produces) a “foreign” element, a scapegoat, and sets about purging it. This interest in scapegoating persists throughout the rest of Burke’s career.

The second phase of Burke’s career sees him attempting to systematize his insistence that “literature is symbolic action.” Following in the footsteps of pragmatist social theorist George Herbert Mead, Burke tried to develop a full-scale philosophy of the act. (The parallels to the work of Russian literary theorist Mikhail Bakhtin are striking, but Burke, like others in the West at the time, did not know Bakhtin’s work.) Burke called his theory “dramatism” and planned to expound it in a trilogy: *A Grammar of Motives* (1945), *A Rhetoric of Motives* (1950), and *A Symbolic of Motives*. This last work was never completed, although pieces of it were published in a volume entitled *Essays Toward a Symbolic of Motives* (2006) after Burke’s death. By “motives,” Burke means the attitudes, values, and beliefs that move a person to act. His “grammar” attempts to identify the necessary conditions of any action, of which there are, he says, five: the act, the agent, the scene of action, agency (means), and purpose. *A Grammar of Motives* offers what amounts to a history of philosophy according to which of the elements in his “pentad” a particular philosophy emphasizes. To take “the scene” as most crucial, for example, leads to naturalism and other kinds of determinism that view the environment as dictating what actors do. To place the greatest emphasis on the agent would mean the kind of voluntarism we associate with certain extreme versions of existentialism. The “ratios” that try to gauge the different roles played by the five elements can be quite complex, and Burke traces out these intricacies through commentaries on a

dizzying array of figures from the history of Western thought.

Presiding over the whole enterprise, although this is never explicitly acknowledged, is the German philosopher G. W. F. Hegel, partly because Burke in this middle phase aspires to the kind of all-encompassing system that Hegel also strives to produce, but more important, because the mode of thought is relentlessly dialectical. For Burke, any philosophy that highlights one element of the pentad at the expense of another will inevitably produce a reaction, a new theory or philosophy that focuses on the neglected item. His philosophy, by way of contrast, will try to be inclusive, to do justice to the roles played by all five elements. I think it fair to say that it does not realize his systematic ambitions. *A Grammar of Motives* is usually accounted Burke's masterpiece, but that is for the wealth of insights it offers on an astounding range of topics and figures, not because he constructs a grand system. In fact, despite his aspirations, Burke is not a systematic thinker. He is constantly chasing side thoughts. His digressions are famous and his distinctive style – full of italics, “scare quotes,” and parentheses – reflects the almost manic quality of his thinking, always on the edge of skittering completely out of control.

In *A Rhetoric of Motives*, Burke moves from a consideration of the conditions of action to a focus on “the use of words by human agents to form attitudes or induce actions in other human agents” (1969b [1950]: 41). Rhetoric is the social component of language, the aspect of language that forms communities and fosters action among individuals in concert. It involves “the use of language as a symbolic means of inducing cooperation in beings that by nature respond to symbols” (43). Burke especially emphasizes “identification” of a recognizably Freudian sort. The rhetor aims to get his or her audience to identify with, to

feel themselves “consubstantial” with a group or an ideal. One effective way to achieve this goal is by processes of association that link the group or ideal the writer wishes to promote to already cherished values. So, for example, I might try to liken the effort to combat global warming to the program that sent human beings to the moon. I would try to transfer the positive feelings about the mission to the moon to a willingness to get enthusiastically involved in this new effort.

Presumably, the final volume of the trilogy was going to examine the specific symbols that language utilizes as human agents form their motives. The reasons Burke failed to complete that third volume are unknown. We might infer the nature of that failure by noting that over 10 years elapsed before he published his next book, *The Rhetoric of Religion* (1961). Perhaps the long struggle with this volume pre-empted the need to complete the trilogy; certainly it announced another shift in his intellectual development, this time from “dramatism” to “logology.” This third phase of Burke's career picks up a major theme in *A Rhetoric of Motives* and pushes it to its logical conclusion. He argues that any linguistic account that aims to describe a scene comprehensively will inevitably produce a hierarchy of terms that leads from the smallest particular up to the highest, most inclusive term, which Burke labels a “god-term.” For example, physics moves from subatomic particles up through atoms and molecules to something called “matter.” For Burke, “matter” is physics' god-term, which functions, crucially, both as the motive of the whole enterprise (to offer an explanation of matter) and to exclude certain considerations (physicists do not acknowledge spiritual causes). “Logology,” then, would be the analysis of any system of linguistic ordering that details its hierarchy and thus understands what it aims to achieve

and what it serves to exclude. The problematic claim is that every use of language, no matter what the field or the occasion, has precisely the same structure. Burke appears, in his final works, to adopt a tragic determinism. Humans are always and everywhere addicted to hierarchy and to monistic, monotheological, modes of thought that always produce excluded victims, punitive orthodoxies, and the conflicts generated by various heresies. The essays collected in *Language as Symbolic Action* (1966) reinforce this tragic vision by offering sweeping definitions of “Man” and of “Language.”

Paradoxically, Burke’s vision narrows as a result of his attempt to be all-encompassing. The universalism of the claims made during his “logology” phase makes everything look the same – and this from a writer whose greatest strength was his unsystematic, even chaotic, enchantment with particular cases. For this reason, one of his earliest works, *Attitudes Toward History* (1937), emerges as his strongest, because it focuses on the plural possibilities, the variety of different attitudes that people might adopt as they face the world and decide how to act, how to live, within it. Similarly, the resources upon which we can call as we take up this task are many. The book offers a catalogue of these resources without ever claiming that any one must be chosen or that any choice has inevitable consequences. Not surprisingly, in surveying this open field, Burke comes to announce that his own perspective is “comic,” a perspective, he claims, that “by astutely gauging situation and personal resources . . . promotes the realistic sense of one’s limitations” yet does not succumb to a “passive” fatalism (Burke 1984b[1937]: 107). Human action cannot carry all before it, but neither is it utterly futile. Learning to roll with the punches is the great comic virtue, an adaptation of attitude to circumstance. Burke at his most magnificent

awakens us to the full glory of human resourcefulness – and highlights how literature especially puts that ingenuity on display while also putting it through its paces.

C

Campbell, Joseph

ROYAL W. RHODES

Joseph Campbell (1904–87), American author, lecturer, and editor, is best known as a popularizer of comparative mythology. He developed a method of symbolic interpretation grounded in a theory of the universal meaning and function of myth, which he regarded as a necessary component of psychological and spiritual health. Though he explored many elements of world mythology, he is best known for his writings on the role of the mythic hero in literature.

Born in White Plains, New York, and raised Roman Catholic, Campbell was fascinated as a child by Wild West shows and American Indian culture, and by visits to the Museum of Natural History and its collection of totem poles. He transferred as an undergraduate from Dartmouth College to Columbia University, where he also completed a Master's degree in medieval literature, with a thesis comparing Arthurian legends with Native American myth. While in Paris and Munich, he studied widely, finding points of contact and interchange in art history, psychology, literature, and other disciplines, seeking in Sanskrit and other world traditions the sources, functions, and meanings of myth. He was influenced by artists like Paul Klee, Pablo

Picasso, and Henri Matisse; novelists like James Joyce and Thomas Mann; and the major psychological innovators of the twentieth century – Sigmund Freud, Carl Jung, Otto Rank, and Wilhelm Stekel – who applied Freudian ideas to literature. He also read widely in the comparative anthropology of Sir James Frazer and recognized the importance of Adolph Bastian's theory that myths functioned as "elementary ideas." A chance encounter with Jiddu Krishnamurti fostered an enduring interest in Indian philosophy and myth. Campbell came to intellectual maturity at a time when grand systems of historical development were gaining considerable popularity, and was particularly drawn to Oswald Spengler's *The Decline of the West*, which posited "a metaphysical structure" of human existence independent of outward social and political forms. Campbell drew lines of connection from this metaphysical view of human history to Jung's interpretation of dreams, which led to his theory of the universality of myths and epics and his belief that mythology offers a universally "true" explanation of the reality of the psyche, one that transcends social, cultural, temporal, and religious differences.

Campbell taught comparative literature at Sarah Lawrence College in New York from 1934 to 1972 and established himself

as a charismatic instructor and prolific author, exploring a variety of mythological archetypes. He edited (1946–55) the collected works of his teacher at Columbia, Heinrich Zimmer, the noted German scholar of Indian art, myth, and philosophy, who taught him to use myth as a psychological guide for personal fulfillment. Campbell co-authored, with Henry Morton Robinson, *A Skeleton Key to Finnegans Wake* (1944), and edited the first six volumes of Jungian Papers from the Eranos Yearbooks (1954–68) in the Bollingen Series.

Campbell's most influential work, *The Hero with a Thousand Faces* (1949), describes the general pattern of the hero's journey, which he called a "monomyth," a term he borrowed from James Joyce's *Finnegans Wake*. The cyclical pattern of the journey comprised three stages, separation, initiation, and return; each stage is further divided into multiple substages. Campbell argues that there is only one myth, with endless variations, that serves as a paradigm of the human quest for self-discovery, the struggle of the individual psyche to fashion its own universe. This mythic archetype, which he found in a variety of different cultures, transcended the locally derived narrative forms in which it was conveyed. Like the structuralist anthropologist Claude Lévi-Strauss, he sought the underlying structures and patterns of myth. For Campbell, "mythologies and religions, are great poems and, when recognized as such, point infallibly through things and events to the ubiquity of a 'presence' or 'eternity' that is whole and entire in each. In this function all mythologies, all great poetries, and all mystic traditions are in accord" (Campbell 1973: 266). Myths, understood as "great poetries," stand opposed to "particular strategies" of adaptation to the external world.

In *Myths to Live By*, Campbell describes four functions of "a properly operating mythology" (1973: 221–2): (1) the mystical function, which awakens "a sense of awe" in

which one is a part; (2) the cosmological function, which offers an image of the universe in accord with the knowledge of the time; (3) the normative function, which validates the given social order; and (4) the spiritual function, which determines psychological initiation and guides the individual toward a healthy and purposeful life. His lifelong project of collecting and arranging world myths led to the four-volume *The Masks of God* (1959–67), which explores symbolic motifs that occur in widely varying cultures across the globe, but united by a common geographic origin, a point he would later make in his *Historical Atlas of World Mythology* (1988). In *The Mythic Image* (1974), a Jungian reflection on theories of the mask, Campbell expanded on his earlier ideas about the hero's journey and the relation of dreams to myth in visual art.

The year after his death, in 1988, the Public Broadcasting Service (PBS) aired *The Power of Myth*, a series (and companion volume) he created with Bill Moyers, which introduced Campbell and his ideas to millions of viewers and readers. Commentators acknowledged that his ideas on myth struck a cultural chord, and his epigrammatic message, "Follow your bliss," resonated with people seeking individualistic forms of spiritual liberation, forms unconstrained by conventional religious dogma. Campbell held that there was no absolute or singular God; he believed instead in the spiritual capacity of the individual, a belief he found was consistent with Hindu and Buddhist concepts of nonduality, self-realization, and interdependent being.

Campbell's work has had a pronounced effect on the study of myths as well as on popular culture. Many writers, artists, and filmmakers saw in this work reaffirmation of traditional narrative forms and characters. For example, director and producer George Lucas, after the release of the first *Star Wars* film in 1977, described as a major influence

his rediscovery of Campbell's writings on the Hero's Journey, which he had first read while in college and which inspired him to draw on traditional mythic elements for his series of films. Projects of this sort reflect to some degree Campbell's belief in the enduring value of the individualistic mythic hero, particularly in a modern Western context characterized by moral and ethical malaise. They reflect, in short, his desire to create a new mythology that emphasized the psychic unity of humankind and that supplanted images, character types, and narrative forms derived from Christian traditions of patriarchal monotheism and its oppressive moral codes.

Despite criticism of Campbell's social, racial, gender, and political views, his claim that human life is more "blissful" when the language of myth is valued and used, spoke to a wide audience. Many cultural figures of the 1960s – such as Bob Dylan, Joan Baez, and Jerry Garcia of The Grateful Dead – were influenced by Campbell, and popular culture continues to resonate with concepts of the hero, the journey, and the mask, found in his work. Indeed, in some cases, as with the concept of the "properly operating mythology," Campbell's influence can be found in such diverse areas as psychology, organizational studies, business management, sustainability studies, religious studies, and popular cinema. Readers who may not have read C. G. Jung and other writers who influenced Campbell were nevertheless exposed to their ideas through his popularization of them. It is a measure of his success at popularizing complex ideas that his books have become primary sources in their own right and continue to produce new avenues of thought about the mythologies that structure our lives.

Carnival/Carnavalesque

R. BRANDON KERSHNER

In his book *Rabelais and His World* (1984) and in parts of *Problems of Dostoevsky's Poetics*, the Russian critic Mikhail Mikhailovich Bakhtin develops the concept of "carnivalization" in order to explore the

literary effect of François Rabelais's comedic vision. Rabelais was a sixteenth-century French doctor, author, and humanist whose romance *Gargantua and Pantagruel* relies on scatological and bodily imagery, caricature, and linguistic and rhetorical excesses of all kinds. For Bakhtin, the "carnavalesque" is an aspect of the medieval celebration known as "carnival," the period of "licensed misrule" in which ordinary citizens could mock and defame the acknowledged authorities of church and state. A form of "theater without footlights" in which everyone participates through pageants, parades, and spectacles, the carnival undermines the concept of authoritative utterance and indulges in the rituals of crowning and decrowning of fools, mockery of all and sundry, foul language, the energetic utterance of nonsense, and the degrading of everything usually held as noble or sacred. One variant of the celebration in medieval times was known as the "Feast of Fools," while our milder contemporary versions are usually associated with Mardi Gras, a period of revelry preceding Lent. Bakhtin values very highly this inversion of established values and regards carnival as the form of oppositional speech elicited by authoritative utterance, the natural expression of the powerless folk. Bakhtin particularly values the anarchic but life-affirming laughter of carnival, which presents a rejuvenated version of the world in a mode for which James Joyce's term "jocoserious" seems appropriate.

In Bakhtin's vision, carnival provides an atmosphere of "jolly relativity" in which recognized authorities are mocked and alternative, usually marginalized, voices have a chance to be heard. Carnival models a new kind of relationship between people, consisting of a freedom and familiarity unknown in the scrupulously hierarchical ordinary life of the Middle Ages. Carnival also brings entities that are usually separated

into close contact in what Bakhtin calls "carnival *mésalliances*." Even carnival's pervasive blasphemies, the profanation of all that is normally held sacred through obscenities linking it to the reproductive force of the earth, expresses for Bakhtin a truth about the actual conditions of life, the material base upon which the flimsy edifice of official idealism is erected. Bakhtin finds the literary roots of carnivalization in Greek narratives, especially in Menippean satire, a form he analyzes and celebrates. But it is most fully developed in the Renaissance, especially in Rabelais's work; by comparison, the effect is residual in a writer as late as Dostoevsky, Bakhtin's other favorite novelist.

Carnival in Rabelais's writing can be seen as an especially creative form of dialogized heteroglossia; on this view, his *Gargantua and Pantagruel* stands as an anarchic response to the official culture of the writer's time. Bakhtin draws our attention to the "bodily lower stratum" in Rabelais, the mechanics of feasting, digestion, and elimination as well as the linked processes of sexuality, procreation, and death. He celebrates the whole eternal round of human material existence, including death, which is celebrated as a necessary part of the cycle of existence and which, indeed, constitutes a kind of triumph over it. The prominence of fools and jesters in this vision effectively opposes officially serious spokesmen for the status quo with figures wielding the weapons of mockery and parody. Rabelais frequently presents the human body in a grotesquely exaggerated or deformed way, and Bakhtin links this mode of "grotesque realism" to the carnival mode in literature. Grotesquely exaggerated births, deaths, ingestion, battles, and couplings create a poetic of the grotesque that, in Bakhtin's view, affirms the folk experience of a fundamentally comic and relativistic existence.

Although Bakhtin insists that this folk tradition is not hostile to women, feminist critics have pointed out that, comically or not, women are frequently abused in Rabelais's works. Others have noted that from a political standpoint the licensed misrule in which Bakhtin sees such liberatory potential may simply function as a safety valve, leeching off popular energy that might have gone into revolutionary activity. It is likely that many of the ideas he develops about medieval carnival and the opposition to authority apply to his own work, given his struggles with the authorities under Stalinism. Certainly the tone of his book on Rabelais is far more enthusiastic, and its sociology more utopian, than is the case in most of his other writings. And this is probably why carnivalization has been the concept most enthusiastically adopted by the Anglo-American critical establishment, though with mixed results. One critic (Ames 1991) has discussed a series of modern novels featuring rather decorous parties (such as Virginia Woolf's *Mrs. Dalloway*) and has argued that they are a contemporary expression of the genuine carnival spirit. But it is debatable whether even such convincing analogues as the "Circe" episode of Joyce's *Ulysses* would meet with Bakhtin's approval, or whether he would see them as degenerate forms of a valid folk impulse that began to decline with the Renaissance. The concept of carnival has been important in some areas of contemporary criticism in part because it allows the critic access to certain political dimensions of literary works while still remaining grounded in a formalist approach by focusing on the idea of genre. Many critics have found it useful since the 1980s to theorize marginalized voices and a wide range of literary transgressions.

Chicago School Neo-Aristotelian Literary Theory

DAVID H. RICHTER

Chicago School neo-Aristotelian literary theory refers to a group of literary critics and theorists at the University of Chicago who flourished in the 1950s and 1960s. Broadly speaking, the principal focal points of the Chicago School were a formalist genre theory and, at a metacritical level, an instrumental pluralism. The first generation of Chicago School critics were grouped around R. S. Crane, while a second generation found inspiration in the work of Wayne Booth, whose rhetorical theory of fiction remains influential among narrative theorists like James Phelan and Peter Rabinowitz.

In his survey of post-World War I American criticism, Grant Webster pronounced an obituary upon Crane and his school: "The usefulness of Neo-Aristotelianism as

a way of responding to literature would seem to be almost nil; . . . the theoretical issues raised by the Aristotelians have become obsolete even before the death of their defenders, *de mortuis nil nisi bonum*" (1979: 123). While this report of the death of neo-Aristotelianism is, as Mark Twain's once was, greatly exaggerated, it may be fair to say that, to the extent that the Chicago phoenix made a second flight, it has been in the work of Wayne C. Booth, Ralph W. Rader, and Sheldon Sacks. Diverse as the ideas and concerns of these three critics are, they emerged as the leaders of a second school of Chicago formalists, a new generation that found its intellectual origins in Crane and his group, with whom they share a great deal of common ground. At the same time, of course, the assumptions, methods, and principles of Booth, Rader, and Sacks shifted a good way, along a number of critical axes, from the ideological positions of the group that collaborated on *Critics and Criticism*, the landmark volume edited by Crane [1952] that set the tone and articulated the fundamental principles of the first generation of Chicago School critics.

INSTRUMENTAL PLURALISM

The major premise of Crane's "instrumental" pluralism is the notion, derived ultimately from Immanuel Kant, that "literary criticism is not . . . a single discipline . . . but rather a collection of distinct and more or less incommensurable 'frameworks' or 'languages.'" These languages, which differ widely in "matters of assumed principle, definition, and method" (Crane 1953: 13), through the referential frame they impose upon literary texts, define and thereby limit the sorts of questions critics can ask and answer about them. Each critical system is thus an instrument with powers and limitations peculiar to itself.

Crane's pluralism was a response to the competing claims of new critical approaches that had grown up in the first four decades of the twentieth century, including among others Marxist, Freudian, and anthropological interpretations of texts. These rival dogmas had produced collectively a semantic morass in which central terms such as "form," "content," and "poem," were being used in a variety of distinct ways, and in which critics "refuted" one another without joining issue in any but the most superficial manner.

As methods of coping with Babel, the three most obvious alternatives to Crane's pluralism were monism, skepticism, and syncretism – all of which are still very much with us today. Monism is the assertion that a single critical method – usually one's own – is capable of providing the whole truth about literature; skepticism holds that no critical language can do other than reduce or falsify the text, and that critical disagreements are evidence of the meaninglessness of all terms and distinctions, or of the radical ambiguity of literary language itself. Syncretism, the combining of elements from a variety of critical methods into a single "rounded" view, is for many critics the most useful and effective alternative. What it ignores, however, is that critical systems have an integral structure that precludes their being mixed at will. It is not merely that terms like "symbol" mean very different things to Freudians, Jungians, and semioticians but also that the significance of the term in each system reflects assumptions, principles, and emphases that are much at variance with each of the others. By contrast, Crane's pluralism recognizes each critical system as a unique framework whose assumptions, principles, and methods enable it to answer particular sorts of questions about literary works but leave it helpless to deal with other sorts. This sense of the qualified validity of incommensurate

critical systems, each within its own sphere, was for the Chicago School critics a reasonable proposition, especially when the discrepancies are clearly evident.

Pluralism is tested most severely when it encounters a critical system that attempts to account for the same aspect of a given text – or what appears to be the same aspect – but by different methods and with differing results. If both systems are adequate to their task, a consistent pluralist would have to grant them equal validity despite their disparate interpretations. It is here that Crane's pluralism is often called into question, since for every page he wrote expounding instrumental pluralism he wrote two questioning the validity of rival critics, notably Cleanth Brooks and the new critics, the anthropological myth-critics, and the medievalists of the school of D. W. Robertson. To an unsympathetic view, Crane could be seen as a monist masquerading as a pluralist, relativistic in theory but narrowly dogmatic in practice, who attacked with special fervor those critics whose aim of elucidating poetic structure most seriously threatened his Aristotelian standpoint.

A more sophisticated, if admittedly partisan, analysis was made by Wayne C. Booth, whose *Critical Understanding: The Powers and Limits of Pluralism* (1979) provides exposition of the epistemology of a variety of pluralisms, including his own and Crane's. Booth admits that Crane's pluralism is "leaky," in that he sometimes failed to assess doctrines other than his own with the relativism appropriate in a pluralistic approach. (For example, having neutrally differentiated between critical methods that bear on specifically literary aspects of a text and those which consider literature through its analogues with other human activities, Crane could not repress a sneer at the "mere" analogies with which rival critics were content.) At the same time, Booth insists that a pure and perfect relativism is

impossible and undesirable, since it could license patent absurdities. His minimal conditions for a valid theory of literature would include "internal coherence," "some correspondence between the chosen languages and the world it purports to treat," and "adequacy to the variety or richness of human perception: call it comprehension." And Booth goes on to suggest that Crane's attacks on Brooks and others were attempts to show that the new critics, in reducing the richness of poetry to linguistic tropes like paradox and irony, had produced thereby interpretations that, according to Crane, were inadequately "comprehensive" (Booth 1979: 84–92).

It would be fair to claim that Booth's version of pluralism represents an advance over Crane's, partly because Booth is more explicitly aware of the prejudices to which his own chosen mode of thought predisposes him, and partly because his pluralism takes into account a wide variety of strategies for systematically organizing the conflicting claims of critical systems. For example, Booth recognizes not only Crane's approach but also the "dramatistic" pluralism of Kenneth Burke and the historical pluralism of W. H. Abrams (Booth 1979: 98–194). In neither Crane nor Booth, however, does the commitment to pluralism direct the critic to *work* in more than one chosen mode, as with Walter A. Davis [1978], who argued that the critic should use a critical method "matched" to the literary work under analysis. The function of pluralism lies in leading critics to a deeper understanding of one another's work and to viewing the exchange of ideas as part of an ongoing and potentially progressive dialogue, rather than a debate in Babel. In fact, pluralism reveals the inherent limitations of one's own critical methods and humbles critics with a sense of the partial insights their work can provide. Even Crane, with all his fervid hopes for neo-

Aristotelianism, was driven to say of his own mode:

It is a method not at all suited, as is criticism in the grand line of Longinus, Coleridge, and Matthew Arnold, to the definition and appreciation of . . . general qualities of writing . . . It is a method, above all, that completely fails, because of its essentially differentiating character, to give us insights into the larger moral and political values of literature . . . (Crane 1953: 192)

GESTALT CRITICISM

One way of understanding the Chicago School approach to criticism is to think of it as “Gestaltist.” Both generations of Chicago School critics promoted the idea that the human mind has a relatively low tolerance for ambiguity and incoherence and that it will tend actively to organize its perceptions into a meaningful pattern wherever that is possible. It follows from these ideas that the inferred sense of the whole-as-pattern is what governs the perceived meaning of the parts. These are commonplaces of perceptual psychology but ones which are not often viewed as applicable to literature (see Olson 1952a; Rader 1974a).

Because of the complexity of the literary text and the disparate accounts we tend to give of our experience of it, it is possible to think of the text as more ambiguous than it actually is; in fact, William Empson made the potential ambiguity of the text the criterion for its poetic status. The Chicago critics, while acknowledging the fact that the creative intentions of poets and novelists often demand the play of ambiguous language, are nonetheless convinced that one may do violence to common sense by overemphasizing the role of ambiguity in literature. The earlier Chicago school rejected Empson’s notion that every alternative meaning for each word in a poem was

considered in our literary understanding, and, in the second generation, Booth and Rader have contested the radical ambiguities produced by J. Hillis Miller’s deconstructive abyme or of Stanley Fish’s “affective stylistics.” Ralph Rader argues that, in most discourse, the purpose which informs language and resolves its potential ambiguities is external to the language itself. One says “Shut the door!” to avoid a draft or to be undisturbed or for some other reason or combination of reasons, but not, usually, for the sake simply of saying it. The unique feature of the literary use of language, for Rader, is that in literature language is self-intelligible, in that it provides its own necessary context, and self-significant, in that understanding it is an end in itself rather than primarily a means to some other end (1974b: 250). A literary work is something made, in other words, for the sake of its own intrinsic power and beauty; and literary form is the principle, functionally equivalent to intention in common discourse, which justifies the existence of the work’s parts and which clarifies the potential ambiguities of its language. To read a poem, play, or novel, and to find it intelligible and moving is to have called up in oneself some intuitive sense of the creative intention which formed that work as one beautiful and effective whole. And it therefore follows for Rader that one major task of criticism is to make overt the tacit knowledge that we must possess to comprehend and be moved by literature. Chicago critics, however, were not interested in formalist solutions; their analysis of texts focused on problems of construction and the critical use of a system of appropriately designed genres.

“CONSTRUCTIONAL” GENRE

Literary texts – poems, plays, and novels – are often seen as embodying themes, visions,

or myths, of one sort or another. Such monogeneric approaches, perhaps paradoxically, attempt to do justice to the individual work's unique nature; however, in viewing an artistic work as a member of a definite class, the critic is likely to return to the characteristic misjudgments of neoclassical criticism, forcing the text into a category to which it does not belong and judging it according to overly rigid rules of art. The Romantic revolution in criticism resisted this kind of misjudgment; thus Kant, Samuel Taylor Coleridge, and Benedetto Croce argued that the object of art is *sui generis*, to be comprehended and judged on its own terms and not by generic regulations.

In contemporary genre theory, genre concepts derive from different aspects of the work under study: the "preconstructional," the "postconstructional," and the "constructional" (Richter 1974). For Crane, historical genre criticism, in which literary classes are empirically derived from identifiable traditions and in which literary forms – for example, the sonnet, the chronicle play, the picaresque novel – exist as templates that an author can imitate or vary from at will, derive concepts from the "preconstructional" aspect of literature. This aspect entails "the relations of works to their origins and sources, whether these are considered literally or analogically." The "postconstructional" aspect of the text, on the other hand, includes "the effects of completed works on readers" in terms of "the qualities or values which any work shares with any other work by partaking in the common causes of all human discourse – language, the mind, society, history, and so on" (Crane 1967, II:18). These qualities or values, embodied in pairs of contrary terms, generate what I call dialectical genres (Richter 1974: 456). Northrop Frye's four mythoi in *Anatomy of Criticism* (1957), for example, are generated through the intersection of two dialectical pairs:

real/ideal and being/becoming. The historical method isolates genres that are mutually exclusive, while the dialectical method produces a systematic group of kinds that overlap and straddle boundaries.

The genres of the Chicago School are understood to derive from a third aspect of the text, the "constructional," the forms which embody "the artistic principles and judgments operative in their composition" (Crane 1967, II:18). Here the work's inferable artistic purpose (identical with the Aristotelian *dynamis* or power of the work) is taken as the synthesizing principle which orders the poet's materials and techniques in forming a single coherent whole. The formal end of any given work represents a unique synthesis of action, character, thought, and language, presented through appropriate technical devices. Yet an open system of literary kinds can be developed in terms of definable similarities. The utility of these discriminations does not reside in an understanding of a given author's work within his or her literary tradition (as in historical theories) nor in a systematic pattern for literature that would enable us to see the relationships of texts with one another and with nonliterary aspects of life (as in dialectical theories); rather, it rests in the critic's insight into how the parts of a constructed whole function *as parts of that whole*.

One major function of generic distinctions, for the Chicago formalists, is to provide hypotheses about literary works that operate in a manner analogous to scientific method. Like physical or biological scientists, the Chicago critic erects a hypothesis to account for a body of data (e.g., the form taken by a certain novel). If the theoretical "predictions" – the deductive consequences – of the hypothesis conflict with the empirical data, the facts of the case, then the hypothesis must be modified and refined or, when the conflict is insuperable,

discarded and replaced by another. Ultimately it is hoped that a theory will emerge which is broadly and specifically explanatory of the form and which is capable, like other useful theories, of explaining new data (e.g., details within the novel, or facts about its critical reception).

This “method of multiple hypotheses” emphasizes, in Crane’s view, the difference between the a posteriori status of these hypotheses and the privileged a priori status of the theories that support them (Crane 1967, II:236–60). Whether Crane’s hypotheses were purely inductive is questionable, for his generic categories may be shown to derive from the articulation of a sizable (but nonetheless limited and fore-known) number of structural predicates. Crane’s error, however, may not entirely invalidate his claims. Rader has argued that the analogy with scientific method lies in the powerful deductive consequences of hypotheses, which allow them to be tested, and either falsified or tentatively confirmed, by the facts of the text (1974b: 245–9).

The generic distinctions of the Chicago formalists come in a wide variety of sizes and degrees of specificity. The familiar distinction between “mimetic” and “didactic” works, in Elder Olson, is the broadest sort of discrimination, equivalent to that between the animal and plant kingdoms in biology (1952a: 63–8, 1952b: 587–92). Sacks’s differentiation of “comic,” “tragic,” and “serious” powers, within novels of represented action, begins to be more specific (1964: 20–4). Crane’s statement that Fielding’s *Tom Jones* is a form of “morally serious” rather than “merely amiable” comedy, cuts finer still (Crane 1968: 100). This practice of dividing and subdividing classes of texts is likely to strike many scholars as “pedantic micro-taxonomy” (Crane 1952a: 638). A classification like “morally serious comedy” can be justified only in practical

terms, through the concrete explanations about imaginative texts, like *Tom Jones*, it allows a critic to make.

Grant Webster has concluded that “ultimately the Chicago school failed” to make its method a significant force “because it did not produce any practical criticism of note on which to establish its own ‘tradition’ . . . Nor did it produce a method of ‘normal criticism’” (Webster 1979: 121). Though Webster ignores many important instances of “normal criticism” by Crane and Olson, and the practical criticism of Chicago critics in Crane’s circle, his impression that the new criticism had a much greater influence on the American academy is generally accurate. But however true this may be of the first generation of Chicago critics, it is untrue of their successors. From its beginnings in Booth’s *The Rhetoric of Fiction* (1983[1961]), the second generation has almost always presented its theoretical concerns in terms of their application to specific works of literature, to be judged in terms of the interpretations which their theories make possible.

THE TELEOLOGICAL SHIFT: TEXTUAL AUTONOMY VS. INTENTIONALISM

The second generation of Booth, Rader, and Sacks shared a good deal of common ground with that of Crane and Olson; but the two generations differed in significant ways. One could call it a shift toward rhetoric, as exemplified by the work of Booth, which has been more generally influential than that of any other Chicago School critic. As a group, though, Rader, Sacks, and Booth were more concerned than Crane’s group with the interpretive decisions made by the reader as clues to the principles of literary construction. Another important difference between the two generations appears in the

way genres are defined. For example, Olson follows the Aristotelian model strictly in giving equal attention to the formal, material, efficient, and final causes of a given form, while Sacks gives pre-eminence to the final cause, the purpose, which subsumes the other three “elements.” Like Sacks, Rader defines genres principally in terms of “inferred creative intention” (Rader 1974a: 89), the reader’s intuition of the final cause. This persistent emphasis upon purpose, inferred intention, the work’s final cause, suggests that the crucial shift since the 1950s has been not merely rhetorical but teleological as well.

The earlier generation of Chicago critics had been committed to a pure formal criticism that banished notions of purpose in favor of a rigorous textual autonomy. The most explicit statement of the series of exclusions necessitated by this view occurs in Crane’s introductory manifesto to *Critics and Criticism*:

what is held constant in this criticism is the whole complex of accidental causes of variation in poetry that depend on the talents, characters, educations, and intentions of individual authors, the opinions and tastes of the audiences they address, the state of the language in their time, and all the other external factors which affect their choice of materials and conventions in particular works. The provisional exclusion of these is necessary if the analysis is to be concentrated upon the internal causes which account for the peculiar construction and effect of any poem qua artistic whole. (1952b: 20)

This position is tantamount to the acceptance of the arguments of Wimsatt & Beardsley’s “The intentional fallacy” and “The affective fallacy” (1954). Crane alludes to his agreement with Wimsatt, without naming him, in *The Languages of Criticism and the Structure of Poetry* (1953: 182) and a parallel argument is featured in

Olson’s essay, “Hamlet and the hermeneutics of drama”: “These problems [of interpretation] in no wise involve the dramatist’s intention, for that is generally something that must be inferred from the work” (1976: 77).

There are important interpretive consequences to the Chicago critics’ shift from Crane’s textual autonomy to the more intentionalist methods of his successors, and a convenient example of this contrast occurs in Crane’s and Rader’s brief analyses of Thomas Gray’s “Elegy.” Crane attempts to “formulate, hypothetically, the overall principle of construction” of the poem but nowhere relates the speaker of the elegy to Gray (Crane 1953: 99). The agent of this “imitative lyric” is simply a young man of particular qualities confronting an issue and resolving it. Rader, by contrast, notes that “for the better part of two centuries it never occurred to anyone to suppose that the agent of the words in the poem was anyone but the poet Gray in his own proper person” (1974a: 93). Very roughly, Rader discriminates between autobiographical lyrics, like William Wordsworth’s “Tintern Abbey” and Alfred Lord Tennyson’s *In Memoriam*, in which the “agents . . . must be referred to as ‘Wordsworth’ and ‘Tennyson’”; dramatic monologues like Robert Browning’s “My Last Duchess,” in which the “agent is emphatically ‘other’ than the poet and is never confused with him”; and “dramatic lyrics” (the term is Robert Langbaum’s [1957]), like Gray’s “Elegy,” which involve “our intuitive recognition that the actor, dramatically independent though he is, was built out of a memory of the poet’s, that the experience we share with the actor has the character of an artificial re-creation and/or extrapolation of an experience which the poet did not invent” (Rader 1974a: 95–6). The pragmatic value of these generic distinctions – which involve breaches of the intentional and the biographical

fallacies – rests in Rader's use of them to explain how the poem works on and within its readers.

While Crane tended to banish such considerations from his analyses of the structure of individual poems and to reserve them for other modes of inquiry, Rader's revision of neo-Aristotelianism demonstrates how intention can be integrated into the formal analysis of poetic structures in a way which accords with and deepens the reader's experience of the poem. But Rader was not the first to make this teleological shift. As early as 1961, Booth was defending, against the new criticism, "the artistic respectability of the visibly 'rhetorical' elements" of fiction. Booth had started out "accepting the main premises of the various 'schools of autonomy'" but finally preferred what he called "a more interesting new view of the craft of fiction," generated by a rhetorical conception of art that sees authors as "making readers" rather than "making a concrete form" (1970: 160–1). A particular reading of a text like *The Turn of the Screw* has to make sense of it as something produced by the Henry James we know from the rest of his life and works: a reading that turns it into something that might have been written by Alain Robbe-Grillet or Conan Doyle won't do. "We are unashamedly exploiting the 'extrinsic' here, reading the story as in fact we all read stories: using, where needed, our postulates about how a certain kind of human being might address other human beings" (Booth 1979: 290). Similarly, the generic structures which Sacks [1964] posits as the broadest principles of form in fiction – satire, apologue, and represented action – are differentiated as mutually exclusive modes available to writers of fiction for implanting their beliefs within a narrative, and which guide as well the intuitive perceptions of readers in their attempt to make sense of the texts.

These teleological revisions reinforce the fact that these genre distinctions are not prescriptive or normative in character but rather descriptions of the principles that make literary works coherent and meaningful, and which we have all been employing intuitively since we learned to read. Thus Booth, Rader, and Sacks insist that criticism make explicit the tacit knowledge readers possess, whether we are aware of it or not, and of relating that generic knowledge of creative intention to its particular causes in the language, action, and literary devices of poetic, dramatic, and fictional forms.

GENERIC DISTINCTIONS AND EMERGENT FORMS

This notion of tacit knowledge led Sacks to suggest the possibility that we might discover the grounds, hidden within the structure of the human mind, of our awareness of literary forms. His approach to this issue goes beyond formal criticism to pose the apparently simple but profoundly disquieting question: what accounts for our ability to interpret a comedy we have never read as a comedy? There are, Sacks suggests, two major possibilities. One is that there exists "a finite inventory of the particular linguistic and narrative techniques by which specific characters in specifiable plights are represented to unique ends which need not be known in advance of the techniques or characters themselves" (1968: 189). In this case, one could in principle define the situations and techniques of every comedy now written or to be written in the future. The other possibility is that there are a very few principles of coherence from among which the reader can easily recognize the one operative within a given work. This possibility allows for infinite creativity within a limited system of genres, while the former view is of limited creativity within

a potentially infinite system of genres. Sacks's argument here, which in effect views the genres of literature less as heuristic categories than as psychologically real entities, eternal and immutable as the Platonic forms, may have derived less from Sacks's training as a neo-Aristotelian than from his interest in Noam Chomsky, particularly *Cartesian Linguistics* (1966). There Chomsky had argued that, despite the diversity of natural languages, there must be universal models of grammatical structure inherent in the mind, since children master their native tongue far more quickly than would be conceivable through the then current behaviorist models of language acquisition. Sacks, by analogy, argued that our tacit sense of genre must be informed by similar innate structures. Since genres vary from one national literature to another just as syntactic categories vary from one natural language to another, the innate structures would be what enables us to *form* the categories and not the categories themselves. The implication is that no literature could contain more than a relatively small number of genres; in *Fiction and the Shape of Belief* (1964), Sacks posited three and argued that satires, apologues, and represented actions effectively exhausted the spectrum of prose fiction. Indeed, he suggested that novels must be organized in one of these three ways if they are to be read as coherent wholes.

By the 1970s, though, Sacks recognized that a good many works (like *Moll Flanders* and *Ulysses*) fell outside his three categories, and was never very comfortable dealing with novels embodying complex intentions – mixed forms like Oliver Goldsmith's *The Vicar of Wakefield*, with its strange amalgam of didactic and comic tendencies, or Vladimir Nabokov's *Lolita*, which requires reading on several distinct levels of interpretation. Ralph Rader attempted to revise this notion of genre to correct the problem.

Rader's conceptions of genre are, unlike those of other neo-Aristotelians, empirical rather than idealist, and Aristotelian rather than Platonic in their treatment of historical change. Rader has claimed that it is "explanatorily more useful" to think of genre "as an abstract and in practice malleable" principle of construction "which can accommodate (at an affective price) many extraformal intentions which the creative freedom of writers may bring to it" (1979: 189). Rader's point is in effect that the novel contains a great many mixed forms and that any theory, like Sacks's, which tacitly assumes that the works it analyzes are fully coherent, is not likely to be precisely descriptive of the novels we actually encounter.

Sacks's analysis of Henry Fielding's *Amelia*, in *Fiction and the Shape of Belief*, presumes that the author's didactic impulses are as effectively integrated into the comic structure of the novel as they were in *Tom Jones*. But given this presumption Sacks has a great deal of difficulty explaining just why *Amelia* has been almost universally judged to be a relatively inferior performance. It is not that Sacks does not understand that *Amelia* is less effective than *Tom Jones*: the problem is that his theory has no place for the not-quite-coherent work. Rader's more freewheeling formalism is adept at explaining the structural features of specific novels, including Daniel Defoe's *Moll Flanders* and Joyce's *Ulysses* (1973: 35–6), and the historical development of forms, developments which occur when various artists are faced with common aesthetic problems and common extrinsic pressures.

Like the novel, literary criticism is an institutional form, whose continuities may be sought in a tradition of common assumptions and problems, and whose evolutionary change is the history of experimental innovations seeking new forms of inquiry and new modes of explanation.

This is what we see in the evolution of the Chicago School: the continuation of a generic mode of criticism focused upon formal problems of literary construction, but with a shift toward rhetorical inquiries and teleological explanations. Along with this shift we see a new emphasis upon the process of literary interpretation and the structures of the human mind that account for our abilities to apprehend poetic meaning. It is tempting to see this development as inevitable, as a repetition, on a smaller scale, of the reinterpretation of Aristotle in operational or rhetorical terms by Renaissance critics such as Francesco Robortello and Lodovico Castelvetro, and of the shift, within an explicitly rhetorical mode, toward a consideration of the psychology of the audience in the English critical theory of the later eighteenth century.

This rhetorical shift can certainly be seen in younger theorists who have worked with Sacks, Booth, and Rader, such as Peter Rabinowitz and James Phelan. In *Before Reading*, Rabinowitz [1987] has extended Booth's rhetoric into an analysis of the various rules for reading that actual readers pursue in attempting to make sense of ambiguous texts. The highly prolific Phelan has produced a fairly complete rhetorical poetics of fictional and nonfictional narrative; he has written about style in *Worlds from Words* (1981), about character and narrative progression in *Reading People, Reading Plots* (1989), about technique, ethics, and audiences in *Narrative as Rhetoric* (1996), about character narration in *Living to Tell About It* (2005), and about readers' judgments in *Experiencing Fiction* (2007).

Colonialism/Imperialism

CÓILÍN PARSONS

Colonialism and imperialism are two closely related but separate terms that have been

used to describe the political, economic, and cultural domination of one group of people by another. Although colonies and empires have existed for millennia, “colonialism” and “imperialism” are most often understood to refer to the expansion of European commercial interests and political power overseas, beginning in the sixteenth century. Modern European colonialism and imperialism are inextricably bound to the development of capitalism in Europe; they both function within a context of nationalist consolidation and global expansion, with individual nation-states (metropolitan centers) establishing control over areas that are distant and different from those states (peripheral territories). In the relation between center and periphery, dominance is predicated on the colonized territory being economically and culturally underdeveloped in comparison to the colonizing power.

The complexity of colonial and imperial networks of power, particularly in the first half of the twentieth century, has led to a confusion of terms, many of which are used interchangeably. Among others, D. K. Fieldhouse [1981] and Robert Young [2001] have attempted comprehensive analyses of the terms we use to describe the thicket of relationships we call up when we use the words “colonization,” “colonialism,” “imperialism,” “neocolonialism,” and “postcolonialism.”

COLONIALISM

The term “colony” derives from the Latin *colonia*, a military outpost to secure conquered territory. The concept was, however, already known long before the Romans established colonies. The Egyptians, Phoenicians, and Greeks formed what we might describe as colonies throughout the Mediterranean world from the third millennium BCE onwards. Greek colonies were usually

established by a group of colonists from a city-state who would leave the metropolis, or founding city, to seek land and trading possibilities overseas. By the sixth century BCE there were Greek colonies in modern-day southern France, Spain, Italy, North Africa, Turkey, and throughout the Black Sea. The intention was to establish permanent outposts of the city-states, populated entirely by Greeks. Colonization – the establishment of colonies – did not, for the most part, involve the subjugation of indigenous populations, but the practice of establishing peripheral population centers keen to maintain a close relationship with the metropolis. Relations between the metropolis and the colony were usually close and friendly, though they could erupt in warfare, particularly when a colony sought to challenge the power of the metropolis.

The practice of establishing overseas trading and agricultural settlements was given new life beginning in the late fifteenth century, when advances in navigation and ship-building enabled the exploration and settlement of new lands. The exploration on the part of nascently capitalist economies was largely necessitated by the search for new routes of access to commodities unavailable in Europe. The establishment of colonies was begun by the Spanish and Portuguese, followed shortly by the English and Dutch. The seventeenth-century British settlement of North America offers a striking example of early modern colonization that resembles Greek and Roman precedents. The colonization (or “plantation”) of Ireland in the sixteenth and seventeenth centuries was similar, though much closer to home. The basic structure was the “planting” of English or Scottish settlers on the land and the displacement of the native Irish. A key feature of colonization in the early modern world was the attempt to establish a permanent and distinctive European presence in far-flung corners of the world (Fieldhouse 1981).

Colonization was rarely a deliberate, systematic policy of European governments, many of which did not have sufficient centralized power to carry out large-scale projects of this kind. A notable exception was the plantation of the northern part of Ireland in the early seventeenth century, which was controlled by the British crown. This did not mean, however, that the plantation was thorough or effective. For the most part, colonization in the early modern period was a haphazard, decentralized search for commercial and agricultural opportunity. Colonization was often financed by private capital (as in Sir Walter Raleigh’s failed colony at Roanoke), or was the result of a movement of peoples unsupported by large-scale capital (as we see in the Plymouth colony in New England).

Some colonization took place in areas where local populations were relatively sparse, or could be easily displaced. In these colonies, the newly arrived population came with the intention of settling into conquered territories and soon came to outnumber the indigenous peoples. Argentina, Australia, and North America are examples of these “settler colonies.” This term distinguishes them from “administered colonies,” such as the Indian subcontinent and much of Africa. In the latter, colonists did not arrive for the purpose of settling, but to exploit the mineral, commercial, human, or other resources of the conquered territory. In these colonies the indigenous population usually vastly outnumbered the colonists. For the most part, administered colonies mark a later stage of European colonization, in which the exploration and settlement of new lands was supplanted by a scramble for power among European nations and new opportunities for capital and investment. Exploitation colonies, then, are more closely aligned with the imperialist stage of European expansion. There are a number of very clear exceptions to these types, such as

Jamaica and other Caribbean colonies, in which a small European population dominated a much larger workforce that was not indigenous, but consisted of imported slaves. Similarly, Ireland, South Africa, Mozambique, and Algeria do not comfortably fit these categories.

Although the creation of overseas colonies was a disparate and varied affair, particularly before the late nineteenth century, the term “colonialism” is often used in a way that would suggest a uniform and historically consistent system of European colonization. In retrospect we can see a pattern of economic, political, environmental, psychological, cultural, and linguistic effects that all colonies shared to varying degrees. While the primary purpose of colonization was trade and settlement, transposing European cultural values onto foreign territories came to be seen as a central plank of the practice (Young 2001). The ideology of colonialism, bound up with an expansionist capitalism and aggressive nationalism, is inseparable from ideologies of racism, specifically from the belief in the racial superiority of Europeans. These tendencies were most influentially revealed in Edward Said’s landmark *Orientalism* (1978). Closely tied to this was the understanding that Europeans were engaging on a civilizing mission in their overseas colonies, bringing benighted cultures into the modern, Western world. French colonialism, based on a perceived “civilizing mission” (*mission civilisatrice*) offers the most striking example of the efforts by European powers to establish their cultural values throughout the colonies. French colonialism was largely an assimilationist ideology, which sought to draw the colonies into an ever-closer relationship with France (some became actual departments of France). British colonialism, on the other hand, has been seen as a looser practice of various kinds of association between the metropolis and the colonies.

IMPERIALISM

Imperialism is widely understood to differ from colonialism, but how it differs is a matter of intense debate. The root of the term lies in the Latin *imperium*, which meant power to rule or apply laws. The greatest power resided in the emperor, who had jurisdiction over all the lands under Roman control. It is from the reach of the Roman Empire through the Mediterranean world and into northern Europe that the connection between empire and extensive control emerged. At the same time, Roman power throughout its empire was mostly autocratic or oligarchic, a feature that we see in modern empires. The Holy Roman Empire, a successor of the Roman Empire, was a loose confederation of rulers and states, and bore little resemblance to what we now understand to be an empire. Similarly, the Mongol Empire of the thirteenth century was a vast contiguous empire, stretching from China to Arabia to the Baltic Sea, but was only briefly a cohesive, single political entity. From the fifteenth century the Spanish Empire, founded on colonization of overseas territories, was the first to take on the character of a modern empire. The power of the Spanish monarch reached far into the Atlantic Ocean and beyond, bringing overseas settlements of Europeans and those they subjugated under the power of the emperor. Those who founded settlements in the Americas remained firmly subordinate to the metropolis.

Throughout the sixteenth and seventeenth centuries it was not unusual for political commentators to speak of a British Empire, but it was mostly separate from the colonies in the Americas. Empire typically referred only to the immediate areas of royal power in England, Wales, and Scotland, and perhaps Ireland. Through the eighteenth century a more expansive definition began

to appear, which recognized the place of colonists in the Americas as part of a single political and economic system called the British Empire. Even as late as the middle of the nineteenth century, however, there was little sense of a cohesive empire, and the Indian territories under British control were seen as politically separate from Australia, New Zealand, and the Caribbean. There was, then, not so much an empire as a collection of colonies. In France, under the emperor Napoleon, there was an attempt to create a contiguous empire in Europe.

In this long history, the terms “empire” and “imperial” are in constant flux and do not necessarily refer to colonization or to overseas expansion. In the last decades of the nineteenth century, however, they became more closely bound up with colonization, not with sovereignty at home. Napoleon III, who styled himself emperor, sought to re-establish French prestige in Europe, not by invading neighboring countries, but by concentrating on overseas territories in North Africa, Indochina, and Polynesia. His global ambition was an early manifestation of imperialism (Young 2001). When Germany was unified in 1871 the King of Prussia was declared *Kaiser*, an imperial appellation that glanced back to the Roman Caesars, though Germany did not have any overseas colonies at the time. The appellation did not simply refer to Prussia’s new-found place at the head of a unified Germanic state, but prefigured Germany’s ambitions for an overseas empire, a “place in the sun” as the Kaiser referred to it.

These empires signaled a coherence that had been lacking in earlier piecemeal colonization and could be seen as the culmination of a developing ideology of colonialism. The “Scramble for Africa” (roughly 1880–1914), which saw Africa carved up between the European powers, was competitive acquisition of overseas territories, on the part of rival nations, based on the clear

understanding that the importance of European powers was to be determined by the extent of their empires. Imperialism was seen as one of the fronts in the competition between European states that would eventually lead to World War I. The US, following the Spanish–American war of 1898, joined the European powers as an imperialist nation. It was at this time that the ideology of modern imperialism was forged, and that observers of empires recognized something they called a “new imperialism,” involving exploitation without settlement. This new imperialism contrasts with the Roman, Spanish, or early English empires, in which large-scale settlement and cultivation was a key component.

Said distinguishes imperialism and colonialism by suggesting that imperialism means the “practice, theory, and the attitudes of a dominating metropolitan centre ruling a distant territory” (1991[1978]: 8), whereas colonialism is the practice of Europeans settling in distant territories. Similarly, Young writes that “while imperialism is susceptible to analysis as a concept . . . colonialism needs to be analysed primarily as a practice” (2001: 17). These definitions are clear and useful, but some theorists point out that European colonization became specialized and specific enough that colonialism was itself an ideology separate from imperialism, which only arose long after colonialism had taken hold (Ashcroft et al. 1998). The concepts of empire and imperialism as we know them today only emerged in the 1880s, and the question remains as to what exactly occurred at this time that was qualitatively different from what went before.

The first wave of European colonization in the era after the Renaissance was closely allied to the development of capitalism, opening up new sources of raw materials and capital and new markets for European goods. Imperialism was also seen by many to

be linked to the changing shape of capitalism, and a number of economic critiques of imperialism were published in the early years of the twentieth century. In one of the most influential theories of imperialism to date, J. A. Hobson argued that imperialism was an economic system based in the metropolitan countries, a particular form of capitalism that led to the appropriation of vast territories for the purposes of exploitation only (1988 [1902]). According to Hobson, imperialism has no ethical component at all, despite the rhetoric of a civilizing mission. Furthermore, he argued, the economic benefits of imperialism to the imperial power were minimal, if they existed at all. There was profit to be made in imperialism, but only by a small number of wealthy industrialists, whose capital investment in the colonies was guaranteed by the presence of European armies. While the imperial state did not reap significant financial benefits from the new imperialism, an ideology of nationalism based on imperial strength ensured that all the major European powers took part in the race for colonies. In some ways, imperialism was a screen for nationalist aggression and the expansion of industrial capital.

Hobson was writing in the Liberal tradition, but it is easy to see that his argument would appeal to Marxists, though not all were critical of imperialism. The best-known Marxist analysis of imperialism is V. I. Lenin's 1917 pamphlet, *Imperialism, the Highest Stage of Capitalism*. "Imperialism," wrote Lenin, "is the monopoly stage of capitalism" (1939[1917]: 88). Whereas capitalism began as free competition, by the time of the new imperialism the capital of the world was concentrated in the hands of a few industrial and banking cartels that were in fierce competition. The history of European colonization mimics the history of capital, for what began as free competitive expansion into territories unoccupied by

other capitalist powers had come to a stage whereby the world had been completely divided up, and competition between the great powers for economic advantage often erupted into military conflict. Combined with this state of affairs, Lenin (and Hobson) saw that imperialism was not based on the search for new markets for commodities, but new outlets to invest capital. Imperialism was thus not a commercial concern, but a financial operation. As Lenin well understood, the development of capitalism and the new imperialism went hand in hand.

Hobson, Lenin, and a number of other influential thinkers bequeathed to us the notion that imperialism was separate from colonialism insofar as it was a world economic system, and not simply a practice of human settlement. Osterhammel [1996] points to the US as an undoubtedly imperial, but not colonial, power, in that it engaged enthusiastically in the world capitalist system, yet had only very few overseas colonies. This distinction between imperialism and colonialism remains useful, and helps us to understand the continued use of the terms "empire" and "imperialism" long after the collapse of European formal control in all but a small number of territories in the world. For much of the formerly colonized world is now postcolonial, but arguably not postimperial.

ANTICOLONIALISM

While in the early twentieth century imperialism was being critiqued in Europe, opposition to colonial occupation grew in the colonies. The revolt of the colonists in the US against British rule (1776–83), the independence of much of South America, and the slave revolt that led to Haitian independence in 1804 established the fragility of the colonial systems. Within the British Empire the legislative independence of Canada

(1867), Australia (1901), New Zealand (1907), and South Africa (1910) were the result of political movements, sometimes violent, by European settlers to gain a measure of independence from London. Power, however, remained in the hands of the colonists, and the indigenous peoples saw little change in their political status. While these changes signaled developments in the colonial system, they were not strictly anticolonial.

Ireland was one of the first colonies to articulate a clear anticolonial stance in the twentieth century and to engage in a protracted independence struggle through legislative and violent means. This resulted in partition and partial independence in 1922, and the declaration of a republic in the independent sector in 1949. At the same time, the Indian National Congress was engaged in one of the most protracted anticolonial struggles of the century, seeking to unify all the disparate elements of British India under the flag of Indian nationalism. The result was partition and independence, with the creation of Pakistan and India in 1947. While Congress had attempted initially to forge a united front against the former colonizers, religious and ethnic divisions were to overtake those aspirations. Ethnic and nationalist identifications were a feature of a number of anticolonial struggles after World War II, including the Algerian War of Independence (1954–62). At the same time, some anticolonial movements were highly international in cast. Pan-Africanism in particular was based on international socialism and a sense of a shared African past and future that included those of African descent in the Americas and Europe.

The end of colonization came about through a combination of political and violent struggle by the colonized, and a recognition by the European powers that the project was unsustainable.

NEOCOLONIALISM

While the period after World War II witnessed the collapse of formal overseas empires, it also saw the establishment and consolidation of what has been called the Soviet Empire, as well as the expansion of US political power throughout the world. In addition, the end of *de jure* domination by European powers of Africa and Asia in particular was undermined by continued *de facto* control over the economies and politics of the former colonies. This economic and political situation is mirrored in the cultural sphere, where metropolitan languages have remained dominant, and English in particular has developed into a global lingua franca. The continued power differential between metropolitan countries and their formal colonies has been called “neocolonialism.”

The Pan-Africanist Kwame Nkrumah, leader of post-independence Ghana, was a key voice in theorizing “neocolonialism,” a stage of imperialism that succeeds formal independence. “The essence of neo-colonialism,” he wrote, “is that the State which is subject to it is, in theory, independent and has all the outward trappings of international sovereignty. In reality its economic system and thus political policy is directed from outside” (1965: ix). This is not necessarily the result of a direct policy of exploitation by the former colonial powers, but the effect of the global reach of capitalism. The imperial/capitalist domination of former colonies did not disappear following the collapse of colonial administration; underdevelopment and exploitation continued to be features of most formerly colonized countries.

The global reach of capitalism has not been limited by independence movements, and the phenomenon known as “globalization” is frequently seen as an extension of

this phase of capitalism. The US, the world's largest economy, has in this formulation taken over from the European powers as the primary imperialist power. While colonization may have come to an end, the concentration of power and resources in the advanced capitalist countries, as well as China, has not, and this concentration may be seen as a continuation of imperialism. This is not only a case of intangible political power: the 2003 invasion of Iraq by the US and its allies has frequently been cast as imperialistic. Hardt & Negri [2000] have made one of the most forceful and controversial cases for the continued existence of imperialism, driven by the states, industries, and international institutions of the developed world.

Commodity

DAVID HAWKES

The term “commodity” refers to an object for sale, and commodification is the psychological process by which an object for sale is conceptually differentiated from an object to be used. Although an apple growing wild may be physically identical to an apple for sale on a market stall, a vast array of legal, cultural, and mental differences attend the ways in which the two apples are regarded. An object for sale has become a qualitatively different thing from the same object in its natural condition: it has become a “commodity” by means of “commodification.” The process of commodification assumes the ability to ex-

change one thing for another, which involves the capacity to conceive of qualitatively different objects as quantitatively equivalent. A new kind of value, or significance, must be imposed on them if different objects are to be exchanged, and it must be possible to express this value in terms of a common denominator. This kind of value is known as “exchange value,” and the common denominator in which it is expressed is money.

A common denominator expresses some quality that the things being evaluated share in common. What do all objects share in common? This common element can surely be nothing material, for commodities differ infinitely in their material natures, and they may not even be material at all. The only thing that commodities have in common is their usefulness to human beings. In fact the word “commodity” originally meant “of use,” just as “commodious” means “useful” today. Commodities all possess a “use value,” and it is use value that is represented by money. But where does this use value come from, what makes an object useful? In the case of manufactured commodities, the answer is straightforward: it is the human labor that has been expended in producing the object’s material qualities that has produced its use value. Of course, not all commodities have been manufactured. But all commodities acquire their use value by virtue of being used, and thus their use value comes into being through human activity, the same kind of activity that allows use value to arise from manufacture. In both cases it is subjective human activity, considered in the abstract, that money represents. Economists refer to this abstract subjective activity as “labor power,” in order to differentiate it from “labor,” which refers specifically to productive activity.

Commodification is the psychological imposition of exchange value upon use value. Historically the process of commod-

ification has taken many forms. In a simple act of barter, the symbolic exchange value of one commodity is conceived as physically present within the body of another. Once exchange expands to the extent that it must be conducted through a common denominator, money becomes the medium that expresses the exchange value of all commodities. And money itself develops through many different guises, changing from precious metals through banknotes to the purely abstract, imaginary money of our own day. For us the habit of commodification has become so ingrained that it takes place automatically, and observers such as Guy Debord and Jean Baudrillard have called it the distinguishing characteristic of the “postmodern condition.”

To the degree that a society is organized around a market economy, symbolic exchange value will replace essential use value in everyday perception. An object’s symbolic value will become progressively more significant in comparison to its essence, or use value. Exchange value does not exist in nature; it is a supernatural phenomenon. But the fact that it exists only in the minds of the people who believe in it does not prevent exchange value, in the form of money, from wielding very considerable objective power. As a result, human beings are constantly tempted to imagine that these symbolic values of their own invention are things of the same kind as the natural phenomena on which they are imposed. Especially as the market grows in power and influence, it may come to seem as though exchange value is a natural, inherent property of objects, rather than an artificial, humanly conceived symbol. Ultimately financial signs and images may come to appear just as authentic as the natural world, and we enter the condition that postmodernist commentators call “hyper-reality.”

This is the illusion that Karl Marx called “commodity fetishism.” Marx was the first

modern thinker to use the term, but the process of commodity fetishism was already familiar in the ancient world. Aristotle emphasized that the physical body of an object, which was the source of its use value, was a part of nature (*phusis*), while its symbolic exchange value was a part of human culture or “custom” (*nomos*). The economic error of confusing exchange value with use value therefore entailed repercussions in other areas of experience, and Aristotle subjected it to an ethical evaluation that dominated European thought until the seventeenth century. For Aristotle, usury depended on such a confusion between custom and nature, since it treated money as a thing, a commodity with a use value to be bought and sold, rather than as the general form of exchange value. Aristotle saw this as a catastrophic ethical error, and he claimed that usury was “most reasonably hated” as an egregious violation of nature. The Aristotelian “schoolmen” kept this theory of usury at the forefront of European economics until the seventeenth century, or even beyond, if we accept R. H. Tawney’s claim that “the last of the schoolmen was Karl Marx” (1998[1926]: 36).

However, the last three centuries have witnessed an exponential growth in both commodification and commodity fetishism, and various thinkers have identified the roots of these phenomena in the objectification of labor power. This “labor theory of value” was initially described in the eighteenth century by David Ricardo and Adam Smith, but their analyses lacked an ethical dimension. Marx provided this, by supplementing the empirical studies of English political economy with the heritage of German idealist philosophy. Marx presented commodity fetishism as the latest phase of the Hegelian self-alienation of the subject. In a society dominated by commodity fetishism, people experience their own subjective activity as an alien, frequently hostile

force that directs their actions and attempts to dictate their beliefs. Unlike Hegel, however, Marx believed he had discovered a practical means of ending alienation. When the producers learn to recognize money as the alienated form of their own activity, he claimed, they will in the same act abolish this alienation through the material means of a proletarian revolution against capital.

The fact that such a revolution failed to materialize should not obscure the pertinence of commodity fetishism to twenty-first-century society. The commodification that Marx observed has developed rapidly, and in a huge range of directions. It has spread throughout the world, rearranging traditional modes of social organization to fit its requirements, reshaping cultures in its own image, and penetrating deeply into the psyches of individuals. This is an absolutely unprecedented situation. Throughout history, all civilizations have fostered some form of market exchange, and the influence of mercantile interests and habits of thought has often been considerable. But never before has the market constituted the ubiquitous, all-powerful, irresistible force that we encounter today. The effects of commodity fetishism on our minds and lives are widely agreed to be historically unique, socially universal, and psychologically profound. Expressed in the form of advertising, to which everybody in Western society is constantly and compulsorily exposed from birth, the values, the new aspirations and desires fostered by commodification burrow deeply into the closest recesses of the mind.

In fact, people in societies whose economy is based around commodification, and which are ruled by commodified human activity, may well construct their own identities around the commodities, or the “brands,” that they consume. Observers of twenty-first-century society like Naomi

Klein and Thomas Frank often comment on the commodity's colonization of the human character, a development that earlier philosophers had termed the "objectification of the subject." The idea that a person's essence, his or her "subjectivity," is constituted by an interior self or "soul" began to seem empirically tenuous at the same time as modernist thinkers were challenging its philosophical credentials. Mid-twentieth-century works like Theodor Adorno's epigrammatic *Minima Moralia* (1994[1951]) reflected on the consequences of commodity fetishism for everyday life, while Walter Benjamin's *Arcades Project* inaugurated the study of commodity aesthetics. Such texts applied Marx's economic observations to the cultural sphere, a project that was also developed by Antonio Gramsci in Italy and Raymond Williams in Great Britain. More recently, postmodernist artists like Andy Warhol and Damien Hirst have integrated the process of commodification into the aesthetic content of their work.

The rise to power of fetishized financial signs has been accompanied by a dramatic surge in the prevalence of power of images in general, and postmodernist philosophers have turned their attention to the implications of this development for subjective experience. Guy Debord argued that commodity fetishism gives rise to a "society of the spectacle," in which signs have replaced the reality they once claimed to represent. Jean Baudrillard's *Toward a Political Economy of the Sign* (1981[1972]) labeled the consequent psychological condition "hyper-reality," and described it as an experience made up purely of "simulacra," or surface appearances, lacking any ulterior or underlying significance. When applied to human history as a whole, this involves an attack on the idea that history has any ultimate goal or meaning – a *telos*, to use the Greek term – and on the "teleological" habits of thought which argue for such an

ultimate purpose behind human existence. If we are no longer solaced by the "grand narratives" of history offered by Christianity or Marxism, as Jean-Francois Lyotard argues in *The Postmodern Condition* (1984 [1979]), then we must seek solace in the local narratives of our material existence, which are very often constituted by the very ideologies that threaten the conventional notion of a subject of, or purpose to, history.

While Romanticism and modernism lamented the death of the subject as a Faustian, cosmic tragedy, many postmodernists portray it as a benign development. They argue that the traditional, unitary concept of the subject was patriarchal and oppressive. Similarly, while modernist art generally resisted the imperatives of the market by retreating into formal difficulty, postmodernist art is happy to embrace commercialism, and it is a tribute to the critical sophistication of popular audiences that it can frequently do so without sacrificing formal complexity. Novels such as Martin Amis's *Money* (1984), Bret Easton Ellis's *American Psycho* (1991), and Chuck Palahniuk's *Fight Club* (1996) use formal techniques of disjunction and estrangement to convey the deleterious psychological consequences of universal commodity fetishism, and they do so to great popular acclaim in spite (or because) of their aesthetic innovation.

The process of commodification does not merely alter our perception of the objects we experience, it alters the objects themselves. A table or a chair that has been produced for sale will look and feel quite different from one that has been produced for use. The subjective impact of commodification is also empirically verifiable; the consumption of particular brands really does affect people's identities, and the boundaries between fiction and reality really are becoming blurred in everyday experience. Most people really are forced to sell their labor power for

money, to commodify themselves, on a daily basis. Above all, the universal commodity known as “money” actually does reproduce autonomously, and the relations between various manifestations of money really do determine the politics of nations as well as the lives of individuals. A “fetish” was traditionally held to designate something that was *falsely* believed to have independent, animate powers, such as a kewpie doll or a magical totem. But the commodities we fetishize today actually do possess such powers. Perhaps to define the term “commodity fetishism” is, in the postmodern context, to argue for its obsolescence. Can a universal aspect of consciousness still be called “false?”

Constellation

DAVID CERNIGLIA

“Constellation” is a term generally used in philosophy and in literary and cultural studies to express the relationship between ideas or concepts and objects, especially the way in which the object retains its particularity in resistance to the universalizing tendencies of the idea or concept. It is most commonly associated with Walter Benjamin and Theodor Adorno, and other critical theorists in the Institute for Social Research in Frankfurt (the Frankfurt School). Benjamin and Adorno use the term in slightly different ways, but in both cases a constellation involves various elements in array or juxtaposition, rather than in a ranked or sequenced order. In this way, the critic better understands the various relationships among the individual elements or the elements taken as a group.

The term first appears in Benjamin’s *The Origin of German Tragic Drama* (written in

the early 1920s). In the “Epistemo-critical prologue,” he contends with both Plato and Immanuel Kant and then develops the notion of the constellation in order to avoid some of the problems these philosophers raise with respect to knowledge and the object of perception. Kant’s theory of knowledge rests on a distinction between noumena and phenomena. A noumenon, sometimes called the thing-in-itself (*Ding an Sich*), refers to the object as it “really” is before it is perceived. A phenomenon, on the other hand, is an object as it is perceived, which has been worked on by a perceiving subject. The relationship between the subject and the object was an important concern for Benjamin and a central concern for Adorno. Benjamin argued that phenomena could be organized in such a way that they gave rise to “ideas.” But ideas are not radically separate from objects:

Ideas are to objects as constellations are to stars. This means, in the first place, that they are neither their concepts nor their laws. It is the function of concepts to group phenomena together, and the division which is brought about within them thanks to the distinguishing power of the intellect is all the more significant in that it brings about two things at a single stroke: the salvation of the phenomena and the representation of ideas. (1998[1968]: 34)

The idea for Benjamin, then, arises from objects, or phenomena, themselves, rather than the objects deriving from an absolute Idea, as in Platonic and Kantian philosophies. Much of Benjamin’s later work involved collecting particulars and organizing them in constellations to arrive at powerful but provisional truths. Benjamin’s *Arcades Project* (*Passagen-Werk*), to which he devoted many years but left unfinished, is in many ways a collection of quotes, observations, and notes about nineteenth-century Paris and its arcades, particulars which he

grouped – or we can assume, intended to group – into constellations. For Benjamin, the constellation is an innovative tool for understanding history, for it does not presuppose a particular causal relationship between events. It offers instead alternative modes of understanding the past and its potential for a progressive interrelationship with the present.

Benjamin understands the constellation as both a defense against the all-encompassing concept but also as an alternative method of recognizing and arranging objects toward the end of knowledge. “Ideas are timeless constellations,” he writes, “and by virtue of the elements’ being seen as points in such constellations, phenomena are subdivided and redeemed; so that those elements which it is the function of the concept to elicit from the phenomena are most clearly evident at the extremes” (1998 [1968]: 34–5). Redemption was, for Benjamin, the antidote to a sterile and mechanistic dialectics, as well as to an unrelenting historical materialism. Like the dialectical image, the constellation provides contingency with a timeless element. Though Adorno disapproved of his friend’s leanings toward mysticism, he found the idea of constellations useful. Whereas Benjamin draws a fairly firm dividing line between concepts and “ideas,” Adorno was dubious that this kind of separation was possible, as Simon Jarvis has pointed out (1998: 175–9), and rejected in any case the notion that ideas were “timeless constellations.” One advantage of constellations in Adorno’s view is that, understood as groups of historically contingent phenomena, they highlight, rather than efface, the sociohistorical specificity of phenomena. For when arrayed in constellations phenomena are not subsumed by universal and transhistorical ideas.

Constellations also provided Adorno with an alternative to the standard dialectical

method, one that accounts for the negative component of the dialectical process. In *Negative Dialectics* (1973[1966]), Adorno presents an overarching critique of idealist philosophy and seeks to demolish any notion of constitutive subjectivity. He argued against subject/object identity, instead insisting on a philosophy of nonidentity, which would attempt to bring the universal and particular together without a reduction to categorical understanding. Objects, Adorno argues, cannot be understood in terms of concepts. There is an inherent tension and difficulty in his work (which he in some ways cultivates) in part because he critiques the very dialectical traditions that subtend identity formation and subjectivity. His method is dialectical, yet whereas dialectics depends on contradictions that are eventually resolved, a negative dialectic resists resolution and revalues the negative element. Since one of Adorno's primary targets was identity thinking, the tensions created by placing objects in constellations emphasized the antagonisms among elements and even among different constellations themselves.

Benjamin's and Adorno's uses of the term "constellation" share a rejection of a certain type of Enlightenment thinking that traffics in neat causal, linear, or transcendental relations between thought and its objects. Constellations illuminate, but they also complicate. Standard syllogisms and dialectics give way to complex interrelationships between seemingly unrelated objects or elements, which are not forced into a particular relation. As Max Pensky explains, the constellation reveals itself at the moment the object is cast off, or "negated" by the dialectical process. "At that point, a meaningful image jumps forward from the previously disparate elements, which from that point onward can never be seen as merely disparate again" (Pensky 1993: 70). Like the dialectical image, the constellation commu-

nicates knowledge, even timeless knowledge, in the midst of historical change.

Crane, R. S.

MICHAEL PETERS

R. S. Crane (1886–1967) was a formalist critic of the Chicago School, and a prominent figure in the debates on how literature was to be read and studied. A professor, essayist, editor, and lecturer, Ronald Salmon Crane began his career at Northwestern University (1911–24) before moving to the

University of Chicago where he remained until his death in 1967. In a 1935 essay, Crane claimed literary criticism was a legitimate academic practice equal to traditional historical scholarship – criticism and history were inseparable. Bold by 1935 standards, these statements inaugurated his role in defining the parameters of literary practice. His enduring contributions to literary theory remain his definition of criticism as a process which must contend with a multitude of literary forms and interpretations. In addition to being pluralistic, Crane believed that criticism should be a *self-critical* practice. He believed that critics should be aware of their application of criticism because singular analysis limits the inherent multiplicity of readings. Critics also had to be aware of the system being applied to the literary work – the effects of which could create a predetermined analysis. His awareness of criticism as a process was essential to his concept of its uses because criticism ought to be aware of its role in shaping history.

Crane's interest in pluralistic approaches to literary history took shape in the 1930s just as humanities disciplines were beginning to seek equality with science and mathematics – a reform effort that created programs like “General Education” and “The Great Books” concept. Crane became a leading voice in the Chicago School, a group of scholars also known as the “Chicago Critics,” the “neo-Aristotelians,” or the “Chicago Aristotelians.” All shared an interest in Aristotle's *Poetics* and rhetorical studies, particularly his writings about imitation and form, which influenced the Chicago School's pluralism. Their general commitment to form and formalist methodologies linked them to Russian formalists and structuralists, and yet they were unlike either. It was a unique, dynamic formalism that addressed the past by addressing a plurality of possible interpretations; unlike

other formalists, they were aware of the historical dimensions of criticism *and* its possible outcomes.

As the idea of the humanities evolved along with Cold War ideology, Crane's method became increasingly pluralist. He questioned all systematic, monocritical methods of literary criticism. From the late 1940s to the 1960s, his work remained central to debates among both formalists and new critics. His popular 1935 essay, “History versus criticism in the study of literature,” accounts for his loose association with new criticism. Arguably the first promulgation of literary criticism as a legitimate academic effort, his 1935 essay invoked Kenneth Burke's notion of “recovery,” highlighting the process of literary criticism as just *that* – a recovery process of historical materials. To the new critics, it was the defining moment that validated a “new” approach. W. K. Wimsatt called this essay “revolutionary” (1954: 41). But Crane did not embrace new criticism or its methodology and was concerned about what he called the “widespread academic influence of the criticism still commonly and, vaguely, referred to as ‘new’” (Crane 1967c: 31). Juxtaposing his own process *and* new criticism, Crane practiced a criticism of criticism.

“Let me give an example from my own experience,” Crane said, in a later essay encapsulating the new criticism debate. “I once thought for a short time, when I was still more or less a ‘New Critic,’ that the essential structure of poetic works, as contrasted with prose arguments, consisted in a hierarchy of proportions or metaphors, running upwards from lines and stanzas to the poem as a whole.” By theorizing the “dialectical opposition between poetry and syllogistic argument,” he realized that he had created a singular principle applicable to all poems and to all works of the imagination – a characteristic of the new

criticism that could lead to the repetition of similar critical outcomes: “There was no need to trouble myself about biographical or historical probabilities or to raise the question whether the same textual details I had brought into harmony with my hypothesis might not admit of another or simpler explanation” (1967c: 38). By occluding multiple readings, monocritical methodologies failed to read works as dynamic wholes, and with repeated application, such methods created similar, predetermined interpretations.

Questions of historical context and critical intention continued to underpin Crane’s developing critical approach. “The ‘critical’ is there,” he insisted, “assuredly, but so also is the ‘historical,’ and in such a relation to the ‘critical,’ in intention at least, that neither can be separated from the other” (1967c: 27). Critical intention made the separation of history and criticism impossible, but it enabled a neglect of probable connections. With self-critical awareness, Crane insisted on avoiding singular methodologies, especially those based on first principles. Critical monism predetermines what the literary critic finds a priori and a posteriori – both before and after. Freudian critics would produce Freudian readings; Jungians, Jungian readings (1967c: 32).

The early 1950s were perhaps Crane’s most visibly productive period. In 1952, he edited *Critics and Criticism: Ancient and Modern* – an anthology of essays by Chicago critics W. R. Keast, Richard McKeon, Norman Maclean, Elder Olson, and Bernard Weinberg. He included his own 1948 essay “The critical monism of Cleanth Brooks,” which laid out some differences with new criticism. While understanding a need for scientific-like rigor in criticism (an idea circulating in the humanities at that time), Crane thought Brooks’s assumptions were inaccurate: scientific language was *not* totally fixed and

objective. Crane used Isaac Newton as an example. Newton inherited a scientific vocabulary subject to change. All words and languages – scientific or other – can develop new senses just as they do in the works of any “innovating poet” (1952: 104). Language was anything but objective and static.

Crane also dismantled Brooks’s focus on language and its structures. If focusing solely on paradox and irony as structural elements of language, a critic would discover the exact same thing – paradox and irony. To make his point, he turned to Einstein’s famous equation as it would have been critically rendered by Brooks’s method. “I offer this [$E = mc^2$], judging it solely by Brooks’s criterion for poetic ‘structure,’ as the greatest ‘ironical’ poem [of the] 20th century” (1952: 104–5). Focusing on the structures of a language subject to constant flux, new criticism failed to register other modes of poetic production (1952: 106). Literature was more than the equivalence of energy and matter; it was capable of exceeding irony. Form and content were historical materials that could be returned to again and again – it was a matter of material and method. Poems could be studied as wholes “possessed of distinctive powers” exceeding predictable monocritical interpretations – a kind of critical formalism activating critical potentials when literary works are connected to probabilities (1952: 105, 107).

New critic W. K. Wimsatt responded in 1953 to *Critics and Criticism: Ancient and Modern* (1952) with “The Chicago critics: The fallacy of the neo-classic species” (Wimsatt 1954: 41–67), arguing that the Chicago critics were too cautious to advance the cause of criticism initiated by Crane’s “revolutionary” 1935 essay – too cautious to be called neo-Aristotelians. Their joint arguments were too “circular” (1954: 42). Wimsatt described their rigid systems as “a repeating pattern of take and put ...

represented mainly as parallels or analogues, using separate vocabularies for separate purposes, and not translatable into one another except with great distortion" (1954: 43). What Wimsatt saw as parallel and analogously separate critical methods, Crane saw as methods multiply congruent with the literature under analysis – void of first principles and rife with probabilities. While Wimsatt identified Richard McKeon as the philosophic-systems expert behind the Chicago critics, it should be noted that Crane held a PhD in philosophy from the University of Pennsylvania (1911). He often drew on his background in logic and analysis, referring to philosophers in the British analytic and the logical positivist traditions – such as Alfred North Whitehead, G. E. Moore, Bertrand Russell, and Rudolf Carnap.

Crane's *The Languages of Criticism and the Structure of Poetry*, published in 1953, a revision of the Alexander Lectures given at the University of Toronto in 1952, consolidated his critique of contemporary critical practices and crafted a definitive statement on critical approaches to language and literary structure. He called into question many methods – including medieval literature scholar D. W. Robertson's application of a general idea about medieval thought to all works of that period. With his acute awareness of critical process, Crane argued for the plurality of critical languages on the grounds that critical terms have different connotations and uses. But he also argued for a kind of formalism that could coexist with the pluralistic thesis of multiple critical languages. He drew distinctions between critical hypothesis (concerned with the potential "shaping principles" of the poetic arts) and interpretive hypothesis (concerned with possible meanings and implications of texts, including the author's intentions). Such formal structuring or shaping principles of the poem as a whole – "possessed of

distinctive powers" – assumed a metalingual observation outside the knowledge of all corrupted forms wherein "the recovery of meaning is an essential prerequisite to the discovery of form though not in itself such a discovery" (1953: 168). Form was not meaning by itself. For Crane, formalism was made structurally dynamic by the critic's awareness, of the "formation" of form itself, an awareness that programmatically duplicates (or imitates) the formative effects that engender probabilities (whether biographical, historical, or otherwise) that shape the possibilities of interpretation and meaning.

Just before his death, Crane published a major collection of his work, *The Idea of the Humanities and Other Essays Critical and Historical*, which collected in two volumes his early essays and previously unpublished works, including "Critical and historical principles of literary history," an "uncompleted short monograph" from 1950 that describes an imagined historian of forms whose first inquiry would be into constructional causes, and whose first interpretive act would be recovery itself – the act of selection (1967a: 61, 65). Such a historian would be aware of forms' effects – not simple cause and effect, but causes and effects without first principles. For Crane, a new sense of formalism was taking shape beneath the surface of the literary debates of the 1950s and 1960s. He saw the plurality of forms as a narrative history of forms, an "organic history" – "continuous and dynamic rather than atomistic and static" (1967a: 35).

In *The Languages of Criticism*, Crane had suggested that all critics are scholars and all scholars critics by degrees strictly relative to the frameworks of knowledge being applied (1953: 27, 168). But if everything was subject to organic dynamism, then a developing theory on the dynamism of forms had to allow for an unknown certainty. Crane's *The*

Idea of the Humanities also reveals that, as early as 1957, he had pushed beyond “Critical and historical principles” in yet another unpublished essay, “Criticism as inquiry.” Crane writes that there is a certain “X” to inquiry – “a hitherto unconsidered possibility of explanation” ignored by conventional interpretation because it is “incompatible with inquiry” (1967c: 29). This “X” was something that eluded a singular mediation: “there is no presumption that [a critical inquiry of literature] can ever be reduced to a single set of logically symmetrical and necessary principles” (1967c: 35). Crane’s pluralistic sensibilities, both in critical methodology and in literary form, is evident in the later work of Wayne Booth, another Chicago School critic, and his student James Phelan, and anticipated the poststructuralist interest in the dialogism of M. M. Bakhtin and his successors.

Critical Theory/Frankfurt School

CARL B. SACHS

Critical theory is a branch of twentieth-century Continental philosophy which emphasizes interdisciplinary collaborations with a variety of fields, including the social sciences, literary and cultural studies, and political theory, toward the goal of radical social change. The Frankfurt School is often referred to as the “first generation” of critical theorists, though major figures like Jürgen Habermas of the second generation maintain some continuity with the critical theory of the Institute. The Frankfurt School takes its name from its first institutional incarnation, the Institute for Social Research, founded in 1923 at the University of Frankfurt. It was founded by Friedrich Pollock and Felix Weil, with Carl Grünberg, an Austrian-Marxist historian, as its first director. It was initially conceived of as an interdisciplinary research group composed of economists, sociologists, psychologists, and historians organized around an Austrian-Marxist conception of social science. The task of the Institute was to further the Marxist project of comprehending the totality of diverse social phenomena in their interconnectedness and fundamental unity. Its members wanted to understand why revolutions failed to break out in the Western industrialized countries even when

orthodox Marxism predicted that the conditions were ripe: low wages, stagnant economy, high unemployment, widespread dissatisfaction with the governments and so on. The larger intellectual and political context of the Frankfurt School included sociologists like Max Weber and Marxist critics like the Hungarian Georg Lukács, who used Weber's account of rationalization to deepen Marx's account of alienation.

In 1929, Max Horkheimer took over as director of the Institute. Unlike Grünberg, whose Austrian-Marxism was strictly scientific, Horkheimer was solidly grounded in philosophy: not only Marx, but also Immanuel Kant, G. W. F. Hegel, Arthur Schopenhauer, and Friedrich Nietzsche. Whereas Grünberg envisioned interdisciplinary collaboration among the social sciences, Horkheimer envisioned it between the social sciences and philosophy. In 1937, Horkheimer published a programmatic statement of the Frankfurt School, in which he distinguished between "critical theory" and "traditional theory": whereas traditional theory provides only explanations of particular social phenomena, critical theory supplements those explanations with assessment of the possibility for radical social change and improvement in human life. There is a corresponding difference in "logical structure":

The primary propositions of traditional theory define universal concepts under which all facts in the field in question are to be subsumed. . . . Facts are the individual cases, examples, or embodiments of classes. . . . The critical theory of society also begins with abstract determinations; in dealing with the present era it begins with the characterization of an economy based on exchange. . . . [but] The relation of the primary conceptual interconnections to the world of facts is not essentially a relation of classes to instances. It is because of its inner dynamism that the exchange relationship, which the

theory outlines, dominates social reality, as for example, the assimilation of food largely dominates the organic life of plant and brute beast. (Horkheimer 1999[1937]: 224–5)

Critical theory elucidates the material processes which generate social reality and examines the relationship between the material processes of society and the concepts used to classify and organize social reality. Horkheimer argues that society is unlike nature insofar as an adequate theory of society must be a dialectical theory. The emphasis on dialectical theorizing is a fundamental commitment of the Frankfurt School, although perhaps taken to its breaking point in Adorno's last writings.

The emphasis on dialectical theorizing also sustains the tension between lived, sensuous particularities – the doings and sufferings of humanity and nature – and the conceptual frameworks under which those particularities are classified. Since the conceptual frameworks are also an element of social reality, rather than something exterior to society as such, a critical theory of society must constantly call into question the adequacy of the concepts employed. The first task of critical theory was to undermine the authority of the quasi-science subtending "traditional theory," a conception of scientific theory no longer taken seriously by most contemporary philosophers of science. For critical theory, scientific objectivity does not require neutrality regarding values or the good. Instead, critical theorists hold that social science must be practical, not merely theoretical: it must bring to light the possibilities for human life that are not realized under existing conditions, as well as the social factors that interfere with both an awareness of those possibilities and their realization. Critical theory must be an instrument of social change. Changing the world requires identifying the nascent possibilities within existing social conditions

for a radically different mode of social organization that is committed to realizing those possibilities. Though the Frankfurt School emphasized the dialectical side of Hegelian-Marxism, they did not abandon materialism; indeed, they consistently opposed both positivism and mysticism on the basis of an avowed materialism. Their principal concern was how to prevent materialist dialectics from ossifying into the dogma of dialectical materialism. The elusiveness and difficulty of their theoretical pronouncements is fueled in part by this problem.

Under Horkheimer's directorship, the Institute developed two interrelated research programs. The first was a revision of the Marxist critique of capitalism in order to understand twentieth-century transformations from entrepreneurial to industrial forms of capitalism and from the "self-made man" to "the organization man," the person who excels at conforming, at fitting in, and at not *reflecting* on what he or she is told to do, even when the assigned tasks require very high levels of intelligence and competence. The transformation in the structures of ownership, and the important role assumed by the state in controlling the economy, do not alter what remains fundamentally capitalistic: the privatization of the means of production. Important contributions to this problem were made by a wide array of critical theorists: Friedrich Pollock, Otto Kirchheimer, Franz Neumann, Theodor Adorno, Herbert Marcuse, and Erich Fromm. Their studies have resulted in powerful new concepts, such as "totalitarian state capitalism" (Pollock), "totalitarian monopolistic capitalism" (Neumann), "the administered society" (Adorno), and "soft totalitarianism" (Marcuse). However, this is not to say that all members of the Institute saw things the same way: Pollock and Neumann had a lengthy debate concerning the respective role of politics and economics in the fusion of state and capital,

with Pollock arguing that the transition was planned and controlled by the state and Neumann arguing that the transition was fuelled by the tendency for profit maximization. Later contributions by Adorno and by Marcuse attempted to reconcile the differences between these theories.

The second research program was a response, from within a roughly Hegelian-Marxist position, to the provocations of Kierkegaard, Nietzsche, and Freud. The Frankfurt School concluded that the neglect of the subjective side of human existence – an aspect of human existence illuminated by existentialism and psychoanalysis – led orthodox Marxists to predict that revolution would follow if the objective (i.e., economic) conditions were met. This theoretical revision also allowed the Frankfurt School to understand more deeply what is at stake in the transition from liberal to advanced capitalism. The need to correct this one-sided emphasis on objective conditions led critical theorists to develop a sophisticated understanding of ideology and of the need for ideology critique. The latter was developed in different ways by Horkheimer, Adorno, Fromm, Marcuse, and Leo Löwenthal and remains one of the most important legacies of the Frankfurt School. But not all cultural products are ideological; cultural products may be *both* expressions of an antagonistic society *and* potentially critical of that society. In that regard the Frankfurt School theorists follow Georg Lukács and Walter Benjamin, a close associate of the Institute, in rejecting any simplistic understanding of the relation between "base" (material conditions of production) and "superstructure" (culture, politics, media).

By the early 1930s, the members of the Institute were concerned about the rise of fascism in Germany and elsewhere. Shortly after the Nazis took power in 1933, the Institute went into exile, first in Geneva, Switzerland and then to America. In

partnership with the sociology department at Columbia University, the Institute for Social Research relocated to Morningside Heights in Manhattan. However, not all members of the Institute moved at once. Adorno, for example, went first to England where he worked on a DPhil under the direction of Gilbert Ryle and did not immigrate to New York until 1937. Adorno's friend and mentor Walter Benjamin, whose secularized messianism, literary criticism, and urban studies highly influenced the Frankfurt School, did not make it out of Europe; upon being told that he was denied entry to Spain, and believing that the Gestapo were about to capture him, he committed suicide at the border of France and Spain in 1940.

While in America, the Frankfurt School underwent two decisive and permanent reorientations. The first was a turn toward greater pessimism about the possibility of fundamentally changing society in ways that would lead to significant improvements in rationality, freedom, justice, and happiness. The Frankfurt School tended to see American culture as pandering to the lowest common denominator, discouraging the expression of discontent or unhappiness lest it develop into radical critique. In America, being busy, being content, and being amused took precedence over the genuine emancipation of human possibilities. The second was the encounter with American quantitative social science driven by statistical analysis. One of the most important contributions of the Frankfurt School to sociology, *The Authoritarian Personality* by Adorno et al. (1993[1950]), resulted from the integration of American social science with German sociology and psychoanalysis, resulting in the so-called "F-Scale" for measuring the individual's disposition to accept or reject fascism. Important work by Horkheimer, Marcuse, and Fromm in America in the 1950s and 1960s coincided

with developments in Germany that saw the reinvigoration of the Frankfurt School.

After the war, Adorno, Horkheimer, and Pollock returned to Germany. Marcuse, Neumann, Löwenthal, and Fromm remained in the Americas after the war. Marcuse taught at Brandeis University and then at the University of California at San Diego; Fromm taught at Bennington College and then at the National Autonomous University of Mexico; Neumann taught at Columbia University after playing an active role in the Nuremberg war crimes tribunal; and Löwenthal eventually settled at Berkeley, where he played an important role in the free speech movement and in the creation of the sociology of literature.

In 1949, Adorno and Horkheimer returned to Germany and by 1950 had re-established the Institute for Social Research at the University of Frankfurt under their joint directorship. During this time Adorno took on increasing responsibilities and by 1958 was the sole director of the Institute, a position that he would hold until his death in 1966. The Frankfurt School played a significant role in the "de-Nazification" of German culture, reconnecting Germans to the tradition of Johann von Goethe, Kant, Hegel, Martin Buber, and Paul Tillich while at the same time coming to terms with the horror of the Nazi period. During this time Adorno wrote prolifically, including two of his most challenging and sophisticated works: *Negative Dialectics* (1966) and *Aesthetic Theory* (1970). He also engaged with Karl Popper, a philosopher of science who had also returned to Germany after the war, in what is now called the "*Positivismusstreit*": a debate over whether the social sciences should model themselves after the natural sciences with regards to neutrality about values and conceptions of the good life. One of the most important responses to the *Positivismusstreit* was Jürgen Habermas's *Knowledge and Human*

Interests (1972[1968]). Habermas had already been working in the Institute since 1956 as Adorno's research assistant, and would, in the 1960s and 1970s, come to dominate the second generation of critical theorists.

In the 1960s, student-led and organized resistance against what was perceived as imperialism, militarism, racism, and sexism were a significant presence on the cultural scene in America, Britain, and Europe. Reactions on the part of the critical theorists were mixed. Adorno appreciated what they were trying to do in some measure but was gravely concerned that they lacked a sophisticated theoretical understanding of the domination they resisted. By contrast, Marcuse, who in the 1960s was at the University of California, San Diego, was both influenced by the student Left and an inspiration to them. Though Marcuse also criticized the lack of theoretical understanding in student movements, he nevertheless saw in them and in emergent Third World movements of that time, an emancipatory potential that seemed to have evaporated from the working class. As Adorno and Horkheimer became increasingly pessimistic, Marcuse turned to alternative, non-Marxist ways of seeing potential for radical change.

One of the lessons to be drawn from these different reactions to the 1960s is that it is quite difficult to make robust generalizations about "the Frankfurt School": the members of the Institute for Social Research differed significantly in their intellectual and cultural backgrounds, theoretical interests, and political sensibilities. Despite the commonalities that hold them together, there is also a great deal that sharply distinguishes them from each other.

As developed by the Frankfurt School, a critical theory of society provides (1) an explanation of various social, political, and cultural phenomena in terms of tensions or contradictions at work within the fundamental structures of society, and (2) a nor-

native criticism of those structures, which shows them to be obstacles to the furtherance of rationality or happiness. Thus, for example, advanced industrial capitalism is not only analyzed in terms of the antagonisms it perpetuates – rich vs. poor, masculine vs. feminine, white vs. nonwhite, global North vs. global South, humanity vs. nature – but also conceptualized as fundamentally irrational, unjust, and incompatible with genuine happiness (though not, importantly, with contentment). Though varied in approach, the Frankfurt School critical theorists focused on four broad areas of concern: (1) the relation between science, technology, and rationality; (2) the administered society and the critique of classical liberalism; (3) the entanglement of myth and enlightenment in the dialectic of Enlightenment; (4) the commodification of culture in "the culture industry."

SCIENCE, TECHNOLOGY, AND RATIONALITY

Critical theory occupies a distinct space among the various philosophical movements of the twentieth century. On the one hand, unlike the logical positivists, critical theorists refused to identify science as the only legitimate form of rationality. In that respect critical theory is one of the main sources of the critique of "scientism," which delegitimizes all forms of knowledge other than those authorized by scientists. On the other hand, critical theory is equally suspicious, if not more so, of mysticism and irrationalism. To reconcile these positions, Frankfurt School theorists hold that rationality goes beyond the limits of science. The new concern about the relation between science and rationality arises from the attempt to integrate themes inherited from German idealism with empirical social science. The German idealists held that

reason itself has the capacity to go beyond experience, whereas science is limited to experience. The capacity of reason to transcend science is manifested in its practical use, whereas reason sets ends for itself, that is, acts autonomously.

An exceptionally powerful formulation of this attitude can be found in Adorno's simultaneous criticism of Heidegger and Popper. Denying that there exists an "open" society of the sort Popper discusses in *The Open Society and Its Enemies* (2002[1945]), he denies also that it can be deformed: "The belief that it has been de-formed emerges from the devastation of cities and countryside through the planless sprawling of industry, in the defect of rationality, not its excess. Who traces deformation back to metaphysical processes instead of to conditions of material production virtually delivers ideology" (Adorno 1990[1966]: 284; trans. modified). Adorno denies that contemporary society is "open," arguing instead that it is insufficiently rational – a society in which reason has failed to determine the ends of technology and industry.

It is not enough for social science merely to generate data (e.g., by writing and administering surveys). The data must be explained through interdisciplinary scientific theorizing (e.g., Marxism and psychoanalysis). It then falls to philosophers to use metaphysical (even religious) concepts, such as "the whole" or "dialectics" or "rationality," to comprehend the *significance* of the scientific insights. However, comprehension of social reality in its totality is never quite achievable, because the concepts available for any thinking at all are themselves part of the social reality. (One cannot step outside of one's own skin.) Beginning in the 1940s, as the potential for radical social change attenuated, the tension between Marxist-Freudian social analysis and the secularized messianism developed by Ernst Bloch and Walter Benja-

min becomes more prominent in the work of both Horkheimer and Adorno, though not, interestingly enough, in the other members of the School.

The critique of science and of technology developed by the Frankfurt School is an important influence in contemporary philosophy of technology, which in turn has had a significant influence on contemporary media studies and cultural theory.

THE ADMINISTERED SOCIETY AND THE CRITIQUE OF LIBERALISM

In response to fundamental changes in the conditions of material production in Western society in the early twentieth century, the Frankfurt School concluded that old categories inherited from seventeenth-century political thinkers – "individual," "rights," "civil society" – no longer applied. In place of the old institutions emerged "the administered society," in which systems of control infiltrate individual consciousness and transform needs and instincts. In place of the autonomous individual who sought in civil society the satisfaction of his or her needs, the administered society created individuals who only had the needs that were deemed desirable by the society to have: the need to overproduce and overconsume.

As should be clear by now, critical theory as practiced by the Frankfurt School is dialectical: it brings to light the contradictions concealed by everyday assumptions, categories, and theories. The critique of "liberalism" is an especially clear example of the dialectical method. Classical liberalism regarded individuals as exercising complete sovereignty over their skills and capacities, and this understanding of what it meant to be an individual played a fundamental role in the overthrow of the feudal order. In that sense, liberalism marked a genuine increase in the emancipation of

human possibilities. Yet with the transformation of capitalism from liberal capitalism to state capitalism, liberalism becomes ideological; it conceals the fact that the conditions of material production are profoundly antiliberal. Even the very category of “individuality” must be critically examined as playing an ideological role, insofar as it obscures the ways in which mass media infiltrate consciousness and influence the formation of beliefs and desires by the creation of “false needs” for consumption, amusement, and excessive work.

In this respect, the Frankfurt School theorists argued that contemporary Western society is rapidly becoming as totalitarian as its enemies:

For “totalitarian” is not only a terroristic economic-technical coordination of society, but also a non-terroristic economic-technical coordination which operates through the manipulation of needs by vested interests. It thus precludes the emergence of an effective opposition against the whole. Not only a specific form of government or party rule makes for totalitarianism, but a specific system of production and distribution which may well be compatible with a “pluralism” of parties, newspapers, “countervailing powers,” etc. (Marcuse 1991[1964]: 5)

However, Marcuse also notes that “for the administered individual, pluralistic administration is far better than total administration. . . . The rule of law, no matter how restricted, is still infinitely safer than rule above or without law” (1991[1964]: 50–1).

At the same time, however, the concept of the autonomous individual retains its force as an ethical ideal in the service of the negation of total administration. Liberalism is false and ideological as a description of actual society, but it is true as an ethical ideal that could be realized, given existing social possibilities and given fundamental changes in the political and economic structure. In

this respect, the Frankfurt School retains a deep fidelity to many of the ideals of the Enlightenment.

THE DIALECTIC OF ENLIGHTENMENT

The Frankfurt School’s ambivalent fidelity is best exemplified in the relationship between the Enlightenment and the Holocaust. In *Dialectic of Enlightenment* (1947), Horkheimer and Adorno argue that the Holocaust, far from being an aberration, has deep roots in the heart of Western culture itself: “Enlightenment, understood in the widest sense as the advance of thought, has always aimed at liberating human beings from fear and installing them as masters. Yet the wholly enlightened earth is radiant with triumphant calamity. Enlightenment’s program was the disenchantment of the world” (2002[1947]: 1). The triumphant calamity, of which fascism and the Holocaust are only the most visible aspect, also includes humanity’s domination of nature and humanity’s domination of itself.

The “dialectic of Enlightenment” is the movement whereby rationality becomes its opposite. Rationality, as “the critique of myth,” itself becomes mythical because it is unable to question its own fundamental assumptions. The Enlightenment culminates in positivism, the valorization of scientific thinking over all other kinds of thought and the reduction of rationality to calculation and thereby the closure of the very space necessary for reflection about the uses and abuses of science. When positivism becomes ossified and dogmatic, what was once the critique of myth itself becomes merely mythical; in that respect, it is a failure of rationality, but at the same time a project ideologically suited for a system of material production that treats everything – people, animals, natural

resources – as valuable if and only if it is turned into a commodity. Resentment against the tyranny of rationality results in the eventual release of irrational desires that fuel hatred (e.g., Nazism and the Third Reich) and paranoia (e.g., the administered society).

Yet it would be a mistake to interpret Horkheimer and Adorno as being simply anti-Enlightenment. Rather, they call for a transformed rationality that is able to reflect upon its own limits: a critique of rationality. Since “critique” itself is necessarily rational, the critique of rationality must be an “autocritique.” Later works, such as Horkheimer’s *Critique of Instrumental Reason* (1994[1967]) and Adorno’s *Negative Dialectics* (1990[1966]), attempted to work out the autocritique of rationality. Whether their efforts are successful, or at least promising, or whether their projects ultimately fail due to an insufficient reconceptualization of the very concept of rationality, remains hotly debated among contemporary critical theorists today.

THE CULTURE INDUSTRY

The dialectical method of the Frankfurt School can also be seen at work in the critique of “the culture industry”: the vast network wherein movies, books, TV shows, radio programs, and music are developed, tested, marketed, sold, purchased, and consumed. On the one hand, such cultural products are interpreted as commodities that conform to the constraints of the material conditions of production. As such they are not the manifestations of pure consciousness or individuality of their creators; they play an ideological role by reinforcing customary thoughts and dispelling negative feelings. Hence feelings of dissatisfaction are “normally” relieved by a shopping spree. On the other hand, because

cultural products emerge from a process that itself contains fundamental contradictions – between the bourgeoisie and the proletariat, between humanity and nature, between the irrational real (administered society) and the rational possible (human liberation) – the cultural products bear within themselves the traces of those contradictions. They can therefore be read critically in order to bring to consciousness the contradictions that are otherwise concealed by ideology. In some cases, it is even possible for artists and writers who are self-conscious of their relationship with late capitalism to exhibit the seemingly irresolvable contradictions of modern life within their work and thereby build safeguards against its commodification (see, e.g., Adorno’s [1991] reading of Samuel Beckett’s *Endgame*). More frequently, however, artists and writers are not conscious of the tensions which are exhibited by their work, and it falls to the critical theorist to bring those tensions to consciousness.

Arguably, there is a strain of cultural conservatism – in contrast to a general political radicalism – in the Frankfurt School which leads some members to dismiss the radical potential of mass media. Consider, for example, Adorno’s well-known contempt for jazz and his admiration of atonal music. The basic point, however, concerns the role played by mass media in altering our experience of cultural products. When a broadcast of a symphony is interrupted with commercials, for example, one cannot experience the symphony in the same way as was possible in a live performance. The easy availability of music albums (and now, music videos) means that the aesthetic experience is no longer the culmination of individual effort. The relation between creator and consumer is mediated by producers, distributors, wholesalers, and retailers – and yet the mediation is absent from the consciousness of the

listener or reader, unless one is a connoisseur. Because the extensive systems of mediation are occluded by the very experience of listening to music or reading literature, the consumer is alienated from his or her very own aesthetic experience.

CONCLUSION

An adequate critical theory must confront and respond to several interrelated questions: (1) How do we account for the normative claims on which critique rests? (2) Are different kinds of critique consistent with one another? (3) What is the relation between the critical and explanatory projects? (4) From what perspective can their claims intelligibly be made? The scope of the critique of advanced capitalism becomes increasingly general, leading, in Adorno's late work, to an indictment of the very concepts with which we think at all about anything. Indeed, it becomes increasingly unclear as to how the explanatory and normative vantage points of critical theory are possible. Perhaps Adorno is extreme in this regard; perhaps his extremism is warranted. Other members of the Institute, such as Marcuse and Neumann, continued to see possibilities for incremental but real social change, and Marcuse in particular saw radical potential in the women's rights, civil rights, and environmental movements.

Whether the late works of the Frankfurt School contain necessary insights into any adequate critical theory, or whether they are instead something of an intellectual, ethical, and political cul-de-sac, remains a topic of intense discussion among contemporary theorists. Some have argued that the Frankfurt School deprives itself of the very normative foundations that are required for social criticism (e.g., Finlayson 2009). Habermas in particular has developed an elaborate new version of critical theory, the "theory of communicative action," based

in part on his critique of the "subject-centered" conception of reason held by Adorno, and which he argues led to Adorno's frustration with existing possibilities of radical change and subsequent retreat into secularized messianism. For a particularly sharp contrast between "Habermasian" and "Adornian" critical theorists, compare Bronner [2002, 2004] with Bernstein [1995, 2002].

Nevertheless, the Frankfurt School thoroughly and permanently changed how we understand social, cultural, and political life in the late twentieth-century industrialized West. They invented tools of ideology and cultural critique that have made a lasting impact on literary and cultural studies. In the process, they made strident condemnations of "soft totalitarianism" in America and Europe and offered a powerful way of understanding what a commitment to the ideals of the Enlightenment must entail if they are to be more than an ideological mystification of entrenched power structures.

Croce, Benedetto

STEFANO SELENU

Benedetto Croce – philosopher, historian, literary critic, and politician – was born in 1866 in Pescasseroli, in the Abruzzi region of Italy, and resided mostly in Naples. As a young student, Croce studied in Roman Catholic schools, but his relationship with religion remained problematic. He suffered a traumatic experience in 1883, when an earthquake in Casamicciola killed his parents and left him injured. He and his brother went to live in Rome with their uncle, the politician and intellectual Silvio Spaventa. In Rome he met the philosopher Antonio Labriola, whose teaching led Croce to philosophical inquiry. According to Croce [1927], his thought was most influenced by the works of literary critic and historian Francesco De Sanctis and Giambattista Vico, and by discussions with Labriola himself.

Croce's vast production extends from literary criticism to aesthetics and philosophy of language, ethics, philosophy of politics and economy, philosophy of logic and science, history and theory of historiography. In the last decade of the nineteenth century, under the influence of Antonio

Labriola, Croce showed a strong interest in Marx and Marxism, which led him to a more concrete and immanent approach to history and occasioned various critical essays (Croce 1966b[1900]), later critiqued by Antonio Gramsci in his *Prison Notebooks*. In 1902 Croce published *The Aesthetic as the Science of Expression and of the Linguistic in General* and in 1903 he and the idealist philosopher Giovanni Gentile founded *La Critica*, an idealist review of literature, history, and philosophy, which contributed significantly to a critique of Italian and European positivism. In a series of works about aesthetics, poetry, history of literature, and literary criticism, Croce developed the theoretical implications of De Sanctis's work. Croce considerably influenced early twentieth-century aesthetic thought, particularly that of the English philosopher of history R. G. Collingwood.

Croce was persistently critical of academic intellectualism and kept himself aloof from universities. He strongly criticized the abstract rationalism of the Enlightenment, which separated real and ideal, the imperfect universe of history from that of perfect rationality. His opposition to the positivist reduction of the humanities to the sphere of natural science was lifelong. He considered the natural sciences “edifices of pseudoconcepts” and, inspired by Giambattista Vico's *New Science*, he recognized the identity of philosophy and history, thus abolishing both the idea of a universal history and that of a universal philosophy, that is, the conception of philosophy as a *closed* system (Croce 1917[1909]). For Croce, the value of a philosophical system resides in its power of interpreting and narrating history; therefore, he defined his philosophy as an absolute historicism, and history as the touchstone of philosophy.

Croce's neo-idealism revised G. W. F. Hegel's thought through the lens of an

immanent model of history. *Philosophy of the Spirit* (1902–17) is the general title of the work in which he expounds his philosophical system. It consists of four parts: *The Aesthetic as the Science of Expression and of the Linguistic in General* (1992 [1902]), *Logic as the Science of the Pure Concept* (1917[1909]), *Philosophy of the Practical: Economy and Ethics* (1913 [1909]), and *History: Its Theory and Practice* (1921[1917]). According to Croce's philosophical system, the only actual reality is that of the spirit, which progresses through the immanence of history. Divided into two spheres, theoretical (art and logic) and practical (ethics and economy), the forms of knowledge influence one another in their historical becoming. In revising Hegelian dialectics, Croce argues that dialectics encompasses both opposition and distinction. There is opposition between a value and its antivalue and distinction between two different and nonopposing logical elements. He argues that among the four spiritual forms of knowledge (art, logic, ethics, and economy) there is no opposition, but only distinction, because they are distinctive moments of the spirit, which progresses in history or, as Croce defined it, the story of liberty.

Ideologically, Croce was the most representative figure of conservative Italian Liberalism. He was elected senator in 1910 and during the years 1920–1 was minister of education. In response to the *Manifesto of the Fascist Intellectuals*, organized by Giovanni Gentile and published on April 1925, he wrote a *Manifesto of the Italian Anti-Fascist Intellectuals*, signed by many important contemporary intellectuals and politicians. In 1926, his house was vandalized by fascists and he was isolated from teaching and participating in cultural events in Italy. During the Fascist regime, although the censorship of his work was

evident, Croce was neither prosecuted by the fascist courts nor suffered physical attacks on his person such as those inflicted on many other antifascists such as Piero Gobetti, Giacomo Matteotti, Nello and Carlo Rosselli, and Antonio Gramsci, who were imprisoned, killed, or exiled. After World War II, as the leader of the Liberal Party, he played an important role in the negotiations between Italian political leaders and the Allied forces. He participated in the Constituent Assembly and was elected Senator of the first Republican government of Italy. He died in Naples in 1952, at the age of 86.

D

Defamiliarization

MATTHEW H. PANGBORN

“Defamiliarization” is the most common English translation of the Russian *ostraneniye*, the term given by Viktor Shklovsky to describe the essentially estranging purpose and effect of art. The term (sometimes translated as “estrangement”) was first introduced in 1917, in the article “Iskusstvo, kak priyom” (“Art as technique,” or “Art as device”), in the journal *Sborniki po teorii poeticheskovo yazyka* (Studies in the Theory of Poetic Language). Defamiliarization, which quickly became a key concept for formalist literary criticism, works by making everyday objects unfamiliar and thus recovering for the audience “the sensations of life” (Shklovsky 1965[1917]: 12). Shklovsky, widely viewed as the founder of Russian formalism, identifies defamiliarization as the artistic technique able, in his famous example, “to make the stone *stony*” (12).

Shklovsky introduced the term in opposition to Russian symbolist theories of art, which abandoned the familiar rather than try to awaken its audience to fresh perspectives on the world of the mundane. Moreover, Shklovsky resisted Russian symbolists’ privileging of the visual, implicit in their attempts to communicate truths through transcendental images and ideals. Such

a reliance upon imagery confined a potentially progressive movement, Shklovsky believed, to a rather worn tradition ruled by Horace’s dictum, *ut pictura poesis* (as is painting, so is poetry). Instead of the visual, Shklovsky emphasized the verbal, arguing that it was through language, and specifically its ability to make new the stale and habitual objects of everyday life, that art provoked in its audience a renewed appreciation for its perception of the world. Poetic language differs from familiar language by being intentionally more difficult to understand, and this difficulty, which prolongs the reader’s act of perception, leads to aesthetic pleasure. This renewed perception and the aesthetic pleasure it generates is the chief means by which literary writers overcome what Shklovsky calls the “over-automatization” of habit (1965[1917]: 12).

Artists accomplish the task of defamiliarization in three fundamental ways, according to Shklovsky. First, they purposefully distort syntax and heighten diction, in order to make their subjects more extraordinary or unsettling. Additionally, they use rhyme, rhythm, alliteration, and metaphor to produce defamiliarizing effects, as in the famous example cited by Shklovsky of Nikolai Gogol’s comparison of the sky to the “garment of God” (1965[1917]: 6). Second,

artists may avoid common expressions and names of familiar objects or activities in favor of phrases and descriptions that highlight the novel or strange in the familiar. Shklovsky illustrates this estranging technique with Leo Tolstoy's detailed description of flogging in "Shame," which is never explicitly named but rather presented as if the event "were happening for the first time" (13). Third, the artist may use "parallelism," Shklovsky's term for the importation into one genre of the terms, methodology, or content typical of another, such as in the use of slang terms, dialect, or ordinary speech in place of "literary language." The resulting "disharmony" requires readers to readjust their expectations of the form (21).

Shklovsky opposes his notion of defamiliarization to an "economic" theory of language according to which statements should express the most information in the fewest words and to an artistic method according to which art clarifies "the unknown by means of the known" (6). Accordingly, defamiliarization may be understood as part of the debate over the role of art in Western society since Romanticism – whether art simply provides an accurate representation of reality or plays a more transformative role in the shaping and understanding of that reality. Many readers regard Shklovsky's ideas as essential to theories of art that advocate the recovery of vital experience lost through the "objective" pursuit of knowledge. Certainly, the Romantic aesthetics of William Wordsworth and the modernist aesthetics of William Carlos Williams articulate the defamiliarizing power of literary language (Robinson 2008). However, Shklovsky's insistence on viewing art as wholly subject to formalist explanation and analysis complicates any easy conflation of his aesthetics with Romantic or modernist practices.

Shklovsky's ideas have had a strong influence on a wide diversity of thinkers and artists, including the Russian formalist

Roman Jakobson and the German playwright Bertolt Brecht. Brecht's development of the concept of *Verfremdungseffekt* – variously translated as "distantiation" or "alienation effect" – in his "epic" or "dialectical" theater, owes a great deal to Shklovsky's defamiliarization (1964: 125–6, 281–2). Brecht employed *Verfremdungseffekt* to reflect his belief that a play should never encourage its audience to think of themselves as passive spectators of a realistically presented scene but should draw attention to its framing, its constructedness, in order to incite audience members actively to make judgments about the events and characters depicted in the play. Defamiliarization has also been a useful concept for theorists of magical realism to describe the ways in which literature accomplishes the "magical" transformation of the everyday (Zamora & Faris 1995: 177).

Shklovsky's defamiliarization provided formalism with one of its key concepts for defining and appreciating a literary work. It also, however, helped formalists overcome what might have otherwise been a confining attention to the artifact itself, by providing a way to discuss the response it evoked in its readers.

Determination

KOONYONG KIM

Determination refers to the idea that a certain event or phenomenon is caused or conditioned by external or internal laws and processes. Closely related to other concepts such as causality, condition of possibility, and the setting of limits, determination has garnered a good deal of critical attention in philosophy, religion, sociology, and other disciplines. In contemporary literary and cultural theory, however, the most useful context is the Marxian tradition of cultural materialism.

One of Karl Marx's chief accomplishments was his critique of G. W. F. Hegel, particularly his conception of dialectics. In the *Phenomenology of Spirit* (1807), Hegel focuses on ideas, concepts, and consciousness in order to come to understand human existence. While the Hegelian idealist system regards consciousness as the foundation of reality, Marx reverses his predecessor's position by foregrounding the ways in which thought is fundamentally grounded in material conditions. By turning Hegel "on his head," Marx is able to theorize a new relation of existence to thought; as he and Frederick Engels remark in *The German Ideology*, "life is not determined by consciousness, but consciousness by life" (Marx & Engels 1972[1932]: 47).

In his eleventh thesis on Feuerbach – "The philosophers have only *interpreted* the world, in various ways; the point is to

change it" (1972[1932]: 123) – Marx suggests that social change is necessarily linked to an understanding of social determinations. His materialist position on determination is elaborated further in the Preface to *A Contribution to the Critique of Political Economy* (1970[1859]), where he explains how the social relations between individuals are defined in terms of their material context and effects and how the social production of their existence coincides with the development of material forces of production. For Marx, these forces and relations together define the economic structure of society, and it is none other than this economic "base" or "infrastructure" upon which a cultural and ideological "superstructure" arises and to which distinct forms of social consciousness correspond. Being, for Marx, is always *social* being, an idea that he sums up in a reiteration of his famous remark about consciousness and life: "It is not the consciousness of men that determines their existence, but their social being that determines their consciousness" (21).

Marx's historical materialism has led many to conclude that Marxism is a form of economic determinism (or "economism") in which economic forces set unalterable limits on the various elements of the superstructure, which, on this view, becomes a mere reflection of the former. Engels countered this common misconception in a letter to Joseph Bloch, in which he wrote that for Marx the *ultimately* determining factor in human history is the production and reproduction of real life, and to suggest that economy is the *only* determinant is a misleading distortion (Marx & Engels 1942: 498). The reciprocity between the base and the superstructure in historical processes is far more complex than the mechanistic determinism described by some critics of Marxist theory. Engels elaborates on Marx's ideas about historical process in a letter to W. Borgius. The historical process articulated in Marx's *Eighteenth*

Brumaire, according to Engels, does not treat individuals like blind, impotent actors, but as those who make history on the basis of existing social relations. In these remarks, Engels underscores the dialectic of a materialist economic system and human agency, a dialectic in which economic forces assert themselves in complex interaction with various legal, political, philosophical, and artistic elements of society (Marx & Engels 1942: 466).

The French Marxist Louis Althusser rereads Marxian determination in terms of this complexity, rather than as a mechanistic force that acts in predictable ways on base and superstructure, which are subject to what he calls “overdetermination.” As used by Sigmund Freud in the *Interpretation of Dreams*, overdetermination refers to dreamwork and the way symbols and tropes, language and images can be used in an excessive and deceptive fashion to “overcode” one’s most hidden wishes. Althusser appropriates this term as part of a critique of the economic determinism in Marxist theory (and thus of the classic base/superstructure model). He argues for the existence of multiple interactions and causations at all elements within the social formation. Incorporating insights from Mao Zedong, V. I. Lenin, and Claude Lévi-Strauss, Althusser holds that Marx’s notion of the “social whole,” in contradistinction to the Hegelian totality, is constituted by various semiautonomous levels or instances and therefore “overdetermined.” Perceptive though this structuralist revision of the notion of determination is, Althusser’s problematic of overdetermination harbors a contradiction of its own. On the one hand, to insure that his structuralist reformulation does not turn into a non-Marxist indeterminacy – or a chaos of unpredictable, unstable social determinations – he argues that the mode of production comprises both the economic base and the superstructural elements in a single entity and that the economy is the determining force in the last instance.

However, on the other hand, in order to avoid the pitfall of economic reductionism, he adds a qualification that “The lonely hour of the ‘last instance’ never comes” (Althusser 2005[1965]: 113). The potential for contradiction is thus deferred, freeing the materialist critique from the temptation to rely on economic forces as the sole determining factor in social relations.

In a recent intervention in the debate over determination, Fredric Jameson proposes that we regard the model of base/superstructure not as a solution but rather as a problematic to be worked out. As a Marxist, Jameson retains the Marxian emphasis on the base, as is exemplified in his theorization in *The Political Unconscious* of three concentric hermeneutic frameworks – historical, political, economic – in which the mode of production is seen as the ultimate horizon of human history as a whole. His stress on the economic base is also detectable in his characterization of postmodernism as a cultural dominant that registers structural shifts in the late or global phase of capitalism. However, Jameson’s framework cannot be farther from economism. On the contrary, Jameson posits a gradual dedifferentiation of social levels, most notably the “becoming cultural of the economic” and the “becoming economic of the cultural” (Jameson 1998: 60) as one of the most conspicuous features of the contemporary globalized world. The unprecedented level of commodification on a global scale has turned culture into business, and what was once considered distinctively economic or commercial has become cultural in the so-called image or consumer society. Analyzing the ways in which various social levels are reciprocally determining and determined in the social totality of global capitalism, Jameson problematizes the traditional deterministic model of base/superstructure and seeks to grasp diverse social fields both in their own specificity and in relation to its material conditions.

Dialectics

TOM McCALL

In its philosophical sense, dialectics brings to mind a focused discussion or dialogue (a word cognate with “dialectic”) that converges on truth, not from memorized

arguments but in real-time inquiries building on step-by-step clarifications. These are achieved through appraisals of the strongest insights and statements about given matters dealing with “generally accepted opinions” involving a degree of speculation and uncertainty, in contrast to assertions based on “the primary and true” first principles of science (Aristotle 1968: 104a3–105a9). Dialectics, in this pedagogical, performative sense, builds on Aristotle’s logical form to achieve a mode of analysis that moves past the common-sense or face values of the issues under discussion and patiently reveals their underlying structures. It does not take a transcendent or a priori position outside them (e.g., by making deductions from first principles) but immanently unfolds within the subject as thought. By virtue of its power (or promise) to dissolve the factuality of the given world, to loosen the hold of immediate, given reality, dialectics has enjoyed a special allure and authority, especially in Continental philosophy beginning with Kant. For its exemplary practitioners – and here the names of Plato and G. W. F. Hegel may stand unquestionably as ancient and modern exemplars – dialectics begins with (but does not necessarily end with) its chief problem: understanding phenomenal reality, which dialectics shows ironically to be an effect of dialectics itself.

In Hegel’s philosophy, the “remainder” occurs at every turn. It is a way of thinking whose power derives from “the tremendous power of the negative” (1998[1807]: 19). The Hegelian subject occurs in different versions – as consciousness, self-consciousness, the World Spirit, *Weltanschauung*, the worldview of an entire culture, Absolute Concept – but always encounters an “other” in the form of an object that is then taken up into a dialectical process. Its aim is to recognize itself in that object. J. G. Fichte and Hegel, like others in the Weimar area at the time, found the origin of dialectics in

a speculative etymological reading of the word *Urteil* (judgment, verdict): philosophy and dialectics began only with a first (*Ur*) partitioning (*Teilen*) of the object, without which there can never be an object and thus no dialectical process. The thinking subject that divides itself ironically persists as the remainder in dialectical thinking. This progress from blindness to insight is enabled by a Hegelian trademark, the *Aufhebung* (sublation), in which the first or negative moment, once recognized, is both preserved (remembered) and overcome: rather than being simply forgotten as a moment of ignorance, it is retained as a moment of progress, as but a momentary blockage in a dialectical process that unfolds ever deeper structures and implications of an emerging totality. The dialectic of master and slave (or “Lordship and Bondage”) in the *Phenomenology of Spirit* (1998[1807]) provides a dramatic instance of sublation, in which something believed to be absolute, an ultimate fact, is re-evaluated, losing its priority: what had seemed to be a cold, hard, and self-subsistent fact is now determined by other factors that stem from a less abstract and more concrete totality. At the stage of self-consciousness, of mind turned on itself, the master commands and the slave does his bidding, the slave dealing directly with the world, the master with the world as mediated through the slave’s labor. This situation allows the slave to develop self-consciousness, but not the master, who gets what he wants (“Bring me tea, now!”), but understands nothing, having no sense of the hard work that goes into constructing the world (making the tea, picking the leaves, etc.) At first understanding the world as “the master’s world,” the slave comes to recognize that the world is really the product of his own activity and labor.

Hegelian dialectics advances into truth first by negation and then by canceling out the negation in more concrete (deter-

minate, articulated) identifications. It is in Hegel that identification and recognition take on a signal importance in describing the importance of dialectics to phenomenology, and especially to a phenomenology of consciousness. Dialectics after Hegel has progressively relinquished the identitarian impulse and instead focused on the “alienation” concept whose contradiction is not resolved in the process of sublation (*Aufhebung*). Among modern practitioners (from Fichte, Schelling, and Hegel to Karl Marx and Frederick Engels, Walter Benjamin, Theodor W. Adorno, Herbert Marcuse, and Jean-Paul Sartre), identity and alienation are founded on a vision of humanity as somehow “fallen” with respect to Absolutes and trivial with respect to Universals. For the idealist Plato, the mind is literally imprisoned by its ideas and it is the mission of philosophy to free it. The point is illustrated in the “Parable of the Cave” which opens book seven of the *Republic* and which precedes and contextualizes Plato’s discussion of dialectics. A man imprisoned in a cave manages to escape his dark realm and to ascend to the light of the world “above.” There he comes to realize that the cave world he had accepted as reality is a prison house of shadows and false objects.

For Marx the proletariat is the dynamo of history, which is shaped “from below,” through the combined labors of the many rather than from above, through Hegelian concepts like Spirit or *Zeitgeist*. From this angle, Hegel’s dialectic, as Marx puts it memorably, “is standing on its head” (1992[1887]: 29). Human actors are for Hegel manifestations of subjective spirit more or less at the mercy of history as objective spirit. For Marx, human actors are vital to a *materialist and historical* dialectic, which holds existing institutions together in specific kinds of relation. In dialectics, the contradiction between capital

and labor – primarily the result of the former exploiting the latter – is revealed and, at least symbolically, resolved. The materialist critic, using a dialectical method, interprets the tensions generated by opposing social forces. For Marx, the class struggle is at the heart of history; contradictions cannot be resolved in conceptual space. Their only resolution lies “in history” itself. “The development of the contradictions of a given historical form of production is the only historical way in which it can be dissolved and then reconstructed on a new basis” (1992[1887]: 619). Marx redeploys a feature of Hegelian dialectic – in which a power that binds is reversed into a power to unbind or bind again in a different way – to describe a form of proletarian opposition that would break the self-devouring contradictions of capitalism. For Marx “the scandal and abomination” (1992[1887]: 29) of Hegelian dialectic is not that it is wrong but that it is right, in a way that Hegel himself and his neo-Hegelian followers could not consistently follow through. Marx’s understanding of Hegel raises some important questions: How can a dialectic that conceives the power of the negative so well possibly be used to affirm and glorify the state? How can dialectic support an “affirmative recognition of the existing state of things” (1992[1887]: 29)? Dialectics, for Marx, is more truthfully conceived as a dissolvent, breaking down those subjects to which it is applied or in which it operates innately.

In the opening pages of *Negative Dialectics*, Adorno lays bare the negative moment in which dialectical synthesis cancels the object. He is not concerned with the Hegelian “rising above” but with the scandalous leftover: “The name of dialectics says no more, to begin with, than that objects do not go into their concepts without leaving a remainder, that they come to contradict the traditional norm of

adequacy” (Adorno 1973: 5). His thought rescues the radical condition of dialectics in a process that leaves something behind, that has, in the past, been ignored, unanalyzed. Dialectics refers here to “the consistent sense of non-identity,” “the untruth of identity” (Adorno 1973: 5). Broadly, then, dialectics is argument about leftovers – what does not fit into concepts, what contradicts the norms of “identity” and “truth.” Contradictions are the core of dialectical presentation, but everything depends upon what is *done with* them. For post-Hegelian philosophers like Marx and Adorno, contradictions are fundamental not so much because they can be resolved but because they cannot be resolved entirely. In dialectics, the contradiction itself, rather than its resolution, is disclosed and *exposed*.

If traditional dialectics, from Aristotle to Marx, establishes identities through a process of negation, Adorno’s *negative* dialectics deconstructs identitarian logics and turns dialectical struggle into the consciousness and remainder of non-identity and of identity as untruth. The negative cognitions opened through this kind of thought do not compound into deeper realizations and new syntheses but remain as scattered testaments to the ruin of contradictions that Adorno calls “the administered world.” Negative dialectics turns “the direction of conceptuality” toward the singular, isolated, non-assimilated and idiosyncratic instance, toward what resists identification. Yet the non-identical (*das Nichtidentische*) itself is a task performed asymptotically, through negations that cannot be negated – unless the way we understand the world were to change. Since the Hegelian model is the standard against which a “negative” dialectics defines itself, it is worthwhile to rehearse one of the formulas of idealist dialectics. The idealists conceived dialectics as a scientific transformation of dualisms

into monisms into new synthetic unities, between the polarities of subject and object. In the first moment of an iterative process, a subject comes across an object whose truth appears to be independent and “in itself” (*an sich*). In a second, self-reflective moment (the moment of the “for itself” [*für sich*]), the subject discovers that the objective truth depends upon assumptions or structures the subject brings to the object. A third moment (the “in and for itself” [*an und für sich*]) further formalizes the lesson learned in the first and second stages (in which the objective reality or “it” of the first moment is recognized as a subjective truth or “me”/“mine” of the second moment), to yield the identity (third moment) of identity (second moment) and non-identity (first moment). Although abstract, such formulas serve as meta-descriptions for a wide variety of materialist thinkers (including those taking non- or anti-dialectical positions). Adorno’s revolutionary formula, the identity of identity and non-identity, confirms the paramouncy of identity and at the same time robs it of its universality and conceptual purity.

The messianic aspect of dialectics, which reveals the given, material world as a sign of deeper realities camouflaged in materialist logic, goes back to Plato’s conception of the philosopher as a force for enlightenment. The critical theorist Walter Benjamin theorized this aspect of dialectics in a way that caused his close friend, Adorno, to accuse him of being too mystical. A good example of Benjamin’s thinking is how he acquires a “dialectical image” of the Marxist contradiction known as the “fetish commodity,” whereby an object in the market can acquire a mysterious dimension in which intrinsic or use value bears no reasonable relation to extrinsic or exchange value. The “dialectical image” does not so much represent a determinate content as mark out a blind spot in the present; it captures, in a photographic

way, the standpoint of the observer caught up with the observed: “When thinking reaches a standstill in a constellation saturated with tensions, the dialectical image appears” (Benjamin 1982: 595). In the dialectical image these tensions “leap out” to show themselves as extreme, irreconcilable, and yet coexistent. *Contra* Hegel, Benjamin sought to retrieve what thought could not conceptualize; at the point where thought breaks down completely – that is the dialectical image, which may be linked to “the allegorical attitude” which, as Horkheimer and Adorno put it, views “every image as writing” (*jedes Bild als Schrift*) (Horkheimer & Adorno 1972[1947]: 24).

The very adaptability and fecundity of dialectical thought, as well as its urge for totality, has courted criticism from a variety of sources, including the idealist philosopher Immanuel Kant (1724–1804), who was especially critical of an analytical style that was little more than the sophistic manipulation of ideas to arrive at foregone conclusions. In the *Critique of Pure Reason* (1781), Kant devotes more than a hundred pages to “paralogisms” (fallacious arguments) and “antinomies” (contradictions, “remainders”) which “the dialectical inferences of pure reason” deploy to build their cloud castles and “transcendental illusions.” What Kant criticized, post-Hegelians embraced. Dialectical thought works well with relatively stable, defined entities but it is less effective with volatile or excessively complicated, nonlinear systems, with multiple variables or with unpredictable emergent properties (e.g., weather systems, stock markets, or gnat swarms).

There is a world of difference between classical and modern dialectics and the procedures of deconstruction, though each begins from the shared insight that there is no such thing as a pure origin that occurs “by itself,” apart from or outside of some prior division – the multiple

interrelations and intertwined factors which make it possible. The most famous and productive challenges came from poststructuralist thought, especially the work of Jacques Derrida and others who were influenced by the French Hegelian Alexandre Kojève. Especially important to Kojève was Hegel's dialectic of lordship and bondage in the *Phenomenology of Spirit*. Derrida, building on the work of Georges Bataille, begins with Hegel's claim that the victory of the bondsman is the revolutionary truth of dialectic, but argues against Hegel that this revolution only assures that dialectic will limit its field of operations to a circumscribed sphere, the "security of meaning" (Derrida 1978: 259). Meaning is an artificial closure which "work" (the work of meaning, of the bondsman) places upon "play" (the play of language across its own enabling systems of differences and deferrals) in order to cash out as pay. The meaning of a text emerges through the application of a "restricted economy," which selects particular elements from those possible and excludes the rest. In contrast to the "restricted economy" of Hegelian dialectics, in which the object is negated so that the Concept can emerge, is the "expenditure without reserve" of the general (unrestricted) economy, of Sovereignty, a word that links Hegel's Lordship to the omnidirectional yet transitory nature of writing itself.

Deconstruction – indeed, a good many other poststructuralist strategies – may be characterized as a dialectics whose conceptual moves are at every point dissolved in undecidability. Every deconstruction begins as a dialectic, just as every dialectic is an incipient deconstruction. Deconstruction is dialectic unraveled by its own determinations. This principle has been recognized and applied in the thinking of the Frankfurt School and cultural studies, in which the concepts and cultural operations enlisted to dismantle centralized hierarchies fall prey to

self-contradiction, in the sense that they are magnified to the degree they become successful, and so come to replace what they displace, in a new hierarchy. But what they need instead is to be unraveled in their own turn.

Dialogism and Heteroglossia

R. BRANDON KERSHNER

From the 1920s through the 1940s the Russian literary theoretician and philosopher Mikhail Mikhailovich Bakhtin (1895–1975) developed a group of concepts bearing on the analysis of language in literature that have proved influential on Anglo-American and European scholarship, especially during the 1980s and '90s. Of these concepts, the one with the widest implications is *dialogizm*, generally rendered into English as “dialogism”; it is most fully developed in the first collection of Bakhtin’s writings to be translated into English under the title *The Dialogic Imagination: Four Essays* (1981[1975]). For Bakhtin, the basic condition of human communication is “heteroglossia,” the simultaneous presence of competing languages and their social, historical, psychological, and physical conditions of utterance. This insures that any statement will have a unique meaning dependent upon its immediate and global context. Under the condition of heteroglossia, dialogism is the necessary and characteristic mode of the production of meaning; both speech and writing, seen in this light, are always dialogical. We might also say that in a world dominated by heteroglossia, which insures the primacy of context over text, dialogism is the characteristic epistemological mode.

Bakhtin views discourse as composed of multiple competing “languages.” Within a discourse, a language may be constituted not only by conventional linguistic differences but also by the special vocabulary (i.e. “idiolects”) of a trade or social group, a popular or literary artistic genre, or even a dominant ideology. Sometimes different languages, idiolects, jargons, and so on can be distinguished only by attention to A “intonation” (an important term for

Bakhtin), which is highly dependent upon context. For each speaker, there exists already present in the social world a series of levels and genres of speech that are trans-individual. Further, each language utterance is *directed toward* other competing languages. In addition to simply articulating a speaker’s ideological position, his speech is inevitably responding to the speech of others, anticipating possible responses, attempting to foreclose a response, trying to win grudging approval from speakers of a different ideological position, and so forth. Because for Bakhtin consciousness and speech are so closely linked, perception is partly dependent upon articulation. Dialogism is not only an element of speech in the social world, but also an element of consciousness.

To this extent, speech always betrays a mixed function; it is “double-voiced,” or multidirectional, and Bakhtin would say that our analysis of language must reflect its various functions in material social contexts. For example, in reference to the novel, Bakhtin isolates three major forms of novelistic discourse: the monologic, unmediated speech of the author; the “objectified” discourse of a character who is merely seen as a “type”; and discourse with an orientation toward someone else’s discourse (that is, “double-voiced” discourse). This third variety, which is of the greatest interest to Bakhtin, can be divided into “unidirectional,” “vari-directional,” and “reflected”; the latter category includes the “hidden internal polemic” (in which a character always carries on an unacknowledged battle with another’s position). Bakhtin sometimes alludes to this internal polemic as the “word with a sideward glance” (1984 [1929]: 196), the condition in which a character’s speech is colored by the concern for how another is reacting. Bakhtin uses the term “polyphonic” for the multivoiced quality of speech in some of his writings, especially in *Problems of Dostoevsky’s Poetics*

(1984[1929]), and the polyphonic work can thus be seen as an instance of dialogized heteroglossia. Because speakers enter at birth into an ongoing multitude of dialogues, they must locate themselves within this energizing chaos. And because all such conversations predate each speaker and continue after the speaker's death, for Bakhtin they are necessarily never closed off; instead, in a term of approval, he calls them "unfinalized." The novel, when used to its fullest potential, reflects this situation: "The language of the novel is a *system* of languages that mutually and ideologically interanimate each other" (1981[1975]: 47). We might also note that for Bakhtin speech is always "metalinguistic," because its meaning always depends on some extralinguistic context.

Dialogic speech is the opposite of monologic speech, and at times Bakhtin identifies the latter with the speech of authority – the church, for example, in the Middle Ages. But to some extent this is a logical fiction that allows him to argue the virtues of the dialogic over the monologic; technically, speech can never actually be monologic. For Bakhtin the fullest demonstration of dialogism at work is in the novel, most especially in the work of his favorite Dostoevsky, in which the quality of "novelness" is highest. By privileging the novel, Bakhtin rebels against the claims of classical aesthetics, in which lyric poetry, the epic, and to some extent drama are given pride of place over the newer genre of the novel. As one of the great contrarians of literary theory, he points out that genres like the epic, with roots in ancient traditions, tend toward monologism, the dominance of a single voice and the inability to render convincingly an interaction of voices. (Why this should be so for drama is not entirely clear, but Bakhtin seems to have in mind classical drama, where he feels characters who use identifiably different speech are "objectified" by the presiding voice of the

dramatist.) The novel, he believes, is not really comparable to these other literary genres, in that it is a "metagenre" capable of borrowing from all the other literary genres, and many nonliterary forms as well. The novel can also infect or colonize these other genres, to some degree "novelizing" them, and Bakhtin views this as a positive effect. While he sometimes speaks in terms of an overall aesthetic unity in the novel, he more often celebrates the multiplicity of voices and subgenres within it, as well as the overall quality of being unfinalized.

In his essay "Discourse in the novel" and the chapter "Discourse in Dostoevsky," Bakhtin uses slightly different terminology to describe the three ways by which dialogism works in a literary text: (1) interaction between the "authorial language" (generally that of the narrator) and the language of the protagonist; (2) interaction between the protagonist's language and that of other characters in the text; and (3) interaction between the language of a text or a protagonist taken as a whole and the language of other texts to which explicit or implicit allusion is made. Thus dialogism in the novel is a function not only of the languages of its characters and author in the process of interacting creatively, but also of the selection of other genres and subgenres with which the novel negotiates. In the case of Dostoevsky, these might include true crime stories, romances, law court reports, and other journalistic genres, as well as ideologically powerful languages such as that of the Orthodox Church. Bakhtin sees the language of the novel as saturated with its multiple social meanings. As he says in "Discourse in the novel," the novelist, in deploying the languages around him for aesthetic purposes, "does not purge words of intentions and tones that are alien to him, he does not destroy the seeds of social heteroglossia embedded in words" (1981[1975]: 298).

The simultaneous presence of different texts in a single work has been discussed by many contemporary critics under the rubric of “intertextuality,” and poststructuralist critics believe it to be a fundamental property of modern texts. Indeed, the relevance of Bakhtin’s thought to poststructuralism motivated Julia Kristeva to publish a highly influential essay introducing the Russian critic to the Western intellectual world. But Bakhtin’s understanding of intertextuality differs from that of (for example) deconstructionist critics. For one thing, his basic model of communication involves speech – often as reported in written discourses – while Derrida’s involves writing. But Bakhtin is not necessarily subject to the Derridean critique that a speech model implies the myth of presence; for Bakhtin, language is never the possession or tool of any single individual and draws no authority from the association with a person, but always has multiple social sources. He also differs from deconstructionist critics because, instead of celebrating the purely linguistic free-play of signifiers, he is interested in the interaction of the multiple languages in a text. While a deconstructionist critic might point to the infinite regress of languages within a text as each “authoritative” voice reveals itself to be ungrounded, Bakhtin would find the same phenomenon pertinent for the opportunity it offered for social analysis. Bakhtin’s continual emphasis on the social contexts that determine meaning in speech complicates any potential Derridean critique of the Russian’s thought.

It should be understood that Bakhtin’s analysis of the novel is a logical extension of his view of the way language constitutes consciousness. He is strikingly uninterested in the unconscious mind, feeling that the conscious mind is a much more complex and mysterious affair than is normally thought. Individual selves are formed in a process of interanimating confrontation with others that is almost entirely a matter of

languages confronting one another; so that the self, he argues, is a gift of the other. Some critics have noted that Bakhtin’s psychology has a number of parallels with Martin Buber’s, especially in the constitutive function of what Buber calls the “I–thou relation.” Others have suggested a parallel with Buber’s theology as well, although the degree to which Bakhtin can usefully be considered a Christian thinker, like the degree to which he is a Marxist, is a matter of heated debate. In any case, Bakhtin believes selfhood to be almost entirely a product of language interactions, always with the proviso that language for Bakhtin is a richer, broader, and more material notion than it is for most linguists. Because of the dialogical nature of speech, the utterance in Bakhtin’s formulation is always concretely and ideologically grounded in material circumstances.

An important concept only loosely related to dialogism, but which also follows from Bakhtin’s view of genre as fundamentally constitutive of literary reality, is the “chronotope.” He develops this idea most fully in the essay “Forms of time and chronotope in the novel.” The term combines the Greek words for time (*chronos*) and space (*topos*) to suggest the mutual dependency of these parameters, in a manner that Bakhtin compares to the Einsteinian cosmology. Bakhtin identifies several chronotopes, such as those governing the “adventure novel of everyday life” and the “biographical novel,” but also uses the term to address major motifs, as in the “chronotope of meeting” or the “chronotope of the road.” Bakhtin’s use of the term for the analysis of a wide variety of literary texts recalls to some degree European phenomenological criticism of the 1960s as practiced by Georges Poulet and Maurice Blanchot. Different genres of writing employ different chronotopes, which, at least in part, reflect changes in the historical conceptions of time and space,

and form the base conditions governing representation in the various genres. The phenomenology of the chronotope thus constitutes a kind of formal horizon, in which narrative temporality and spatial relations are mutually involved with chance rather than logical consequence. In chronotopic analysis, according to Bakhtin, neither time nor space is privileged, as one or the other often is in literary criticism; for him, the two are always seen as interdependent.

An unusual aspect of Bakhtin's view of literary history is that he projects the novel genre backward in time, finding novelistic roots in both classical Greek and Roman precursors. Bakhtin's discussions of the interworkings of time, space, and fundamental principles such as causality in these early literary narratives are fascinating and suggestive. It is unfortunate, however, that his exploration of the chronotope is illustrated by a number of obscure narratives for which he is attempting, at the same time, to establish an original generic status. On the other hand, his innovations as a classicist, bringing new attention to genres such as the symposium and the Menippean satire, as precursors of the novel, no doubt influenced his development of the concepts of heteroglossia, dialogism, and polyphony in the novel. But the idea of the chronotope, linked as it is to fictional genres, has provided contemporary critics with a useful tool of analysis that was not previously available.

Discourse

YASSER MUNIF

The term "discourse" refers to a systematic and relational sequence of meaningful statements (speech and text) and semiotic elements (signs and symbols) that influence practices and give expression to the values, behaviors, and worldviews of social groups. Historically, the concept was in use in the sixteenth century to describe the practice of speaking or writing at length about a particular theme. In everyday language, the term is often used casually to imply a structured argument about a particular theme. The modern genealogy of the concept, however, goes back to the work of Swiss linguist Ferdinand de Saussure and includes pre-eminent poststructuralist theorists like Michel Foucault. For mainstream linguistics, highly indebted to Saussure, the focus is on the analysis of the internal mechanisms of language in use. In contrast, according to the Foucauldian perspective, which tends to be more influential in cultural studies and literary theory, the emphasis is on examining the impact of discourse on the social sphere.

In the 1900s, Ferdinand de Saussure developed a linguistic theory that differed

significantly from its predecessors. Although the term “discourse” was not used extensively in Saussure’s work, his theory of language has had a significant influence on theories of discourse. Unlike his predecessors, Saussure was not particularly interested in the diachronic approach to specific, individual languages, that is, their historical evolution; rather, he favored a synchronic or structural analysis of linguistic systems. By emphasizing structural (and thus universal) aspects of language, Saussure does not deny the importance of social norms and rules in linguistic systems. Instead, his aim is to examine the structure of language as a fixed system. He aspires to explain the rules that connect the different elements to each other and give coherence to the system. For Saussure, a language is a “series of differences of sound combined with a series of differences of ideas” (Saussure 1981 [1916]: 120). According to this framework, meaning emerges because there is a closed taxonomy of signs that depends on a relational system of differentiation. Signs do not have meaning by themselves; they acquire it within a differential and relational system. The idea of language as a system provided the foundation for a conception of discourse as systematic and relational.

The notion of discourse acquired new meaning as poststructuralist theorists attempted to solve some of the problems that Saussure’s ideas raised. Julia Kristeva, Roland Barthes, and the linguist Emile Benveniste built on Saussurean linguistics to show the importance of sociocultural and intertextual dimensions of discourse. Barthes’s contributions to a post-Saussurean understanding of signification includes his innovative theory of mythic discourse that focuses on the semiotic dimension of cultural practices and reworks the Saussurean framework (sign/signifier/signified) to show that there are two levels of signification: denotation and connotation. On the

level of denotation, signification is largely descriptive and objective; a signifier refers to a signified. Denotative meaning tends to be stable and referential and requires little interpretive analysis; it is “commonsensical,” as Barthes once thought, though he would later distance himself from this position. On the level of connotation, on the other hand, signification is largely suggestive and subjective; meaning is variable, tending toward abstraction or metaphoric displacements; interpreting connotative signs requires greater sensitivity to linguistic features and to the social and cultural contexts of their articulation. According to Barthes, connotation occurs in the second order of signification, where the denotative, or first order, of signification acquires specific cultural meanings through use. The second order has obvious ideological implications, for a dominant group can present a connotative sign in the guise of a simple denotative one. Cultural practice becomes hegemonic when this process succeeds in the formation of a *myth*, which is presented as truthful to those influenced or governed by that practice. Barthes’s *Mythologies* (1972 [1957]) explores the kinds of cultural practices open to “mythic” transformation and offers a theoretical explanation for the process by which myth becomes a meta-language with its own signifying system.

Like Barthes, Benveniste believed that accounting for context in the construction of meaning was vital, especially with respect to the social positions of the speaker (*locutaire*) and the hearer (*allocutaire*) as well as the context in which conversations take place. Discourse, in this view, is contrasted to history: the latter represents a fixed and objective repository of *past* events where no speaker is involved, while the former implies a dialogue in the *present* tense between a speaker and a hearer. Discursive utterances, as opposed to historical utterances, are the product of intersubjective social acts.

Within this relational model, the speaker attempts to produce statements to influence the worldview of the hearer.

In a similar vein, Bakhtin proposes a theory of language that stresses “the primacy of context over text” (1981[1975]: 263). He uses “discourse” to refer to the way in which the voices of speakers are structured in social contexts. Bakhtin shows that texts are dialogical; several voices compete within a single text. What privileges one voice over another depends on the role that institutions and dominant social groups play within a culture. Therefore, the goal of the critic is to stress the dialogical conversation which occurs among various voices within and without text.

In the 1960s and early 1970s, Michel Foucault’s work on discourse emerged as one of the most influential theoretical projects of the era. Though he learned a great deal from thinkers like Saussure and Barthes, he was less interested in semiotics as such than in the conditions of existence and historical specificities of signifying structures understood as discourse, or “discursive formations” (1972). Though he did not ignore the importance of signification, his main interests lay in what discourses *do*, and this complex engagement of signification and context challenged both abstract theories of the sign and materialist theories of society. One of the innovations of Foucault’s conception of discourse is the idea that webs of signification are in fact relations of material force, power realized within discourse systems. The reconfiguration of the relation between discourse and context led, necessarily, to a revised view of the traditional relation between theory and practice, according to which theory was removed from and governed, as if from afar, the various forms of practice.

Foucault’s early studies of institutions – *The Birth of the Clinic* 2003[1963]), *Madness and Civilization* (1992[1961]), and the

Order of Things (1973[1966]) employ an archaeological method to analyze what he terms historical “epistemes” – discursive systems of thought and knowledge – and the rules of enunciation they generate. In *The Order of Things*, Foucault shows that each historic epoch has an episteme or a system of knowledge that orders it. An episteme makes certain discourses acceptable and others unthinkable. Two consecutive eras are separated by an epistemic break which transforms systems of knowledge and alters radically the conditions of existence of a discourse. Therefore, a discourse that may be legitimate within one episteme (an era characterized by a unique way of knowing) might become inconceivable in another. One of his most influential archaeological studies of epistemes was *Madness and Civilization* (1961), in which Foucault describes the emergence of asylums and mental health practices that establish coherence in a discursive system that both creates norms for “sanity” and excludes from society those individuals determined as “insane.” To some extent, Foucauldian archaeology provides the foundation for subsequent “genealogical” analysis, a mode of historiography that eschews the search for origins and instead seeks to understand local emergences and resistances. Genealogy does not concern itself with “the anticipatory power of meaning” but rather with “the hazardous play of dominations” (Foucault 1977: 148).

In *The Archaeology of Knowledge* (1972 [1969]), Foucault provides a systematic description of the archaeological method. He contends that discourse is formed of “practices that systematically form the objects of which they speak” (1972[1969]: 49); it imposes certain taxonomies that have the power to produce knowledge and shape practice. This led Foucault to challenge two key theoretical trends in the 1960s: Marxian dialectical materialism and poststructuralist textualism. Unlike traditional linguistics,

Foucault's theory makes clear that discourse acts on *and in* the world; it does not merely represent it. Discourse is, in effect, a constitutive part of reality. His insistence on the "relative autonomy" of discourse from the economic base came as a response to orthodox Marxism dominant in French intellectual circles in the 1960s. For orthodox Marxism, ideology and culture are mostly determined by economic processes, and they represent a reflection of dominant socioeconomic relationships. Foucault was not concerned with such concepts, conventionally understood, as "truth," "representation," or "totality," which were operative concepts for many Marxists at the time. Nevertheless, he was sympathetic to the Marxian analysis of material conditions and looked with skepticism at theories of textuality and language that ignored, obscured, or denied the material and formal dimensions of discourse and "discursive practices."

Discursive formations, as Foucault describes them in *The Archaeology of Knowledge*, are systems of knowledge that contain traditional "disciplines" as well as new disciplines and interdisciplinary conjunctions that represent new possibilities between disciplines. At one end of the spectrum is the "statement," which functions as a basic unit of analysis, and can be meaningfully uttered only if it conforms to the rules of enunciation generated by the discursive formation itself. Statements constitute the building blocks of discursive formations; they are performative acts that acquire meaning only as events within a specific discourse, which is in turn grounded in a particular sociohistorical moment. It is crucial to view the statement as an act of enunciation as well as a piece of text. Finally, what matters in the enunciation of a statement is not the psychology of the subject who enunciates it but the institutional and discursive position from which a statement is uttered. At the

other end of the spectrum is the "archive," the conceptual space in which all discourses circulate, where they are accessible. The archive is not ordered from without, according to an abstract system of reference. It is governed by an internal principle of dispersion. Foucault defines discourse as a "dispersion of statements" that follows certain regularities and abides by a set of rules of enunciation. There are a number of conditions (material, ideological, disciplinary) that maintain the uniformity of discourse and make it appear fixed. In other words, heterogeneous statements form a complex discursive unity because they operate according to discursive regularities. The role of the theorist is to explain the rules that lie behind what appears to be a logical sequence of statements or a coherent discursive formation. To analyze a discourse, one ought to pay particular attention to regularities that emerge in the formation of objects and concepts. These various formations become visible through the enunciative position of the speaking subject. A discursive formation, Foucault writes, is defined by a "delimitation of a field of objects, the definition of a legitimate perspective for the agent of knowledge, and the fixing of norms for the elaboration of concepts or theories" (1977: 199).

Starting in the 1970s, discourse theory became increasingly influential in literary and cultural theory. The influence of feminist and critical race theories, many developed outside traditional academic disciplines, led to new challenges for discourse analysis. Nowhere is this more evident than in postcolonial studies. Edward Said was the first to use Foucault's theories of discourse to analyze the specificities of imperial and colonial cultures. In *Orientalism* (1978), Said examines the strategies used by colonial powers to represent "the Orient." These representations, he argues, are necessary to sustain and reproduce the idea of "the

West.” He notes that Orientalism is a colonial discourse that constitutes not only a simplistic and, for the most part, fictive representation of “the Orient” but more importantly, the discursive conditions of possibility for the emergence of a colonial subject. Discourse theory has had a wide-ranging influence on feminist theory as well. Feminist scholars, after Foucault, however much they may decry his avoidance of questions of gender, nevertheless learned from his work strategies for challenging those aspects of feminist thought bound to or reliant upon essentialist identity politics and foundationalist philosophies. Postcolonial and feminist approaches to discourse provided new and influential conceptual tools that have altered in a fundamental way the methodologies of literary and cultural theory.

E

Eliot, T. S.

GAYLE ROGERS

One of the most influential poets and critics of the twentieth century, Thomas Stearns Eliot (1888–1965) revitalized and, in many important respects, redefined the nature of literary texts and traditions and the role of criticism in relation to them. In numerous essays and lectures, he argued that neither poetry nor criticism should be a genteel and belletristic enterprise; rather, the two work together analytically in the construction of literary history. This approach to the literary artifact, part of a larger modernist attempt to understand the role of the critic in relation to literature, enabled a number of critical methodologies, particularly the kinds of practical criticism and close reading favored by new critics like I. A. Richards and Cleanth Brooks.

Eliot was born in St Louis, Missouri, to a distinguished Massachusetts family that had been moved west by Eliot's grandfather William Greenleaf Eliot, who established the city's first Unitarian Church and served as president of Washington University. Eliot was an undergraduate at Harvard University, where he studied philosophy and literature under George Santayana, Josiah Royce, and the new humanist Irving Babbitt, and was also writing verse, under the

strong influence of the French symbolist Jules Laforgue. After graduating, he traveled to Europe and attended Henri Bergson's lectures at the Sorbonne in 1910–11. He then spent a year at Merton College, Oxford University, in 1914, and completed his Harvard dissertation (though not his degree) on the British idealist philosopher F. H. Bradley in 1916. He finally settled in London, where he would spend most of his adult life, and took a job as a clerk at Lloyds Bank. In 1925, he would take an editorial position at Faber and Gwyer (later Faber and Faber) that he would continue (mostly in a directorial capacity) until his death.

In the 1910s and early 1920s, Eliot began to publish his poetry and criticism in London's vibrant yet contentious world of little magazines and literary reviews. Collaborating with his mentor and fellow American expatriate Ezra Pound, he began to shape his career as a poet-critic in the tradition of Samuel Johnson and Matthew Arnold. Like others in the modernist movement, particularly Virginia Woolf and Lytton Strachey, Eliot critiqued the excesses of Romanticism, the chaotic and undisciplined state of contemporary criticism, and key Victorian and contemporary writers. He read the Provençal poets that Pound was translating, and he published on French authors such as Charles Baudelaire,

Arthur Rimbaud, and Jules Laforgue, whose work he had discovered through Arthur Symons's study *The Symbolist Movement in Literature* (1899). He was also at this time influenced by T. E. Hulme's neoclassicism and his arguments for restrained, "masculine" writing. Eliot's controversial valuation of figures like Laforgue and of "metaphysical poets" like John Donne, who were largely ignored by British readers, was not welcomed by members of London's critical establishment, especially J. C. Squire of the *London Mercury* and Edward Marsh, champion of the Georgian school of poets. Part provocateur, part antagonist, Eliot argued in numerous essays that the best English literature situated itself within a European context, and it was this larger context that Eliot sought to define and analyze in his critical essays.

Eliot's ideas about English literature and its role in a larger tradition were succinctly formulated in his essay "Tradition and the individual talent" (1919), in which he asserts that "No poet . . . has his complete meaning alone," nor does any national literary tradition develop and flourish without the cooperative nourishment of its European neighbors (1975: 38). He believed that the mature poet's mind must be

aware that the mind of Europe – the mind of his own country – a mind which he learns in time to be much more important than his own private mind – is a mind which changes, and that this change is a development which abandons nothing *en route*, which does not superannuate either Shakespeare, or Homer, or the rock drawing of the Magdalenian draughtsmen. (Eliot 1975: 38)

Connected to this idea of tradition is the theory of "depersonalization," according to which the expression of the poet's personality is to be avoided in favor of a catalytic process. Eliot famously compared the poet to a piece of "filiated platinum . . . intro-

duced into a chamber containing oxygen and sulphur dioxide"; the result, sulphurous acid, is formed only in the presence of the platinum and does not in any way alter the platinum. "The mind of the poet is the shred of platinum" (1975: 40–1). Depersonalization, then, is a complex process of transforming one's own affective response to the world into what Eliot called a "new art emotion" (43).

Over against Romantic theories of poetry, especially William Wordsworth's, in which personal emotional experience occupies a central place, Eliot notes that "Poetry is not a turning loose of emotion," but rather "an escape from emotion" – though Eliot is quick to note that only one who *has* emotions can "know what it means to want to escape from these things" (43). Freed from the inhibiting limits of one's own emotional life, the "truly great" poet's task is to take an entirely new standpoint to tradition. The mature poet must acquire

[a] historical sense . . . [and] a perception, not only of the pastness of the past, but of its presence; the historical sense compels a man to write not merely with his own generation in his bones, but with a feeling that the whole of the literature of Europe from Homer and within it the whole of the literature of his own country has a simultaneous existence and composes a simultaneous order. (38)

Like Pound's idea that "all ages are contemporaneous," Eliot's notion of the "presence" of the past not only revives and revises but also dramatically extends the critical sense of "tradition" across centuries and civilizations. Eliot thus implies that to be traditional *is* to be novel and original, not derivative or imitative, because poets must draw upon and reorder a host of literary monuments far beyond the workings of their own minds. That is to say, originality has more to do with one's historical sense than with the expression of

one's singular personality. Eliot made his bold investment in "tradition" when many of his peers saw this notion as merely an allegiance either to one's national predecessors or to ideals of "civilization" discredited by the Great War.

As "Tradition and the individual talent" indicates, Eliot sought to reform the English canon. In "The metaphysical poets" (1921), he expresses his preference for seventeenth-century poets like John Donne, George Herbert, and Andrew Marvell over John Milton, Percy Shelley, and John Keats because the former were able to unify thought and feeling in their "critical poetry." Since Milton, a "dissociation of sensibility set in, from which [English poets] have never recovered," wherein thought and feeling became separated. This dissociation was most evident in the Romantic exaltation of emotion over intellect (Eliot 1975: 64). The problem becomes particularly acute by the time of Tennyson and Browning, who "do not feel their thought as immediately as the odour of a rose. A thought to Donne was an experience; it modified his sensibility. When a poet's mind is perfectly equipped for its work, it is constantly amalgamating disparate experience" (64). The metaphysical poets, Eliot writes, had minds that were capable of "devour[ing] any kind of experience" because no misguided poetic ego stood in the way (64). Their works are thus superior, he concludes, because the best of them combine physical and metaphysical environments into a single poetic whole, crafting the geographically local into the philosophically universal.

The most controversial and infamous expression of this strand of Eliot's thought appears in his essay "Hamlet and his problems" (1919), in which he posits that "a set of objects, a situation, a chain of events . . . shall be the formula of [a] *particular* emotion" in a literary work (1975: 48). The essential emotional state that an author

wishes to convey through the text must be represented precisely by "external facts, which must terminate in sensory experience," not by the author's or a character's emotional experience. This material expression of a mental state of affairs – reflected in language – Eliot calls a work's "objective correlative," a term he borrows from the nineteenth-century American painter Washington Allston. Eliot claims that both Lady Macbeth's sleepwalking speech and Macbeth's speech upon learning of his wife's death display a "complete adequacy of the external to the emotion," while Hamlet is "dominated" and overwhelmed by an "excess of . . . facts," ideas, and feelings that remain "inexpressible," leaving the play an "artistic failure" (47–8). The work of art, Eliot once again suggests, must be liberated from pure attachments to an author's or character's psyche in order to create an aesthetic structure that is both internally consistent and capable of entering into the tradition in which contemporary and traditional works "are measured by each other" (39).

Eliot's own poetic works in many respects exemplify the principles of his critical theories, in some cases precisely by demonstrating the very dissociation of sensibility that he condemned. His works became the inspiration and starting point for new critics like I. A. Richards, whose *Principles of Literary Criticism* (1924), published only two years after *The Waste Land* first appeared, includes an appendix devoted to Eliot's work. Poems like the antiheroic dramatic monologue "The Love Song of J. Alfred Prufrock" (1915) and "Gerontion" (1920) reflect on the decay of European culture while at the same time exemplifying his belief that the modern poet must become more "difficult, . . . more and more comprehensive, more allusive, more indirect, in order to force, to dislocate if necessary, language into his meaning"

(Eliot 1975: 65). Eliot's *The Waste Land* – published along with James Joyce's *Ulysses* and Virginia Woolf's *Jacob's Room* in the *annus mirabilis* of modernism, 1922 – exemplifies the difficulty of modern poetry, both in terms of its network of allusions and its innovative stylistic and formal strategies. The poem transforms narratives of personal and cultural decline into a jarring, polyglot assemblage of fragmented allusions, overlapping voices, and poetic contortions as Eliot – himself on the verge of a nervous breakdown – allowed his mind to act (as he prescribed) as “a receptacle for seizing and storing up numberless feelings, phrases, [and] images” of a world brutalized and changed utterly by World War I (1975: 41). Eliot's later works are more philosophical and speculative – some say withdrawn – and less stylistically radical. *Four Quartets* (1944), despite its merits, had little of the bold experimentalism of “Prufrock” or *The Waste Land*. Its innovation lies in the poetic treatment of mystical and philosophical ideas that offered an alternative to the clash of ideologies in an era of world war.

One of Eliot's most significant contributions to literary criticism was the founding in London in 1922 of *The Criterion*, a literary periodical that he edited until 1939. *The Waste Land* was published simultaneously in the inaugural issue of *The Criterion* and in the *Dial* (a US literary journal). Eliot used the review to disseminate his cultural politics, to promote the criticism of like-minded thinkers on the Continent, and to publish translations of new literature that he believed might “Europeanize” what he saw as an insular English national culture. By the mid-1920s, Eliot had begun to turn away from the Indic and Eastern philosophies that he had studied at Harvard and employed in the latter parts of *The Waste Land* and toward a worldview rooted in the history of the Church of England, in which he was confirmed in 1927. By the following

year, he was able to declare himself a “classicist in literature, royalist in politics, and Anglo-Catholic in religion” (Eliot 1928: 7). His religious commitments reflected an idea of Europe that in some of his works he appeared to mourn. He argued that Dante was the “universal” poet of a Catholic continent that over the centuries had broken down into the artificial nationalities of the modern era, as seen most violently in World War I. Nations had disrupted and fractured Europe's late medieval wholeness, Eliot believed, and a writer such as Blake, while an individual genius, was unable to write within the tradition that Eliot celebrated and mourned in his essays. Blake's work thus remains inimitable, non-universal within an English culture insufficiently connected to a larger literary structure of the past and present. The essays in *Christianity and Culture*, especially “The unity of European culture,” examine this structure from a standpoint of cultural conservatism. His defense of and admiration for Charles Maurras, the French writer who co-founded the conservative review *L'Action française* and introduced fascism to France, fit within Eliot's intellectual schema but also earned the poet much criticism from his colleagues.

Eliot was awarded the Nobel Prize for Literature in 1948, and his poetry and criticism was a major influence on other poets and critics at least through the 1960s. His general theories of criticism and literature profoundly influenced British and American literary critics. His understanding of literary works as self-sufficient objects unconnected to the mind of the poet inspired the practical criticism of Richards and the cultural vision of critics like F. R. Leavis and William Empson. Since the 1960s, however, Eliot's reputation has suffered, in large measure because critics were unearthing new information about his political and cultural views, including most notoriously, anti-Semitism. Recent scholars have called into

question the assumption that Eliot (and modernism generally) were apolitical. His “Europe” has been criticized as exclusivist and ethnocentric; his literary “tradition” includes no women or non-Europeans and few minorities; and his elitism would appear to exclude lower-class writers from study; all of this created a model for analyzing literature too provincial for our time. Eliot left scholars with paradoxes we now see as fundamental to the modernist sensibility: he was an avant-gardist who criticized the avant-garde and an innovative poet who was conservative, even reactionary, in his criticism. He also appeared to contradict his most important insights when suggesting on multiple occasions that *The Waste Land* should be read as nothing more than a biographical piece. To some extent, the paradoxes that define Eliot’s career are those of his era; and while contemporary critics find fault with his politics and cultural views, his fundamental critical insights, as well as his poetry, continue to exert a powerful influence on our conceptions of modernism and modernist poetry.

Empson, William

ANTHONY FOTHERGILL

William Empson (1906–84) was a literary scholar and poet whose major works made him one of the most influential critics in England and the US from the 1930s onwards. Although committed to the idea of “close reading” commonly associated with the American new criticism, Empson’s critical position consistently, often contentiously, insisted on the importance of linguistic and historical context, of language as understood and used by ordinary people, and the importance of biography and authorial intention as key to the understanding of literary works. His abiding contribution remains his stress on close textual criticism but within this broader context, particularly on the analysis of the ambiguity and complexity of literary language and the creativity of oppositional, subversive readings of “canonical” texts.

Empson was born into the socially privileged class of Yorkshire landed gentry and went to school at Winchester College (1920), with its proud culture of dissenting intellectual rigor. He enjoyed “a ripping education,” excelling in mathematics and science and gaining prizes for his poetry and essay writing (Haffenden 2005: 96). He went to Cambridge in 1924 to study mathematics and was active in the famous humanist group, The Heretics Society, becoming its president

in 1928. Members had to be, if not “heretics,” willing to reject “all appeal to authority in the discussion of religious questions,” a condition which admirably suited Empson’s intellectual temperament, as is evident by his late book *Milton’s God* (1961), which was itself often regarded as “heretical” by critics whom Empson attacked as moralizing “neo-Christians.” Active in Cambridge’s cultural life, by 1928 Empson was becoming well known for his complex and taut poetry in a “metaphysical” mode, which F. R. Leavis and Ludwig Wittgenstein, among others, greatly admired. (Empson in turn later castigated “Leavisites” for being moralistically doctrinaire.)

After attaining his BA in mathematics in 1928, Empson embarked on an English literature degree, writing, in 1929, an undergraduate essay for his tutor, I. A. Richards, which was to become the basis of his first and arguably most influential work *Seven Types of Ambiguity* (1930), published when he was only 24. His English studies were abruptly truncated when he was ignominiously thrown out of his college and (such was the power of the University) banned from the city of Cambridge itself, when discovered *in flagrante* with a young woman. While this bitter experience did not determine his anti-Establishment views and his lifelong irreverence and contempt, bordering in later years on hatred, for Christian puritans and all forms of personal and institutional hypocrisy, it undoubtedly underlined them, for all the urbane detachment with which he scoffed at the matter.

The exile from Cambridge became a prolonged period of years abroad, teaching first in Japan (1931–4) and then in China (1937–9), with an interlude in London (1934–7), where he freelanced, worked for Mass Observation, and published *Poems* (1935). Politically, Japan signaled for him the ominous growth of a nationalism and power worship, the dangers of which, as

a left-leaning liberal, he associated with the rise of fascism in Europe. Later critics have seen this experience as the origin for the politically framed discussion in *Some Versions of Pastoral* (1935), which deals with the ideological disguises of complicated power relations and the transformation of power into “the natural,” a process that in Marxist theory is called “false consciousness.” In China, on the contrary, at a university forced into remote geographical exile by the Japanese invasion of 1937, Empson found the intellectual solidarity of colleagues and students and the sharing of everyday hardships exhilarating. For two years, literally on the move, he taught from books he carried largely in his head, there being no library. Despite “the savage life and the fleas and the bombs” (Haffenden 2005: 536), he started on what was to become *The Structure of Complex Words* (1951). In 1939 he returned to England working for the BBC (1940–6) mainly in the Overseas Service as Chinese editor, but also on propaganda programs alongside George Orwell. In 1947 he returned to China where he stayed until 1952, thus witnessing the civil war, and the Communist Party takeover. In 1953, after his return to England, he took a position at Sheffield University as professor of English, where he remained until his retirement in 1971. Empson’s late period saw the publication of one of his most critically contentious works, *Milton’s God*, and his *Collected Poems* (1961). He received several honorary doctorates, including one from Cambridge, some 50 years after throwing him out. In 1979 he was knighted “for services to English Literature.” He died in April 1984. Numerous essays and reviews have been published posthumously in some eight volumes, notably *Using Biography*, *Argufying*, and two volumes of *Essays on Renaissance Literature*.

For all the surface appearance of conceptual rigor, especially in *Seven Types of*

Ambiguity and with the propositional equations in *The Structure of Complex Words*, Empson was not a theoretical critic. His very style of writing – a down-to-earth bluntness, salted with off-hand allusions – shows an attempt to undercut any pretensions of scholarly or institutional decorum. He distrusts the idea of models of linguistic analysis that are untested against ordinary human experience and language use, beyond the literary. When invited by *Kenyon Review* to write on “My Credo,” he denied having one. It smacked far too much of doctrinaire belief for his “taste” (itself a key Empsonian word along with “method,” “decent,” and “trick”):

A critic ought to trust his own nose, like the hunting dog, and if he lets any kind of theory or principle distract him from that, he is not doing his work. . . . All the same there is a place clearly . . . for such theories; for one thing, without a tolerable supply of handy generalisations you can't stretch your mind to see all round a particular case. (Empson 1997 [1950]: 177)

Empson was himself vague about his own categories. At bottom, he never let himself be tied down to the seeming exactitude of his own terms, for example “seven” or even the word “ambiguity” in his first work. The critical inspiration for his study was, alongside the model of close reading demonstrated by Richards, that of Robert Graves and Laura Riding’s *A Survey of Modernist Poetry* (1927). From the latter he took the idea that close reading confronts the reader with contradictions (ambiguities), which the reader attempts to understand and is thereby led back ultimately to sites of conflict *within the author*. For Empson, “Good poetry is usually written from a background of conflict” (1930: xii). This conflict can exist at a “merely” linguistic or semantic level, but it *may* be locatable only as an unresolved and irresolvable tension and contradiction within the writer, and indeed (as he argues

in *Some Versions of Pastoral*) may also exist at a more generalized sociohistorical level. As he said of the close analysis of words, “a profound enough criticism could extract an entire cultural history from a simple lyric” (Empson 1987: 97).

Empson defines “ambiguity” very generously, even loosely, and he certainly did not wish his readers to let definitions distract them from their critical emotional reactions to particularities of actual words on the page and the business of (at least attempted) “sense-making” which is central to the interpretation of any literary work, as it is to every area of human communication. Literary language lies on a continuum with ordinary everyday language and is not ontologically distinct from it. By taking this position, Empson disputed the contention of Richards and the new critics that in literature sentences consisted of “pseudo-statements” of a different logical category from “ordinary language.” Literature, for Empson, was precisely *not* an autonomous form insulated from consideration of authorial intention or the possibility of plain prose *paraphrase*, both “fallacies” which were anathema to the new critics.

For Empson, ambiguity is “any verbal nuance, however slight, which gives room for alternative reactions to the same piece of language” (1930: 1). Furthermore, “the machinations of ambiguity are among the very roots of poetry” (3), and for readers the critical energy of ambiguity lies in our having to hold in our minds two radically different meanings at the same time without bringing them to clear resolution. He gives definitions of seven types which move from the relatively simple, in which “word or grammatical structure is effective in several ways at once,” to the more complex, in which “two ideas, which are connected only by being both relevant in the context, can be given in one word simultaneously” (2, 102). It is the complex forms that require

the greatest interpretive effort from the reader, as when “a statement says nothing, by tautology, by contradiction, or by irrelevant statements; so that the reader is forced to invent statements of his own and they are liable to conflict with one another” (176). Finally, he points to “extreme contradiction” (e.g., “let” in English, meaning both “to allow” and “to hinder”), a species of ambiguity which becomes sheer irresolvable ambivalence of a kind influenced by his reading of Sigmund Freud, particularly his essay on “The antithetical meanings of primal words.” “Antithetical meanings” demonstrate a fundamental division in the writer’s mind, often in the writer’s “unconscious,” “subconscious,” or sometimes “preconscious” awareness (Empson was not too fussy). Empson pursues these types by analyzing closely poems by Shakespeare, the metaphysical poets, Andrew Marvell, Gerard Manly Hopkins, and T. S. Eliot. With virtuoso brilliance and sometimes heavily contested readings, Empson explains, “I have continually employed a method of analysis which jumps the gap between two ways of thinking; which produces a possible set of alternative meanings with some ingenuity, and then says it is grasped in the pre-consciousness of the reader by a native effort of the mind” (239). In all of Empson’s writing, beneath the formalism of his approach, there lies something like a rational humanist moral and epistemological imperative: criticism shares “the central function of imaginative literature [which] is to make you realize that other people act on moral convictions different from your own” (1961: 261). Elsewhere, he notes that “the more one understands one’s own reactions the less one is at their mercy” (1930: 15).

The politics of language implied in these remarks is one of the “tricks” (in a negative sense) language and literary forms can play on us, and this structure lies at the heart of

Empson’s second, perhaps most wide-ranging and accessible work, *Some Versions of Pastoral*. Here he brilliantly redefines “pastoral” extremely broadly, not as a single genre or subject matter, but rather as a mode which adopts the common “trick” of “putting the complex into the simple” (Empson 1935: 23). His ingenious analysis, with its particular emphasis on “double plots” shows how the pastoral can (appear to) resolve the contradictions or complexities of an individual or societal kind. He tackles works as various as Shakespeare’s sonnets, Marvell’s “The garden,” John Gay’s *The Beggar’s Opera* and Lewis Carroll’s *Alice in Wonderland* in the service of a Marxist-influenced reading of the ideological presuppositions of texts, uncovering the political and social tensions within seemingly harmoniously unified literary works. Presenting the idealization of relations between rich and poor, the pastoral projects a false image of social unity.

Empson’s *The Structure of Complex Words* has been variously praised by critics as his magnum opus, and the embodiment of his theoretical and literary critical genius (see, e.g., Norris 1978; Kermode 1989). Others see it as an unnecessarily convoluted account of quasi-mathematical semantic “equations” that cut across the varying senses of single words. Empson devotes whole chapters to the ambivalences of keywords such as “wit” in Alexander Pope’s *Essay in Criticism*, “all” in John Milton’s *Paradise Lost*, “dog” in Shakespeare’s *Timon of Athens* and “honest” in his *Othello*, and “sense” in William Wordsworth’s *The Prelude*. Through close reading, which is always socially and culturally contextualized, Empson shows the ways in which our words carry hidden histories of meaning of which we are barely conscious and which make up a work’s linguistic and sociohistorical complexity.

Milton’s God seeks to rescue Milton from the doctrinaire readings of “neo-Christian”

critics (such as C. S. Lewis and E. M. W. Tillyard), who fail to recognize that the Christian god is a god of cruel sacrifice, whom Milton implicitly puts on trial. Empson in this late text characterizes his increasingly controversial, some would say idiosyncratic and doctrinaire, voice. His lively attacks on “neo-Christians” from his “liberal, rational humanist” position (Norris 1978) increasingly color the tone of his late and posthumously collected essays in *Using Biography* and *Argufying*.

Empson’s influence can be traced along two varying routes. Some, like Christopher Norris and Paul de Man, see Empson as a proto-deconstructionist who stresses a text’s “undecidability,” which forever defers the final resolution of an ambiguity. Both the new critics and Empson evoke paradox, contradiction, and irony as powerful literary tropes, but while the first confidently rely on the unity of the text for closure, for Empson, “the text does not resolve the conflict [of meanings], it *names* it” (de Man 1983: 237). Others have been inspired by the ingenuity and complexity of his close verbal analyses (Ricks 2000), though for Empson that alone is insufficient unless embedded in historical, biographical, and sociocultural contexts of meaning.

Énoncé/Énonciation

DOTTY DYE

The French term “*l’énoncé*” (often referred to as an “utterance” or “statement” in

English) is a linguistic object – the words spoken or written through an act of “*énonciation*.” It operates on a narrative level and can be thought of as the thing being expressed, the content of communication. In speaking, the *énoncé* is limited either by a pause or by the intervention of another speaker, while in writing it is limited by the parameters of the text or work in question. The French term *énonciation* (enunciation in English) designates the written or verbal act or site of communication. In other words, the *énonciation* acts on a discursive level and consists of the *énoncé* in a particular context and by a particular subject (speaker or writer). Study of the *énonciation* permits consideration of the subjectivity of discourse, the markers of which – personal pronouns such as *I, you*, and adverbs such as *here, now, later* – are rendered meaningless without the specific spatial and temporal context that the *énonciation* provides.

The two terms are interdependent, as is evident by their definitions – one cannot be fully defined without some reference to the other – and their function: acts of *énonciation* produce an *énoncé* and the *énoncé* does not exist without an act of *énonciation*. This interdependence is of particular interest in a number of fields of study including linguistics, semiotics, semantics, psychoanalysis, sociology, and narratology. They were introduced in the structuralist linguistic of Ferdinand de Saussure, who analyzed the laws and traits of language as a system (*langue*) in which individual acts of speech (*parole*) came into existence. The distinction between *énoncé/énonciation*, according to Stephen Heath, “rejoins and displaces that between *langue/parole*; every *énoncé* is a piece of *parole*; consideration of *énonciation* involves not only the social and psychological (i.e., non-linguistic) context of *énoncés*, but also features of *langue* itself” (1977: 8).

The analysis of the *énonciation*, however, exceeds the limits of a solitary phrase, which are the units studied by Saussure. The French linguist Émile Benveniste was the first to clearly explain the difference between the two terms and to underline the importance of *énonciation* in discourse studies. He claimed that before the *énonciation*, language is only a possibility of language and that the *énoncé*, the reality of the language, is only presented within the context of a discourse: the speaker/writer announces his or her position as speaker/writer and the language is used to present a particular perspective and temporal position in the world, because the speaker/writer determines the verb tense for the expression of the *énoncé*. Benveniste proposed the terms “story” (*histoire*) and “discourse” (*discours*) to distinguish between two modes of *énonciation*. Story corresponds primarily to third-person *énonciations* and discourse to first- and second-person *énonciations* which more clearly indicate the presence of the narrator. In literary analysis, this distinction, in concert with theories of narratology, enables a poststructural analysis of language – in literature, philosophy, theater, film, and other cultural texts – that foregrounds the layered quality of representation.

The distinction and terminology are especially important in performance and gender studies, where the analysis of the *énonciation*, as opposed to the statement in and of itself, requires looking at the context – at the act of *saying*, in which a variety of factors (who/where/how) affect the meaning. The psychoanalyst Jacques Lacan used the distinction between the subject and the object positions implicit in the terms to explore condition of subjectivity in the context of what he called “the Symbolic Order,” the realm of law and discourse in which one’s claim to be a subject is both understood and confirmed. It is the context of the *énonciation* that determines the way

that the *énoncé* will affect the speaker's and the listener's subject position. Thus to speak to others is to exercise agency, to act upon them and thereby determine their subjectivity.

The linguist and semiotician A. J. Greimas, in his study of the relation between *énonciation* and *énoncé*, explores the complexities of signification and communication in systems of meaning, specifically how the context surrounding the *énonciation* is able to separate the *énoncé* – what is actually said – from its meaning (Schleifer 1987: 165). Generally speaking, structuralists tended to privilege the *énoncé*, but poststructuralists like Julia Kristeva emphasized context and modality (*énonciation*). Her semiotics challenged this hierarchy by demonstrating how the body itself can be both *énoncé* – the message itself – and *énonciation* – the site of communication. This view disrupts the binary and hierarchical view of the terms favored by the structuralists because the body is not either one or the other but both at the same moment.

One of the most far-reaching implications of the critique of the relation between *énoncé* and *énonciation* has to do with the function of authorship. In “The death of the author,” Roland Barthes argues that “linguistics has recently provided the destruction of the Author with a valuable analytical tool by showing that the whole of the enunciation is an empty process, functioning perfectly without there being any need for it to be filled with the person of the interlocutors” (1977[1968]: 145). Umberto Eco's experimental fictions and semiotic theory are marked by the idea of the fictional reader wherein the reader is incorporated into the act of the enunciation, a phenomenon he categorizes in *The Name of the Rose* as “irony, metalinguistic play, enunciation squared” (Eco 1983: 531). This

quote sums up Eco's idea of the postmodern mentality and demonstrates the ground that the two terms and the theories surrounding them have covered.

Indeed the distinction between *énoncé* and *énonciation*, by opening up the way to Benveniste's distinction between story and discourse, permitted poststructuralists to challenge structuralist ideas of signification and to extend this challenge into analyses of various types of narration, including film and literary studies, and to establish narratology as an important element in literary and cultural theory.

F

Fabula/Sjuzhet

PETRE PETROV

The conceptually related terms *fabula* and *sjuzhet*, rendered into English approximately as “story” and “plot,” were elaborated by the Russian formalists within their overall theory of narrative prose. In formalist usage, the two terms acquire a significance markedly different from that of their English equivalents, as well as from their traditional meaning in Russian. Thus *sjuzhet* is best understood as plot construction (or emplotment), viewed formally, while *fabula* should be grasped as the sequence of events making up a story (or storyline), but viewed outside the artistic process of narration. The distinction between the two allowed the formalist theoreticians to make significant headway in grasping the workings of form in literary fiction. More specifically, it provided them with the conceptual means for bringing the essential topics of “deformation,” “perceptibility,” and “defamiliarization” outside the initial sphere of poetic language and extending their applicability to the narrative genres of literature. The differentiation between storyline and the manner of its emplotment has had foundational importance for the discipline of narratology. Influential Western theories have relied on analogous dichotomies to analyze

the structure of fictional texts: *histoire* vs. *recit* (Gérard Genette), “story” vs. “discourse” (Seymour Chatman), “fabula” vs. “story” (Mieke Bal) and so on. The isolation of these two aspects has enabled, on the one hand, the exploration of the narrative structures that underlie the endlessly varied stories we tell; on the other hand, it has furthered inquiry into the different modalities of narrative presentation (order, point view, voice, mood, and so on).

Both *fabula* and *sjuzhet* existed in the Russian language before the formalists appeared on the scene in the mid-1910s and began using them for their particular purposes. They had not been a part of a rigorous terminological apparatus, which means that their semantics lacked the methodological precision with which the formalists eventually infused them. In fact, in casual use the two words were often interchangeable. Of the two, *sjuzhet* had a higher frequency of usage. Like its French equivalent, *sujet*, it referred either to a particular concatenation of happenings that make up a particular story, or, generally, to “storyline” as such. Harking back to Aristotle’s use of the term in the *Poetics*, *fabula* had a more specialized application, but it too referred to the events related in a piece of narrative fiction. Both were thematic concepts. They aimed at the

content of narrative, *what* storytelling told, not *how* it told it. The shift the formalists introduced has mostly to do with the fact that they turned *sjuzhet* into a formal concept, one that related more to the “how” than to the “what” of narration.

An eminent predecessor of the formalist movement in Russia, the folklorist Aleksandr Veselovsky had used the term *sjuzhet* in his comparative analysis of tales from various ethnic traditions. According to him, each tale could be broken down to its constitutive elements, which he called “motifs.” These were the smallest narrative units, the elemental building blocks for the greater sequences of storytelling. Some motifs, Veselovsky noted, were typical and widespread: they entered storylines from most diverse places and times. Sometimes an entire series of motifs was repeated, which produced a recognizable and stable *sjuzhet*. This was the point of departure for Viktor Shklovsky, one of the leaders of the emerging formalist movement, when he began theorizing the artistic peculiarities of narrative fiction. He too was fascinated with the ubiquity of certain narrative lines through geographical space and historical time, but for different reasons altogether. While Veselovsky had explained this ubiquity by pointing to similarities in “primitive” psychologies, customs, and rituals, Shklovsky saw it as a consequence of the universal laws of art. To his mind, what connected the distant cultures in which identical plots appeared were not similar ways of life and thinking, but similar ways of telling stories. Consequently, the identity of a *sjuzhet*, its specificity, as well as its value for literary studies, resided not in the events comprising it, but in the way they were put together. The door was open for a reinterpretation of *sjuzhet* along purely formal lines.

Several years later, in his study of Sterne’s *Tristram Shandy*, Shklovsky first advanced

the categorical distinction between *fabula* and *sjuzhet*. After complaining of the indiscriminate use and frequent confusion of the two terms, he stipulated that the *fabula* is only the material used in the formation of the *sjuzhet* (1965[1921]). The narrative as an artistic creation, Shklovsky argued, is a product of the working-over of the *fabula* by the mechanisms of *sjuzhet*. By that time it had become customary for the formalists to view the literary work as the interaction of two antinomic factors: a formative intention, which aims at the effect of novelty or “defamiliarization,” and its opposite, the “material,” which is being molded or “tampered with” in the process. For Shklovsky, the measure of genuine artistic form, its desired effect and perceptibility, is determined by the deformation to which it subjects its material. Most of the formalists’ early research had focused on poetry, where perceptibility of the formative impulse was guaranteed by the deformation to which poetic techniques subjected the verbal material (semantically, but also syntactically). With the conceptual pair *fabula/sjuzhet*, Shklovsky could extend this line of thinking into the domain of narrative fiction.

As in poetry, where the practical, communicative aspect of language served as the background against which the workings of form became apparent, so in the formalist approach to narrative poetics there was a need for a “norm,” a kind of “zero-ground,” against which one could measure a story’s literary character and come to appreciate the artifice of its making. This is just the function that the concept of *fabula* is meant to fulfill. It represents the zero-ground of narrative construction, a neutral idiom for the rendition of events. The parallel with the different functions of language is not exact. Whereas one can easily imagine what practical language might mean, there are difficulties in envisioning something like a normative presentation of events. Boris

Tomashevsky, the formalist who explored in a most sustained fashion the question of plot construction, explained that *fabula* stands for the events of the story in the logical coherence of their temporal and causal concatenation. One wonders, however, whether Tomashevsky means the action itself, as if it were happening in real life, or its presentation. In either case, *fabula* appears to be less a primary ingredient in the making of stories, than a later extrapolation from the story as told. For, after all, in literature one deals exclusively with stories that, in one form or another, have already been told. It is only by abstraction that one could arrive at a strictly consequential progression of pure action. In formalist theory, the question of the ontological status of the *fabula* remains ambiguous.

One unambiguous feature of this theory is that the *fabula's* role is subsidiary to the much more vital role of the *sjuzhet*. For Shklovsky (1965[1921]), the latter was the premeditated deviation from the straight line of recounting action (i.e., from the *fabula*) – a consciously devious course, in which he saw the essence of narrative art. Against the line of least resistance, *sjuzhet* erects its deliberately burdened or retarded construction. Shklovsky sees this construction as made up of various narrative “devices” or “techniques” (possible translations of the Russian *priyomy*), which serve to retard, temporally scramble, or variously modulate the straight and simple succession of events. His formulations often sacrifice rigor and clarity to rhetorical sweep, leaving ample room for ambiguity. In this instance, it remains unclear whether *sjuzhet* refers simply to the agglomeration of such devices (which would be consistent with Shklovsky’s much-quoted identification of a literary work with the “sum total of stylistic devices employed in it” [quoted in Erlich 1955: 90]), or to the entire story as told, that is, to the whole narrative presen-

tation, including events, characters, and settings.

In writing about filmic narrative, another formalist theoretician, Yury Tynyanov, also gave explicit preference to *sjuzhet*. He spoke in favor of poetic cinema, which dispenses with a coherent *fabula*, relying instead on the web of *sjuzhet* linkages created in film editing. For Tynyanov, *fabula* and *sjuzhet* are interdependent interactive factors in the dynamic unity of the narrative. The former is the actual structure of the story, which we encounter immediately in the process of reading a narrative or watching a film; the latter is something that we piece together as we come to grasp the plot. The two are related dialectically, insofar as each is experienced through the other. On the one hand, we can only get to the *fabula* by first passing through and unraveling the intricacies of emplotment (*sjuzhet*). On the other hand, the aesthetic experience of the *sjuzhet* relies on our sense of the “story pure and simple”; in other words, only against the background of the *fabula* could we fully appreciate the text’s compositional movement. The tension between these two factors informs at each moment our experience of the narrative work. For Tynyanov, montage cinema makes the fullest use of this tension, while *fabula*-driven film deflates it, thus diminishing the aesthetic potential of the medium. Where Shklovsky leaves us with the impression that *fabula* and *sjuzhet* are sequentially related moments in the making of narrative fiction, Tynyanov’s conception allows us to think of them as coexisting impulses shaping the reception of the text. Because he sees the text as a dynamic system of relations between factors of various significance, he sees the storyline and its emplotment function more as integrated functions than as contrasting ordering schemes.

A different, albeit not always lucid, conceptual alignment between *fabula* and

sjuzhet is proposed by Tomashevsky in his *Theory of Literature*. Having defined the work of narrative fiction as a totality of thematic motifs, Tomashevsky proposes the following distinction: *sjuzhet* stands for the actual arrangement of motifs in the work, while *fabula* gives us those same motifs, only in their causal-temporal order. From this, we might conclude that *fabula* and *sjuzhet* are different ways of looking at the same totality of elements. But then Tomashevsky makes it clear that the two are not really commensurate – that is, they refer to different elements and thus to different kinds of totalities. He points out that the individual motifs in the text have different function and value. Some, the so-called “bound” motifs, are essential for the integrity of the story; others, the “free” ones, are not. Some are dynamic, in that they advance the action, while others are static. Only the bound motifs should be considered part of the *fabula*; the *sjuzhet*, on the other hand, includes the free motifs as well. The difference, then, does not seem to be between two different arrangements of the same component parts. Rather, it is a difference between a rich actuality (the *sjuzhet*) and an impoverished abstraction (the *fabula*).

Tomashevsky’s inquiry into the functions of narrative motifs and plot development was soon to be followed by Vladimir Propp’s groundbreaking study of fairytale narratives, *The Morphology of the Folk Tale*. Though not a member of the formalist circle, Propp was strongly influenced by them. In his methodology, the separation between *sjuzhet* and *fabula*, with all its implications, is firmly in place. But whereas the formalists wished to show the convoluted artistry of the former, Propp was attracted by the schematic regularity of the latter. Choosing a strongly *fabula*-oriented genre, the folk tale, Propp showed that its narratives can be analyzed as various arrangements of a limited number of basic

elements. These basic elements, which Propp calls “functions,” are clearly derived from Veselovsky’s stable motifs, but not without a major shift of focus: Propp has reduced the *fabula* to a pure scheme of happenings, admitting no trace of accidental content. What is left is the purely generic core of narrative events (“interdiction,” “delivery,” “complicity,” etc.). The 31 functions defined by Propp, together with the rules for their combination, comprise a kind of a grammar of *fabula* construction. Although Propp’s research relied exclusively on Russian sources, it held out the promise of nothing less than a universal narrative language. His book, rightfully considered the pioneering text of narratology, was translated into English in 1958, soon thereafter into French and Italian, and exercised formative influence on the emerging structuralist movement. In particular, it served as a point of departure for the semiotic theories of narrative developed by A. J. Greimas and Roland Barthes.

Fanon, Frantz

CHOUKI EL HAMEL

Frantz Fanon (1925–61) was one of the most influential theorists in postcolonial studies. In his short life, he combined political activism, an interest in race and race relations, and training as a psychiatrist to produce foundational works that described the psychology of colonialism as well as the politics of anticolonial resistance. His influence is hard to overestimate: his writings were central to the political struggle that sparked the Algerian war in the early 1950s, when French colonial power was challenged decisively by native Algerians, but they were also vitally important to the Black Power movement in the US in the 1960s. Fanon's message – when all else fails, violent revolution against oppression is the only option left open to colonized people – resonated at a time when European empires were, quite literally, falling apart as colonial territories fought for and achieved postcolonial independence. It is for this reason that

Henry Louis Gates regards him as “a global theorist” (1991: 457) and Edward Said calls him a “true prophetic genius” (1994: 272). However, when his work was first published, its “worldly” aspect was underscored by European intellectuals like Jean-Paul Sartre, who insisted that Fanon's work and the message it conveys was crucial for Europeans to read and acknowledge. Of Fanon's most influential work, *The Wretched of the Earth*, Sartre wrote, “Europeans, open this book, look inside. . . . Have the courage to read it, primarily because it will make you feel ashamed, and shame, as Marx said, is a revolutionary feeling” (2004 [1963]: xlviii–xlix).

Frantz Fanon was born in 1925 to a middle-class family in Fort-de-France, on the island of Martinique, which was then a French colony. His father worked in the customs service, a social ranking that allowed his son to attend the prestigious Lycée Schoelcher, where he was a student of Aimé Césaire, the Martiniquais intellectual, poet, and playwright. Fanon was greatly influenced by Césaire who, along with the Senegalese poet and cultural theorist, Léopold Senghor, pioneered the concept of *Négritude*, which had its embodiment in a movement that championed the civil and human rights of black people and the validity of black culture in all of its manifestations and that was sensitive both to local conditions and to opportunities for international and transnational solidarity.

Having left Martinique, which was, during World War II, dominated by the pro-Nazi Vichy government in occupied France, Fanon found himself in a colonial territory seething with resentment over French colonial rule. He served in Algeria in 1943 and experienced first-hand the racism of French colonialists and military toward blacks and North African troops who fought for France; however, because of the nature of French imperialism, which

regarded colonial territories as part of the national whole, they were also fighting for freedom and equality in Algeria (see Cherki 2006). The stark reality of the difference between freedom for France and oppression for Algerians – a reality found throughout the European empires – led Fanon to conclude that the “civilizing mission” promised by French colonialism was based on racism and prejudice rather than on a policy of assimilation whereby a dominated colonized group adopts the values of the dominant culture for the purpose of achieving equality and equal rights.

Unique among literary and cultural theorists, Fanon was trained as a psychiatrist, and it was this experience more than any other that lent authority to his conceptions of colonial racism and the complex conditions of colonial experience. When Fanon returned to Martinique after the war, he was determined to get involved in politics and campaigned for Aimé Césaire, who ran as a Communist candidate for a seat in the French General Assembly. In 1947, however, after the death of his father, Fanon left Martinique for France to study medicine and psychiatry in Lyon with the aid of a scholarship. While in France, he forged alliances with the philosopher and political activist Jean-Paul Sartre, who supported emigrant students from colonized countries studying in France. He also had close contact with prominent African and West Indian intellectuals, some of whom were published in *Présence Africaine* founded in Paris in 1947 by Alioune Diop. *Présence Africaine* was dedicated to the promotion of *Négritude* and the achievements of diasporic Africans throughout the world, including Edward Blyden, Marcus Garvey, and W. E. B. Du Bois.

In postwar France, Marxism and leftist revolutionary thinking had a strong influence on the French and émigré intelligent-

sia. In this environment, Fanon found a conceptual framework that reflected his own experiences and political commitments, a framework defined by the intersection of existentialism, Marxism, and psychoanalysis. Existentialism, rooted in Heidegger’s phenomenology and developed with a political orientation by Sartre, stressed personal experience, freedom of choice, responsibility, and a belief that individuals must be held accountable for the creation of a meaningful life. For Fanon, it constituted a call to action, for he believed that individuals must lay claim to their fate and engage in the creation of an egalitarian society without racism and economic inequality. Marxism offered him a way to analyze and critique the oppressive structure of colonial capitalism, while psychoanalysis, together with his training in psychiatry, enabled him to recognize how this oppression affected the psychological health of colonized peoples.

Though educated in France, and though he identified with French culture, Fanon later became ambivalent about his French identity. Though he had succeeded in achieving some social status, it did not translate into full integration into French society, in large part because he never felt accepted or appreciated as a black man. Ultimately, his experience led him to the belief that the racism deeply embedded in French society created an inferiority complex that blinded blacks to their own subordination. These experiences inspired his first book, *Peau noire, masques blancs* [*Black Skin, White Masks*], published in 1952, when he was just 27 years old. In this book, Fanon insisted on race as a primary factor for understanding the binary world of the colonizer–colonized relationship. Unlike Albert Memmi, who understood the experience of colonized peoples from a classical humanistic perspective, Fanon preferred a Marxian analytical

framework that saw the relation between the colonized and the colonizers as a psychosocial construct along the lines of the Hegelian master–slave relation. In the eyes of white culture, he argued, black culture is inferior and thus colonization becomes both necessary and desirable – an act of civilizing charity to rectify the unfortunate condition of *being black*.

Racism, as Fanon experienced it, was a betrayal of the assimilationist ideology of French colonization. Despite his education in the metropolitan capital, he realized that he was nothing more than a black colonial subject constructed to serve the ends of the white colonizers: “I resolved,” he wrote, “to assert myself as a BLACK MAN. Since the other hesitated to recognize me, there remained only one solution: to make myself known” (1994a[1952]: 115). For Fanon, to make oneself known was to remove the white mask of the so-called European norm and show one’s true face – a black face, the face of a man who would, like any other man, white or black, reject oppression, pain, and suffering. Race and the oppression associated with it intersected with a number of other important themes in Fanon’s work, including gender. Indeed, Fanon was unique in focusing on the interrelationship of race, gender, and nationalism. Unlike many writers of his time, Fanon paid special attention to women’s oppression under the traditional Algerian patriarchal structure, which was exacerbated by repressive colonial policies. In *A Dying Colonialism*, a collection of essays on the Algerian revolution published in 1959, at the height of the Algerian war, Fanon devoted two chapters to women’s issues in the colonial situation. However, despite his progressive position with respect to women’s issues, his vision was, like that of most intellectuals of his time, limited by the assumption that patriarchal social organization and heterosexuality were normative.

For example, his explanation of the use of the veil by Muslim women is guided by his awareness of multiple meanings: on the one hand, the veil signals women’s exclusion from political life; on the other hand, it served as a symbol of resistance in the struggle against colonial domination. Fanon was able to note the radical implication of women taking up “the *haik* [outer gown covering the entire body], thus affirming that it was not true that woman liberated herself at the invitation of France and of General de Gaulle” (1994b[1959]: 62). And he was eloquent in his awareness of how women suffered in the war for independence: “In Algerian society stories were told of women who in ever greater number suffered death and imprisonment in order that an independent Algeria might be born” (107–8). In the end, Fanon’s defense of women’s agency was hamstrung by his residual belief in the constraining customs and norms of patriarchy. This ambivalence is neither confronted nor analyzed critically in his work.

In 1952, after his marriage (to a white French woman, José Dublé), Fanon left France for Algeria to work as the director of Blida-Joinville Psychiatric Hospital, a city just outside Algiers), where he treated French soldiers as well as Algerian rebels. Fanon was soon outraged at the alienation and brutality suffered by Algerians under the French colonial regime. In protest, he resigned his position as director and asserted, in his letter of resignation, his commitment to exposing the oppression of the Algerian people: “If psychiatry is the medical technique that aims to enable man no longer to be a stranger to his environment, I owe it to myself to affirm that the Arab, permanently an alien in his own country, lives in a state of absolute depersonalization” (1994c[1964]: 53). He then joined the National Liberation Front (FLN), the Algerian nationalist movement

that in 1954 declared a war of independence against French colonial rule. Ostracized and blacklisted by the French authorities, Fanon was forced to leave Algeria for Tunisia, where he became a prominent spokesperson for the FLN. His writings for FLN's official organ *El Moudjahid* ("resistance fighter") portrayed the struggle in Algeria as a model for anticolonial movements throughout Africa. Fanon stressed, in *A Dying Colonialism*, that independence could only be attained through violent revolution against the French colonial regime. Despite experiences elsewhere in North Africa – Morocco, for example, achieved independence through diplomatic negotiations – the Algerian war taught Fanon that violent revolution was more often than not the only effective means to achieve liberation from foreign colonial occupation. And while this aspect of Fanon's work met with criticism, his eloquence in stating the case for violence – that it was both legitimate and necessary – had a tremendous impact on anticolonial movements in the decades that followed events in Algeria.

Fanon's experiences in France and Algeria led him to see the world in a Manichean way, that is, in terms of a bitter struggle between irreconcilable opposites. His last book, *Les Damnés de la terre* [*The Wretched of the Earth*], offers a penetrating analysis of this kind of struggle: "This compartmentalized world, this world divided in two, is inhabited by different species" (2004[1963]: 5). Fanon analyzes the phenomenon of colonial violence and asserts that the period of "decolonization," in which anticolonial struggle moves toward the assertion of independence, "implies the urgent need to thoroughly challenge the colonial situation" (2). This challenge, in most cases, must be addressed by violence. Fanon believed that violent struggle against foreign occupation and oppression was a legitimate form of self-defense and thus morally justified: "violence

is a cleansing force. It rids the colonized of their inferiority complex, of their passive and despairing attitude. It emboldens them, and restores their self-confidence" (51). Despite this justification, however, his thought gained notoriety in European circles in part through the work of Hannah Arendt, who portrayed Fanon as an apologist of violence (1970).

In *The Wretched of the Earth*, Fanon is careful to emphasize that the "spontaneity" of violent revolution must be leavened by the political education of the people at the hands of intellectuals who have rejected the "national bourgeoisie" that installs itself as the heir of the colonial bourgeoisie that is on its way out. As a Marxian political analyst, he believed that newly independent African nations would duplicate the colonial style if they were governed by the *comprador* bourgeoisie (i.e., a noncapitalist clique acting in their own rather than in the national interest), arguing that such a state of political affairs would merely preserve the geopolitical status quo that paves the way for neocolonial domination by economic, political, and cultural means. The nature of capitalism and the class system in Africa were different from that of industrialized Europe. The African model did not fit the classical Marxian paradigm which is why Fanon argued that the peasantry who had traditional communal claims to land should lead the social revolution rather than the Marxist model of the revolution of the landless proletariat. Fanon resented the national bourgeoisie who were simply a class of native agents educated and employed by the European colonial bourgeoisie to serve as collaborators for their mutual self-interest. For them, "nationalization signifies very precisely the transfer into indigenous hands of privileges inherited from the colonial period" (2004 [1963]: 100).

Violence may be the necessary tool for achieving liberation, but it will remain inert

and self-defeating if a strong national culture has not been developed to harness the energies it unleashes. Thus Fanon posited a three-fold process through which the nation must pass – from a period of imitation, in which the colonizer serves as norm, the colonized are tempted by projects of cultural revival and then finally there comes the decisive period of true revolution and national self-recognition, a “combat” stage, in which the colonized writer “turns into a galvanizer of the people” through a “revolutionary literature, national literature” (159). Fanon’s Marxian orientation led him away from a narrow-gauge nationalism that could lead to isolation and social regression, toward the formulation that made his work so vital to contemporary theorists of postcolonialism, transnationalism and globalization: “It is at the heart of national consciousness that international consciousness establishes itself and thrives” (180). For Edward Said, one of Fanon’s heirs in postcolonial studies, there is another important stake in the struggle, for “unless national consciousness at its moment of success was somehow changed into social consciousness, the future would hold not liberation but an extension of imperialism” (Said 1994: 267).

The Wretched of the Earth has been widely influential among anticolonial activists around the world, especially among African nationalists and writers like Steve Biko of South Africa, Ngugi wa Thiong’o of Kenya, and among intellectuals and activists in the United States, including Malcolm X. Fanon was a strong intellectual presence in the Black Power movement, the Black Panther Party, and the Student Nonviolent Coordinating Committee (SNCC). His experience with racism, specifically with the colonialist ideology of racial difference, provided the foundation for a good deal of postcolonial theory in the 1970s and ’80s. He was a foundational influence on Edward Said and Homi Bhabha, early theorists of postcolonial studies, and

continues to play a strong role in the work of younger theorists whose interests lie in analyzing the intersection of race, colonialism, violence, and anticolonial struggle.

Fanon died, after a battle against leukemia, in Washington, DC, on December 6, 1961, about seven months before Algeria proclaimed its independence. He is buried in the cemetery of Chouhadas (“war martyrs”) in Algeria. Although the issues and problems that Fanon analyzed belonged to a particular historical moment, they remain with us in new forms of neocolonial domination, including the policies of international agencies like the World Bank and the International Monetary Fund, the economic interests of multinational corporations, and the hegemony of Western entertainment media. Moreover, the pressing problems faced by immigrants of former colonies residing in Europe suffer through the same experiences of alienation and oppression that Fanon diagnosed in the colonial situation. One of the most enduring lessons that Fanon has taught is that the struggle for equality and economic justice are grounded in racial oppression and colonial violence, and that the postcolonial era is no more free of them than it is of the fundamental architecture of power that led to colonization in the first place.

Form

PETRE PETROV

The concept of literary or artistic form has been evoked in a bewildering number of contexts, prominently in the works of Russian formalists. The name of this critical movement is a sufficient indication that “form” occupies a central place on its agenda. Yet this centrality is not tantamount to a single or unambiguous understanding on the part of the Russian formalists as to the nature of literary form. In fact, they often avoided providing any definitive meaning of the term, preferring terminology less burdened with prior significations and thus less susceptible to ambiguity. The formalist notion of form developed not so much as the result of explicit definitions, but as the corollary of concrete attempts to grasp and analyze the elusive artistic nature of texts. This, more than anything else, was the pursuit that shaped and distinguished the formalist movement. One of its members, Boris Eikhenbaum (1965 [1925]), noted that the question of form eventually became synonymous with the question of literature, of what constitutes a “literary fact.” As the movement evolved, the formalists’ understanding of what makes literature a distinct and special realm of human practice developed new levels of complexity, as did the conception of literary form.

At the inception of the movement, 1916–20, “form” was, first and foremost, the banner under which the formalists set out to liberate literature from everything they considered extraneous to it: authorial self-expression, didactic suggestion, ideological or social commentary, psychological analysis – essentially all of the text’s possible referents and contexts. The separation of sign from referent had been theoretically established in the philosophical writings of Edmund Husserl; it was also a pivotal point in the linguistic theory of Ferdinand

de Saussure. These two thinkers, in two different ways, had argued that linguistic expressions (spoken or written) relate directly to meanings, not to things. As a consequence, language appeared as a self-sustaining realm in which expressions and meanings, “signifiers” and “signifieds” (Saussure), entered into meaningful relations without needing the support of extralinguistic reality. The Russian formalists, who were influenced by both Husserl and Saussure, made the “liberation of the sign from the object” (Jakobson 1987 [1935]) the foundation of their theoretical work. Together with the Russian futurists, they advocated the self-sufficiency of the artistic Word, its independence in relation to extraliterary reality. Literary signs, the formalists held, are only apparently aimed at a world “out there.” Since they are, inevitably, tools of human communication, they cannot help but represent something. But this is only a subsidiary role. Their primary function within literature is autoreferential: they draw attention to themselves, to their own expressive form.

This notion of form, relying as it does on an opposition to the content of expressions, passes easily to the level of perception. Since in our everyday speech we mostly aim at *what* our expressions say, and not so much at *how* it is said, the form of our discourse fades into the background. But literature, the formalists argued, inverts the priorities of pragmatic communication. It is a kind of discourse where the *how* becomes prominent and palpable; it makes form as such perceptible. This line of thought is expressed most fully in the early writings of Viktor Shklovsky, in which form figures as an almost tactile property of the literary artifact. In an influential essay of 1917, the young Shklovsky described artistic activity as a force that resists and reverses the effects of automatization, which follow from the

habitual and pragmatic intercourse with things, as well as from the sheer passage of time (1990a[1917]). Where time and experience blunt our perception, art intervenes in order to revitalize it. It gives us objects – the artistic works themselves – shaped in such a way that we become aware of the shaping work itself. One could almost visualize what Shklovsky meant by form as a rough surface that impedes the movement of perception, not letting it glide over the object. In this sense, form correlates with the term *faktura* (“texture”), which in formalist usage refers to the material structure of the aesthetic artifact, its characteristic “density.” But Shklovsky’s text allows another interpretation as well: apart from being the quality or effect manifest in the products of artistic activity, form may be grasped as being itself an activity, a movement through which art is reborn in ever-new instances.

Akin to this second, more dynamic conception are those formalist pronouncements that equate form with the act of deformation. Thus Shklovsky declared that a new artistic form emerges as a transgression of an earlier norm (1990b[1919]), while Jakobson famously characterized poetic form as organized violence committed against language (1978[1923]). In both these statements, “form” is something that becomes manifest in the distorting effects it has on its pliable counterpart (i.e., a norm). Whether this counterpart happens to be an earlier aesthetic tradition, which has become exhausted and automatized or, as in Jakobson’s case for poetry, the language of everyday communication, it serves as a necessary precondition or background for the perceptibility of formal manipulation.

Within the literary work, everything that is not “form” is given the name “material.” In order to eschew the old duality of form and content, where one could be understood to be a sort of a wrapper for the other,

the formalists insisted that the concept of material is organically fused with its opposite. Initially they understood material as referring to the semantic elements in the work that provided the necessary support for the execution of the intended formal twist. Since these elements owed their place in the text to the exigencies of form, they had to be considered as formal elements, not as extraneous matter. For the formalists, material was an aspect of form.

However, the question of what should count as material and what as form in each given text turned out to be a difficult one. It seems that Shklovsky, at least initially, had hoped to define the two aspects as determinate and immanent to the work. In narrative fiction, for example, he isolated the thematic element of the *fabula* (the story's events in their actual sequence and causal logic) and opposed it to the formal construct of the *sjuzhet* (the story as told in the text). The former could be seen as the "material" manipulated by the latter (Shklovsky 1965[1921]). But such simple dualities as *fabula* vs. *sjuzhet* or poetic vs. practical language were bound to prove reductive. Obviously, formal innovations in poetry did not spring solely from opposition to quotidian speech, just as such innovations in fiction were not necessarily and always rebellions against factual narration. From quite early on, the formalists were aware that new artistic devices acquired their significance from opposition to pre-existent paradigms that had become worn out. In other words, what the emergent formal paradigm "deformed" was not semantics or language in general, but another formal paradigm. This called for a dialectical approach to the nature of both form and material.

A more sophisticated model of the text emerged in formalist writings beginning in the second half of the 1920s. The literary work was seen as a whole composed in the

interaction of multiple constitutive factors, each fulfilling a particular function within a unified formal design. In poetry, for example, one could distinguish factors such as rhyme, rhythmical pattern, sound instrumentation, phrasing and syntax, semantics, lexical style, and so on. Comparing different poetic texts, especially if they are from contrasting formal traditions, shows a difference in the way these factors are balanced. The relative value of one element vis-à-vis the others is different in each case. In this peculiar internal balance lies the distinctive character of a given literary text, style, genre, or school. Yury Tynyanov explained that the interaction of components within the formal construction of the text should not be imagined as a peaceful and equal coexistence, but as a dynamic of dominance and subjugation. In his concept of dynamic form, one component or group of components is promoted over the rest in accordance with the ruling constructive principle and appears as the embodiment of the text's formal "gesture." In relation to this dominant element (termed, fittingly, the "dominanta"), the other constructive moments of the text function as a prerequisite background; their subjugation enables the "showcasing" of the one featured element. Tynyanov too uses the term "material" to designate the subsidiary, aesthetically neutral factors in the text (2000 [1924]), but he makes it clear that their meanings are situation-specific: each element of verbal art can be stylistically foregrounded or demoted depending on the particular construction in which it is featured and on the underlying principle of that construction. For each literary text the analyst must establish anew the provenance of what constitutes form (i.e., the region that is formally activated and that comes to count as the "dominanta") and what constitutes material, as well as the specific ways in which each is what the other is not.

For Tynyanov form is not primarily a fact encountered in subjective perception. Even less is it some semi-mystical movement that restores to worldly things their eroded density and texture. It is, first and foremost, the result of objective dynamism: textual elements interact within a dynamic ensemble to produce a particular aesthetic effect; the text as a whole interacts with other works, past and present, in relation to which it stakes its claim to aesthetic significance. Being itself a system (of elements and linkages), the text exists as an element of a greater dynamic system: the literary tradition (Tynyanov 1971[1927]). These two levels are inextricably related: without the broader context of literary history, we would strive in vain to determine what makes this or that work formally distinct. The mere words on the page are incapable of deciding this. Only in relation to the work's relevant context can we understand why a certain formal feature is promoted and come to appreciate the corresponding effect. This is tantamount to saying that form is not something that belongs or inheres in the literary artifact. It is a relational category, a function of intratextual and intertextual linkages. Form is thus "in" and "beyond" the text.

Such a view represents a radical departure from traditional aesthetics in which form was related to the author's creative vision and shaping touch. For the formalist, if a work exhibits a distinct shape or character, this is due not to the genius or the special craftsmanship of its maker, but to its objective place in the literary system of its time and in the process of literary evolution. To capture this idea, the formalists made use of the term *ustanovka* ("set" or "orientation"), which allows one to think of the literary text and its formal characteristics as "intended" without having recourse to the author and his or her supposed intentions. Translated descriptively, *usta-*

novka is the specific manner in which a work addresses itself to a specific historical context. It does this not by dint of the author's subjective designs, but objectively, through its own structure, which is always a response to a literary but also to an extra-literary environment. For Tynyanov, asking about the text's *ustanovka* implies asking about its function in the general cultural life of its time (in fact he used the term interchangeably with "function").

From a directly intuited characteristic of the aesthetic object, form had come to be perceived as a highly mediated concept, touching on a broad range of considerations. As the question of what makes a text "literary," or formally salient, grew more complex, the usefulness of the term "form" grew more suspect. With time, the formalists' general meditations on the nature and impact of form branched out into a series of specific questions about the internal organization of the literary text and the structural dynamics of the literary field. To address these questions, concepts such as *dominanta*, *ustanovka*, "function," "system," "construction," and "constructive principle," proved more useful than the broad category of form.

Formalism

PETRE PETROV

Formalism, despite being hampered by historical circumstances, was of paramount importance to the intellectual life of early twentieth-century Russia, Europe, and North America. Its influence on the humanities, particularly the study of literature, is largely owing to the originality and variety of formalist conceptions and the rigor of formalist methods. Formalism developed, especially in the West, on a double path: a theory about language and a methodology for reading texts.

Born on the eve of the October Revolution (1917), the formalist movement was in existence for a mere decade and a half before being forcefully extinguished around 1930, during Stalin's "cultural revolution" (1928–32). In this relatively short period, marked by social upheaval and violent dislocations in all spheres of Russian life, the formalists laid the foundations for a rigorous and systematic study of literature and elaborated a rich conceptual apparatus that would make such an endeavor possible. To them belongs the distinction of being the first to define and explore the sphere of literary phenomena as an autonomous domain with laws and regularities peculiar to it alone. In their work, the formalists drew on significant developments in philosophy, linguistics, and aesthetic criticism during the first two decades of the century. Two especially strong influences on them were the phenomenological ideas of Edmund Husserl and the linguistic theories of Ferdinand de Saussure. The formalists' own theoretical writings show marked kinship with the roughly contemporary work of the American new critics, while also anticipating some of the principal positions of literary structuralism. The connection to structuralism is demonstrable also in the "Prague School" of the 1930s, whose genetic tie with Russian formalism is indisputable, and whose contributions to aesthetic and literary theory bear an unmistakable structuralist stamp. In Russia, the narrative morphology developed by Vladimir Propp manifests most clearly the influence of formalist ideas and procedures. Although more ambivalently, such influence is evidenced also in the theoretical writings of M. M. Bakhtin and his school.

The principal figures associated with the group label "formalist" are scholars born in the 10-year period between 1886 and 1896: the literary critics Viktor Shklovsky, Boris Eikhenbaum, Yuri Tynyanov, and Boris

Tomashevsky, and the linguists Lev Iakubinsky, Grigory Vinokur, and Roman Jakobson, although the latter's work carried on far beyond the scope of the formalists' original interests and research. The literary historians Viktor Zhirmunsky and Viktor Vinogradov, also born in this period, gravitated toward the movement, although never fully identified with some of its more radical positions. The name of Osip Brik deserves mention less for his scholarly input than for the role he played as organizer and propagandist of formalist views.

A characteristic feature of formalism was the movement's strong connection with the contemporary artistic avant-garde in Russia, and in particular, with the futurist school of poetry, whose prominent figures included Vladimir Mayakovsky, Velimir Khlebnikov, and Aleksei Kruchennych. These ties were particularly strong in the mid- to late 1910s. Some of the influential formalist statements from that time could be read as theoretical reformulations of aesthetic principles implicit in the poetic practice of the futurists. This closeness with the left avant-garde accounts for the provocative theses and generalizations, sharpened rhetoric, and iconoclastic tone found in some of the early formalist writings.

The emergence of Russian formalism is marked by a duality that is both institutional and methodological. Institutionally, the movement sprung up from the activities of two university discussion circles, one in Moscow and one in St. Petersburg, whose members were students and scholars in their late teens or early twenties. At Moscow University, a group including Jakobson, Vinokur, and the folklorist Petr Bogatyrev, calling itself the Moscow Linguistic Circle, began meeting in 1915. A year later and independently of the Muscovites, the group *Opojaz* (the Russian acronym for "Society for the Study of Poetic Language") was

formed at Petersburg University under the leadership of Shklovsky. The two places corresponded (albeit, not fully or unconditionally) to two general orientations which would remain distinct through the late years of formalism. The members of the Moscow circle, as its name indicates, were more interested in linguistic problems. *Opojaz*, more varied in character, did not shun linguistic inquiries, yet tended to utilize the study of language for solving problems of literary theory and analysis.

What made the Moscow Linguistic Circle and *Opojaz* similar, and eventually drew them together into a common orbit, was the dissatisfaction of their members with the current state of scholarship in the two disciplines: linguistics and literary studies. In the mid-1910s, the former was still dominated by a tradition concerned primarily with the derivation and historical mutation of forms; while the latter was bogged down in eclecticism that could feature, at any given time, biographical excursions, psychological portraiture, socio-ideological criticism, and aesthetic impressionism. Leaving behind the questions of genesis, young linguists like Jakobson and Vinokur turned toward a functionalist understanding of language, which foregrounded its uses for concrete purposes and in determinate communicative situations. At the same time, their colleagues, like Shklovsky and Eikhenbaum, were searching for a way to eliminate what they saw as the generality and arbitrariness in the inherited approaches to literature by focusing closely on the text at hand and blocking off the distracting perspectives of history, psychology, and ideology. The two pursuits proved to be complementary. The linguists' interest in the functions of language drew them to literature, and especially to poetry, as a special linguistic "act," a distinct and unique kind of verbal performance. The literary scholars, on the other hand, cutting

out the diverse external facts and contexts of the literary artifact, narrowed their focus to what was left after the excision: to the material medium of literature, that is, to language (*langue*).

The question on which the two strands of formalist thought converged almost from the very start, the question that essentially defined the early history of the movement, was the general one concerning the specificity of literature. Albeit for different reasons and coming from different directions, both linguists and literary theorists were compelled to ask: What is literature? What constitutes its uniqueness, its special mode of being? In an article of 1917, considered the virtual manifesto of Russian formalism, Shklovsky proposed that the specificity of art, in general, and literature, in particular, consists in its effect on perception, in its ability to renew and revitalize the way we apprehend the world. This effect Shklovsky called “defamiliarization.” Opposing the inert force of everyday life, which blunts our feel for things, “habitualizes” our surroundings and the objects populating them, there stands art with its ability to “make strange.” This it achieves through specific techniques or devices that impede our perception, thus forcing us to linger over the canvas or page. Shklovsky concluded the article by making an example of poetry. He argued that in comparison with the practical uses of language, poetry clearly exhibits the tendency to make our contact with the written word difficult. Consequently, he characterized poetic language as an “attenuated, tortuous” idiom, as speech consciously constructed for the purpose of drawing attention to the very fabric of expression. In an earlier, more technical study, Iakubinsky had demonstrated the intentionally “rough” texture of poetic language and argued for a clear demarcation between practical and poetic speech – a pivotal distinction in early formalist theory.

The departure from prevailing views on literature that Shklovsky’s article announced was radical indeed. It debunked a tradition that associated literary craft with a special kind of *thinking*; it heralded a tradition of asking about literature as a special kind of *speaking*. While predecessors had considered its distinguishing elements to be *images* and *ideas*, the formalist found them in what they called “devices of artistic construction.” What traditionalists had seen as a tool of cognition, the formalists saw as a tool whose sole function was to point to its own making.

Understood this way, literature promised, at last, to offer itself as a legitimate object of systematic scholarship. Its specific character called for an equally specific discipline of knowledge, for a literary “science” distinct from neighboring fields, including philosophy, history, sociology, psychology, and the history of ideas. The goal of this discipline was to study the very devices that distinguish artistic writing from all other modes of discourse. Such, in fact, was the initial program of the formalists, who very much saw themselves as the avant-garde of the emerging science of the literary. Jakobson (1973[1921]) summarized their mission by stating that he and his colleagues should devote themselves fully to the study of the device, make it their “only hero.” In the same place, he asserted that the object proper of their analytical attention should be not even literature per se, but “literariness,” that is, the function or quality that make a text artistic. And indeed, the many formalist studies published in the period 1916–21 can be seen as so many attempts to analyze concrete examples of the literariness of literature. This was done usually by demonstrating how a set of formal techniques acts on the verbal material to deform it and thus distance it from a normative background: either that of everyday language, or that of a prevailing aesthetic tradition

that has become, as Shklovsky put it, “automatized.” Special emphasis was invariably placed on this moment of differentiation from the typical or the mundane. Some years later, Tynyanov (1971[1927]) reformulated Jakobson’s insight by explaining that the special property of literature, that which made it “literary,” is nothing other than its “differential function,” that is, its relation in a particular moment to existing literary and extraliterary norms.

Although they at times rejected the label “formalist” – coined not by them but by largely unsympathetic colleagues – the formalists never denied the salient place that the notion of form had in their theoretical work. From early on, they distanced themselves from the traditional and trite opposition of form and content. Although in early formalist writings explicit definitions are scarce and usages not always consistent, formalist discourse eventually cohered into a theoretical field and formalists themselves reached a common understanding that paired “form” not with “content” but with the concept of “material.” Whereas content may suggest a heterogeneous substance externally and mechanically opposed to a second substance called “form,” “material” intimated something absorbed in the formative process, and thus integral to it. Because the artistic work of deformation needs something to deform, this “something,” that is, the “material,” is itself a formal factor. Its presence is indispensable for the attainment of the effect proper to art. According to Tynyanov (2000[1924]), material is simply a functionally degraded and neutralized form.

A particular recasting of the coupling form/material could be found in the pairing of “device” and “motivation,” first introduced by Shklovsky (1965[1921]). While the deployment of devices always has priority in literary craft, it is rarely unmediated. It needs to be corroborated by other

elements in the work. Typically, for a particular formal figure to be executed, it must be first enabled by an appropriate context that makes its execution justified. This enabling context is what Shklovsky calls “motivation.” In a much-quoted example, he speaks of Don Quixote as merely a motivating factor in the plot of Cervantes’s novel (1990b[1921]). Here the main “device” to be deployed is the gathering of various stories, told by different characters, into a single text. The figure of Don Quixote, traveling across the geographical and social landscape of Spain, is what enables Cervantes to string these stories together on a common thread. It is the motivation of his device. In those instances when motivation is deliberately subverted (i.e., when it is shown for what it really is – an excuse for formal play), we have the “laying bare of the device” – a most cherished moment for the formalists. In works whose entire organization is aimed at laying bare the underlying formal procedures, literature appeared to be conscious of itself as artifice, of its literariness.

While poetry, with its highly crafted idiom, was understandably privileged in the formalists’ early search for the distinctive properties of literature, they were well aware of the significance of a formalist analysis of prose texts. It was necessary to show how prose too qualifies as an artistic discourse, or formalism was bound to appear embarrassingly lopsided. Shklovsky (1990c[1919]) was again the one to lead the way. He undertook to show that the principle of impeded form is applicable to works of fiction no less than to those of poetry. For in fiction too, he maintained, one can speak of the deployment of devices for the purpose of “making it strange.” He even stated that the principles of plot construction are analogous to those of sound instrumentation in verse. Something like a rhythmic organization was discernible in prose as well, only the

means for implementing it were different. One could formulate the parallelism of poetry and prose within the general definition of literature as follows: whereas the goal of poetry is to make perceptible its own verbal construction, the purpose of narrative fiction, typically, is to make perceptible its own plot construction, how the story is made.

What went into the making of plot were, once again devices, all in essence aimed at breaking or twisting the smooth flow of the story. The soul of plot construction, maintained Shklovsky (1990c[1919]), its master device, was something he called “staircase construction”: the advancement of the story not by a straight line, but along a roundabout course on which gradation becomes possible through repetition. He gave examples from folklore – songs, tales, epics – to show how the introduction of new information in a subsequent line or textual segment is dependent on the repetition of elements from the preceding segment. In a bold generalizing sweep characteristic of his theorizing manner, Shklovsky asserted the absolute primacy of this formal jagged movement over the content carried by it. The latter – whatever the story was “about” – was seen as hardly more than a “filler,” called forth in order to enable, or “motivate,” the execution of the movement.

The duality of deformed material and deforming technique – so essential in the formalist vision of the literary text – was reproduced in the domain of narrative fiction in the opposition of *fabula* and *sjuzhet*,” translated roughly as “story” and “plot.” *Fabula* is the story “told straight,” that is, in the proper temporality and succession of its events. *Sjuzhet*, on the other hand, is this same story, not as it might have happened in real life, but in its literary presentation: with all the twist and turns, retardations, interpolations, temporal jumps and cuts introduced in the process of artistic exposition. In other words, *fabula* is the inert, unorgan-

ized, aesthetically indifferent material of storytelling, while *sjuzhet* is what storytelling does to this raw substance as it subjects it to the peculiar laws of fictional narration, purposefully “constructing” it, which means also “deforming” it.

The formalists made another major contribution to the theory of prose by elaborating the concept of *skaz*. Impossible to translate with a single English word, *skaz* in the language of the formalists stands for a style of literary narration that strives to approximate the characteristics of oral delivery. For it to qualify as *skaz*, the narration must be appreciably distanced from literary speech, that is, it must be evocative of dialect, particular jargon or lower-class speech. In an influential study of Gogol’s story “The Overcoat,” Eikhensbaum (1974 [1918]) demonstrated how the techniques of *skaz* dominate and determine the thematic unfolding of the story. The formalists’ partiality to this aspect of prose is easy to understand: with *skaz*, they had the invaluable opportunity to make a point that was usually reserved for the analysis of verse: the pre-eminence of language as such, the exposing of its articulatory motions at the expense of semantics. *Skaz* is a type of narration that points to its own production: the intonation, linguistic patterns, and verbal peculiarities of the fictional storyteller.

A chronology of the formalist movement would traditionally distinguish a second phase in its development beginning around 1921 – the first relatively peaceful year after the ravages of the Revolution and the Civil War. A characteristic feature of this more mature period is said to be a marked historical turn in formalist thought: the increasing recognition that it is not enough to analyze literary phenomena in the timeless mode of theoretical meditation or in the equally timeless confines of the minute textual analysis. This characterization should be accepted with the understanding that the

attention to history was in large measure prepared by earlier developments in formalist theorizing. It was evident, for instance, that the early notions of defamiliarization, deformation, and perceptible form would remain rather weak and one-sided if evoked solely within the limits of individual works, as effects somehow immanent to the text itself. They could acquire their full significance only if one considers a particular “background” against which the effects of novelty or deformation could stand out. In other words, one needs to step outside the single text and enter the context of works contemporary with it, or inquire about connections between it and a literary tradition evolving through time. These extratextual relations held the key to the elusive “differential quality” on which so much in the formalists’ thinking about literature was premised, but are also fundamental to the very idea of what constitutes “form.” During the 1920s, formalist studies of the literary text that showed “how it is made” gave way to ever more insistent inquiries into “how it relates.”

Consideration for the place a given literary work occupies in a historical context made it quite obvious that neither the significance nor the perceptibility of devices could be constant givens: these values changed through time, just as literary mores, sensibilities, and perceptions did. By the same token, form could not be regarded as an invariable function once and for all proprietary to the text. Rather, it had to be seen as an effect pertinent for and sustained by a particular literary environment. This background had to be factored into the study of form as an integral component. Inside the text, as it were, the question of formal construction is more complicated. In even a cursory historical overview, one sees the same formal elements, their significance differently weighted, moving from one text to another and from one tradition to the

next. Rhyme, for example, played different roles in the poetry of the eighteenth century, or in the age of Pushkin, or in the era of experimental modernist verse and the early formalist movement. In each case, this role was relative to the other elements of the poetic craft: pattern of stress, syntax, sonority, semantics and so on. The key to the distinctiveness and artistic effect of the work lay not so much in the application of some special technique to a material, but rather in the novel internal distribution of self-same aspects, in the altered weight they had relative to one another.

The notion of “dominant” was based on just such an understanding of the text’s internal construction. Borrowed from the German art historian Broder Christiansen, the notion was elaborated in studies by Eikhenbaum, Tynyanov, and Jakobson. As one factor of the literary construction receives preferential weight in relation to the rest, the other factors can be said to function as its enabling background. They are subordinated for the sake of the prominent feature, the “dominant.” Seen from the opposite perspective, one can say that in its pre-eminence the dominant organizes and unifies the other elements of the literary construction. The relationship between dominant and subjugated formal factors is, of course, analogous to the earlier one between device and material, yet carries a different conceptual accent. First, it stresses the nature of the literary work as an integral whole, a concrete totality; second, it implies the dynamic constitution of this whole: it is the active tension between different aspects of the work that hold it together as an aesthetic object.

If the value, and hence the effect, of formal techniques was relative to the other elements with which it formed an integrated unity, the same was true of the value and effect of the work as a whole. These were relative to the literary world to which the

work belonged. Just as the text constituted a system of dynamic variables, so did the “literary series,” which in formalist parlance designated, broadly, the field of literature, and more narrowly – a particular literary context (e.g., an author’s oeuvre, a tradition, a contemporary movement) relevant for the analysis at hand. Thus Tynyanov (2000[1924]) found it more prudent to speak not of “literariness,” which implies a timeless quality inherent in the text, but of “literary fact.” Like the dominant, this too is a relational category. It implies that the literary quality of a text is something that *happens*, not something that simply *is*. A text becomes a literary fact only in a specific environment, where its features correlate with the features of other significant literary phenomena. In this interaction, the text’s main formative principle can “stand out” or – in formalist terms – acquire a significant differential quality.

And still, despite their engagement with works of the past, it would be improper to say that during the 1920s formalist theory became significantly historical. The attention to historical facts and relations did not quite amount to an engagement with history *per se*. The formalists were not really interested in exploring at length the peculiarities of past traditions, even less in tracing lines of development from past to present. For them history mattered mostly insofar as it offered them a series unfolded in time, a concatenation of interrelated facts. They focused primarily on sequences that demonstrated how one literary phenomenon is engendered by another on the principle of opposition. Eikhenbaum (1972[1922]), for example, found such a sequence between the writings of the young Tolstoy and a dominant tradition of Romantic prose, and went on to show how Tolstoy’s realistic style was formed against the canonized features of the preceding school. Thus the notion of literary evolution, which gained

prominence in formalist theory from the mid-1920s, represented a sort of dialectical shuttle through time between opposing constructive principles. The main exponent of this notion, Tynyanov (1971[1927]) explained its mechanism as follows: as a given constructive principle, once fresh and ascendant, begins to wear out, the opposite principle is triggered (somehow immanently, by the very law of literary evolution); the new dominant artistic technique spreads across the contemporary literary scene, gaining as much ground as possible; with time, this second principle undergoes the same process of automatization as its predecessor, thus precipitating the next revolution in literary form, and so on.

To ask about the evolution of literary phenomena was, in Tynyanov’s mind, something principally different from asking about their genesis. The latter, an obsessive preoccupation of nineteenth-century philology, was something he wanted to leave behind. Genesis chronicled the actual inheritance and continuity of ideas and styles from one historical frame to the next, from one significant author to that author’s supposed successor. It involved the enumeration of similarities, influences, and affinities, leaving ample room for speculation and scholarly impressionism. Evolution, as Tynyanov and the formalists wanted it, was about the systemic derivation of formal features, not about the historical emergence of this or that author, or the circumstances in which this or that work was written. Much more important than genesis was the generative mechanism, the very law of succession. The law dealt with norms, functions, and relations, not with characters, ideologies, or private lives. Characteristically, Tynyanov (2000[1924]) employed the term “shift” (*smeshchenie*) in place of the traditional term “development”: “shift” emphasized both the contrastive, dialectical, nature of change and its lawful character.

One might say that in formalist thinking the very notion of historical time was subordinated to and understood through the notion of systemic alteration.

One may argue with Tynyanov's mechanized concept of literary evolution, but it is certainly consistent with the conceptual tenets of the formalist movement. Its members set out to establish an autonomous science of the literary, whose prerequisite was a likewise autonomous literary domain, sustained by its indigenous laws. They eventually arrived at a vision of literature as a system that functions autonomously, almost automatically, both through time (diachronic) and at each cross-section of the historical flow (synchronic). In both these dimensions, the self-sufficiency and self-subsistence of the literary series was guaranteed by the law of difference: the existence or emergence of each literary phenomenon was to be explained by its constitutive difference from the other phenomena comprising the series. The conceptual affinity with Saussure's groundbreaking vision of the linguistic system is unmistakable. His *langue* also represented a totality of items held together by mutual differentiation. And just as Saussure's system of linguistic signs needed no recourse to external reality – since it was built on the interior relay between words and concepts, “signifiers” and “signifieds” – so could the formalist literary system dispense with the actual referents of literature: emotions, ethical values, ideas, historical events. But the departure from Saussure was no less significant: whereas he had confined his theoretical interest to the “synchronic” aspect of language, the formalists focused on the diachrony of literary facts in the study of a system in its transformation through time.

A vision of literary history as a dynamic interplay of differences, of norms and their lawful transgressions, left very little room for the traditional figure of the author, as

well as for the very idea of authorship. To the formalists, authors appeared as executors of a role prescribed to them by the immanent principles of literary evolution. Whether they knew it or not, they were called upon to fulfill an objectively determined function. The author's subjective decision about the character and significance of the work he or she produces is not at issue here; rather, the form, in its historical movement, introduces a moment of necessity, an imperative. This is, so to speak, an objective phenomenon. The author merely responds to the imperative. Or better yet: the evolutionary mechanism “used” the author's subjectivity toward the achievement of a preset goal, immanent to the dialectic of the form. Paradoxically, it was not the author who chose expressive means; it was the expressive means that chose the author. Osip Brik took the paradox to an extreme when he declared that Pushkin's *Eugene Onegin* would have been written even if Pushkin himself had not been born.

This type of hyperbolic statement played directly into the hands of formalism's detractors – a group that grew larger and more vocal as the movement itself expanded and garnered prestige. By the mid-1920s, the formalists were unquestionably the main force on the literary-critical scene in the Soviet Union. Marxist criticism was not even a close second. The ruling ideology since 1917, Soviet Marxism, did not possess anything like a consistent aesthetic theory or literary doctrine. It was still primarily about the historical life of productive forces, economic relations, and their reflexes in ideology and politics. Marxist views on literature were, for the most part, derivative of general principles concerning all ideological phenomena. These general principles were so radically at odds with the formalist approach that a clash between the two schools of thought was inevitable. The major critical assault on the formalists from the Marxist

wing came in 1925 with the publication of Lev Trotsky's *Literature and Revolution*. The communist leader devoted an entire chapter of his book to exposing the fallacy of formalism: the blatant disregard for the rootedness of artistic forms in life and for everything this rootedness implied – the fabric of time- and class-specific values, psychologies, behaviors, and ideas that informs every literary text. Trotsky acknowledged the contributions of formalism to the close analysis of verse, as well as the utility of the method for literary investigations. But he assigned it only an auxiliary technical role in a comprehensive study of literature whose starting point would have to be the social and historical being of humankind.

Partly due to the external pressure of criticism, partly due to the limitation of their methods, some formalists attempted to move beyond an intrinsic, or immanent, approach to literature. By the late 1920s, they were ready to admit that the facts pertaining to their field of research intersect with and are significantly influenced by other “series” of facts. Some thinkers walked a tightrope between, on the one hand, admitting that literature is not “free of life” (as Shklovsky had asserted) and, on the other, continuing to view it as a highly specific and autonomous domain. Eikhenbaum and Tynyanov performed balancing acts of this kind, by showing that literature constantly incorporated phenomena from beyond its sphere proper: speech forms and genres formerly considered nonliterary; thus, chiefly through the medium of language, literature was in constant interaction with life. Yet the critics did not fail to stipulate that, once established as literary facts, the previously extraneous items submitted to the peculiar laws of the literary system. The latter, in Tynyanov's view, was part of a dynamic interaction with correlated systems. In their totality, these integrated

spheres represented the complex mechanism of all social life – itself a “system of systems.” As Tynyanov (1971[1927]) understood it, this totality featured integration without subordination: each system preserved its relative autonomy vis-à-vis the others within the binding whole. To the very end, the formalists were reluctant to admit an unmediated relation between socioeconomic and artistic phenomena, where the former could be said to engender or determine the latter.

The end came in the years 1929–30, a time of forceful Marxist offensive in the fields of science and culture, following Stalin's consolidation of power. In pursuit of ideological purity, adherents of the new hard line set out to expose and eliminate ideological deviations in all branches of thought. Viewed previously as the ideological opponents of Marxism, the formalists now became simply ideological enemies, whose destruction was a higher priority than the serious engagement with their arguments. The target of vituperative attacks in the press and at specially organized meetings, the formalists had little choice but to surrender. Some, like Shklovsky, wrote self-critical reflections, acknowledging the defects of their approach. Others, like Tynyanov, retreated from literary criticism. Still others, including Eikhenbaum, Tomashevsky, Zhirmunsky, and Vinogradov, adapted to the demands of the new orthodoxy and continued work as literary scholars within the Stalinist establishment. It was not long before “formalism” became the name of a heresy; for decades after the movement was no more, the name was used by pundits of socialist realism to brand those critics who had failed to pay sufficient attention to the ideational side of literature. Extinguished in the Soviet Union, formalism enjoyed an afterlife of sorts through the activities of the Prague Linguistic Circle.

Formed around Jakobson, who had left Russia for Czechoslovakia in 1920, the Circle developed some of formalism's later insights into an early brand of structuralist aesthetic theory.

Freud, Sigmund

JASON B. JONES

Sigmund Freud (1856–1939) is best known as the founder of psychoanalysis, a school of thought and a psychotherapeutic method that assumes a division in the mind between consciousness and the “unconscious,” which Freud conceived of as a realm of repressed memory, desire, and instinct.

Freud was born May 6, 1856 in Freiberg, Moravia (now Příbor, in the Czech Republic), the son of a Jewish wool merchant. The family moved to Leipzig shortly after Freud's birth, eventually settling in Vienna in 1860, where he would remain until 1938, when the Nazis allowed him passage to England. After briefly considering a career in law, the young Freud decided to pursue medicine, and entered Vienna University in 1873. Under the tutelage of Ernst von Brücke, he studied the central nervous system and qualified as a physician in 1881. In the early 1880s, Freud worked at Theodor Meynert's psychiatric clinic and studied under the French neurologist Jean-Martin Charcot at the Salpêtrière in

Paris. He began publishing his work on cocaine at this time, and by 1887 was working on hysteria, inspired in part by Charcot and Austrian physician Josef Breuer, who were using hypnotherapy. In 1895, Freud and Breuer published *Studies on Hysteria*. The following year, Freud coined the term “psychoanalysis,” and began his own self-analysis in 1897. By 1900, he had begun to develop many of the principle concepts of psychoanalysis, most of which were included in his first major work *The Interpretation of Dreams*.

Freud’s influence on twentieth- and twenty-first-century literary and cultural theory is difficult to underestimate. From the beginning, his work, particularly on childhood sexuality, was criticized by the medical establishment. But it was this very notoriety that made psychoanalysis so attractive to theorists interested in new methods for analyzing human experience. Freud himself, and many of his early followers, saw the value of psychoanalysis for literary criticism, and by the middle of the twentieth century his work was being used by a wide variety of social and cultural theorists.

Freud left behind a legacy of controversy. During his lifetime, the psychoanalytic movement endured schism after schism, as Freud’s associates – figures like Carl Jung, Alfred Adler, and Ernest Jones – defied him either by showing signs of independence or by following him too closely. Controversy began early in his career. In September 21, 1897, he wrote to his confidant, the German physician Wilhelm Fliess, disavowing his earlier theory that all neuroses arose from child sexual abuse. Instead, he now argued, neuroses emerge as defense against desire, including sexual desire for one’s parents or siblings. Many critics of Freud have found this move outrageous, for it denies the reality of child abuse (the seduction of the child by the parent) and

appears to legitimize the sexual desire of children. For such critics, mental illness and trauma do not have their origin in the individual psyche but are attributable to external causes, that is, to external forces acting on the otherwise healthy mind, much as an injury is the product of something outside the body.

Freud took an entirely different view. Given the ubiquity of neurosis, he argued, child abuse simply could not be the general cause. Moreover, because the unconscious does not distinguish between memory and fantasy, it is difficult to pinpoint with any accuracy whether a given event was real or invented. In repudiating the seduction theory, Freud made internal conflict the source of neurosis, which he understood as a defense against one’s own desire, not simply a response to external events. Repression, and the neuroses that almost inevitably follow from it, is rather like mis-translation or misinterpretation: as we grow and learn more about what it means to “love” another – and as we start to look for a partner, perhaps using our parents as a model – our feelings about earlier experiences change. It is only as adults, suffering the effects of neuroses, that we begin to interpret – or, more accurately, *mis*interpret – those early experiences. In his 1895 work *Project for a Scientific Psychology* (1953–74, 1), Freud called this temporal structure *Nachtraglichkeit* (deferred action): events that are not pathogenic at the time of their occurrence may become so later. In turning away from the seduction theory, Freud was neither turning a blind eye to his patient’s suffering nor to the reality of child abuse. Instead, he was trying to understand the complex ways the mind reacts to external reality.

Freud’s first major work, *The Interpretation of Dreams* (1953–74, 4 and 5), might easily be called one of the most important books of the twentieth century. In it, Freud

developed a system for understanding the operations of the unconscious mind. His central claim is that every dream is the fulfillment of a wish. That this is not immediately apparent is due to dream-censorship, the process by which unconscious desires are distorted or translated into forms more tolerable to the conscious mind. Working together, the analyst and patient (or analysand) treat the dream as a kind of rebus, the solution to which is the buried wish. Wish fulfillment can mean a number of things – from the fulfillment of a wish to continue sleeping to the successful, if distorted, fulfillment of an unconscious desire. The nature of the wish can only be revealed through interpretation, specifically through the process of “free association,” which requires the patient to say anything that comes to mind, without revision or judgment. However, conscious thoughts that spring from free association are only the beginning of a process in which the analysand becomes accustomed to the idea that the unconscious may be exerting some force. *The Interpretation of Dreams* is particularly fascinating on the question of dream symbolism, for in subsequent editions Freud added footnotes first defending, and then repudiating his own desire to believe in such symbols. They are culturally dependent shortcuts to meaning, he finally recognizes, rather than expressions of unconscious thought. What is most important for psychoanalysis is the interpretation of a dream within the context of an individual analysis. Along with *The Psychopathology of Everyday Life* (1953–74, 6) and *Jokes and Their Relation to the Unconscious* (1953–74, 8), *The Interpretation of Dreams* uncovers a rich world of meaning beneath the most banal activities. However, while dreams may be “the royal road” to the unconscious (1953–74, 5:608), they by no means exhaust the ways one might gain access to it.

If *The Interpretation of Dreams* emphasizes the process of making the unconscious conscious, subsequent work focused on supporting the ego in its struggle to mediate between reality and desire. We see this struggle already in Freud’s 1905 work *Three Essays on the Theory of Sexuality* (1953–74, 7), which rejects the idea that human sexuality takes one natural form. The first essay, on perversion, recounts the different ways in which sexuality can take on a nonreproductive aspect. Freud isolates four component parts: the source (the psychobiological origin of the desire), pressure (the intensity of the desire), aim (what one desires to do), and object (what one desires). Any one of these components can go astray, but variations in aim and object are particularly interesting from Freud’s point of view, because they establish quite clearly that there is nothing inevitable about heterosexual attraction. The second and third essays focus on the curious delayed onset of sexuality and argue that many of the apparently innocent pleasures of childhood (thumb sucking and the like) can be understood as “sexual,” and that the transfer of desire outside the family is a complicated endeavor. A key idea here is that every finding of an object is in fact a refinding of it. Repetition plays a key role in desire – whether one speaks of repeating the same object-choice (so-called sexual identity, for example, or even a preference for a particular “type” of man or woman) or of repeating the same intensity of satisfaction.

Some of Freud’s most influential works are case studies, the best known focusing on Dora (1953–74, 7), Little Hans and the Rat Man (1953–74, 10), Schreber (1953–74, 12), and the Wolf Man (1953–74, 17). The case studies emphasized the role of dream interpretation and free association in psychoanalytic therapy and dramatized the structure of transference (i.e., the projection onto the analyst of the patient’s repressed feelings)

and counter-transference (i.e., the projection onto the patient of the analyst's own repressed desire). However, not all of the case studies describe clinical successes. The Dora case, for instance, is basically an account of Freud's heavy-handed approach to analysis at this time, and it is hard not to read the case without concluding that Dora was right to reject her analyst's interpretations. Freud ultimately gave up a form that he increasingly found produced "useless and objectionable" distortions (1953–74, 10:156).

After about 1914, Freud preferred to write either theoretical works on aspects of psychoanalysis or reflective works that applied psychoanalytic concepts to culture (both historical and prehistorical). Sometimes he drew analogies between psychic processes and cultural works in order to elucidate the latter, as in "Creative writers and day-dreaming" (1908), which first proposes that children's play, like dreams, is a kind of wish fulfillment (the wish to be grown up), and then argues that "His Majesty the Ego" is "the hero alike of every daydream and of every story" (1953–74, 9:150). In other works, he uses cultural works or famous figures to illustrate complex psychological points, as when he studies "Leonardo da Vinci and a memory of his childhood" (1953–74, 11) in order to speculate about the origins of homosexuality, or when he speculates on so-called primitive cultures in *Totem and Taboo* (1953–74, 13), which uses evidence from anthropology, comparative religion, and psychoanalytic observation to propose a universal desire to kill the father.

A series of reflections on meta-psychology in the 1910s, along with the disappointments and traumas of World War I, led Freud to a wholesale restructuring of his theory in the early 1920s. In "On narcissism" (1914), "Instincts and their vicissitudes" (1915), "Repression" (1915), "The unconscious" (1915), and "Mourning

and melancholia" (1917) (all in 1953–74, 14), he refined the key concepts of psychoanalytic theory at the same time that he began to recognize their limitations. In particular, the theory of narcissism troubled him. While in early writings he argued that narcissism meant simply the ego taking itself as a love object, he now tended to use the term to describe a state lacking any division between psychic agencies or between the inner and outer worlds. Such "primary narcissism" became the backdrop against which the id, ego, and superego emerge. What had previously been the most typical instance of narcissism, the taking of the ego as an object, became for Freud a "secondary" manifestation of this more primary (and, in a sense, necessary) form.

The distinction between primary and secondary narcissism led to an entire reformulation of psychoanalytic theory in the 1920s, with a focus on the structural model of the mind and on the conflict between Eros (libido, the drive or instinct toward life and self-preservation) and Thanatos (the death drive). In the structural model, Freud imagines the ego as menaced on all sides: by the id's untrammelled desire, by the superego's exacting, even punishing, ideals, and by reality's stubborn refusal to conform to our wishes. The role of the ego is to use libido to mediate the demands of the id and reality. But the id is always pushing for greater and greater satisfactions, which threaten to tear the psychic system apart. Moreover, this delicate balancing act is stressful for the ego, and so there is always a temptation to lay down this burden and return to an undifferentiated primary narcissism. There is, Freud increasingly emphasizes, an ambiguity in the idea of satisfying a drive. Indeed, in *Beyond the Pleasure Principle* (1920), he argues that a drive is an "urge inherent in organic life to restore an earlier state of things which the living entity has been obliged to abandon under the

pressure of external disturbing forces"; hence, Freud can claim, counterintuitively, that "*the aim of all life is death*" (1953–74, 18:35, 38).

In reformulating his theory, Freud also took a fresh look at culture. *Group Psychology and the Analysis of the Ego* (1953–74, 18), *Civilization and Its Discontents*, and *Moses and Monotheism* (1953–74, 23) urged readers to see how civilization could facilitate, not just high ideals, but also violent and degrading behavior. In *Civilization and Its Discontents*, the watchword is *Homo homini lupus*: man is a wolf to man. In analyzing how hatred and aggression can work to facilitate group ties, and especially how the ego might find itself attracted to such passions, almost against its better judgment, Freud found himself in the uncanny position of describing, in advance, the horrors of World War II and the Holocaust.

Freud was finally recognized in the 1930s, receiving the Goethe Prize in 1932 for his contributions to German culture. The next year, however, the Nazis took control of Germany and virulent anti-Semitism spread into Austria. Freud was visited by the Gestapo, but eventually was allowed to leave Vienna, assisted by a Nazi official, Anton Sauerwald, one of whose principle responsibilities was Freud and his assets. In 1938, Freud left for London. Many of his family members died in the Holocaust, and he was himself not to live much longer in exile. He suffered from oral cancer (the result in part of a lifelong habit of cigar smoking), and died in 1939, having persuaded his doctor to administer a lethal dose of morphine.

Though much of Freud's thinking is today rejected as either speculative or unscientific, his enduring legacy is substantial. Freudian psychoanalysis remains vital today by virtue of important psychotherapeutic practices (such as free association and dream interpretation), the theory of drives, and the theory of neurotic symptoms and

concepts, such as repression, narcissism, and the unconscious. Despite the many schisms and alternative schools, and despite the fact that it no longer has a significant role in therapeutic practice, Freudian psychoanalysis remains a powerful tool of literary and cultural theory. Freud remains one of the great thinkers of the twentieth century, one who has fundamentally altered our way of looking at the human mind and its relation to the external world.

Frye, Northrop

JENNY WILLS

Northrop Frye (1912–91) is one of Canada's best-known literary theorists and is responsible for reinventing the way many scholars think about literary criticism. Frye employs the methods of archetypal criticism and genre theory, especially in his most noted work, *Anatomy of Criticism: Four Essays* (1957), in which he devises a complex, multidimensional theory of literary criticism. Known for championing literary criticism as an autonomous and valuable field of analysis, Frye's writings have influenced a number of critics, including Harold Bloom and the historian Hayden White. Like his contemporary, Joseph Campbell, Frye believed that literature functioned in archetypal fashion and that the nature and value of humanity could be understood more clearly by reading literary texts in terms of their necessary and organic connection to specific historical epochs.

Born in Sherbrooke, Quebec, Frye spent the majority of his career at Victoria College at the University of Toronto. He began teaching in 1935, and in the spring of his first year was ordained as a minister in the United Church of Canada. In 1936, he attended Merton College, Oxford, where he studied with Edmund Blunden and attended lectures by C. S. Lewis. By 1938, he had completed his Oxford degree, and returned to Victoria College. His back-

ground in the church, together with his interest in the symbolic tradition of literature championed by Lewis, provided the groundwork for his later work on archetypes in literature. His first book, *Fearful Symmetry: A Study of William Blake* (1947), draws attention to the presence of a metaphorical structure derived from the Bible and mirrored in the works of William Blake. Frye returned to Blake throughout his nearly 50-year career, particularly noting the religious and existential components in Blake's poetry, as well as Blake's enduring relevance to the twentieth century. In an oft-cited moment of *Fearful Symmetry*, Frye argues that a poet inherently writes with "one eye on his own time and another confidently winking at ours" (19), insinuating the enduring significance of archetype and myth as is evidenced in texts like John Milton's *Paradise Lost* and Blake's *Four Zoas*.

Frye's most influential text, *Anatomy of Criticism* (1957), addresses literary criticism through the practices of classical mythological and genre theories in order to construct a critical methodology wherein the chief concepts and central questions for criticism are derived entirely from the literature under analysis. Frye does not deny external contexts; his main concern is that such contexts remain external to the practice of criticism. In the "Polemical introduction," Frye distinguishes between literature and the critical study of literature, while criticizing theoretically driven literary criticism, including Marxist and Freudian approaches, for going "outside the text" to find the source of meaning. For this reason, Frye has often been considered akin (in part) to the new critics who likewise rejected extratextual influences in literary criticisms. Frye advocates a systematic approach to literary criticism, something quite different from the personal and emotional reaction that the work also produces. For

this reason, he is known for pushing the discourse of literary criticism in the direction of science. This relationship is made clear with the declaration: "Criticism seems to be badly in need of a coordinating principle, a central hypothesis which, like the theory of evolution in biology, will see the phenomena it deals with as parts of a whole" (16).

Throughout *Anatomy of Criticism*, Frye examines the roles of themes, modes, and myths in a variety of epochs, beginning with the works of Aristotle. His approach in this book allows him to generalize and categorize literary epochs and to regard the whole of Western literature in what he saw as a neatly designed pattern or chart that acceptably explained trends, traditions, and generic similarities. For example, he complicates Aristotle's argument in *Poetics* about the relationship between the comic and the tragic modes by expanding the concept of modes. In *Anatomy of Criticism*, Frye proffers a theory of modes in which a literary mode corresponds to a particular epoch: myth (classical period), romance (medieval), high mimetic (Renaissance), low mimetic (eighteenth and nineteenth centuries), and ironic (twentieth century). Frye contends that modes are based on the representations of heroes who face conflicts and tensions in their historical moment. "Fictions . . . may be classified, not morally, but by the hero's power of action, which may be greater than ours, lesser, or roughly the same" (33). While the hero may determine the nature of the fiction, the fictions are themselves caught up in a cyclical historical structure (much like that of Giambattista Vico's), in which, as Frye pointed out, the late twentieth century appears to be heading toward a new mythical era. Frye also emphasizes the significance of modes and symbols, pointing out distinct "phases" that maintain particular literary traditions: descriptive, formal, mythical, and anagogic.

Finally, Frye suggests that there are four primary genres in literature – epic, drama and lyric, fiction – that are best understood in terms of an author's relationship to the reader. "The genre is determined by the conditions established between the poet and his public" (247).

Frye's later works on imagination elaborates on his earlier systematic frameworks. His study of early literature provided archetypes through which all literature could be evaluated. In his collection of essays, *Spiritus Mundi*, he defines archetypes as "conventional myths and metaphors" (1976: 118), forms that exist primarily in the "order of words" and that provide the material for literary criticism. This attitude toward the text conveys the importance, in Frye's theory of imagination, of an archetypal framework that frees the reader from extratextual influences and enables imaginative responses to literature.

And yet Frye recognizes the codependence of intratextual and extratextual literary function, claiming in *Critical Paths*, that "criticism will always have two aspects, one turned toward the structure of literature and one turned toward the other cultural phenomena that form the social environment of literature" (1971: 25). The "path" that turns toward literature Frye terms "centripetal," while its counterpart, the path that turns toward society, is "centrifugal." Frye differentiates between the two paths on the basis of genre, citing the example of John Keats's "Ode on a Grecian urn." Frye contends that although lyric poetry is predominately centrifugal, with the reader's attention drawn to the order and movement of words, there is also a centripetal aspect drawn from visual aesthetics and historical knowledge. Nonetheless, it is through mythology that a "new poetics" can be found: the basic purpose of the centrifugal function is to move criticism away from structuralism and toward an understanding of symbol, myth and history, that

is, toward the archetype. For Frye, this is the purpose of criticism and social responsibility.

The author of 35 books, contributor to more than 60 books and 100 journals, Frye was also an accomplished editor, compiling and editing 15 books. His legacy continues through the highly pedagogical nature of his theoretical reflections. In a late essay, he makes this intention explicit: "I have been addressing myself primarily, not to other critics, but to students and a nonspecialist public, realizing that whatever new directions can come to my discipline will come from their needs and their intense if unfocused vision" (1993: 8). This statement makes clear Frye's unwavering sense of responsibility to the field of literary criticism and the importance of directing and encouraging future scholars. His call for autonomous literary criticism, a criticism that ignores the social and historical contexts and concentrates on the succession of stable modes in literary history, validates what is for him the independence and vitality of literature and literary studies.

Functions (Linguistic)

PAUL H. FRY

In his seminal essay "Linguistics and poetics" (1960), Roman Jakobson enumerated six functions for all utterances, going on to argue that the nature of any given utterance can be determined by observing which of these functions is the "dominant," or motivating feature, of the utterance. The focus of attention in that particular essay is one of these functions, the "poetic function," as it is Jakobson's task to show that linguistics and poetics must not isolate themselves from each other.

No one has disputed the argument of "Linguistics and poetics" in its essentials, although Jakobson's work as a linguist in the tradition of Ferdinand de Saussure has been largely eclipsed in many quarters by the linguistics of Noam Chomsky. The decisiveness and finality of this essay are what only a scholar as wide-ranging as Jakobson could hope to achieve. He seems to span the schools of modern literary theory because he has been a contributor to so many branches of it. An important member of the Russian formalist movement who developed, with Yury Tynyanov, a formalist approach to literary historiography in the mid- to late 1920s (which entails the concept of the "dominant"), Jakobson later joined the Prague Circle of linguists who expanded the formalist concern with poetics into every aspect of linguistics. Drawing simultaneously on Saussurean

semiotics rooted in the principle of binary opposition and the formalist notion of “device” (or “function”), Jakobson and his colleagues developed the intellectual framework for what came to be known as “structuralism.” His friendship with the anthropologist Claude Lévi-Strauss in Paris consolidated the form of structuralism that came to the United States as the first wave of French influence on academic literary studies in the early 1960s. Jakobson himself arrived to take up a position at Harvard; and while in the United States he was at once the mentor of countless scholars in linguistics and an ally – mediated by his former Prague colleague René Wellek – of the American new critics. His distinction between the metaphoric and the metonymic tendencies of verbal utterances was borrowed by the psychoanalyst Jacques Lacan, who influentially linked this pairing with what Freud called the activities of condensation and displacement in the dreamwork. And finally, despite his own apparent indifference to theoretical developments after structuralism, Jakobson is often cited by Paul de Man, Jacques Derrida, and others, yet never – a rare distinction – subjected to critique.

The purpose of “Linguistics and poetics” is twofold: first to distinguish among the six linguistic functions and then more fully to define the poetic function. In the first place, then, Jakobson says that any message has six “sets” or orientations: a set to the addresser; a set to the addressee; a set to the context (the subject matter, understood as a range of verbal reference beyond the message); a set to the code (the orientation of the message to the rules and lexicon of its language); a set to the contact (the channel of communication, such as a microphone or a book); and, finally, a set to the message itself, to the texture of its own utterance. These sets can be grasped as “functions” in the following way: the expressive; the conative (commanding or demanding); the referential;

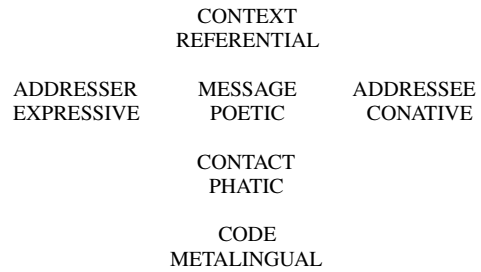

Figure 1. Jakobson’s chart of relations between linguistic functions

the metalingual (definitional, or exemplifying a type of utterance, as in “a mare is a female horse” or “the cat is on the mat”); the phatic (as with a microphone: “testing, one, two, three”); and the poetic, featuring the prominence of equivalence or parallelism in the utterance. Jakobson charts these relations as shown in Figure 1. It is not altogether clear, or in any case it is never spelled out, why three of these functions are arranged vertically, two horizontally, and one is on both axes, but in the long run it will be worth making the somewhat speculative effort to explain why.

Jakobson gives wonderful examples of utterances in which each of the six functions is “dominant” (the best is Dorothy Parker’s depiction of awkward strangers making conversation on a dinner date – “Well, here we are,” “Yes, here we are,” and so on – as an instance of the phatic function). However, it may be worthwhile to supplement his examples with an analysis of a single utterance for all six functions, each of which, once the setting is understood, may be the dominant. In proof that his breakdown works for any utterance whatsoever, the choice should be as innocuous as possible, so let us take “It is raining.” The expressive or emotional function of this utterance is “It’s raining in my heart” or “I’m singing in the rain.” The conative function, when addressed to a child, for example, is “Don’t go out without putting

on your raincoat.” The referential function is of course the dominant (“it is the case that”) when the message is spoken by a meteorologist. The phatic function comes into view when we think of Dorothy Parker’s awkward date: “It is raining (for want of anything better to say).” The metalingual function is actually rather fascinating, as it is also in other languages (“*Il pleut,*” “*Es regnet*”). If we make the message definitional or equational (as it ought in principle to be: a is b, in some sense or another), we mean to emphasize a curious mystery: “‘It’ is raining”? What, or who, is this “it” that is said to rain? Or is the definition of “it” “raining,” as the definition of “mare” is “a female horse”? The poetic function, finally, is here quite uninteresting, but it exists: the phonic equivalence of “it” “is,” and “ing,” reinforced by the eye-rhyme with the first “i” in “raining.”

To take another illustrative example, consider how difficult yet how interesting it would be to decide which function is the dominant in “The rain in Spain stays mainly in the plain,” given that five of the six functions jostle for dominance. As a musical refrain rapturously sung, this message is expressive of incipient love; Henry Higgins is meanwhile exhorting Eliza Doolittle to improve her pronunciation (conative); as a pointless expression, the message is merely the type of utterance with which one learns to pronounce (metalingual); it also is a “contact,” a pretext for this odd couple to be together, hence echoed back and forth in a parody of improving the communicative circuit, starting with Eliza’s Cockney disharmony (rine/rayin) and ending with her perfect unison (rayin/rayin); and, of course, the message fairly jingles with internal rhyme (poetic, though here again uninteresting). The only thing that is unimportant in this setting (though certainly not in most others) is the referential question whether the message is a statement of fact.

“Poetics,” as a branch of linguistics, can be seen as the study of the ways in which the set to the message becomes the dominant in the message. To begin with, Jakobson argues that the forming and uttering of sentences takes place along two axes. The vertical axis, also called the axis of selection, is the whole storehouse of the language from which the utterance is to be drawn. It is arranged (as posited first by Saussure) in clusters of binary pairs of signs exhibiting equational or oppositional relations of similarity or dissimilarity. The clustering is labyrinthine, needless to say, because these relations can be phonetic (eye/I, I/u), rhythmic (innocent/bystander; by-the-shore/cupidor), semantic (boat/ship; boat/plane), or combinations of these features (as in “I/u”); but it is still an organized and finite set of possibilities excluding deviant links. As the linguist Samuel Levin pointed out, a writer like e. e. cummings can stretch this point in saying things like “He danced his did,” but in principle “did” does not belong anywhere near options like “fandango” or “number” on Jakobson’s vertical axis, hence does not complete a well-formed utterance (Levin 1964: 311–12). The choice of signs (or “tagmemes” – signs chosen at every level of the linguistic unit from the phoneme to the phrase, not just at the level of the word) takes place for Jakobson along the horizontal axis, also called the axis of combination. When the sequence of choices is made to promote to dominance any of the other five functions, their contiguous pattern is formed with an eye to grammar primarily, with the purpose of expressing, dictating, referring, defining, or sustaining contact, and there is no pronounced evidence of similarity or dissimilarity (though there is always some, hence the ubiquity of the poetic function) in the tagmemes chosen. They are just next to each other in a fitting way; they are “contiguous,” and Jakobson calls this feature along the axis of combination “metonymic,” referring to

the trope in which one says “the throne” when one means the king sitting on it – just as in grammar one word comfortably rests adjacent to the next.

Relations on the virtual vertical axis (best drawn perhaps with a dotted line) are by contrast forms of identity and opposition, hence “metaphorical” (a is b, or a is diametrically opposed to b), emphasizing the trope of equivalence. Yet sometimes equivalence does appear in the formation of a sequence, as in the normally prosaic Jakobson’s amusing description of Poe’s raven: “the never-ending stay of the grim guest” (1960: 372). Jakobson defines the “poetic function” in a famous italicized sentence: “*The poetic function projects the principle of equivalence from the axis of selection to the axis of combination*” (358). Hence – to offer an explanation of his chart – the existence of the poetic function on both axes of his diagram, with context, code, and contact consisting of the poetic function’s resources on the vertical axis, and the actual message stretching out horizontally between addresser and addressee. By this means, he continues, “Equivalence is promoted to the constitutive device [i.e., the dominant or motivating device] of the sequence” (358). In other words, the poetic function metaphorizes the sequence, and does so by a variety of means: phonetic (rhyme, or distribution of high and low tones as in Chinese verse), rhythmic (accentual, metric), or semantic (symbolic or thematic parallelism). “Repetition in verse,” said Osip Brik, an admired former colleague of Jakobson’s – “perhaps the keenest of the Russian formalists” (Jakobson 1987: 78) – “is analogous to tautology in folklore” (quoted in Eikhenbaum 1965 [1925]: 111). In other words, the poetic function is not just the imposition of sound patterns on messages, or “phonetic isolationism,” as Jakobson calls it. It is the establishment of parallelism or equivalence

on a variety of levels. Jakobson’s sustained analysis of the poetic function that concludes his essay (not nearly as often read or anthologized as his preliminary taxonomy of the six functions) finds a number of ways of emphasizing this point. For example: “Rhyme is only a particular, condensed case of a much more general, we may even say fundamental, problem of poetry, namely *parallelism*” (1960: 377).

Semantic parallelism is not just a possible corollary of sound parallelism, it follows inevitably from it as a form of “ambiguity” (Jakobson here endorses William Empson’s *Seven Types of Ambiguity* [1930]) arising from the inhibition of a message’s metonymic, declarative flow by metaphoric features that render palpable the structure of the message itself. This leads Jakobson to see poetry, after the Russian formalists and in agreement with the new critics, as an organically indivisible complex of formal features, with no distinction possible between form and content: “poeticalness is not a supplementation of discourse with rhetorical adornment but a total re-evaluation of the discourse and of all its components whatsoever” (Jakobson 1960: 377). It is important to distinguish too, therefore (as did Aristotle), between poetry and “verse,” the mnemonic device used at various times in history to encode scientific treatises and legal systems, because in those cases aspects of sound parallelism subordinate themselves to the still-dominant referential function with no intention of re-evaluating the reference.

As to intention, the alert reader of Jakobson’s essay may notice his slight embarrassment in distinguishing between the metalingual and the poetic function, as both are equational. Poetry and metalanguage, he argues, are nonetheless “in diametrical opposition to each other: in metalanguage the sequence is used to build an equation, whereas in poetry the equation is used to build a sequence” (1960: 358).

Possibly so, the anti-intentionalist might complain, but how do you know? One might go on from there to insist that all six functions arise from inferences about intention. Here is where it is important to remember, however, that Jakobson is a linguist, and that he is trying to show what poetics can learn from linguistics. Linguists study messages against the backdrop of real settings. They listen to oral messages and find diacritical ways of transcribing the varieties of pitch and inflection that indicate the setting (or “set”) of the message. To make this point Jakobson recounts the anecdote of an actor asked by Constantin Stanislavsky at his audition to utter the expression “this evening” in 40 different ways, each expressive of a situation, from the anticipation of a tryst (this EEVening) to the anticipation of a deadline (this EVening) to the designation of a particular evening (THIS evening). Written merely as words on paper, “this evening” is always the same, but from performance it can be transcribed in 40 different ways, each expressing an intention. And so it is with the distinction between metalanguage and poetry. If one means “a mare is a female horse” to be poetry, one says it as poetry, using the equation to build the sequence.

Functions (Narrative)

DAWN SECKLER

The term “function” refers to the most basic unit of a narrative. The Russian folklorist Vladimir Propp is often credited with first using the term in his seminal work *Morphology of the Folktale* (1968[1928]). The term was later appropriated by French structuralists like Roland Barthes, Claude Bremond, Claude Lévi-Strauss, and Tzvetan Todorov, who sought to identify common narrative structures in literary discourse. Although the definition of the term differs slightly in the work of these theorists, in every instance it maintains the meaning of a narrative unit.

Employing a formalist methodology, Propp compared approximately 100 fairytales in order to isolate constant narrative elements from their variable features. Propp identified an unvarying, chronological sequence of plot events that comprise the fairytale, which allowed him to make the claim that “all fairy tales are of one type in regard to their structure” (1968[1928]: 23). Propp called these constant sequentially arranged plot components “functions.”

The variable elements of fairytales are the “*dramatis personae*” or characters.

Propp identified a total of 31 functions in the fairytale and assigned each a simple descriptive definition (e.g., “absence,” “interdiction,” “violation,” “delivery”) and a graphic designation (either a Greek or Latin letter). A series of examples from *Morphology* will illustrate the difference between the variable *dramatis personae* and the invariable functions: “1. A tsar gives an eagle to a hero. The eagle carries the hero away to another kingdom. 2. An old man gives Suchenko a horse. The horse carries Suchenko away to another kingdom. 3. A sorcerer gives Ivan a little boat. The boat takes Ivan to another kingdom” (19–20). Notice that each example is composed of the same two events occurring in an identical order. First, one character gives something to a recipient, and then the bestowed object transports the recipient away. These two events are examples of two different, but sequential functions. Respectively, they are the “receipt of a magical agent,” which is designated by the letter “F” (43) and “spatial translocation between two kingdoms,” designated by the letter “G” (50). Note that while the characters or agents of these events may change in each instance, the result of the action cannot. According to Propp a “function is understood as an act of a character, defined from the point of view of its significance or the course of the action” (21). Although fairytales are uniform from the point of view of structure – of their morphology – precisely because they contain a constant set of functions occurring in a specific order, they nonetheless exhibit diverse plots owing to their different characters, settings, and stories.

Claude Bremond adopts the concept of the function in “The logic of narrative possibilities” (1980[1966]), in which he seeks, following Propp’s lead, to establish a taxonomic classification of “narrative based on

structural characteristics” (387). However, unlike Propp, Bremond does not limit himself to the study of a particular genre. Rather, he argues that all narrative depends on a succession of events that create a structured temporal sequence. While retaining the essential defining feature of function – he continues to think of it as the “basic unit” or “narrative atom” of narrative – Bremond modifies Propp’s conception in order to incorporate the idea of process. For example, he does not attempt to identify and name each function, but instead seeks to establish the “elementary sequence” upon which all texts depend. This sequence is a combination of three functions that describe the onset of an action, its occurrence, and its completion or closing. Moreover, Bremond also differs from Propp insofar as the triadic groups of functions that comprise these sequences need not necessarily follow one another sequentially. Narrative diversity occurs because the narrator always has the choice to “actualize” a function or to leave it unfulfilled (388). Therefore, if an elementary sequence is interrupted or stopped, a new elementary structure takes over, leading the narrative action in unforeseen directions. Owing to the diverse corpus of texts within which Bremond seeks a common structure, his rendering of functions within these sequences is necessarily less specific and less formulaic than Propp’s. In a postscript to “The logic of narrative possibilities,” Bremond himself admits that his model does not allow for “an indisputable classification of the events of the narrative” and is “too universal to be pertinent” (1980: 411). Perhaps for these reasons, Bremond’s work has not proven as influential as Propp’s.

In “An introduction to the structural analysis of narrative,” Roland Barthes continues the quest to identify “the smallest narrative unit” comprising narrative forms (1977[1966]: 88). Like Bremond, Barthes

does not limit his investigation to one narrative type or genre, but attempts instead to develop a theory applicable to all narratives regardless of their historical, geographical, or cultural origins or contexts (79–82). Barthes's innovation was to differentiate types of narrative units according to their use. He pinpoints two classes of narrative units: functions and indices. Functions are actions that have correlates or, phrased differently, actions with subsequent reactions: if a door is opened, it will later be closed. Indices add complementary information to set the mood of an episode or provide meaning via description. Attention to the proportion of these distinct narrative units helps to differentiate genres: for example, whereas the fairytale is highly functional, psychological novels are heavily indicial (93). Barthes further divides the class of function into two subgroups – cardinal functions (also called nuclei) and catalyzing functions – which differ in their functionality within narrative. The cardinal function effects change in the narrative; it creates a situation of consequence, a “hinge-point” (93), that leads the story to develop in a new direction. Like Bremond, Barthes combines cardinal functions into sequences. For example, the several functions involved in a character taking a phone call – telephone rings, telephone is answered, dialogue, telephone is hung up – constitute a sequence. Catalyzing functions provide information that propel the narrative forward by linking one cardinal function to the next cardinal function, thus making them consecutive, and not necessarily consequential.

While Propp's comparatively modest objective was to define the fairytale according to its structure, Barthes's goal was to find a way to situate function within a larger structure of possible effects and, in codifying and interpreting narrative functions and indices, to understand more completely the relationship of language to narrative

forms. Narratology in the decades after Barthes's landmark essay has explored the implications of Proppian narrative function in increasingly sophisticated analytical models (see, e.g., the work of Gérard Genette), while A. J. Greimas's narrative semiotics has developed the Proppian function in the direction of a more complex narrative grammar.

G

Gadamer, Hans-Georg

PAUL B. ARMSTRONG

Hans-Georg Gadamer (1900–2002) is best known for his theory of understanding as a historical dialogue between the present and the past. His dialogical model of interpretation has played a leading role in debates about meaning, language, and art in philosophy and literary criticism.

Gadamer was the grandson and son of renowned chemistry professors who had little respect for their colleagues in the humanities (whom they called the “chattering professors” [*Schwatzprofessoren*]). A stipulation of Gadamer’s inheritance was that he must not use it to buy books. He studied philosophy and classical philology at Marburg, where he became Martin Heidegger’s student and protégé, but he fell out with his mentor during the 1930s when Heidegger joined the Nazi party. A professor at Leipzig during World War II, Gadamer tried to keep away from politics and maintain a low profile, and he was named rector of the university by the Allies after the war because he had a clean record. After repeated quarrels with the Russian occupying authorities about academic freedom, he left for West Germany, where he held distinguished professorships at Frankfurt and Heidelberg.

Developing ideas first introduced by Edmund Husserl and Martin Heidegger, Gadamer helped to turn phenomenology’s investigations of meaning-creation from consciousness to interpretation and language. Gadamer calls his project “philosophical hermeneutics” because he believes that reflections about the Being of human being should give central emphasis to analyses of the structure of understanding and the workings of language. “Understanding is the original characteristic of the being of human life itself,” he asserts in his magnum opus *Truth and Method* (1989[1960]: 259). Taking a cue from his teacher Heidegger, Gadamer argues that the way to study Being (ontology) is to interpret how it manifests itself in language: “Being that can be understood is language” (1989[1960]: 474). Gadamer’s “hermeneutic ontology” consequently seeks to understand Being by analyzing how human beings understand and communicate.

Gadamer views understanding as a historically situated process of engaging with others in a back-and-forth exchange that neither pole fully controls. He compares understanding to the “to-and-fro” of a game (*Spiel*) that depends on the participation of the players but that goes beyond them. Like a conversation that takes on a life of its own, such an interaction can change both parties (teaching the interpreter new

truths by surprising his or her expectations, or disclosing meanings in a text that the author could not have anticipated). Theories of knowledge that pose a subject over against an object, either to master it or to passively reflect it, miss the dialogical, interactive dimensions of understanding. Gadamer is skeptical of scientific method because, like Heidegger, he finds in science a will to dominate and control that is exemplified by technology. The title of *Truth and Method* is ironic because “truth” for Gadamer is not a matter of “method.” Understanding others, whether in the experience of a work of art or in an encounter with someone from another culture, is a dynamic and unpredictable process that cannot be scripted in advance by rules or procedures.

Because he views understanding as fundamentally historical, Gadamer criticizes the Enlightenment view of rationality as neutral, bias-free knowledge. The notion of a standpoint that is beyond the limits of any standpoint is a myth, he argues. If we sought to eliminate all of our assumptions and expectations about something we wish to understand, we would have no way of getting to know it. Challenging the Enlightenment critique of prejudice, Gadamer argues that the pre-judgments (*Vorurteile*) that we bring to interpretation are necessary and potentially productive. Building on Heidegger’s concept of the “forestructure” (*Vorstruktur*) of understanding in *Being and Time* (1962[1927]), Gadamer explains that we interpret by projecting expectations that reflect our community’s conventions and our prior experiences. Interpretation is often described as inherently circular because we give meaning to the parts of a text by projecting a sense of the whole they fit into, even as we acquire a view of the whole by working through its parts. Without presuppositions, Gadamer points out, interpreters would have nowhere to start this process of hypothesis-projection. This is why, for ex-

ample, expectations formed by the genre or the period to which a work of art belongs are crucial initial guides to understanding it.

Instead of trying to free ourselves from prejudice, Gadamer argues, we should ask whether our presuppositions are productive by testing them. We can only determine the legitimacy of our predispositions and pre-judgments by deploying them in a dialogical encounter with whatever we seek to understand. Interpreters should hold themselves open to the possibility of surprise and disappointment, he urges, because negative experiences are an important test of our prior understanding of the matter at hand. By putting one’s prejudices into play, the interpreter also puts them at risk, and one can learn from the experience of understanding because the unexpected twists and turns of dialogue can change the views with which one began.

Gadamer’s notion of the productive power of prejudice attributes a positive role to tradition. Authority must be questioned, he argues, but it is not always wrong. The interpreter’s presuppositions and predispositions give evidence of his or her belonging to various traditions, and the process of interpretation is how tradition is handed on (*Überlieferung*). Gadamer’s advocacy of tradition has been criticized as conservative, but his theory of preservation is dynamic and critical, a process in which the legitimacy of established authority is tested and accepted views are open to revision. Not a static authority to be held in reverence, tradition for Gadamer is part of an interactive dialogue between past and present that transforms what is preserved by subjecting it to reinterpretation and reapplication from ever-changing situations.

Gadamer describes the interaction of past and present in interpretation as a “fusion of horizons” (*Horizontverschmelzung*). Texts from the past offer themselves to a future of interpretation across the horizons from

which they originated, and it is a mistake to think that the goal of interpretation should be to reconstruct the author's intentions. The author's original meaning is a dead meaning, Gadamer argues, because texts live by showing themselves able to be applied to situations unimaginable when they were first produced. One aspect of the historicity of understanding, according to Gadamer, is that we can be certain the future will understand us differently than we understand ourselves.

Consistent with his convictions about the value of dialogue, Gadamer participated in extended conversations with philosophers who questioned or opposed his theories. One of his most important interlocutors was the Marxist social theorist Jürgen Habermas, who criticized Gadamer for understating the power of political and social forces to undermine the ideal of free communicative interaction (an ideal both shared). Gadamer also engaged in a much-publicized exchange with the deconstructionist Jacques Derrida, who questioned whether the experience of horizontal fusion ever occurred given the role of difference and deferral in the workings of signification. Gadamer's analysis of understanding as a variable historical process was a positive influence on Richard Rorty's pragmatism, which views truth as a product of a community's vocabulary, and on Paul Ricoeur's theory of the conflict of interpretations. Gadamer's direct descendants in Germany were the "Constance School" theorists Hans Robert Jauss (who advocated a history of reception that focused on horizon-change) and Wolfgang Iser (who proposed a theory of fictionality and the imaginary as "play").

Genette, Gérard

MIA L. McIVER

Gérard Genette (b. 1930), one of the most influential theorists of narratology, has been working since the 1960s to develop and

refine an analytic vocabulary with which to understand how fictional narratives are constructed and communicated. A pioneer in the field of narratology, he has gone on to make significant contributions to poetics and aesthetics and has written on a wide variety of topics ranging from music to the visual and plastic arts.

Genette was born in Paris in 1930 and, after taking a degree in classical letters at the *École normale supérieure*, taught at the *lycée* (high school) level and at the Sorbonne. In 1966 he published *Figures*, a collection of essays that established his reputation as a literary scholar. In it, he embarks on a project to extend the structuralist insights and methods of linguist Ferdinand de Saussure and anthropologist Claude Lévi-Strauss to literary criticism, which he claims is a structuralist enterprise. Four more volumes of *Figures* have since appeared (the most recent in 2002), containing essays on authors including Stendhal, Flaubert, Proust, Alain Robbe-Grillet, Paul Valéry, and Jorge Luis Borges, as well as theoretical reflections on figuration, rhetoric, diegesis, realism, axiology, and repetition-variation. Genette's inductive approach works by paying close attention to the details of individual texts, seeking to understand how they come to exist within vast textual networks. His style is precise, his taxonomies and typologies technically complex, but readily graspable by nonexperts. He presents his ideas in short vignettes with ample illustration, often betraying a subtle and sly wit.

Genette studied under Roland Barthes – “my mentor-despite-himself” (Genette 2005: 2) – and later joined him at the *École des hautes études en sciences sociales* in 1967. In 1970 he founded, along with Tzvetan Todorov and Hélène Cixous, the journal *Poétique*, which to this day remains the foremost outlet for systematic investigations of how texts generate meaning. In 1972, Genette published *Figures III*, which

contains an extended essay arguing for the radical singularity of Proust's *À la Recherche du temps perdu* in the history of narrative fiction. Three years later, he published it under the title *Discours du récit* [*Narrative Discourse*] (1980[1972]), and it has remained Genette's best-known work. In his reading of Proust, he argues that *À la Recherche du temps perdu* manipulates narrative order, duration, and frequency in the “formidable game it creates with Time” (160). This game consists primarily in the text's manipulation of analepsis (flashback), prolepsis (anticipation, or flashforward), and metalepsis (shifts between narrative levels), as well as in the distension or compression of narrative movement and the frequency by which narrative elements are repeated. In addition to challenging the oversimplified characterization of narrators as simply first-, second- or third-person, Genette examines how distance and perspective contribute to regulating the narrative information conveyed to the reader, arriving at a theory of focalization that takes into account both the angle of the reader's perception and the location of narrative utterances. His concept of focalization has proven to be his most durable and has stimulated much new work and debate among narrative theorists, particularly in the work of Gerald Prince.

In the years following the publication of *Figures III*, Genette brought out both *Mimologics* (1976), a magisterial account of the legacy of Plato's Cratylus argument about the firmness and naturalness of ties between language and the material world, and *The Architext: An Introduction* (1979), a slender volume in which he overturns the practice (conventional since Aristotle), of dividing genre into the categories of drama, epic, and lyric. Instead, Genette proposes a distinction between *modes*, which are transhistorical, everyday practices of enunciation and communication, and *genres*, which are his-

torically determined formal protocols that guide discursive practices. He puts forward the concept of “architextuality” to account for the patterns of instances that make up generic classes: genre classification ought to derive patterns from instances to arrive at architextuality, a relationship “of inclusion that links each text to the various types of discourse it belongs to” (1992[1979]: 82).

If architextuality marked a broadening of Genette’s interests from narrative to genre, then two texts in the 1980s extended his purview even further. *Palimpsests: Literature in the Second Degree* (1982) explores how texts relate to each other through four channels that make up architextuality: intertextuality (quoting, allusion, plagiarism), metatextuality (commentary), hypertextuality (not electronic links, but grafting one text onto another), and paratextuality. In *Paratexts: Thresholds of Interpretation*, Genette focuses on the “empirically made up . . . heterogeneous group of practices and discourses of all kinds and dating from all periods,” which he “federates” under a single name, “paratext,” based on “a common interest, or a convergence of effects” (1997b [1987]: 2). Paratexts are threshold texts written by authors, publishers, and critics. There are two categories: peritext and epitext, the former indicating the spatial dimension of the book, with its dedications, prefaces, table of contents, and scholarly notes, the latter indicating all the completely external “messages” about the book, such as the authors’ letters and interviews, publisher’s promotion and so on. The reader’s role is an important consideration for Genette, who regards the reader’s relation to the text to be social, contractual, and consciously and pragmatically organized.

Genette’s work in the 1990s has focused primarily on aesthetics, and he frequently articulated his ideas and position in response to thinkers like Nelson Goodman, one of the leading figures in twentieth-

century aesthetics and analytical philosophy. In *Fiction and Diction* (1991) Genette undertook to define literature and literariness themselves and to show how verbal works of art can be differentiated from other verbal messages. His verbal and textual playfulness is well displayed in the late *Bardadrac* (2006), a personal dictionary that epitomizes Genette’s classificatory imagination with entries that begin with “Aa” (a river in northern France), detour through an embedded lexicon that wryly deciphers media-speak, and terminate at “Zut” (“This could be my last word”). Genette’s influence is widespread among narrative theorists; including Prince, Mieke Bal, Dorrit Cohn, Seymour Chatman, Monika Fludernik, and Shlomith Rimmon-Kenan, who have developed or critiqued elements of Genette’s narratology.

Genre Theory

SEVINÇ TÜRKKAN

Genre is the term used to characterize groups of similar texts that share certain recognizable conventions and that belong in the same literary tradition. Since Aristotle, genre has functioned fairly consistently in Western literary discourse and has shaped critical theory and creative practice. At the same time, its meaning, validity, and purpose have been repeatedly questioned and redefined. The Aristotelian division of genres – epic, lyric, and drama – which was the hallmark of Renaissance and neoclassical poetics, was first called into question during the European Romantic movement centered in Germany in the late eighteenth and early nineteenth centuries. In the works of Johann Gottfried Herder, Johann Wolfgang von Goethe, Friedrich Schiller, and Novalis, the concept of genre came under serious scrutiny and gave rise to debates we see in contemporary genre theory. Before the era of the German Romantics, genres

were thought to be stable, universal categories, immune to historical change; it was also generally agreed that the existence of new genres was inadmissible on the grounds that Aristotle had not accounted for them. With the Romantics came an understanding of genres as historically determined and dynamic entities. In the later nineteenth century, evolutionary models of development emerged, according to which it was possible to trace the specific nature of such historical determination. By the end of the twentieth century, Genette could argue, in *The Architext* (1992[1979]), that the tripartite division of genre has been wrongly attributed to Aristotle alone and that it is more accurate to speak of a conflation of Plato and Aristotle's understanding of genre. Despite two centuries of controversy and the rise of new, hybrid forms, the classical division of literature into epic, lyric, and dramatic genres remains foundational to our thinking about literary typology.

The work of Russian formalists played an important role in twentieth-century reconsiderations of genre, which was subject both to synchronic (formal) and to diachronic (historical) analysis. Formalists inherited the problematic of literary evolution but they reformulated it, arguing that literary evolution was discontinuous and that the organization of genres was neither stable nor universal. In any given period, literary genres are in competition and marginalized genres may sometimes come to dominate literary production. For example, formalist new criticism privileged poetry over the novel in the first half of the twentieth century, while the novel came to prominence in the second half. Formalists acknowledged both the inevitability of alteration in the organization of genres and, more important, the state of "permanent revolution" in individual generic traditions.

At the same time that formalists were describing this revolution, Vladimir Propp, whose *Morphology of the Folktale* was first published in 1928, built on the work of formalists in order to uncover the grammar of a genre, in this case, the folktale. What Propp proposed was not simply a new definition but a new kind of definition, involving the identification of plot “functions” and “invariants.” However, he did not apply his methodology to other genres, and some scholars have pointed out that his analytical method does not work well when applied to more complex types of literature. Perhaps this is why the Prague School, which developed out of Russian formalism, shifted its attention away from the problematic of genre to the question of aesthetic norms. A similar shift, from the category of genre to literary or cultural systems, marks the semiotic structuralism of Yuri Lotman and the structural semantics of A. J. Greimas, as well as the very different structuralism of Northrop Frye, whose contribution to genre theory lies in his development of a theory of archetypes.

Genre remains central to other schools of literary thought, which stem from Russian formalism, particularly the Polish formalist movement, established in the 1930s. In “Royal genres” (2000[1961]), Ireneusz Opacki moves away from methodological problems to the question of generic hybridization. He sees generic change as competition and combination; in any given literary period, the majority of genres tend to be dominated by a “royal genre,” which affects other genres by transforming them into hybrids of itself. Opacki suggests that analysis of such hybrids can provide the key to the poetics of a given literary approach or period. This trend toward hybridity parallels a similar trend toward dialogism and heteroglossia, terms formulated by the Russian theorist Mikhail Bakhtin to refer

to the linguistic stratifications and ideological investments found in narrative fiction. Bakhtin’s ideas were instrumental in post-structuralist reconsiderations of the novel form, especially in the work of Tzvetan Todorov and Julia Kristeva, who introduced many European and US readers to Bakhtin. The very element of his work that separated it from that of Russian and Prague formalists, that is, ideological critique, was precisely what attracted later theorists and readers, for it offered a methodology by which formal and ideological concerns could be fruitfully pursued in the same critical discourse.

Developments in French structuralism and poststructuralism have led to further innovations in genre theory, particularly in narrative forms like the novel and film. Theorists like Roland Barthes – particularly in his seminal “Introduction to the structural analysis of narrative” (1977[1966]) and *S/Z* (1974[1970]) – and Christian Metz, in his *Film Language: A Semiotics of the Cinema* (1974), brought to the study of narrative genre the formal methodologies of structuralism, semiotics, and linguistics. In some cases, as in the work of Maurice Blanchot, we find a refusal of all attempts to fix aesthetic practice and determine its form (1995[1953]: 141). To some extent, this is in line with the thinking of Italian philosopher Benedetto Croce, writing at the turn of the century, whose *Aesthetics as Science* (1953[1900]) makes a strong argument against genre division. For him, such divisions are a result of “superstition” and it only “survives to contaminate modern literary history” and to “deceive us as to the true nature of the aesthetic” (449). The idea that we might refuse generic definition and limitation found its most forceful articulation in Jacques Derrida’s influential essay “The law of genre” (1980), in which he argues that the “marks” by which a work

inscribes its genre paradoxically do not belong to that genre; thus the generic boundary dissolves at the very moment it is established.

The late twentieth century also saw a trend away from the creator of genres to the readers who constitute them in various practices of reading and reception. Roman Ingarden, Wolfgang Iser, and Stanley Fish have been extremely influential in developing theories of reader response in which the elements of genre find their continuity and stability in reading practices governed by what Fish calls “interpretative communities” and other institutional contexts. Linked to these efforts were those of the Constance School, particularly the work of Hans Robert Jauss, who developed Edmund Husserl’s idea of “horizons of expectations” to account for the reception of literary texts. This is very close to the contract theory of genre developed in the semiotic structuralism of Jonathan Culler [1975], who argued that “literary competence” defines our ability as readers to recognize and interpret the codes of a given genre and to perform readings of particular exemplars. The limits of structuralist approaches to generic competency is tested by E. D. Hirsch, who argues in favor of validity of interpretation, which postulates an “intrinsic” generic type that “lies somewhere between the vague, heuristic genre idea with which an interpreter always starts and the individual, determinate meaning with which he ends” (1976: 81).

Many recent developments in genre theory continue the work done by poststructuralists like Bakhtin, while others move in the direction of the feminist critique of gender (Eagleton 1989). Genre has always been the focus of comparative literary studies and for interdisciplinary work within cultural studies, though in recent years Clifford Geertz has noted a “blurring of genres” (Geertz 1980). Despite contempor-

ary trends that advocate hybrid genres or the abolition of genre as a conceptual category, the concept remains an important point of departure for both literary and theoretical work. Indeed, cultural studies has recently focused its attention on what are commonly called “subgenres” (e.g., detective novels, romance novels, science fiction); but this attentiveness assumes a certain agreement on what the concept actually designates, which, as the history of genre theory demonstrates, is difficult to achieve. The problem of nomenclature may be one of the most resilient and productive elements of genre theory, pushing it toward greater critical acuity and descriptive nuance.

Poststructuralism announced “the death of the author” and the dissolution of genres, and these theoretical gestures have had a liberating effect, for the traditional concept of genre implies rules and conventions that impose limits on the spontaneity of the author and the open-endedness of literary forms. The various, sometimes contradictory, trends in genre theory in the late twentieth and twenty-first centuries are signs less of a theoretical stalemate than of new opportunity for productive dialogue between proponents of formalist and historicist conceptions of genre. And while these trends have proven successful thus far in combating reductive classification and authoritarian reading practices, traditional conceptions remain powerfully evident in pedagogical and publishing practices. Genre may be in question, but we are not yet “beyond genre.”

Gentile, Giovanni

KATHLEEN RYAN

Giovanni Gentile (1875–1944) was an influential Italian philosopher, educator, and politician chiefly remembered for his educational reforms and adherence to fascism. Born in Castelvetrano (Trapani), Sicily, Gentile studied philosophy at the University of Pisa (1893–7) and went on to teach at *licei* (secondary schools) in Campobasso and Naples before earning a docent position in the philosophy department at the University of Naples in 1903. From 1907 to 1932, he held successive faculty positions at the universities of Palermo, Pisa, and Rome. Gentile took a leave of absence from Rome to serve as Minister of Public Instruction under Mussolini from 1922 to 1924. The fascist regime named him director of the University of Pisa in 1932 and president of the Academy of Italy in 1943, a term cut short by his assassination in 1944.

Gentile's life traversed a tumultuous period of Italian history. He grew up in the wake of the Risorgimento movement (roughly 1815–70), which saw the unification of the Italian state, and experienced first-hand the attendant social unrest and struggle for cohesion in the newly formed nation. As Italy moved into the twentieth century, progressive improvements yielded a climate of optimism and romantic nationalism. At this time, Gentile was

studying Italian and German idealism at the prestigious University of Pisa under Donato Jaja, a former student of Bertrando Spaventa, cofounder of the Neapolitan school of Hegelianism. His graduate thesis on Antonio Rosmini and Vincenzo Gioberti, idealist activists in the Risorgimento through whom he channels Kant and Hegel, shows that Gentile saw himself as the philosophical heir to Hegel with the mission of realizing the cultural and civic unification of Italy.

In 1903, Gentile and Benedetto Croce founded *La Critica*, a scholarly cultural review intended to unify national culture and strengthen idealism against the competing schools of positivism and naturalism. Gentile edited the influential review and contributed numerous writings, including essays on religion and philosophy, critical studies of Italian poets, and a series on Italian philosophy later published as the three-volume *Le origini della filosofia contemporanea in Italia* (1917). After a decade of collaboration, the two philosophers parted ways, due in part to Croce's opposition to fascism. Gentile developed a philosophical system known as *attualismo* or actualism, which emerged from 1912 to 1917 in works that included *The Theory of Mind as Pure Act* (1922[1916]) and *Sistema di logica come teoria del conoscere* (1917–22). Actualism is a neo-idealist, neo-Hegelian system that reduces reality to the act of thinking and that substitutes Hegel's historical, objective Becoming with an infinite Becoming that self-generates in the immediately present moment by a dialectical synthesis of the *pensiero pensante* (thinking thought) and the *pensiero pensato* (thought produced). Advancing itself as the most coherent form of idealism, actualism acquired a considerable following, especially among Gentile's students, who published their findings in *Giornale critico della filosofia italiana*, the review Gentile founded in 1920.

A distinguished teacher, Gentile advocated a humanities-based curriculum for *licei* and first rose to national prominence in 1907 defending religious instruction in elementary schools as fundamental to the Italian way of thinking (*its forma mentis*). In what is perhaps his best-known work, *Sommario di pedagogia come scienza filosofica* (1913–14), Gentile defines ideal education as a mental/spiritual bond between teacher and student toward the goal of self-formation. For Gentile, the highest form of self-consciousness is philosophy. His educational views influenced the Irish poet W. B. Yeats and caught the attention of Benito Mussolini who, in the early 1920s, sought alliances in the intellectual community. In 1922, as Minister of Public Instruction, Gentile enacted the Riforma Gentile, a sweeping organic reform of the educational system, which was both condemned as elitist and praised for raising academic standards in a country with one of the highest illiteracy rates in Europe. Although Gentile resigned as minister, he remained active in the Fascist Party, which he joined in 1923, and his reforms, including mandatory religious instruction and segregation of high schools into specialized curriculum, still form the base of the Italian educational system.

The most influential of Gentile's early writings was *Fondamenti della filosofia del diritto* (1916), which argues that the individual's self-realization is inextricably tied to that of the state. He advocated Italy's engagement in World War I as a means of unifying the population, and later, as a fascist, he insisted that freedom could only be enjoyed by serving the state. His organization of the 1925 Manifesto of Fascist Intellectuals earned him the everlasting ire of Croce and his anti-fascist associates. He went on to direct regime-sponsored cultural initiatives such as the *Enciclopedia Italiana*, which brought together many

important intellectuals and artists in the service of fascism. After 1923, Gentile wrote mostly propaganda with some exceptions, including a series of critical essays on Dante and Giacomo Leopardi, which, along with his work on actualism, informed his often-overlooked dialectical theory of art as self-translation expounded in *The Philosophy of Art* (1972[1931]). In the same year, just after being installed as director of the University of Pisa, he oversaw the university professors' oath to the regime. Fascism's suppression of personal freedoms came to a dramatic climax in the years 1943–5, when Italy erupted into civil war. Shortly after becoming president of the Italian Academy and completing *Genesis and the Structure of Society*, the conclusion of his social-political theory, Gentile was killed by a communist resistance group outside Florence on April 15, 1944, at the age of 68.

Gramsci, Antonio

DANIEL M. MARKOWICZ

Antonio Gramsci was a leading Marxist intellectual whose theories of ideology and hegemony have had a profound impact on contemporary thinking about literature and culture. He founded or edited some of the most notable political newspapers in Italy in the first quarter of the twentieth century, including *L'Ordine Nuovo* (The New Order) and *Grido del Popolo* (Shout of the People). He was a factory organizer, representative to the Communist International in Moscow (1922–4), Member of Parliament, and Secretary General of the Italian Communist Party (PCI). Imprisoned for organizing an insurrection against Mussolini's Italian Fascist regime, Gramsci wrote important texts on Italian history and politics, culture, and Marxist theory, the *Prison Notebooks*, for which he is best known and in which he reflected on the nature of dominant social groups, particularly how such groups manage to maintain ideological hegemony in the society at large. Thirty-three notebooks containing his writings were smuggled from his room in a Roman clinic, where he was treated for spinal malformations (due to Pott's disease, a form of tuberculosis) that plagued him his whole life. He died there on April 27, 1937. From the time of his trial, he was considered a dangerous thinker, so much so that the public prosecutor pointed to him and declared, "For twenty years we

must stop this brain from functioning” (Fiori 1971: 230).

Gramsci was born in Ales, a small impoverished town on the island of Sardinia, and his early life was spent under conditions of dire poverty. His father worked as a registrar but was imprisoned for six years for embezzlement on what are considered politically motivated charges. His schooling was regularly interrupted due to financial strain, but he managed to enter the *liceo* in Cagliari in 1908 and roomed with his older brother Gennaro, who introduced him to socialist politics. It was also in Cagliari that Gramsci was exposed to a wave of Sardinian nationalism and rural social unrest that was ruthlessly repressed by mainland troops. These experiences led him to focus on peasant problems and the relationship between class and uneven regional development (Hall 1996: 416) – a concern that informs his famous article for *L’Ordine Nuovo* “Some aspects of the Southern question” (1990: 441–62). In 1911, he left Sardinia for the University of Turin on a scholarship for poor students. At that time, Turin was the most advanced industrial center in Italy, and it was here that Gramsci came into contact with the intellectual and political ideas that were animating radical movements throughout the country. In addition, Turin’s working class was notorious for its militancy. A series of general strikes and antiwar demonstrations between 1912 and 1915 provided the backdrop for his first years in Turin, culminating in an insurrection in August 1917, sparked by diminishing bread supplies. The spontaneous nature of these uprisings drew him away from the “Southern question” (i.e., the problem of underdeveloped southern Italy) toward the more internationalist vision of Italy’s socialist parties, which drew inspiration from the Russian Revolution and the establishment of the Second International. However, he never abandoned national concerns and

insisted that any political and social transformation must start on national terrain. His acquaintance with Turin’s working-class struggles became a key component of his political thinking, at the center of which was the necessity of unifying Italy’s southern peasantry and northern industrial proletariat, the two revolutionary forces pitted against landowners and the capitalist class.

In 1913, Gramsci joined the Italian Socialist Party (PSI), but it not was until 1917 that he rose to prominence within the party and edited the party’s newspaper *Il Grido del Popolo*. During those years, the party split into a reformist right-wing faction, which saw Italy’s transition to socialism through the framework of parliamentary reforms and concessions to the moderate trade unions, and a revolutionary left-wing faction, which refused to work with bourgeois parties in coalition governments. Because of the indifference of the reformists to the problems of the southern peasantry, Gramsci turned his attention to the revolutionary “maximalist” faction, which had taken over the PSI in 1912. But his movement toward the Left was also motivated by the outbreak of the Russian Revolution in February 1917. For Gramsci, the Revolution questioned a form of Marxism that insisted on the gradual evolution of socialism through the unfolding of impersonal, economic laws. In an early essay for the leftist newspaper *Avanti!*, “The revolution against *Capital*” (1990: 34–7), he chided the “positivist and naturalist incrustations” of orthodoxy and insisted that it was not “raw economic facts” that drove historical development but the “collective, social will” of the people.

At this time, he was writing on a wide variety of subjects, including theatre, literature, and politics. His insistence on the representation of working-class and “subaltern” groups, which designates those

who occupy social strata outside or in resistance to normative class or caste hierarchies (e.g., peasants, women, workers), was central to his reading of Marxism as a response to totalitarian regimes. His idea of a “national-popular collective” governed much of the thinking in the *Prison Notebooks*. His emphasis on popular action made him increasingly frustrated with the PSI’s refusal to prepare for insurrection or to coordinate the energies of the combative Turin labor movement and the increasingly restless peasantry. In 1919, Gramsci and a few others (including Palmiro Togliatti, Umberto Terracini, and Angelo Tasca) established the weekly *L’Ordine Nuovo*, which became the ideological organ of the PSI’s revolutionary Left. It was in these pages that Gramsci earned a reputation as the foremost proponent of factory councils. These councils followed the Soviet model whereby elected delegates would take over the means of production and fulfill both the economic function of worker management and the political function of socialist democracy. These factory councils provided the nucleus of the newly formed Italian Communist Party (PCI) established in 1921 due to the passivity of the PSI in the face of factory takeovers. At the same time, this period saw the rise of fascism as a dominant force in Italian politics, fostering a wave of repressions that drove many of the Left leadership into exile and quelled the revolutionary zeal that had energized Italy’s labor movement (including the Fiat strike of 1920). Gramsci went to Moscow in 1922 as the Italian representative to the Comintern (Communist International). He met Leon Trotsky and Igor Zinoviev, as well as his future wife, Julka Schucht, a violinist and member of the Russian Communist Party, with whom he had two children, Delio and Giuliano.

Gramsci took over leadership of the PCI in 1924 after the arrest of its first General

Secretary Amadeo Bordiga. At this time, the PCI attempted to win autonomy from the Third International and the Comintern. By 1926, Fascist repression reached an intolerable degree after the attempted assassination of Mussolini and the liquidation of parliamentary democracy. Gramsci, along with other Communist deputies, was arrested, and in 1928 was brought to trial and sentenced to 20 years in prison. The following year he was given writing materials and began a plan of study and analysis of a wide range of topics in Italian culture and politics, including concepts like hegemony and the subaltern. He filled 33 notebooks, which chart the development and revision of concepts like hegemony and the subaltern. To his sister-in-law, he wrote that he wanted to investigate “the creative spirit of the people in its diverse stages and degrees of development” (1994: 84).

The *Prison Notebooks* consist largely of a response to the failure of socialist revolutions in the West and the resiliency of capitalism during the postwar economic crisis, which defied the logic of Marxist orthodoxy and demanded a new analysis of capitalist society. For Gramsci, such an analysis must start with practical, concrete conditions rather than abstract, impersonal laws. Such thinking put him at odds with classical Marxism, in which politics, ideology, and culture make up a “superstructure” that is determined by an underlying economic “base.” Instead, according to Gramsci, base and superstructure are dialectically intertwined, and it is this entwinement that forms what he calls a historic bloc whereby “the complex, contradictory and discordant *ensemble* of superstructures is the reflection of the ensemble of the social relations of production” (1971: 336). His insights into new technologies led to a critical analysis of innovations in the US such as Taylorism and Fordism (277–322). Taking his cue from Marx’s formulation in the 1859

Preface to *A Contribution to the Critique of Political Economy*, Gramsci insisted that the superstructure is where struggles are fought and won. This inversion of the base/superstructure relationship is his most lasting contribution to Marxist theory.

The fragmentary, schematic, and coded nature of the *Notebooks* has proven an obstacle to their interpretation. While arguments over their meaning have evolved with critical fashions, the very obscurity that prevents easy interpretation also opens up avenues of application that might otherwise be foreclosed were Gramsci to have specified clearly the social and historical points of reference in his discourse. Despite Gramsci's political misfortunes, his bouts of illness, and his untimely death, which left his work largely unfinished, the *Notebooks* continue to have a lasting impact on Left politics and cultural theory. Indeed, the political and social context to which Gramsci responded fostered an unorthodox reinterpretation of Marxist thought – which censorship forced him to refer to as a “philosophy of praxis” – that challenges the assumptions of classical approaches and provides increased opportunities for the materialist analysis of culture and politics.

Central to Gramsci's conception of ideological struggle is the notion of hegemony. In his formulation, hegemony is the result of “moral and intellectual leadership” (1971: 12–13) whereby the interests of a single class dominate those of subordinate classes through a process of consent. Hegemony is not exercised through direct domination (though the military and police stand ready to use coercion if necessary), but is achieved through various political, social, and cultural means. Though ideally hegemony is achieved without force, consent to the conditions established by the dominant class takes place in a context of antagonistic political relations; thus, through mechanisms of intellectual and moral persuasion,

heterogeneous social groups come under the control of a single dominant class and its ideology. According to Gramsci, the leadership of the dominant class performs the social function of intellectuals, whose role is to direct, organize, and lead others. This, of course, includes the mass political party, whose function is to organize and direct spontaneous action toward either the maintenance or the transformation of the social order.

Ideology also undergoes a significant reformulation in Gramsci's work. While classical Marxist thinkers considered ideology to be merely a mechanistic reflection of economic relations, a symptom of one's “false consciousness,” Gramsci insisted on its material character. It acted, he claimed, as the cement that unifies a historic bloc and allows social groups to acquire consciousness of their positions in a social order. Accordingly, ideologies are never merely imposed on the superstructure through mechanistic laws but are the result of contests between hegemonic groups at a particular moment. Art and culture find their social function within this dynamic superstructure and acquire a political significance as tools in the battle between class interests for hegemony. The significance of culture therefore is its participation in forming a collective, popular will. The importance of any cultural artifact is the extent to which it “sinks its roots into the humus of popular culture,” galvanizing a “national-popular” that expresses lay sentiment (Gramsci 1985: 102). Popular culture is endowed with the potential to incite counterhegemonic forces against ruling class interests. It is in this sense that Gramsci's notion of culture is interventionist, for culture does not merely reflect social realities but is a force actively changing them.

The reception of Gramsci's work has largely followed the fortunes of the intellectual Left. His reputation as a major thinker was secured largely through the efforts of his

friend and comrade Palmiro Togliatti, who made the *Prison Notebooks* available in translation, from 1947 to 1971. While at first Gramsci's work was grounded in the particularity of the Italian political situation and was used to legitimate the actions of the PCI, his heterodox understanding of political power and the role of culture was broadly influential, especially in New Left movements of the 1960s and 1970s. Gramsci's emphasis on practical activity over theory had a decisive influence on the development of British cultural materialism, specifically the study of class structures and cultural production that we see in the works of Raymond Williams and E. P. Thompson. The Birmingham Center for Contemporary Cultural Studies also produced much work in the 1970s and 1980s that was inspired by the relational and contingent way Gramsci conceived of cultural struggle. In *Subculture: The Meaning of Style*, Dick Hebdige asserts that Gramsci's notion of hegemony "provides the most adequate account of how dominance is sustained in advanced capitalist societies" (1981: 15). Stuart Hall, one of the most influential thinkers in the Birmingham Center, drew on his work to explore the potential of ideological and cultural categories to organize "masses of men" (1980: 69). Gramsci's emphasis on the superstructure as active and dynamic provides the groundwork for studies of race, gender, and nationalism that continue to preoccupy theorists of cultural studies.

Gramsci's political and cultural theories have gained new relevance in recent decades, which have seen the collapse of the Soviet Union, the rise of postmodern theory and its disenchantment with master narratives of legitimation, and the seemingly uncontested hegemony of neoliberalism in the West and, increasingly, in the developing world. His work helped fuel the field of subaltern studies, whose work, chiefly that

of Edward Said [1978] and Ranajit Guha and Gayatri Spivak (1988) focuses on colonized individuals whose social and political identity resembles that of the European subaltern. Gramsci's challenge to classical Marxist formulations has inspired a range of post-Marxist criticism that uses the advances of poststructuralism to develop new theories of society and "the social." One can see Gramsci behind the work of Laclau, Judith Butler, and Slavoj Žižek, who try to theorize universality and hegemony, foundations and contingency in an era of global capital. His refusal to make direct linkages between class position and ideological and political identities contrasts dramatically with the often unforgiving dialectical criticism of Georg Lukács and Theodor Adorno. In *Hegemony and Socialist Strategy*, Laclau and Chantal Mouffe cite Gramsci as the "breaking point" for Marxist orthodoxy, replacing the "fullness of class identities" with more dynamic "hegemonic identities" (2001[1985]: xi). As social movements negotiate local alliances in a globalized economic and political terrain, and as class positions and relations become increasingly less clear, Gramsci's attention to concrete activity on the superstructural level makes possible more varied and more powerful tools for political and cultural criticism.

Greimas, A. J.

PAUL PERRON

Algirdas Julien Greimas (1917–92), long recognized as the leading authority in structural semiotics, was born in Tula, Russia, in 1917 and studied law in Kaunas (Lithuania) before enrolling for an undergraduate degree at the University of Grenoble (France) from 1936 to 1939, where he studied French medieval language and literature, specializing in Franco-Provençal dialectology. At the end of his studies in prewar France, he returned to Lithuania for his military service. His country was invaded, successively by the Soviets and the Germans before being reoccupied by the Soviets in 1944. At that time, he escaped to France, enrolled for a doctorate at the Sorbonne in Paris under Georges Matoré and defended his *doctorat d'état* with his primary thesis on fashion in France in 1830, a lexicographical study of the vocabulary of dress according to the journals of the time, and a secondary thesis on various aspects of social life in 1830 based on a synchronic model of analysis, where language is considered as a system at a given moment in time.

Greimas began his university career teaching the history of the French language in Alexandria, Egypt, where he met and worked with Roland Barthes before taking up a chair in French language and grammar at the University of Ankara, Turkey, in 1958. By this time, he had abandoned lexicography, which he considered inadequate to describe semantic fields as he was coming to understand them. He was appointed to the Istanbul University, and then the University of Poitiers before being elected in 1965 to the prestigious *École pratique des hautes études* in Paris, where he and Roland Barthes directed seminars in semiotics. His seminar attracted a large number of students and professors from France and abroad that became known as Paris

School Semiotics which continues today to meet monthly in Paris, some 17 years after its founder's death (see Perron & Debbèche 1998).

Though his original training was in philology and lexicography, Greimas was also well versed in the tradition of anthropology that had its roots in comparative mythology and grammar, which encompassed research undertaken, among others, by Claude-Lévi Bruhl and Louis Hjelmslev, along with Roman Jakobson and Claude Lévi-Strauss. His methodology, however, was totally reframed in the 1970s, thanks to his encounter with French phenomenology and the rethinking of Saussurean linguistics by some of the leading humanists and social scientists of the time. Linguistics also contributed greatly to this theoretical and methodological renewal, along with history, art criticism, literary criticism, and sociology. Although the reframing in question focused mainly on the dimension of meaning and its formation into intelligible patterns, Greimas explored a variety of topics, including the discourse of science, French commerce, historical discourse, urban life, architecture, literature, gesture, passions, and numerous manifestations of intersubjective verbal and nonverbal communication.

Greimas's theory of the sign builds on the theoretical works of the Swiss linguist Ferdinand de Saussure (1857–1913). He began with Saussure's now classical definition of the "sign" as an entity made up of something physical – sounds, letters of the alphabet, gestures, and so on – the "signifier"; and the image or concept to which the signifier refers, the "signified." He designated the arbitrary relation between the two "signification." He considered that these three dimensions of the sign were inseparable, and stressed that the linguistic system was made up of differences so that the mechanisms of language rested on two types of relations: groups of elements of the writ-

ten or oral chain whose values are defined in terms of the other elements of the system – syntagmatic relations; and associative relations or relations between elements of the utterance and other elements absent from the utterance – paradigmatic relations (i.e., the sign black takes on its value in terms of all the absent colors of the chromatic paradigm). The phonological model, based on the premise of a fundamental parallelism between these two planes of language (i.e., sound and concept), as well as the variable dimension of signs, remains one of the organizational principles of Greimassian semiotics. Since signs on the plane of expression signify in terms of differential gaps, and the gaps of the signifier correspond to the gaps of the signified, which in turn are interpreted as features of signification, visual, auditory, or tactile units can be analyzed and decomposed into minimal subunits, or "semes," considered as semantic features.

Although Greimas's definition of sign depends in part on Saussure's, he reconceptualized the latter's theory in terms of the theoretical works of the Danish linguist Louis Hjelmslev. Under Saussurean influence, the term "sign" was commonly linked with the minimal sign, the word, or the morpheme, the smallest element of signification in an utterance that cannot be divided into smaller units without moving on to the phonological level. It is in this sense that language is defined as a "system of signs." But Hjelmslev and Greimas found Saussure's notion of sign to be too restrictive, because Saussure, by defining the sign as a totality, was able to separate expression from content when establishing his analytical procedures. To avoid this contradiction Greimas turned to Hjelmslev's redefinition of the sign, according to which the semiotic function "semiosis" is considered as the relation of reciprocal presupposition that exists between the expression-form and the

content-form, whereby meaning is created at the moment of the linguistic act.

Contrary to Anglo-American linguists for whom the sign is a given, for Greimas the sign is first and foremost a construct that excludes the referent as a necessary condition for the existence of linguistics (Greimas & Courtés 1982: 297). In an important article, he suggested that since signs can be redefined as the conjunction of an expression-form and a content-form of varying dimensions: “a word, a sentence are signs, but they are also discourse insofar as they can appear as discrete units. Initially, poetic discourse can be considered as a *complex sign*” (Greimas 1972: 10; my translation). In his theoretical writings Greimas attempted to work out an analytical methodology based on the relationship of reciprocal presupposition between expression-form and content-form.

In *Structural Semantics* (1983[1966]), Greimas elaborated on the elementary structure of signification and the notions of semantic axes and semic articulation; he defined semes (minimal units of meaning at the semantic level comparable to phemes at the phonetic level) in relationship to lexemes (i.e., words, and substantive prefixes and suffixes); and he postulated an isotopy that designates the text *as such* in the repetition of classemes (i.e., contextual features) and the recurrence of semic thematic, abstract, or figurative categories. There does exist, however, a certain amount of ambiguity linked to the concept of structuralism, which, as far as the Paris School is concerned, can be understood only in relationship to signification. For example, in North American structural linguistics, represented by Leonard Bloomfield and distributionalism (the objective description of the relations within language, excluding semantics), meaning exists but one can say nothing about it. However, as far as French structuralism is concerned, meaning happens to

be the essential dimension of language. Therefore, from this perspective one could say that Greimas is a poststructuralist and that he represents what could be called “scientific structuralism,” just as physics can be said to be structuralist. A further point to make is related to structure and meaning, since for Greimas meaning can only be apprehended as articulated meaning. In other words, meaning can only be described in terms of signification, and his first priority was to come to grips with the concept of meaning as structure. It was necessary for him to think about the minimal conditions for the appearance, apprehension, and/or production of meaning. This led to the formulation of the elementary structure of signification that can be represented by what has been called the “semiotic square” (see Figure 1).

One of the main axioms of the Paris School is that a discourse universe can be apprehended as meaningful only as a consequence of its “differential” articulation. What this signifies is that meaning itself can best be framed in terms of semantic oppositions such as *being vs. seeming*, along with their logical negations *not being vs. not seeming*; these oppositional pairs together form a “semiotic square,” a set of minimal

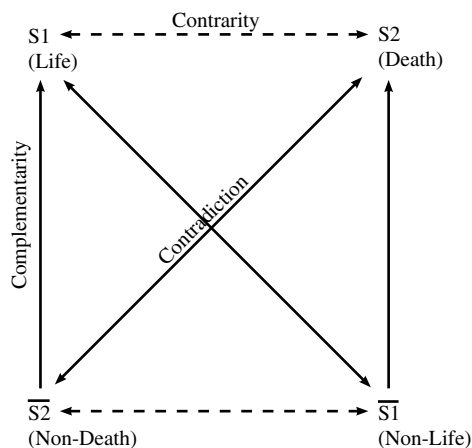

Figure 1

differences that constitute the most minute units of meaning discernible within a given context. In this way, the existence of foundational values, or axiological structures – considered by Greimas as universals or indefinable – was postulated and provided the framework for the elementary structure of signification. For the Paris School any discourse presupposes a semantic universe theoretically made up of the totality of significations, postulated as such prior to its articulation, which it actualizes in part. The microsemantic universe deploys elementary axiological structures, for example *life vs. death* (individual microsemantic universe) and *nature vs. culture* (collective microsemantic universe). These fundamental structures were considered to be ad hoc universals and served as starting points in the analysis of semantic universes, whether they happen to be individual or collective.

Though semiotics may be considered a *structural* science, it is not a *completed* science but rather an ongoing scientific project, a *historical process*. Current semiotic theory rests on a number of fundamental principles. First, semiotics is a coherent description of the generation of signification as signifying objects produced in intersubjective communication. Second, the concept of generation makes it possible to introduce the notion of “hierarchical levels” in the description of languages; the number of *levels of depth* is heuristic and depends on the discovery strategy adopted. Third, the generative apparatus produces “discourses,” that is to say, totality of meanings in terms of words or sentences. Finally, semiotics borrows from linguistics the principle of relevance or “pertinence,” which states that elements situated either at an immediately superior or inferior plane can be used to describe a certain phenomenon.

Greimas’s leading role in the progressive conceptualization of semiotics began in 1956, when he published “L’actualité du

saussurisme,” in which he examined works by Maurice Merleau-Ponty and Claude Lévi-Strauss. He concluded that: “the Saussurean postulate of a structured world, apprehensible in its significations can, indeed, contribute to the elaboration of a unified methodology for the Humanities and Social Sciences” (quoted in Greimas 1989: 541). This is a major breakthrough, for, in counterdistinction to the dominant trend of distributionalism, Greimas’s theory extrapolated concepts borrowed from Saussure’s “system” and Hjelmslev’s “process.” These innovations, Greimas thought, would enable great progress toward reframing the social sciences and humanities. Nearly a decade later, in 1964, both Barthes and Greimas gave seminars based on Hjelmslev’s linguistic and semiotic theory. Barthes later published his findings as *Elements of Semiology* and Greimas published his as *Structural Semantics*. As Greimas himself has noted on occasion, discourse analysis came about more or less by accident. Upon finding Lévi-Strauss’s paradigmatic analysis of myth to have fallen short of discourse analysis, Greimas turned to Vladimir Propp’s work on folk tales, which provided him with the syntagmatic or syntactic component of his theory. The principle consisted in positing that Propp’s function was not a function but a sentence, that is to say a verb and actants. When analyzing Propp’s 37 functions Greimas realized that they could be organized into four successive sequences, which corresponded to the syntagmatic unfolding of the actantial model: a quest sequence (subject → object) and a communication sequence (sender → object → receiver), in which two sequences of communication frame an action sequence. Later, an attempt was made to better formulate the elements of narrativity.

The advances in discourse analysis led to a third stage, beginning in the early 1970s. Greimas and his colleagues started from the principle that the function, as a verb, is

overdetermined by two elements: modalities and aspectualities. They described two kinds of modality (i.e., modes of signification): wanting and having-to, which *virtualize* the process; being-able and knowing, which *actualize* it. Similarly, an act consists in a subject causing something to happen or to be. But in order for something to be it has to be realized; for it to be realized, conditions for realization must be met, that is to say, a subject has to be able to do or know how to do. Along with the act as a causing, they developed the notion of the competence of a doing subject – causing-to-be or to-do became performance.

The Paris School discovered that the only way to construct a narrative grammar was as a modal grammar. On this view, communication consists not in a knowing-how but in a causing-to-know, that is to say, causing can be either in a realizing or in a virtualizing position. In this new narrative grammar, doing or causing and being are modalities; what remains is content, or semantics. The group worked on discourse analysis and adopted a strategy of treating texts as complex signs; their aim was not simply to apply theory to texts by way of methodology but to consider texts as living experiments for reconfiguring theory. Narrativity could thus be regarded as a syntactic form of the organization of the world. At this time, Greimas abandoned the Proppian analysis of narrative and constructed a syntax that functioned more or less as a calculus. Propp's actors became purely functional: for example, subject, object, antisubject, conjunctions, disjunctions, transformations. The constants in Propp's functional analysis of folk tale were reconsidered in terms of an ideological narrative schema that corresponded more or less to a individual's quest for the meaning of life, for the meaning of individual life, and for the meaning of collective being. The new model of the narrative schema was then

widely generalized, extended, and applied to numerous disciplines in the humanities and social sciences.

A fourth stage, extending into the twenty-first century, includes the development of a discursive syntax, since a narrative syntax based on modalities is already in place. The Paris School found the need to construct an *aspectual* syntax at the discursive level. When Greimas and his colleagues found that axiological, or value, systems rested either on modalities or on aspects, they began to study aspectual processes, that is, actions, cognition, and passions, which have a beginning (inchoativity), a duration (durativity), and an end-point (terminativity). It was a daunting task to study aspectualities, because unlike typical and stable binomial categories in semiotics, they are *tensive*. Tension, tensitivity, and laxity define the fundamental relation subject–object as seen by an observer. Moreover, during this last stage the Paris School has been attempting to give a semiotic interpretation to the traditional theory of passions.

Greimas's influence in semiotics has been powerful; his work with the Paris Group has enabled a number of new directions, including catastrophe theory, which is an attempt to found semiotics in mathematics; and the movement in post-Hjelmslev linguistics toward the elaboration of a semiotic typology of languages, especially monoplanar languages, biplanar languages, and metalanguages, which challenges the typology of signs put forward by Charles Sanders Peirce. As far as these scholars are concerned, linguistic systems, and not signs, are critical. The modalization of communication theory is another area under investigation that owes much to Greimas's innovations in semiotics. Instead of the traditional schema, which includes a sender, a receiver, and a message, modalization posits two interacting, modally competent subjects facing each other. Each subject, whether engaged in

conversation or arguing or simply fighting, has its own proper trajectory. Each has its own modal history and their meeting brings about a form of polemic or “structure of trust,” a struggle or engagement between two competencies that can be considered as a polemico-contractual intersubjective relation. In other words, we are dealing with a continuous tension between primitive confrontation or contractuality. However, there never is a definitive struggle, which differentiates pragmatists with their conversational or interactional structures from the Paris School and its narrative structures, for whom there always exists a subject and an antisubject who are in a permanent conflictual relation.

Greimas’s foundational theories of semiotics continue to provide the impetus for Paris School researchers, who focus on three major areas of semiotic investigation: the pathemic force of language, its ethical or moralizing dimension, and, finally, its aesthetic impact. The exploration and working out of these three domains should enable them to construct the next phase of their semio-narrative grammar.

H

Heidegger, Martin

PETER FENVES

Among the two or three most influential German-speaking philosophers of the twentieth century, Martin Heidegger (1889–1976) played a decisive role in the development of phenomenology, hermeneutics, existentialism, and deconstruction. After completing a dissertation on speculative grammar in late scholasticism, Heidegger came into contact with the originator of phenomenology, Edmund Husserl, whom he assisted for several years. In the 1920s, as a young professor in Marburg, with few publications to his credit, his magisterial teaching style attracted an impressive group of students, including Hans-Georg Gadamer and Hannah Arendt. In Marburg he also prepared the work for which he would henceforth be known, *Being and Time*. Immediately hailed as a landmark, it remains Heidegger's pivotal work. Although the direction of his inquiry changed in the ensuing decades, these alterations cannot be understood without an appreciation of what he tried to accomplish in his first major work. As it stands, *Being and Time* is a fragment; a second part was to be written under the title "Time and Being," and a third part would complete the "destruction" (i.e., dismantling or deconstruction) of the Western

philosophical tradition. Upon the publication of *Being and Time* in 1927, Heidegger moved to Freiburg, where he began to doubt that his initial conception of the project could be sustained.

All of *Being and Time* follows from the question with which it begins: "we should raise anew *the question of the meaning of being*" (1962[1927]: 19). Heidegger places this inquiry under the rubric of phenomenology because it is directed toward the "logos" (hence, the meaning) of a phenomenon, which in this case is that of being (*Sein*). The advantage of phenomenology for Heidegger's project lies in its distance from the Platonic tradition, which conceives of being as a "heavenly place" that lies "beyond" appearances. For Heidegger, being is neither "behind" nor "beyond" phenomena and cannot therefore be represented primarily in terms of underlying substances. But an inquiry into the meaning of being is unlike other phenomenological investigations because being appears only as the being of an entity (*Seiende*). The inquiry thus begins by singling out an outstanding entity whose own understanding of being will be disclosed in preparation for the goal of uncovering the meaning of being as such. Because the question revolves around meaning and understanding – rather than axioms and principles – the inquiry is also

hermeneutic. The outstanding entity Heidegger identifies at the inception of *Being and Time* is that of the questioner, who is always in some way concerned with its own being. Heidegger calls this entity *Dasein*, which can be translated as “being-there” but is generally left untranslated in English discussions of his work.

Heidegger introduces *Dasein* as a technical term in order to distinguish his inquiry from the philosophical subjectivism that developed out of Descartes’s effort to ground knowledge in the self-certainty of the self-reflective subject. *Dasein* is not the human being in general but, rather, that self-understanding entity whose “‘essence’ . . . lies in its existence” (1962[1927]: 67). In other words, *Dasein* does not express its inner nature by developing toward some prescribed goal; instead, it finds itself thrown “into its ‘there’” (174). The disclosure of its “thrownness” takes place in moods and affects, not by means of theoretical reason. Far from being a locus of consciousness that must somehow connect with a transcendent world of things, the “there” into which *Dasein* finds itself thrown is always a world. And the world, for its part, is not an aggregate of things but, rather, a unitary complex of meanings that derives from the project in which *Dasein* is currently absorbed. The first part of *Being and Time* describes the “thrown-projective” character of “everyday” *Dasein*, which does not so much find as *lose* itself by interpreting its being on the basis of what an indifferent “anyone” (*das Man*) sees and says. Heidegger calls this movement of self-securing “fallenness.” Instead of seeing itself as nothing beyond its own possibility, everyday *Dasein* clings to whatever presents itself as firmly established.

The second part of *Being and Time* aims to uncover a countermovement to that of fallenness. Just as Husserl proposes a “phenomenological reduction” in which

the “natural attitude” is “put out of action,” Heidegger repeats his analysis of everyday *Dasein* so that the character of “authentic” *Dasein* can appear, with the expectation that the meaning of its *own* being will come to light. The source of this reduction is not a new attitude, which the inquirer could adopt at will; rather, the reduction of everydayness derives from what *Dasein* cannot overcome, obviate, or “put out of action,” namely its own death. But there is a basic problem of phenomenology here: one’s own death cannot appear to oneself. As the “ownmost possibility” of *Dasein*, death recedes from phenomenality in general. Unless one’s own death can announce itself, however, the inquiry goes no further. Heidegger thus claims that there is “first-hand” evidence of one’s own death: the call of conscience, which retrieves *Dasein* from its fallenness by revealing its nothingness – its lack of essence beyond existence. Authentic *Dasein* sees itself as guilty, in turn. Guilt here is not moral culpability but, rather, an ontological condition, in which every decision “realizes” a specific possibility of *Dasein* and thereby violates its existential character. On the basis of his analysis of death, Heidegger delineates both the futural character of *Dasein*’s temporality and its corresponding historicity. Authentic *Dasein*, in contrast to its everyday counterpart, emerges from a historical “people” (*Volk*). Far from ending with a grand summary, however, *Being and Time* ends with a question: Why has the entire philosophical tradition succumbed to a “vulgar” concept of time as a succession of now-points and thus failed to see that time is the horizon in which being is understood?

The claim that time is the horizon for the understanding of being is a crucial element of the “destruction” of metaphysics that Heidegger proposes. And it also responds to a danger Heidegger discusses in the late 1930s in conjunction with his extensive

confrontation with Nietzsche's thought: the danger of "nihilism." To say that being does not lie beyond appearances is to renounce the metaphysical tradition; but it is not to affirm the nihilistic claim that being is no more than a word. For Heidegger, the being of an entity consists in whatever makes it accessible. To a certain extent, then, being can be interpreted as "ground" or "reason." Heidegger published a supplement to *Being and Time* under the title "On the essence of ground" that pursues a question of the following kind: if the being of something makes it accessible, what makes being accessible? And being must somehow be accessible, for otherwise no inquiry into its meaning could even begin. To say that time is the horizon in which being is understood means above all that finite ("horizontal") time allows the being of Dasein to appear – but perhaps only the being of Dasein. *Being and Time* elaborates another version of the same schema, which is not so thoroughly implicated in the analysis of Dasein: insofar as the being of something makes it accessible, being itself can be understood as the event of unconcealment (*Unverborgenheit*); but unconcealment is itself accessible only by virtue of a prior concealment, which can then be considered the "ground" or "essence" of being.

Heidegger's thought then turns to the idea of primordial concealment. It – rather than death – functions as the nonphenomenon that allows the being of things to appear. In some of his later writings Heidegger spoke of a "turn" (*Kehre*) he undertook in the years after the publication of *Being and Time*. And there is no doubt that the lectures and essays of the late 1930s are different from those of the late 1920s. The precise character of, and underlying reason for, this "turn" are matters of scholarly dispute, especially since political events intervened in Heidegger's self-described "path of thinking." Soon after Hitler seized control

of the German state in 1933, Heidegger joined the Nazi party and assumed the rectorship of the university in Freiburg. His inaugural address emphasizes the degree to which the sciences are to subordinate themselves to the will of the *Volk*. Less than two years later he resigned as rector, and around the same time he began an intensive study of Friedrich Hölderlin, especially his "river poems," from which Heidegger attempts to discern the relation of the ancient Greeks to the modern Germans and thereby trace out the fate of the latter. Heidegger's 1934 lectures on Hölderlin's poem "The Rhine" mark the beginning of his exposition of poetry in particular and art in general. In the same vein, he undertakes a dismantling of traditional aesthetics in conjunction with his reflections on Nietzsche's attempt to overturn metaphysics by elevating the value of art over that of truth. And in the mid-1930s Heidegger prepared a series of lectures that were revised for publication in 1960 under the title "The origin of the work of art."

Foregoing the traditional concepts of aesthetic reflection, while emphasizing the circular character of his own inquiry, Heidegger makes the bold assertion that "art is truth setting itself to work" (1971: 39). Truth is understood here not as the correspondence between thought and thing but, rather, in accordance with the translation of the Greek word for truth that Heidegger first discusses in section 44 of *Being and Time*. Reading the *a* of *aletheia* ("truth") as a privative, Heidegger elucidates truth as the negation of forgetfulness or concealment (in Greek *lanthanomai*). "The origin of the work of art" does not discuss the thrown-projective structure of Dasein; instead, it identifies a similar structure in art: every great work of art is riveted by a struggle between world and earth. The world erected by the work is disclosive, whereas the earth from which it emerges

tends toward concealment. The struggle between world and earth stamps the work with a “rip” or “outline” (*Riss*) that cannot be reduced to the aesthetic category of form (1971: 70). Every work is thus a site in which the earth (concealment) is drawn into the open (the world). More exactly, the work of art allows concealment to come into the open – as concealment, which refuses to make itself accessible. The work thus sets up a disturbing place for the “essence” of being to show itself in the very gesture of refusal. Heidegger nowhere associates his analysis of art with that of authentic Dasein; but both the work of art and the call of conscience give evidence of what altogether recedes from appearances – one’s own death in the first case, the “essence” of being in the second. “The origin of the work of art” is, however, as hesitant about its conclusion as *Being and Time*, for Heidegger emphasizes that the ways of concealment are so elusive that we can never know in any given instance whether it is a matter of genuine refusal or only a dissimulation of what under other circumstances would appear.

After World War II the French forces that occupied Freiburg denied Heidegger the right to teach. But his thought continued to influence much of French philosophy, including the work of Jean-Paul Sartre, whose identification of existentialism with humanism prompted Heidegger to write a “Letter on humanism” in which he denied that he was ever an existentialist, dismissed humanism as a late-born species of metaphysics, and described language as “the house of being” (1977: 213). In the same context Heidegger began to reflect on the “essence” of modern technology. Far from denouncing it as a mere means that encourages us to forget about human ends, he emphasizes its disclosive character. Modern technology does not simply uncover things, however; it also challenges them – so much so that their being consists in a

constant “stockpile” (*Bestand*) that meets the challenge (1977: 298). The ever-accelerating activity of modern technology thus runs counter to the fundamentally retarding work of art: the latter sets up a site where concealment remains concealed, whereas the former recognizes concealment only in the form of the yet-to-be-uncovered. Many of Heidegger’s last writings, including his readings of early Greek thought and modern German poetry, seek to delineate a “counterarea” (*Gegend*) that is not so much beyond the provenance of modern technology as its implicit horizon, where things are no longer made and being is tautologically allowed to be (see especially 1966).

Hermeneutics

PAUL B. ARMSTRONG

Hermeneutics is the study of the theory and practice of interpretation. It is closely related to semiotics, the theory of signs. There is a problem for interpretation, it is said, whenever there is the possibility of misinterpretation, and this is the case every time signs are used. Hermeneutics has traditionally been of special interest in such fields as biblical and legal interpretation, where the stakes are high in determining which of various competing meanings to regard as correct. Renewed attention has come to be paid to hermeneutics as many different movements in modern philosophy have recognized that problems of language and communication are central to understanding human life. In contemporary literary theory, questions about how to adjudicate the conflicts between opposing critical methodologies, along with controversies about how to understand language and signification, have also made hermeneutics a prominent concern.

The tradition of interest in interpretation can be traced back to the Greeks. The term "hermeneutics" derives from the Greek word for interpretation (*hermēneia*) and is associated with the mythological figure Hermes, the winged messenger of the gods who symbolizes the crossing of boundaries, communication, and travel. In the medieval period, the main issue for hermeneutics was how to interpret sacred texts and, especially, how to explicate allegorical meanings. For

example, against the objection that "many different senses" coexisting in one text may produce "confusion or deception," St. Thomas Aquinas argued that "the very hiding of truth in figures is useful for the exercise of thoughtful minds" (1981 [1265–74]: I.9.2). With the Reformation and the onset of Protestantism, the insistence of Martin Luther (1483–1546) on the primacy of the individual believer's personal relation with God gave new importance to hermeneutics because of the question of how individual readers, no longer constrained by the institutional authority of the church, should interpret the Bible to discover their own truth. In the eighteenth century, with the Enlightenment's emphasis on the finite capacities of human reason, hermeneutics took a secular turn and focused on how to construe meaning as a function of language, history, and the intentions of the author. These remain central topics of modern hermeneutic theory.

The founder of modern hermeneutics is Friedrich Schleiermacher, whose lectures at the University of Berlin attempted to lay out a systematic theory of interpretation. Although Schleiermacher noted that understanding a text may require considerable technical knowledge, he also insisted that "interpretation is an art" (1985[1819]: 76) and cannot be reduced to a set of mechanical rules or procedures. The goal of interpretation for Schleiermacher is to put oneself "both objectively and subjectively into the position of the author" – objectively, by "knowing the language as the author knew it," and subjectively, by "knowing the inner and outer aspects of the author's life" (83–4). According to Schleiermacher, the interpreter should "transform himself, so to speak, into the author" and try "to gain an immediate comprehension of the author as an individual" (96). Schleiermacher famously declared, however, that interpreters must seek to "understand the author

better than he understood himself” and “must become aware of many things of which the author himself was unaware” (87). Schleiermacher’s concern with recreating the author’s inner world reflects the Romantic period’s conception of meaning as an expression of individual subjectivity. But his paradoxical description of interpretation as an attempt to understand the author by going beyond the limits of what the author knew launches the modern debate about whether an author’s intentions should constrain interpretation or whether a text may have meanings that these do not encompass.

The next seminal figure of nineteenth-century hermeneutics was Wilhelm Dilthey, who is known for his goal of establishing the humanities (*Geisteswissenschaften*) as a field of legitimate inquiry distinct from the natural sciences (*Naturwissenschaften*). The sciences explain nature by discovering relations of cause and effect, according to Dilthey, whereas the humanities seek to understand historical expressions of human life. The humanities are therefore fundamentally a hermeneutic science, and the methodologies appropriate to humanistic inquiry require a theory of interpretation.

Following Schleiermacher’s emphasis on recreating the author’s world, Dilthey identified “empathy” as necessary to understand another’s life-expressions. This is not solely a private, subjective matter for Dilthey, however, because he regards interpretation and meaning as deeply rooted in history. “Humans understand themselves, not through introspection, but only in history,” he argues (1913–79: 7:279; translation mine). “What humans are, only history can tell them,” he writes (8:224). Elsewhere, he is even more emphatic about the historicity of human experience: “the totality of human nature is only history” (8:166). For Dilthey, interpretation is an historical activity that has as its object the historically

situated life-expressions through which human beings work out their understanding of themselves and their worlds. Dilthey is an important forerunner of hermeneutic phenomenology in his attempt to develop an indirect route for understanding human existence, not through the immediacy of self-reflection, but by interpreting its historical manifestations in a way that takes social and cultural contingencies into account. His emphasis on the historicity of understanding and expression also announces the widespread concern in modern hermeneutic theory and in literary and cultural studies with the social, cultural, and historical dimensions of interpretation.

A central tenet of hermeneutics is that interpretation is a circular activity. According to the so-called “hermeneutic circle,” our understanding of any part of a text depends on our sense of the whole to which it belongs, even as we can only achieve an interpretation of the whole by working through its parts. We interpret the sentence “Joe was murdered” differently, for example, according to whether it occurs in a newspaper or a novel. The genre of a text (the kind of linguistic artifact with which we are dealing) is an important clue for interpretation because it gives us a preliminary sense of the whole into which we should fit its parts. Other indications of context – the period in which the text was produced, for example, or what we know about the author’s typical themes, interests, and style – are similarly valuable guides to interpretation because they provide hints about the way details in a text will form patterns. One reason we can be surprised as we read, however, is that our expectations about a text’s configuration may not be confirmed by later revelations if the parts refuse to fit the wholes into which we try to shape them. We may begin to sense someone is playing a joke on us, for example, if anomalies begin to accumulate and we suspect a hoax in a

report we had originally taken for “real” and “factual.” Or variations and innovations in a text may defy what we expected of its genre, period, or author. We would not experience such surprises, however, if interpretation did not depend on an anticipatory sense of the relationship between part and whole.

The circularity of interpretation suggests that understanding is a configurative process of building consistency and constructing patterns. The configurative movement of the hermeneutic circle is visible, for example, in the well-known perceptual shifts that can occur with those figures that first seem like a duck but that may change into a rabbit, or like an urn that may transform into two faces. In a circular manner, our reading of the beak of the duck shifts if we can be induced to see the figure instead as a rabbit, in which case this shape changes meaning and becomes a pair of ears. Similarly, two squiggly vertical lines may seem to compose the contours of a vase – until we shift the pattern to which we assume they belong and consequently see its details differently, with two juxtaposed mouths, noses, and foreheads now facing one another across the empty space that had previously formed the body of the urn. These gestalt shifts enact the circular interdependence of part and whole in interpretation and suggest that the hermeneutic circle describes not simply how we construe texts but, more fundamentally, how we understand the world.

The founder of existentialism, Martin Heidegger, saw in the hermeneutic circle evidence of how we are always ahead of ourselves as we project ourselves into a future of possibilities. His important chapter on “Understanding and interpretation” in *Being and Time* (1962[1927]) argues that interpretation is always guided by an anticipatory understanding that projects a range of meanings that the state of affairs in question may have. To interpret is therefore

to lay out (*aus-legen*) possibilities for which our expectations have paved the way. The “fore-structure” (*Vorstruktur*) of interpretation means that there is no understanding without presuppositions. To try to clear one’s mind of preconceptions is not the right way to know something, according to Heidegger, but would instead prevent one from understanding in the first place by eliminating the expectations that we need to guide our guesses about how a text’s details should be configured. According to Rudolf Bultmann, a theologian who was Heidegger’s friend and colleague during the 1920s, “the exegete is not a *tabula rasa* [blank slate], but on the contrary, approaches the text with specific questions or a specific way of raising questions and . . . has a certain idea of the subject matter with which the text is concerned” (1960[1957]: 289). Interpretation is paradoxical because it must be without presuppositions about its results, in the sense that it must hold itself open to the possibility that its expectations might not be fulfilled, even as it cannot do without presuppositions that direct and structure its attention toward what it seeks to understand.

The hermeneutic circle has many important implications for interpretive theory. It suggests, for example, that interpretation can never be entirely prescribed or reduced to a mechanism for churning out readings. Every interpretation of a text requires what Leo Spitzer calls an “inner click,” whereby we divine a configurative relation between part and whole. Because understanding requires guesswork, no rules or formulas can guarantee successful hypotheses in advance. Interpretation is a matter of hypothesis-testing, and different texts will require different guesses about how their parts fit together. Experience teaches inasmuch as past acts of interpretation give us practice guessing, but the most seasoned interpreter facing an unfamiliar text is still a beginner

who must try out various hypotheses about its configurations until the details “click” – and must then remain humbly aware that anomalies may arise that call for revising one’s guesses or for rejecting them and starting all over again. No theory of interpretation can guarantee that it will always provide persuasive, illuminating readings, and any critical methodology is no better than the skill of its particular practitioner in imagining plausible configurations and testing the ability of these hypotheses to adjust themselves to the evidence for which they must account. There is an ineradicable element of irrationality in interpretation because it depends on guesswork, but interpretation is also a rational enterprise to the extent that an interpreter subjects his or her hypotheses to critical examination and leaves them open to revision.

A persistent concern for hermeneutic theory is that the circularity of interpretation may turn vicious. If what we see in a text depends on the patterns we project, how do we know that our expectations are not self-fulfilling? There is no assurance that this risk can be avoided, and the danger of self-confirming circularity has prompted lively debates about validity in interpretation. The very possibility of surprise – of anomalies not fitting into the expected patterns – is one safeguard, but it alone is not sufficient to guarantee valid readings. If vicious hermeneutic circularity is a version of solipsism, another hedge against self-confirming self-enclosure is the intersubjective recognition of other interpreters that one’s hypotheses seem legitimate. Consensus itself can be blinding, however, by insulating interpreters who see in the same way from anomalies that might challenge their shared perspective. Interpreters from what Stanley Fish calls different “interpretive communities” (psychoanalytic, deconstructive, Marxist, feminist, etc.) may disagree radically with one another about how to read a

text, and resolving such disputes may be impossible because they reflect opposing presuppositions about the aims of interpretation. Such disagreements express the interpreters’ different assumptions about the sort of configurative patterns that should guide understanding, and they may not be proof of hermeneutic error so much as evidence that a text is open to conflicting interpretations. The danger of vicious, self-confirming circularity can never be absolutely banished, for it is a fact of hermeneutic life. The most one can say is that interpreters should remember that their hypotheses about a text’s configurations are provisional and contestable.

This being said, hermeneutic theorists are divided over whether a text’s meaning is fixed and invariable (the view of “monists”) or open to change according to how, where, and when it is interpreted by readers with opposing presuppositions, interests, and aims (the “pluralist” position). The leading monist is E. D. Hirsch, Jr., who argues in his influential book *Validity in Interpretation* (1967) that the meaning of a text is single, determined once and for all by the author’s intentions, which it is the responsibility of the interpreter to reconstruct. Hirsch distinguishes “meaning,” which in his view is determinate and unchanging, from a text’s “significance,” which has to do with how this meaning is evaluated against different, variable contexts, purposes, or interests.

According to Hirsch, the only way to avoid vicious hermeneutic circularity and to decide correctly the meaning of a text is to grant priority to the author’s original intentions. Hirsch notes that the criterion of “coherence” alone cannot decide between competing interpretations because opposing hypotheses about a text’s configurations can fit its parts together with equal success. That is exactly the problem, he argues: “If we have a distorted sense of the text’s whole meaning, the harder we look at it the more

certainly we shall find our distorted construction confirmed.” Thus, he continues, “the only way to avoid pure circularity in making sense of the text” is to compare one’s reading with “the author’s typical outlook, the typical associations and expectations which form in part the context of his utterance” (238). Hirsch’s critics point out, however, that this move displaces rather than resolves the problem of validity, because the question then becomes how to interpret the other texts that an interpreter might consult (letters, diaries, essays, and other literary works) to construct “the author’s typical outlook.” As these critics note, interpreters who disagree about the meaning of a given text will usually also read an author’s other writings in opposing ways.

A leading proponent of the pluralist position is Hans-Georg Gadamer, who argues in his monumental work *Truth and Method* that “there is something absurd about the whole idea of a unique, correct interpretation” given “the finitude of our historical existence” (1989[1960]: 120). According to Gadamer, meaning is not a thing-like entity that knowledge should seek to reflect without distortion. It is, rather, a dialogical interaction between interpreter and text, a to-and-fro exchange on the model of “play” (*Spiel*) that neither party fully controls and that will vary according to what each party contributes. Gadamer describes understanding as a historically contingent process whereby the “horizons” of the text and the interpreter meet and interact in potentially unpredictable ways. On the one hand, the text is directed across the horizons of its original situation toward a future of interpretation it cannot fully anticipate or control. On the other hand, interpreters set in motion expectations based on presuppositions that define their historical, social, and cultural situation, and thereby open themselves across their horizons to the possibility of surprising new

experiences that may transform their understanding of themselves and their worlds. This “fusion of horizons,” as Gadamer calls it, will vary according to the historically changing presuppositions and interests of the interpreter. “Not just occasionally but always, the meaning of a text goes beyond its author,” he argues, inasmuch as the historicity of understanding means that later readers will “understand in a different way, if [they] understand at all” (296–7).

Gadamer argues against what he calls the Enlightenment “prejudice against prejudice” because the prejudgments (*Vorurteile*) that interpreters bring to a text are not simply obstacles to understanding, but are necessary to set the process of dialogue in motion. We can never know in advance, he argues, which of our presuppositions will turn out to be productive and facilitate dialogue with the text and which will prove misleading, unhelpful, or erroneous. Testing our prejudgments is one value of hermeneutic dialogue. By putting their presuppositions to work, interpreters also put them at risk, because the encounter may reveal their limits and call them into question. “To be historically means that knowledge of oneself can never be complete,” Gadamer explains (302). What one may learn in hermeneutic exchanges about the blindnesses and shortcomings of one’s defining assumptions can make interpretation a process of self-discovery through the unpredictable work of understanding others.

The indispensable role of presuppositions in understanding leads to what the prolific French philosopher Paul Ricoeur calls “the conflict of interpretations.” Ricoeur distinguishes between different kinds of hermeneutic methods, according to what they aim at and how they go about disclosing it. According to Ricoeur, “archaeological” methods practice a “hermeneutics of suspicion” inasmuch as they regard the surface presented by a text as a disguise to be

unmasked in order to uncover the meaning behind it. "Teleological" methods advocate a "hermeneutics of revelation" that seeks meaning not behind but beyond, in the values, possibilities, or goals a text testifies to or tries to open up to our view. The rule for reading, in such methods, is not suspicion, but trust, faith, and hope. Influential modern practitioners of suspicious hermeneutics include Sigmund Freud, Friedrich Nietzsche, and Karl Marx, but they in turn differ among themselves about the kind of secrets or hidden meanings interpreters should seek to unmask. Nietzsche demystifies institutions and ideological systems in order to reveal the will-to-power they disguise, whereas Freud construes textual distortions as evidence of the regressive pull of infantile fixations and unconscious desires, and Marx interrogates the apparent self-sufficiency of the cultural superstructure to disclose its dependence on the economic base.

Practitioners of revelatory hermeneutics include various kinds of formalism that seek to foster appreciation of a work's values rather than suspect its deceptions, and these methods can also vary among themselves in their assumptions and aims. For example, followers of Kant who view a work of art as a self-contained, autonomous entity may seek to describe the linguistic features through which a poem calls attention to its own structure (such as rhyme, rhythm, and other parallel constructions) and thereby achieves self-referential, formal closure. For the new critics, this means describing how a work attains organic unity by molding contradictory elements together through such techniques as paradox or irony. By contrast, phenomenological critics view the work not as an object-like entity, but as a meeting of subjectivities, and they consequently aim to explicate the patterns of response whereby the consciousness of the reader brings to life authorial acts of meaning-creation lying

dormant on the page. Such critics often take a positive view of disjunctions and disruptions in the reader's experience of a work, inasmuch as these disturbances may pose a challenge to customary ways of making sense.

Whether suspicious or revelatory in orientation, interpretations may come into conflict when their guiding presuppositions embody opposing beliefs about language, literature, and life. The question then arises whether such differences can be resolved. Here, it is useful to make a distinction between "weak" and "strong" hermeneutic disagreements. Disputes may arise between interpreters with shared presuppositions because they wager that different hypotheses about textual meaning will do a better job of fitting its parts together into inclusive, suggestive, or otherwise interesting configurations. Such disagreements are one of the ways interpretive communities go about the business of hypothesis-testing. Disputes within an interpretive community may be vociferous, but they are "weak" in the sense that fundamental presuppositions are not at stake, as they are in "strong" conflicts between rival hermeneutics with opposing theories about human being, textuality, and culture.

The disagreement between Marx and the structuralist Claude Lévi-Strauss about how to interpret Greek tragedy provides an instructive example. Attempting to explain how works from ancient Greece still appeal to modern audiences, Marx calls attention to the historical conditions of production when they were written and interprets classical mythology as an effort to establish imaginary mastery over nature when rudimentary economic practices prevent real control. The modern audience's appreciation of the past has to do, in his view, with the nostalgia of an advanced industrial society about its primitive beginnings. By contrast, Lévi-Strauss sees Greek mythology

not as an historical social practice but as a logical tool for conceptualizing universal contradictions. He consequently views Sophocles' version of *Oedipus* as an attempt to resolve a logical contradiction between two theories of human origins (are humans born from one stock or two parents? i.e., is reproduction a replication of the same or a creation of difference?). This contradiction recurs, he argues, in later instances of the Oedipus story (in Shakespeare's *Hamlet*, say, or Freudian psychology).

Marx and Lévi-Strauss disagree about how to interpret classical mythology, but their different interpretations go back to a more fundamental, "strong" disagreement about what to assume about the "being" of human being – in this case, between Marxism's presupposition that human beings are social animals whose nature changes with their daily practice and economic relations across history and culture, as opposed to the structuralist's assumption that humans are linguistic animals defined by their unchanging capacity to order the universe in binary oppositions (hence Lévi-Strauss's assumption that all versions of the Oedipus story are variants of the same mythic structure that repeatedly attempt to overcome the identical, unresolvable contradiction). Some methods of interpretation are more compatible than others because their defining presuppositions are reconcilable, but not all disputes in the conflict of interpretations are amenable to mediation because some presuppositions exclude others, and interpreters must ultimately decide in such cases what they think it is better to believe not just about a particular text but, more fundamentally, about language, literature, and life.

The fact of irreconcilable hermeneutic conflict is one reason why Richard Rorty (1931–2007), an important recent American philosopher in the pragmatist tradition, calls for abandoning the epistemological model of positivism that is based on the

metaphor of a "mirror" that seeks to reflect nature without distortion. He argues instead that "truth" is a contingent, contestable, and potentially multiple state of affairs that may vary depending on the "vocabulary" employed by the investigator. According to Rorty's influential and controversial theory, "there is no way to step outside the various vocabularies we have employed and find a metavocabulary which somehow takes account of all possible vocabularies, all possible ways of judging and feeling" (1989: xvi). In his view, "the idea that the world decides which descriptions are true can no longer be given a clear sense" (5) because a variety of not necessarily mutually compatible interpretive frameworks can perform effectively, and the most we can ever have is "a circular justification of our practices, a justification which makes one feature of our culture look good by citing still another" (57).

Rorty therefore calls on interpreters to regard their defining beliefs with "irony" – to combine "commitment with a sense of the contingency of their own commitment" (61) inasmuch as the language they choose to do their hermeneutic work cannot claim to be necessary and certain, but is only one among a variety of alternatives. "Truth," on this account, is "whatever the outcome of undistorted communication happens to be, whatever view wins in a free and open encounter" (67) – and this may and probably will change across history and from culture to culture. The value of maintaining an "ironic" attitude toward one's hermeneutic commitments is that it may allow the interpreter to engage in productive conversation with others about the comparative worth of different presuppositions, recognizing that no standard for judging these exists outside the conflict of interpretations.

Rorty identifies his philosophy with political liberalism, and the controversies his views have generated are among the many

important disputes in contemporary literary theory about the politics of interpretation. His notion that “truth” depends on the freedom of uncoerced dialogue among opposing interpreters echoes Jürgen Habermas’s advocacy of an ideal of undistorted communication that, in his view, might enable consensus determined by no force other than the force of the better argument. Rorty similarly calls for “persuasion” rather than “force” to decide interpretive disagreements. In addition to the dilemma that some disagreements may not be resolvable (an impasse that Rorty accepts but that Habermas laments), a further problem is that persuasion itself is not outside the workings of force and power. This is why, for example, Hans Robert Jauss distinguishes between attempts to convince one’s interlocutor by a comparative analysis of reasons (*Überzeugen*) and efforts to bully others into submission through tricks, stratagems, or coercion (*Überreden*). The political problem of rhetoric as an exercise of persuasive power is how to draw this line, and this dilemma calls attention to how the conflict of interpretations entails a battle for power.

Critics of Rorty’s liberalism and of similarly pluralistic models of interpretation also point out that pluralism itself is not neutral but is an ideology that reflects particular, historically contingent, and culturally relative European and American traditions. The notion of the public sphere as a free arena for exchanging arguments may consequently itself be exclusionary and coercive because it implies the prior acceptance of certain political values about how a community should be constructed. Defenders of pluralism reply that the values behind this model – for example, respect for the dignity and worth of human beings regardless of their beliefs, and recognition of the viability of different assumptions about the “good” – may indeed be histor-

ically and culturally contingent, but that they are nevertheless preferable to their alternatives.

Questions about the politics of interpretation have figured prominently in recent discussions of hermeneutic theory. An important precedent is Friedrich Nietzsche’s practice of “genealogy,” a suspicious hermeneutics that seeks to demystify cultural values and institutions by unmasking the power relations they serve (for example, disclosing how conventional moral categories stifle vitality and thereby preserve the dominance of groups that by other standards would be judged weak or bad). Inspired by Nietzsche’s analysis of the interrelation of knowledge and power, Michel Foucault argues that the notion “author” is not an unproblematic, natural fact, but is a historical institution and a “function of discourse” that serves various social and political purposes. According to Foucault, “the ‘author-function’ is tied to the legal and institutional systems that circumscribe, determine, and articulate the realm of discourses”; it “does not refer, purely and simply, to an actual individual insofar as it simultaneously gives rise to . . . a series of subjective positions that individuals of any class may come to occupy” (1977[1969]: 130–1). Rather than providing the goal of interpretation, the “author” should be regarded as a hermeneutic, culturally contingent construct. The authority of the author, on this account, is not a benchmark for validity but is a political mechanism that restricts and controls what can be meant and known.

This kind of critique of the political implications of epistemological categories shows the pervasiveness of hermeneutic processes in the construction of states of affairs that might otherwise seem simply “real” or “natural,” like gender, race, and sexual identity. An important example of this mode of critique in postcolonial and

cultural studies is Edward Said's influential indictment of "Orientalism." Said unmasks "Orientalism" by analyzing it not as an objective body of scholarship about the Near East, but as a mechanism, complicit with imperialism, for controlling others by deploying self-confirming categories and assumptions that (in a perversion of Schleiermacher's famous slogan) presume to know them better than they know themselves. According to such analyses, the possibility that the hermeneutic circle might turn vicious is not merely an epistemological dilemma, but is a manifestation of the will-to-power inherent in the will-to-know.

The prevalence of interpretations oriented toward political, historical, and cultural matters has given rise to renewed assertions of the neglected importance of aesthetics and literary form. Some advocates of a return to "beauty" and "aesthetic pleasure" have invoked Susan Sontag's provocative essay "Against interpretation," in which she claims that "the effusion of interpretations of art . . . poisons our sensibilities" and represents "the hypertrophy of the intellect at the expense of energy and sensual capacity" (1966: 7). She memorably concludes: "In place of a hermeneutics we need an erotics of art" (14). Although the new critics' practice of "close reading" was among her targets, Sontag's condemnation of the inability of interpretation to do justice to the aesthetic experience recalls Cleanth Brooks's influential essay, "The heresy of paraphrase" (1947), in which he argues that any interpretation cannot capture the elusive, definitive essence of poetry for the very reason that it always translates the work into terms other than itself. This argument recalls the Kantian notion that beauty is defined by its self-sufficiency, its capacity to rest within itself (it is characterized, for example, by "purposiveness without purpose" and "lawfulness without a law") (see Kant's *Critique of Judgment*). Such a

model of the autonomy of art implies a fundamental antagonism between aesthetics and hermeneutics.

A different view is offered by the "Poetics and Hermeneutics" group founded at the University of Constance by Hans Robert Jauss and Wolfgang Iser, heirs to the Gadamerian tradition. Jauss [1982] regards the aesthetic experience as integrally related to the role of expectations in understanding inasmuch as art has the capacity to provoke a "horizon change" in the audience. Whereas "'culinary' or entertainment art" confirms what the audience already thinks and feels by satisfying prevailing standards of taste and ethical judgment, "the artistic character of a work" can be measured by the challenge it poses to the aesthetic, moral, and emotional categories through which the audience receives it – that is, in Gadamerian terms, by its opposition to the existing "horizon of expectations." According to Jauss, the aesthetic experience consequently varies with the history of reception and the hermeneutic conventions of the audience. Works that were initially dismissed as "trash" or morally outrageous, he points out, may later come to be venerated as the audience's conventions for understanding and appreciating art change, and so-called "classics" that become excessively familiar can lose their aesthetic effect precisely because of their canonical status.

Without necessarily privileging disruptive or revolutionary art as Jauss does, Iser argues that a literary work's aesthetic effects depend on the "virtual dimension" that readers create by filling in gaps and building consistent patterns in an anticipatory and retrospective process that reflects the circularity of interpretation. Rejecting the "classical norm of interpretation" that sees meaning as a stable object lodged in the text, Iser describes reading as a dynamic, ever-changing, to-and-fro process that recalls his teacher Gadamer's characteriza-

tion of the hermeneutic encounter as dialogical “play.” Iser’s late work finds in the “imaginary” a capacity for negating pre-existing constraints and crossing boundaries that supports the production of an endless variety of fictive worlds. The to-and-fro of “play,” according to Iser, not only enables us to understand other worlds, but also provides the possibility for the potentially boundless creation of new meaning, including the generation of works of art that may embody unprecedented visions of what human being might be. The reflections of Jauss and Iser on the implications of interpretation for art, culture, and society demonstrate once again that hermeneutic questions are coextensive with the problem of meaning and show why, over its history, the theory of interpretation has interacted with so many domains.

Husserl, Edmund

PAUL B. ARMSTRONG

Edmund Husserl (1859–1938) was the founder of phenomenology, a school of philosophy that analyzes the structures of consciousness and experience. Born in Moravia in the Austro-Hungarian empire to Jewish parents and educated in Vienna and Berlin, Husserl first studied mathematics before turning to philosophy. He held prestigious professorships at the universities in Göttingen and Freiburg before retiring in 1928. During the 1930s, he was persecuted by the Nazis because of his Jewish heritage (e.g., he was denied library privileges at his former university). After his death, his library and approximately 50,000 pages of manuscript and typescript were smuggled to Leuven, Belgium, where the Husserl Archive was established.

Husserl sought to develop rigorous methods for describing how consciousness makes meaning because he thought this was necessary in order to clarify the foundations on

which philosophy, science, and other disciplines rest. This attempt to disclose the experiential basis of knowledge has important affinities with the American pragmatism of William James and Charles Sanders Peirce. Husserl's study of the lived world inspired the development of existentialism, and his descriptions of consciousness have informed aesthetic theories that focus on how the literary work is constituted by the author's and the reader's acts of meaning-creation.

The phenomenological method that Husserl outlined in *Ideas* (1998[1913]) begins by suspending the "natural attitude" that assumes the existence of things in the external world. In order to free philosophy of presuppositions, Husserl demanded the "bracketing" of everyday assumptions about subjects and objects. The givenness of conscious experience that remained after this "reduction" could then be described and analyzed, he argued, with confidence that it is the necessary and certain foundation of whatever knowledge we have about ourselves and the world. The existence of the external world is a contingent assumption, he maintained, but our experience of it is indubitable. Similarly, any psychological concepts about the self are abstractions from the lived experience of consciousness. Phenomenology has been characterized as a form of idealism because it regards consciousness as the foundation of meaning, but it has also been viewed as a kind of empiricism because it seeks to ground knowledge on actually lived experience. This duality reflects two of Husserl's primary concerns – namely, with identifying the fundamental structures and processes of meaning-creation and with locating these in the givenness of everyday experience.

The fundamental structure of consciousness and experience, according to Husserl, is "intentionality," a term that refers to the directedness of meaning, with "intentional

acts” taking aim at “intentional objects” (not to be confused with the colloquial notion of an “intention” as a conscious purpose). All consciousness is consciousness of something, he famously declared. Conversely, he argued, objects exist for us only as objects of actual and possible consciousness. Husserl’s first extensive analysis of “intentionality” came in his two-volume study *Logical Investigations* (1970b[1901]), but his most concise and accessible explanation of it can be found in a series of lectures published under the title *Cartesian Meditations* (1973[1929]).

One implication of intentionality is that objects are present in consciousness only in a particular aspect (*Abschattung*) or profile. Our perception of an object includes tacit assumptions about what is hidden or not-yet-disclosed from our perspective. We discover we had made such assumptions when we find ourselves surprised by aspects that later come into view – surprise we would not experience if we had not had expectations about what lay beyond our horizon. Our understanding of the world develops as perspectives blend (or fail to confirm our assumptions and expectations).

Time is fundamental to the creation of meaning, as Husserl shows in his important explorations of the lived experience of temporality in *The Phenomenology of Internal Time-Consciousness* (1964[1928]). Any particular moment has what William James called “fringes,” not only a “protentional horizon” that points ahead to potential future acts of understanding but also a “retentional horizon” that refers back to previous experiences that the present amplifies, confirms, disappoints, or revises. Objects are temporal constructions constituted through the interaction of these “protentional” and “retentional horizons.” Our sense of self is similarly a historically developing product of patterns of intentional activity that change according to our experiences over time.

Our assumptions and expectations about what other people experience are also crucial components of the horizon that both limits and defines our situation. Husserl’s *Cartesian Meditations* conclude with an extended reflection on the problem of solipsism, an important concern for phenomenology inasmuch as the procedure of “reduction” might seem to risk imprisoning the philosopher in a circle of isolated, private experience. Husserl finds that the horizonal quality of experience is not only temporal but also intersubjective. The world presents itself in aspects and profiles that we expect will complete themselves not only in the future but also in what other people can experience from perspectives different from our own. Although we are in some sense condemned to solipsism because we can never experience the world from the perspective of another observer (or share that person’s experience of himself or herself), phenomenological reflection reveals that our world is intersubjective through and through because our immediate experience includes, as part of its horizons, expectations about how it will blend with the experiences of other people.

Husserl’s reflections about the lived world (*Lebenswelt*), especially the experiences of temporality and other people, culminated in his final book, *The Crisis of the European Sciences* (1970a[1934]), which is an important source for existential phenomenology. Another key text is *Being and Time* (1962[1927]) by Martin Heidegger, Husserl’s student and designated successor to his professorship at Freiburg University. Heidegger describes his monumental study of the structures of existence as an exercise in phenomenological reflection. These two works were an important influence on the French existentialist philosophers Jean-Paul Sartre, especially his magnum opus *Being and Nothingness* (1966[1943]), and Maurice Merleau-Ponty,

whose seminal work *Phenomenology of Perception* (1962[1945]) is an extended exploration of the lived world.

Husserl's theories of consciousness have also been influential in aesthetics. They informed the analyses of his student Roman Ingarden of the constitution of the literary work of art by authorial acts of meaning-creation and their subsequent "concretization" in the aesthetic experience. The concept of "intentionality" is also central to the view of Georges Poulet and the Geneva School that literary works are constructs of consciousness that project a world. Husserl's theories of temporality and the historical constitution of meaning undergird the study of the act of reading and the history of reception by Constance School phenomenologists Wolfgang Iser and Hans Robert Jauss. The theory of intentionality also guided various studies of the process of interpretation in the modern revival of interest in hermeneutics led by Hans-Georg Gadamer in Germany and Paul Ricoeur in France. The critique of "presence" offered by Jacques Derrida's "deconstruction" also originated in an intensive study of Husserl's phenomenology (in *Speech and Phenomena* [1967]). Husserl sought to establish philosophy as a "rigorous science" by discovering its first principles, but instead the provocation of his thought has given rise to a multifaceted tradition of inquiry known as "the phenomenological movement."

I

Imaginary/Symbolic/Real

MICHAEL LUNDELL

Jacques Lacan's conception of the imaginary, the symbolic, and the real orders constitutes one of the most important developments in post-Freudian psychoanalysis. Based in part on Freud's thinking about the Oedipal complex and the unconscious, Lacan's triad provides a mechanism for describing different orders of psychic reality. In part because he never defined these terms explicitly, and in part because the relationship among the different orders is unstable, they remain in some ways enigmatic. Nevertheless, Lacan's own usage, and that of his protégés and successors, provides us with a fairly clear sense of their nature and function. The terms "imaginary," "symbolic," and "real" have proven extremely influential and have paved the way for a resurgence of interest in psychoanalytic approaches to literary and cultural texts, especially in cultural studies, film theory, feminist theory, and the study of sexuality and gender.

For Lacan the development of the human psyche has its roots in childhood. From birth the child lives in an imaginary world without language or an understanding of the individuality of the self. This is a pre-symbolic stage where the child's identity

does not exist in opposition to anything else. The child is an intractable part of the world in which he or she lives. The identity of the infant changes during what Lacan calls the "mirror stage." At this point in the child's development, an individualized identity begins to form quite apart from the child's parents. This discovery is of crucial importance, for at this time the child notices that he or she is different from the mother, who was the first object of the child's desire. For Lacan, this moment of individuation is an inaugural misrecognition by children of themselves; the "prosthetic" function of their parents having been disregarded in the fabrication of an illusion of self-sufficiency. But the lack that stems from this break with the pre-symbolic desire for the mother marks another starting point, this time the beginning of the child's desire to regain the fullness of connection that he or she enjoyed in the time before the mirror stage. The mother figure is also the unreachable figure of perfection and the father figure is the dominant, unbeatable, force of prevention. Both mother and father thus form an initial basis for what constitutes the unattainable "other."

The mirror stage is the beginning of the lifelong struggle between the desire for the other (whether the other is the self, the mother, or ultimately anything) and

the impossibility of ever attaining it. It is also the point at which the triadic construction of the psyche's relation to the world is established. The imaginary order is a pre-Oedipal, prelinguistic realm in which fantastic structures of the self (illusions of totality and completeness) arise in a stage of development that is, as Lacan puts it, "premature." This stage of development begins with the mirror stage and the emergence of the misrecognized self and continues to influence the subject throughout adulthood. It is through an acknowledgment of the imaginary that the subject is able to ascend to the symbolic order, in which the self is determined within social, legal, and other institutional structures. Social maturation is thus a kind of surrender to the symbolic order. Despite being made of so many fragments that necessarily change and shift over time, the imaginary is rooted in a unified concept of the self as a whole being made of these different elements.

It is within the symbolic order that the imaginary is made manifest. The symbolic is the order of language, and so it is within language that the subject attains a coherent social identity. Since Lacan proceeds from a structuralist understanding of language, the signifying systems that make up the symbolic will be constructed along the lines of significant differences. Thus there are opportunities in the gaps of discourse and institutional structures for the subject to reaccess the imaginary order; for some theorists, like Julia Kristeva, poetry and other aesthetic experiences afford such opportunities, as do religious and sexual ecstasy. By and large, however, it is in the symbolic order that the subject acquires the kind of social identity that prevents a permanent (i.e., psychotic) investment in the imaginary.

The symbolic order is the realm of language, law, and symbolization in which subjects constitute themselves *as subjects*.

Entrance into the symbolic begins with the acceptance of a primary law, which Lacan calls the "name of the father." Based on Freud's Oedipus complex, the "name of the father" is both the paternal figure and the abstract structures of law and language. The father figure prevents the infant from reconnecting with the mother just as language prevents its user from achieving a mimetic relation to the world it signifies. The symbolic order prevents the fulfillment of desire precisely because language and the law cannot designate the grounds of that desire in the order of the real. Ironically, the desire for the other that links the subject residually to an imaginary order can only be articulated within the symbolic. The real is the realm of what cannot be symbolized, the unattainable object of desire (which Lacan designated *l'objet petit a*); nevertheless, the symbolic constantly attempts to define, allude to, or grasp the real. Not "reality" in the common sense – that is, what we experience as real in the symbolic – the real is what escapes our experience, what is unavailable to it. The real exists before and outside of the symbolic, before the mirror stage; it is that which cannot be known but is the object of our most fundamental desires. In the terms of the triadic structure Lacan describes, desire is positioned in such a way that it grasps toward the unattainable real throughout life.

In psychological terms the three elements of the psyche are in a constant and shifting relationship throughout human development. The ability to understand and manipulate the relationship between the symbolic and the imaginary is necessary if one is to achieve a healthy and mature adult psyche. Elements outside of the control or grasp of the subject – that is to say, intrusions or irruptions of the imaginary – play an important role in constituting the symbolic order and can disrupt the subject's development and lead to psychosis or social

or aesthetic rebellion. The negotiations within the symbolic–imaginary relationship constitute psychic life. The imagined self is predicated on the symbolic for the constitution of its order. “The power of naming objects,” Lacan says of the symbolic in Book II of his seminars, “structures the perception itself” (2006[1966]: 169). Therefore the imaginary order is always incomplete and this produces a fundamental anxiety wherein the subject is aware that the elements of the symbolic order cannot truly represent the imagined self and yet the symbolic is the only means by which the imagined self can reflect in this critical fashion. “On the imaginary level,” Lacan says, “the objects only ever appear to man within relations which fade” (169). The real, on the other hand, is “impossible,” as Lacan frequently put it, because it cannot exist within the symbolic: it cannot be represented as it “truly” is because it defies definition completely. It defies truth, a dominant value in the symbolic order. The real is also the place where there is no absence, only absolute presence, while the symbolic is defined in part by the absence, in a play of difference, that constitutes signifying systems. The relation of the imaginary to the real must be negotiated through the symbolic, because the real has no “place.” The imaginary continues to negotiate toward the real, driven by the infantile desire for “*objet petit a*.” The desire of the imaginary order is thus the desire to regain the real of the pre-symbolic world.

The triad imaginary/symbolic/real has had wide application in literary criticism and theory. The act of uncovering the “meaning” of a literary text is a negotiation through the Lacanian triad itself. The reader must manipulate the symbolic order of the text’s words, narrative structure, characterization, and other elements in order to form a notion of what that text “means.” In this example therefore, the text is an imaginary

order constructed within the symbolic order. The meaning of a literary text is of course open to debate and therefore its “real” meaning can never be comprehended. Lacanian literary theory is less concerned with representations of mental states than it is with the function of language in the pursuit of desire. Take, for example, Lacan’s “Seminar on ‘The purloined letter’” (1972[1956]), which suggests that the text of Edgar Allan Poe’s short story is structured in such a way that it is akin to the structuring of the psyche along the lines of the imaginary/symbolic/real. Because of the prominence of letters (and their false variants) in the story, Lacan saw it as an example of how the object of desire (*objet petit a*) is pursued within the symbolic order. The imaginary investments of the characters are revealed through the circulation of the letter, whose meaning is deferred. It is this deferral that links the action of the story to the structure of the mind, particularly the unconscious, which Lacan famously likened to the structure of language.

Because Lacanian desire is so closely linked to the highly visual, prelinguistic imaginary order, it has been especially useful in film theory, where the triadic arrangement of orders helps us understand the vicissitudes of the viewer’s desire. Theorists like Christian Metz applied Lacan’s concepts to explore the role of the spectator who, like a child looking into a mirror, attempts to fashion his or her imaginary self through cinematic images. This attempt takes place in the symbolic order that structures film (through elements such as plot, characterization, color, sound, music, intonation and image) and in the subject’s viewing practices; but at the same time, the imaginary self constructed in the process is given access, however tentatively or fleetingly, to the *objet petit a*, the object of the viewer’s desire. Laura Mulvey (1975) complicates this Lacanian

reading by suggesting that gender plays an important role in the cinematic experience, which for Mulvey is constituted by an exposition of male fantasy by male filmmakers for male viewers. The presentation of a female character on the screen as an object of desire for a male character doubles, at the level of the symbolic, as an object of desire for the viewer, who is allowed, in the fantasy space of the cinema, to enter into the imaginary. The image that is manipulated by the film on the screen for male pleasure does so through a situation that mimics the mirror stage, where misrecognition paves the way for the construction of the “specular” ego ideal.

Mulvey’s Lacanian approach to film theory suggests that the construction of an imaginary relation to desire is the principle motive force of cinema. The Marxist philosopher Louis Althusser came to a similar conclusion concerning the subject’s relation to the world. Ideology, he argued, is “an imaginary relation to real relations” (1971: 82). In his widely anthologized essay “Ideology and ideological state apparatuses: (Notes toward an investigation),” Althusser develops a conception of ideology akin to Lacan’s mirror stage according to which the social subject comes to be “interpellated” as a subject by ideology. The subject thus takes an imaginary position within the symbolic, which functions through the repressive control of ideological state apparatuses (ISAs), such as schools, government institutions, the military, and so on. In his 1977 essay “Imaginary and symbolic in Lacan,” the Marxist literary theorist Fredric Jameson argues that the conflict between Freud and Marx can be mediated by Lacan. Marx and Freud each seem to suggest that they can identify the “real” of history (class struggle, Oedipal conflict), but Jameson believes that they each work with their own vision of the symbolic order and can therefore offer nothing more than illusory

representations of history. Lacan allows us to see history as the ungraspable real, and at the same time to see that our representations of history are actually symbolic textualizations of imaginary relations. In this context, history is as fragile and unstable as the image of the child in the mirror.

Perhaps the most influential and, arguably, productive use of Lacan’s triadic concept emerges in the work of the Slovenian philosopher Slavoj Žižek, who has developed a provocative theoretical model that combines elements of Hegelian and Kantian philosophy, cultural and film theory, and Lacanian psychoanalysis. In works like *The Sublime Object of Ideology*, Žižek argues that one must not overcome, resolve, or abolish the death drive, but rather “come to terms with it.” What we struggle with is our compulsion to repeat, symptomatically, the (re) capture of “the *Real of our desire*” (1989: 3). The “hard kernel” of the real – the “sublime object,” the *objet petit a* – the “impossible kernel which resists symbolization, totalization, symbolic integration” (1989: 6), can be encountered only in dreams, or in the “surplus-enjoyment” that arises through the crises and contradictions of capitalism. In *Looking Awry: An Introduction to Jacques Lacan Through Popular Culture*, Žižek outlines the state of the real in terms of its death as an authority. At the same time, he concedes that the real requires some form of identity. The “ambiguity of the Lacanian real is not merely a nonsymbolized kernel that makes a sudden appearance in the symbolic order,” he writes. “The real is at the same time contained in the very symbolic form: the real is *immediately* rendered in this form” (1991: 39). Žižek’s reinterpretation of Lacan’s work made it accessible to critics of politics and ideology. Of particular importance was his application of the Lacanian term *point de capiton* (“upholstery button”), which serves as a nodal point that halts the ceaseless sliding of the signified

under the signifier. Like the shark in Steven Spielberg's 1975 film *Jaws*, it is the point at which anxiety concerning the real crystallizes and takes on a sensible and knowable form.

The triad of concepts pioneered by Lacan has not only revolutionized psychoanalysis, it has become one of the most powerful analytical tools in the humanities to emerge from poststructuralism. While there is room for debate concerning the nature and effects of the real and imaginary orders, the symbolic order has acquired a well-nigh universal status in many branches of intellectual thought. Lacan recognized this aspect of the symbolic when he noted that "The human order is characterized by the fact that the symbolic function intervenes at every moment and at every stage of its existence" (1988[1978]: 29). In part because of the difficulty of his style, in part because so much of his corpus has remained untranslated, Lacan has remained a forbidding and even obscure figure in literary and cultural theory. But his influence on writers like Althusser and Žižek has meant that his ideas have gained wide acceptance, even while he himself remains an enigma.

Implied Author/Reader

JUSTIN SULLY

The concepts "implied author" and "implied reader" were introduced into literary criticism by Wayne Booth in *The Rhetoric of Fiction* (1961), which emerged from the neo-Aristotelian school of formalism associated with the work of R. S. Crane. Booth's seminal text, an expanded second edition of which appeared in 1983, set out to examine what he calls "the technique of non-didactic fiction, viewed as the art of communicating with readers" (xiii). This concern for the reader led Booth to re-evaluate the conventions associated with authorship and reading; specifically, to identify the authors and readers implied

by the reading process. The implied author and implied reader are figures imagined or “inferable” by the reader or critic based on formal and rhetorical elements of the text. The implications of these concepts for literary theory are significant, for they cast doubt upon readings of literary texts that rely on the real-life experience of authors and readers – that is to say, that rely on extratextual elements that are difficult, if not impossible, to locate, measure, or substantiate.

For Booth, the implied author, the authorial presence projected by a specific narrative, is often – or, many would argue, *always* – distinct from the “real” (i.e., the living or once-living figure to whom a given work is attributed) author of the text. The role and importance of the implied author is evident in cases such as Jonathan Swift’s “A modest proposal,” in which the author implied by the text is clearly at odds with what we know of the “real” author. Just as the implied author must be distinguished from the “real” author, so too is it distinct from the narrator. While the narrator is the character or voice that tells the story, the implied author is, in effect, an imaginary construct developed by the reader or critic from formal and rhetorical elements; it compensates for the absence of the “real” author by positing an original authority for both the written text and the story it conveys. In practice, however, the distinction between “real” and implied author can be difficult, if not impossible, to make or sustain. Indeed, this problematic relation is one of the reasons that the implied author is widely recognized by narratologists as a feature of all narratives (Rimmon-Kenan 2002). By suggesting that the problem of authorship is located predominantly, if not entirely, in the text, Booth’s concept of the implied author can be understood as part of the larger formalist project that includes the new criticism and

that regards with suspicion historicist and biographical interpretations of texts.

The implied reader, a concept that has enjoyed considerable theoretical attention, occupies in common usage a structurally analogous position to the implied author, by functioning as a mediating presence between a narratee or listener in a story and the real, individual reader of a text. In the narratological conception of the implied reader, which complements Booth’s implied author, the emphasis is laid on the image of the reader implied or intended by the text itself. The implied reader is thus distinguished by narratology from an audience, reader, or narratee that exists, even if unnamed, *within* the narrative. This distinction is especially helpful in clarifying certain complex cases of narrator–narratee relationships, for example in Chaucer’s *Canterbury Tales* or *The Thousand and One Nights* and in historical studies of readership (e.g., analysis of the “early modern reader”). This definition of the implied reader is closely related and sometimes indistinguishable from other narratological concepts, such as Michael Riffaterre’s “superreader,” Jonathan Culler’s “ideal reader,” and Umberto Eco’s “model reader,” that seek to describe how texts assume, demand, and imply readers equipped with specific linguistic competencies, kinds of knowledge, and experience (Riffaterre 1966; Culler 1976; Eco 1984). For some early phenomenological theorists of reading, like Georges Poulet, the text becomes a new kind of subject, one that occupies the reader’s consciousness: “You are inside [the text]; it is inside you; there is no longer either outside or inside” (Poulet 1969: 54). This notion introduces a new theoretical problem, for it now becomes clear that the “real” reader in an important sense *creates* the implied reader.

This phenomenological conception of the implied reader was systematically theorized by Wolfgang Iser, a leading figure in

the Constance School, which flourished at the University of Constance in the 1970s and '80s. Iser relies less on a separate category of reader inferred from linguistic or formal elements than on the idea of a reader defined by the very structure of reading itself. Iser differs from Hans Robert Jauss, his colleague at Constance, whose theory of reception focused on the "horizon of expectations" brought by "real" readers to their encounter with texts. Iser's indebtedness to German hermeneutic and phenomenological traditions of literary theory leads him away from formalism, in which the reader is understood as an effect of language or narrativity, and orients his thinking toward the cognitive act of reading, in which the reader, in the very act of reading, creates a horizon of meaning for the text. Iser's implied reader exists in a less determined relationship to the text and stresses instead the cognitive act of reading. For Iser, the implied reader exists in the mind of the reader and is formed in the dynamic point of contact between the singularity of the individual act of reading and the formal indeterminacies of the text. In this sense, the conception of the implied reader is an important attempt to produce a theory that accounts for both the structuring effect of reading and the autonomy and specificity of the individual reader's response. The implied reader, according to Iser, "incorporate[s] both the prestructuring of the potential meaning by the text, and the reader's actualization of this potential through the reading process – which will vary historically from one age to another" (1974: xii).

Iser's theory of reading, with its emphasis on a historically contextualized "prestructuring" process, laid the groundwork for reader-response studies in the 1970s. Along with early reader-response theorists like Stanley Fish, he helped to redefine the nature of the reader's engage-

ment with texts and textuality. The ambivalence and indeterminacy so often attributed by poststructuralists to the text could now be regarded as an essential component of the reading process. In *The Act of Reading* (1978), in which Iser developed further the role of the reader that he had first outlined in *The Implied Reader* (1974), the emphasis falls less on the nature of the reader implied in reading practices than on the nature of the reader's aesthetic response while reading. This turn to what Iser would, a few years later, term "literary anthropology," suggests that reading is an index to our humanity. "If a literary text does something to its readers," Iser writes, in *Prospecting*, "it also simultaneously reveals something about them. Thus literature turns into a divining rod, locating our dispositions, desires, inclinations, and eventually our overall makeup" (1989: vii). Far from reflecting a shift in his thinking about the reader (say, from an abstract presence to a dynamic process), Iser's later work on literary anthropology both supports and builds upon reader-response theory; further, it complicates the very notion of the implied reader by arguing that the textual practices that give rise to such a figure also alter the "real" reader that mediates it. It is perhaps because living readers are always available for study – indeed, because, in Iser's view, reading is central to being human in a way that "authoring" is not – that the implied author has not received the same kind of theoretical attentiveness.

In recent decades, new theories that investigate the "ethics of reading" have taken the idea of the implied reader into a new field of study. It should not be surprising that Booth has figured prominently in this new direction, nor that J. Hillis Miller, who began his career under the influence of phenomenological critics like Georges Poulet, has shown how poststructuralist theories of narrative are compatible with

an ethical point of view (Miller 1987; Booth 1988). By the end of the twentieth century, the implied reader had migrated out of the text and into an ethical world in which the critic, like the anthropologist, is able to seek the lineaments of our human experience.

Ingarden, Roman

ANTHONY FOTHERGILL

Roman Ingarden (1893–1970) was one of the most important twentieth-century philosophers to influence literary theory and criticism, applying the philosophy of phenomenology to literary and other artistic works, in seeking objectively to define the ontological nature of the work of art. Though his philosophical publications were massive in number and formidably broad-ranging in topic, it is with his works on aesthetics, most notably *The Literary Work of Art* (1931), and *The Cognition of the Literary Work of Art* (1937), that his impact in the English-speaking world has been greatest. Ingarden's influence can be found, on the one hand, in the formalist theory of René Wellek and the new critics and, on the other, in reader-response criticism and reception theory. These lines of development reflect the two foundational aspects of Ingarden's thinking: the idea of the autonomous work of art but also the role of the reader in realizing or "concretizing" it.

Born in Kraków, Poland, Ingarden studied, in the period 1912–18, first mathematics, then psychology and philosophy under Edmund Husserl in Göttingen and Freiburg, Germany. He wrote his doctoral thesis, which became his first book (1921), on Henri Bergson's concepts of "Intuition and intellect." He then taught philosophy

in Lvów where he wrote his habilitation thesis on *Essentielle Fragen* (Essential questions; 1924), under Kazimierz Twardowski. In 1933 he was appointed professor at Lvów University and published *The Cognition of the Literary Work of Art* (1973b[1937]) in Polish, as a sign of solidarity during a time of German aggression. During World War II, with Polish universities closed, he secretly continued to teach philosophy and mathematics to children in an orphanage secondary school. In 1945 he moved to Jagellonian University, Kraków, where he held the chair in philosophy from 1946 until his retirement in 1963. From 1950 to 1956 (under Polish Stalinism) he was suspended because of his alleged “idealism” (ironic, given his lifelong rejection of idealism, including the works of the later Husserl). In *The Ontology of the Work of Art* (1989[1962]) and *Experience, Artwork and Value* (1969) Ingarden extended his aesthetic discussion to embrace music and the visual arts and the idea of aesthetic value. He died suddenly on June 14, 1970, while still in full philosophical flow.

Ingarden’s aesthetic theories took the early realist phenomenological position of his teacher Husserl to focus less on the basic structures of consciousness than on the ontology of objects, their essential structure and status, as our experience has cognition of them through *intuition*. His complex studies of the ontology of the literary work of art, offer a critical philosophical analysis of its “strata” and structures conceived at a general level. He has sometimes been criticized for his overly abstract discussions, which very rarely refer to specific works. His aim was “scientific”: to describe the formal structures common to all “members of this class of objects.” He provided an account of what the object of literary study was: how it is “given to consciousness” and what kinds of knowledge we can expect of aesthetic experience (Crowley

& Olsen 1973: xiv). He thus saw his enterprise as theoretically prior to what literary scholars undertake when they investigate specific objects or practices (e.g., different forms of reader response in different genre). The latter might challenge his hypotheses if empirical study disputed his conceptualizations. His “intuitive” methodology also “bracketed out” consideration of extra-aesthetic factuality – social, historical, psychological contexts of the work – and theories stemming from such contexts.

His primary philosophical concern was with the realism/idealism problem and he saw in aesthetics, in the category of the work of art, a testing ground for that problematic dichotomy. Unlike real objects or events, or ideal objects, works of art are “purely intentional” objects, acts of consciousness, owing their existence and essence to that consciousness and not equivalent or reducible to “real” objects, although they do have a material base (for a literary work, printed letters on paper; for a cathedral, “a pile of rocks”). Nor are they ideal essences, like the idea of a triangle or the number five, for they exist in time, are time-bound and changeable.

Ingarden summarizes his basic theses in his Introduction to *The Cognition of the Literary Work of Art*. (1) Every literary work is a multilayered formation composed of four heterogeneous “strata”: (a) “word sounds” and phonetic formations of a higher order, for example, rhythms, alliteration, the melody of sentences, and so on; (b) “meaning units,” ranging from the meaning of individual words to that of sentences and whole paragraphs; (c) “schematized aspects” through which the objects of the work are presented (e.g., visual or auditory or psychological facets) of (d) the stratum of “represented entities” (the “state of affairs,” as he called them – the objects, events, and other elements forming the work’s characters, plot, setting, and so on). (2) Strata

cohere in a “polyphonic harmony,” creating the work of art as an organic unity. (3) Literary sentences, unlike those in scientific or nonliterary discourse, which make genuine assertions or judgments about the real world, are “quasi-judgments,” creating the fictional appearance of “reality,” but without any referents beyond the presented world. Similarly, objects in works of art inhabit “quasi time and space,” not real time and space, even when real historical events or places are ostensibly “referred to” in, say, historical novels. (4) The “purely intentional” literary work of art, created by the artist’s consciousness and carrying within its strata “artistic value,” is to be distinguished from the “aesthetic object” which is the outcome of its realization, its “concretization.” This latter is achieved through the creative attention of the individual reader’s consciousness (or, with drama, a production of a work and its apprehension by the spectator). The aesthetic object carries the aesthetic value held in potential in the work of art. (5) The work of art must be distinguished from its concretizations, for it is a *schematic* formation, a skeletal structure to be “fleshed out” in the concretization process. Furthermore, this schematic quality implies the existence of many “places of indeterminacy,” gaps in the text where a thing, an action, an event, a stretch of time, say, are not definitively supplied. These indeterminacies, these unwritten aspects, are “filled in” in the readers’ imaginations, in their concretizations. It follows that there can be no definitive concretization, for a wide variety of readers will use the work identically as a core for their own concretizations. Indeed, the same reader can, on rereading a given text, generate alternative concretizations, thus enabling a kind of self-critique.

Ingarden made conscious many aspects of reading and understanding art works which typically remain unconscious. He

provided many avenues for literary critics to explore. His analysis of literary (quasi) time, for example, and of the temporal sequentiality of the written text has enabled sophisticated analyses of how reading is directed by, but also creates, the work. Similarly, the ways individual readings (need to) overcome the *indeterminacies* of the text explains the plurality of concretizations and thus “interpretations” of works. His model of strata also helps to explain differences of evaluation of a work among critics who are in fact emphasizing different strata. In genre studies it also enables us to recognize differences of stress between genres (e.g., word sounds in modern poetry) and across time (the modernist novel’s tendency to emphasize “schematized aspects” over “represented entities”). Postmodernist critics have recognized in his work a forerunner to the self-conscious fictionality of their period, while arguing that what for Ingarden is implicit in the text is for them explicit, thus in part undermining his argument. Though his work built a bridge between philosophy and contemporary literary theory and criticism, his emphasis on the “harmony” of the work has also been criticized as based too fully on classical notions of organic unity unable to accommodate modern nonrealist experimental art.

Intentional Fallacy

PAUL H. FRY

"The intentional fallacy," the famous essay of 1946 by William K. Wimsatt and Monroe Beardsley, is easy to misunderstand and has quite frequently been misunderstood. Its purport is clearly that a poem should speak for itself. In urging criticism to look for internal coherence in a poem rather than for extraneous evidence of an author's guid-

ing intention, Wimsatt, Beardsley, and their colleagues (who came to be called "the new critics" after the title of John Crowe Ransom's book, *The New Criticism* [1941]) were engaged in part in a continuation of the attack on romanticism and its late nineteenth-century variants that emerged after the turn of the twentieth century by T. S. Eliot, T. E. Hulme, and Ezra Pound, all of whom emphasized authorial impersonality. A poem is not an "expression" of feeling, but rather a discrete, independent verbal object, a complex of meaning. Wimsatt and Beardsley and the other new critics tended to emphasize poetry, suggesting that a poem with its smaller scope and denser texture exhibits a more complex unity than a novel or a play. The new criticism did eventually turn its attention to novels and plays, but always drew from the model of the poem in reading them.

The poet and critic William Empson always complained that "the Wimsatt Law," as he called it, forbids us from considering an author's intentions and declares further that "no reader can ever grasp the intention of an author" (Empson 1984: vii). This is not quite the case, as clearly in the course of reading we may or may not grasp the meaning of an author (there is no reason why we should not); but Wimsatt and Beardsley would argue (1) that we can never know whether we have done so, and (2) even supposing that we have done so the invocation of an intention is not a proper criterion for the determination of meaning. Nor is it quite fair to see the spirit of their essay, with Empson, as legislation meant to empower critics and disenfranchise poets. It oversimplifies, too, to follow the generations of "historical" critics who continue to claim that the new criticism ignored history, a part of which, of course, is authorial biography. It is tempting to defend Wimsatt and Beardsley from this charge by saying

that they anticipate the historicist Michel Foucault of "What is an author?" (1977 [1967]) and the then-structuralist Roland Barthes of "The death of the author" (1977 [1968]). The argument can indeed be made, but Foucault's essay is ultimately a challenge to the implicitly political or ideological "authority" of the author and Barthes's a challenge to the historiographical premise that the genesis of a structure is its meaning. In Wimsatt and Beardsley, there remains a place after all for both the author and for history.

Wimsatt's student E. D. Hirsch does not so much misunderstand him in his important book, *Validity in Interpretation* (1967), as argue that ignoring authorial intention introduces a measure of ungrounded subjectivity into interpretation and amounts to a tacit denial of the possibility of correct or valid interpretation. While it is true enough that Wimsatt and Beardsley have little to say about validity, and – as authors of *The Verbal Icon* – would strongly disagree with Hirsch's contention that "meaning is an affair of consciousness not of words" (1967: 4) they certainly do see criticism as subject to norms. Indeed, in their view one of the criteria for the success of a poem is that its meaning can be known. If its meaning is anyone's guess, then it must be internally incoherent – or, more precisely in their language, it must contain elements that are not "relevant."

But this claim introduces a more complicated confusion that arises at least in part from the terms of the essay itself. In laying stress repeatedly on judging the "success" of a poem as the critic's task, the authors collapse into one another what would seem to be the separate critical tasks of interpretation and evaluation. To know the meaning of a poem, one would have thought, is not the same as to approve or disapprove of it; but Wimsatt and Beardsley really do appear to render these critical acts

inseparable, on the grounds (but one must infer this) that a bad poem is either incoherent, a botched thought, or trivially coherent, a greeting card sentiment, and a good poem is coherent at a high level of complexity. This inference is surely what they have in mind (the reader may notice, here and elsewhere, how difficult it is to avoid speaking of intention), yet they do not say so; and Wimsatt admitted in "Genesis: An argument resumed" that instead of saying "judging the success of a work of literary art" in the first paragraph of "Intentional fallacy," he and Beardsley should have written "judging either the meaning or the value of a work of literary art" (1976[1968]: 222). That the distinction between interpretation and evaluation remains largely unexamined (or is assumed not to have even provisional importance) is the reason why the authors' exchange with Ananda K. Coomaraswamy on whether anyone with their critical principles could distinguish between "a skillful murder and a skillful poem" (Wimsatt & Beardsley 1954b: 6) is unsatisfactory and confusing. Nevertheless, it is possible to infer even from this exchange that meaning and value are inextricable (the meaning of a murder can never be anything other than crude, morally maladroit, hence murder is simply by definition unskillful), and this position is consistent with their overall argument.

Finally, it is frustrating to many readers that the authors do not extend their sense of intention ("*what he intended*," as they put it in italics) to include a concept that was readily available to them in the philosophical tradition and that would have suggested a way of reconciling intentionalism with their own criterion of internal coherence. This concept is often called "intentional structure," and is meant to suggest, among other things, that where one discerns a structure at all one perceives likewise

discerns an intention, albeit not necessarily the intention of an author. (It could be one's own, though it necessarily entails an intuition of another's intention.) This position was revived in an important essay by Steven Knapp and Walter Benn Michaels called "Against theory" (1982), which argues that if uttered language or even language as such (in dictionary definitions) is not understood as intended then it is not language at all but only looks like language. Thus in disagreeing with each other, Knapp and Michaels argue, Wimsatt and Hirsch, for example, perform the misfire common to all literary theory: in claiming *either* that intention is irrelevant to meaning *or* that meaning can only be grounded in intention, they suppose in common that there is a difference between intention and meaning which in fact does not exist. Without examining this argument (which is borne out in English at least by the dictionary, as to intend and to mean are the same), one can see that with some such concept as "intentional structure" in place, the sense of alternative paths that makes the Wimsatt and Beardsley argument polemical, the sense of a fatal choice to be made between intention and meaning, would not have needed to be sustained.

"The intentional fallacy" begins with five "propositions," here paraphrased: that a poem is produced by an intention does not make intention a standard for judging it; the only way to gain knowledge of intention that is not intrinsically evident is to seek external evidence for it (the author's stated intention in letters, etc.), which is unreliable; like a successful pudding or a machine, a successful poem has no lumps or bugs in it – all tends to a single end, achieved meaning, and the poem therefore differs from a practical message, which is "successful if and only if we correctly infer the intention" (Wimsatt & Beardsley 1954b: 5) (a poem by contrast only seems to communicate

with an auditor; as J. S. Mill said, it is not heard but overheard); a poem expresses thoughts, but they are the thoughts of a dramatic speaker or "persona," not the poet; a poet can improve a poem in revising it, hence in a sense improving on an original intention, but "it follows that his former concrete intention was not his intention" (1954b: 5).

These propositions are subject to the misunderstandings and objections already discussed, and need little further elucidation, but they should suffice to show how far from the truth it is that Wimsatt and Beardsley think a poem is somehow unintended, or that it has no author. One may say, perhaps, that the author "thinks a poem," but that is a very different matter from what the author thinks *about* it, which has no special authority. In pursuit of this distinction, Wimsatt and Beardsley conclude their essay with a skeptical discussion of Samuel Taylor Coleridge's marginal "gloss" to the "Rime of the Ancient Mariner" and of Eliot's "Notes" to *The Waste Land*.

More important to the integrity of their essay's argument is the central section in which the authors outline three kinds of evidence for meaning, ranging from external to internal. It is here that they attempt to establish the objective basis for criticism that Hirsch's critique denies, or in any case tends to disregard. What is wholly external "is private or idiosyncratic" (Wimsatt & Beardsley 1954b: 10) as in what the author said about the poem in a letter. This kind of evidence is actually the only kind that they consider to be off limits. It is true that a great deal else could fall into this category, such as historical or political circumstances, known psychological turmoil, or other biographical facts, but Wimsatt and Beardsley spend nearly all their time attacking the evidence supplied by the author's opinions concerning the creative process behind a poem. What is wholly

internal to the poem, they argue, is what belongs paradoxically in the public domain: language as it is used in accordance with the ear of a cultivated reader as to grammar, syntax, and semantics. Here is the bridge between author and reader that passes through the poem itself.

There is, however, a kind of evidence that is intermediate between external and internal, and it is just here that author and history resume the place that common sense accords them in the study of literature. Wimsatt and Beardsley argue – with a measure of confessed anxiety that this sort of thing may lead criticism astray – that “evidence about the character of the author or about private or semiprivate meanings attached to words or topics by an author or by a coterie of which he is a member” is fair game (1954b: 10). This is rather loose, and “the character of the author” could be construed so as to readmit most of the evidence that has been banished. It is only fair to urge anyone skeptical about this passage to read Wimsatt’s far more extended and detailed discussion of intermediate evidence in “Genesis: An argument resumed” (1976 [1968]). The rest of the quoted passage, however, may stand on its own: it designates the kind of approach that is called philology, and recognizes that the language of the author, still in the public domain by virtue of being published, needs to be studied as an idiolect based on all available sources, not just the “poem” itself; and recognizes further that an author’s language is personal only in part and belongs also to a cultural milieu or horizon within a specific historical moment. Here, then, is a very great deal that is so often said to be excluded from critical method by Wimsatt and Beardsley.

There is, however, one notable moment in their essay that would seem after all to exclude or in any case not to defer to philological evidence. In a footnote to the dis-

ussion of intermediate evidence, we find what appears to be a concession to whim: “And the history of words *after* a poem is written may contribute meanings which if relevant to the original pattern should not be ruled out by a scruple about intention” (Wimsatt & Beardsley 1954a: 281). At first blush, it seems easy to score a point against the authors here by citing, say, “the Great Creator rais’d his plastic arm” from Mark Akenside’s *The Pleasures of the Imagination* or “all who build them again are gay” from Yeats’s “Lapis Lazuli.” We know, we say scornfully, that “plastic” in the eighteenth century meant sinuous and flexible, and that “gay” in Yeats’s time still only meant “joyous,” here perhaps in reference to Nietzsche’s *The Gay Science*. And yet, if the original pattern of Akenside’s poem accommodates the notion that God living in the Eternal Moment may have been experimenting with polymers, as he is quite capable of doing, the poem is plausibly the richer for that; and if a queer theorist wishes to read Yeats’s poem as arguing unintentionally but tellingly that a far greater number of the sages who rebuild cultural monuments even in times of destruction are gay than straight readers acknowledge, one feels the churlishness of refusing to add that reading to the readings that are philologically sound. “Relevant to the original pattern” is a formula that arguably opens criticism to forms of imaginative possibility which, *pace* Hirsch, are not completely unmoored. We can scarcely be said to have narrowed our agenda if we avoid the intentional fallacy as Wimsatt and Beardsley describe it.

Intentionality and Horizon

PAUL B. ARMSTRONG

“Intentionality” and “horizon” are related terms that describe how consciousness is directed toward a world of objects and how our understanding of anything, from objects to ideas, is limited by our point of view. The term “intentionality” has a long history in philosophy, going back to Aris-

totle, but its modern significance is the result of extensive analyses of the structure of consciousness and experience initiated by the German philosopher Edmund Husserl, the founder of phenomenology. While they are grounded in philosophical discourse, “intentionality” and “horizon” have become key concepts in phenomenological theories about the mode of existence of literary works, the experience of reading, and the process of interpretation.

According to Husserl, consciousness never exists purely, in isolation, but is always consciousness of something. Conversely, objects are given to us only as objects of actual or possible consciousness. “Intentionality” refers to this reciprocally determining relationship between acts of consciousness and their objects. Our experience of objects is characterized by “horizons” of various kinds because it is defined by our particular perspective (similar to the way the “horizon” of a landscape presents itself to us). The term “horizon” suggests not only the limits of our perspective but also how we typically transcend them in our expectations about what the future holds and what other observers might see (beyond our “horizon,” say, on the other side of the mountain we are climbing).

The “intentionality” of consciousness is not the same as the colloquial notion of “intention” and does not necessarily imply, as does that notion, a self-conscious plan or purpose. In phenomenology, the term “intentionality” covers all acts of meaning-creation, whether or not they are deliberately “intended.” This distinction is easier to make in German, where the words *Absicht* or *Vorhaben* refer to an “intention” in the sense of a design, goal, or plan, as opposed to the technical term “*Intentionalität*,” which encompasses meaning in general. For example, a phenomenologist would say that even our dreams are characterized by “intentionality,” in the sense that they are

meaningful (if bewildering) constructions of worlds of objects. Our interpretations of their meanings, however, are “intentional” in that they have the purpose of clarifying this meaning (their “intention” is to explicate our dreams’ “intentionality”).

The French phenomenologist Maurice Merleau-Ponty makes a similar distinction by contrasting “unreflective” and “reflective” modes of meaning-creation. When we reflect (and take up a deliberate, purposeful attitude toward some aspect of our experience), we find a world of unreflective but nevertheless meaningful experience already there. It turns out we had been making meaning, directing ourselves toward objects that we had understood in various ways, without self-consciously noticing the intentionality that had patterned our worlds. Our relations with the world are characterized by “intentionality” whenever they are meaningful, whether or not we are aware of this. Phenomenologists are interested in describing the different kinds of intentionality that make up experience (when we perceive, imagine, judge, remember, dream, love, hate, fear, write, read, and so on) and in studying how various objects present themselves in consciousness (how sounds compose themselves into a melody, for example, or how literary works unfold in reading).

Husserl distinguishes between “intentional acts” and “intentional objects” to describe how consciousness makes meaning. When I see three sides of what seems like a cube, my “intentional acts” give meaning to what I see by assuming the existence of three hidden sides that lie beyond the horizon defining my perspective. The “intentional object” given in consciousness is characterized by its incompleteness. What I take for granted about the “cube itself” is nothing more or less than an expectation that an infinite series of different “profiles” or “aspects” (*Abschattungen*) in which the object could present itself will

harmonize with what is available to my view. The experience of surprise is especially important for phenomenologists because it reveals the contribution of our intentional acts to constructing our worlds. Hidden sides would not surprise us, after all, if we did not already have tacit expectations about them. When later experience or the testimony of other observers shows us our perception was faulty or incomplete, our surprise calls attention to the perspectival quality of intentional objects and reveals our previously unnoticed intentional activity in going beyond the limits of our horizons.

For phenomenology, the intentionality of consciousness is a clue to the structure of existence. For example, the French existentialist Jean-Paul Sartre argues that consciousness is characterized by “transcendence” because we know objects by going beyond the limits in which they present themselves, and this capacity to cross boundaries is, in his view, defining evidence of human freedom. Martin Heidegger, Husserl’s student and the founder of existentialism, similarly describes existence as always ahead of itself (*sich vorweg*). The paradox of experience, according to phenomenology, is that it is inherently limited, positioned, and incomplete even as we are always surpassing its constraints as we project ourselves toward the future and interact with other people across the boundaries defining our point of view.

The distinction between “intentional acts” and “intentional objects” allows phenomenology to study the subjective and objective dimensions of experience while avoiding the notorious “subject–object split” (i.e., the Cartesian idea of an absolute separation of mind and matter). Phenomenological reflection “brackets,” or puts out of play, the assumption of everyday perception (the “natural attitude”) that human beings are autonomous subjects engaged with independent objects. If we look only

at what is given in experience, according to phenomenology, the “subject” and the “object” are abstractions from the lived activity of meaning-creation. There is no autonomous “subject” because consciousness is never unengaged but is always reciprocally defined by its relations with its world. The intentionality of consciousness means that we are always already in and of our world as intentional acts direct themselves toward intentional objects. The natural attitude may assume that “real” objects exist independently of whatever we may think about them, but this is an abstraction from the profile in which the intentional object is given. If I kick a stone and it hurts, as Samuel Johnson famously did to refute Bishop Berkeley’s idealism, my pain seems evidence of its “reality” because it is an aspect that is consistent with my other experiences of “it.” Instead of regarding knowledge as a mirroring relation of correspondence between subject and object, the notion of intentionality seeks to do justice to the mutually defining relation between acts of meaning-creation and the states of affairs toward which they are directed.

The term “horizon” is both a spatial and a temporal metaphor. Spatially, objects are characterized by “external” and “internal” horizons. An object’s external horizon is its boundary over against other objects that provide the background against which it is foregrounded. An object has an external horizon because our understanding of something depends on its context. Its boundary from other entities delineates what it is, over against what it is not, and this structure of differentiation suggests that the presence of an object is a construction defined by implicit absences. An object’s internal horizon includes all of the potentialities contained within the profile which manifests it, possibilities that we assume would be fulfilled by other aspects that harmonize with the view given to us if,

for example, we were to walk around and examine the other side of it or call out to observers over there and ask what they see. According to Husserl, we can interrogate any horizon about what it contains and imagine a series of variations on the profile given to us that would render its indeterminacies determinate. Again, the incompleteness with which intentional objects are given suggests that the presence of the world is rife with absences. The French philosopher Jacques Derrida first developed his theory of deconstruction by analyzing this dialectic between presence and absence in Husserl’s notion of intentionality.

Temporally, any given moment of experience is characterized by horizons that bound it even as they open it to the past and the future. William James (1890) famously compared consciousness to a “stream” in order to suggest that the lived experience of time is a perpetual flux from which clock-time is an abstraction. A moment is not a point or a discrete entity but is, rather, a passing experience of duration with what James called “fringes” that connect it to other moments. Similarly, according to Husserl (1964[1928]), any moment is characterized by “retentional” and “protentional” horizons. The present has a retentional horizon because the past is always slipping away, even as we preserve an ever-changing sense of what it was. The past is given to us across this horizon in a series of profiles that vary as the perspective of the present shifts. Analogously, as we project expectations about how aspects given at any moment will complete themselves, the potential horizon bounding the present offers shifting views of the “not-yet.” We never have the past or the future as such, in and of themselves, but only experience them through a series of perspectives that are always changing. Consequently, Merleau-Ponty (1962[1945]) argues, time is not a line of distinct points but, rather, a

“network of intentionalities” – an ever-moving array of horizons as the past and the future manifest themselves in a series of shifting profiles.

The horizontal character of the moment has important implications for meaning-creation. For example, as Husserl (1964 [1928]) shows in his analyses of internal time-consciousness, we can compose sounds into a melody only because the present moment is linked horizontally to a network of past and future moments. A melody is not an objective entity but a developing temporal construct. Sounds would be meaningless if they stood by themselves and could not be joined perspectively into an emerging sense of the pattern they compose. This figure is never completely or simply present but is a retentive and protential pattern of relationships across our temporal experience. Wolfgang Iser (1978) similarly describes reading as a process of “consistency-building” that connects the partial perspectives in which a text manifests itself into an ever-changing sense of the whole. Like the experience of listening to music, reading is a temporal process through which we make sense of the text in a shifting series of anticipatory and retrospective acts. What Iser calls our “wandering viewpoint” makes its way through a text that never offers itself all at once but only through changing temporal perspectives. Like reading and listening to music, all understanding is a to-and-fro activity of consistency-building across the varying horizons of the moment.

The Polish phenomenologist Roman Ingarden applied Husserl’s theory of intentionality in an influential analysis of the mode of existence of the literary work (1973[1965]). Ingarden was interested in the literary work because it is a peculiar kind of object, neither “ideal” like a triangle nor “real” like Dr Johnson’s stone. Instead, he argues, the work is an intersubjective

state of affairs whereby the writer’s intentional acts of meaning-creation are lodged in a linguistic artifact (the “artistic object”) that are then “concretized” by readers through different but reciprocal intentional acts (constructing an “aesthetic object”). The “artistic” and “aesthetic objects” differ in a number of respects. For example, the artistic object presents people, places, and things in “schematized aspects,” with “spots of indeterminacy,” that readers then fill in differently according to their own experiences and predilections. My aesthetic object will differ from yours even when we read the same work according to how we fill in these blanks (or leave them open) and otherwise actualize the potentialities of the text.

The act of reading literary works draws on similar experiences in everyday life with objects presented incompletely, in aspects and perspectives. That is why reading can immerse us in a world that seems lifelike and can also bring about changes in how we understand our own experience (e.g., by invoking and then surprising the habits with which we customarily fill out indeterminacies). The interaction between the intentionality in the text and the reader’s patterns of intentionality can be harmonious or dissonant in varying degrees. Ingarden argues that the aesthetic experience at its best is characterized by a “polyphonic harmony of value qualities” (1973[1965]: 369) but Hans Robert Jauss (1977) finds value in the disruptions through which a work may challenge the reader’s “horizon of expectations” and defy the presuppositions that we bring to the text.

The relation between the artistic and the aesthetic object raises the question of the determinacy of meaning. Some phenomenologists regard the literary work as a stable entity with a fixed meaning, like an object that is the same regardless of the different views that variously positioned observers may have of it (the “cube” we

assume exists beyond the horizon delimiting our perspective). For example, E. D. Hirsch, Jr. (1967) refers to the intentionality lodged in the text as its “meaning,” determined once and for all by its author, and he calls the variable actualizations of readers its “significance.” Other phenomenologists, like Hans-Georg Gadamer and Paul Ricoeur, argue that meaning is not a determinate object but, rather, a reciprocal, mutually determining interaction of intentional acts and intentional objects. Gadamer (1989[1960]) describes understanding as a historically variable “fusion of horizons” between past and present in which neither pole stands alone. For these thinkers, the meaning of a work varies according to the position, presuppositions, and expectations of the interpreter, and the work’s “sameness” is nothing more or less than the ability of various perspectives on “it” to blend (or not, as when different interpretations come into conflict about its meaning). Whether the theory of intentionality supports a monistic or a pluralistic conception of meaning is a matter of ongoing dispute within phenomenology.

Italian Neo-Idealistic Aesthetics

KATHLEEN RYAN

Italian neo-idealistic aesthetics is an early twentieth-century theory of art that developed within the larger framework of Italian neo-idealism. A fusion of metaphysics, aesthetics, and literary criticism, it defines art as a dialectical synthesis of intuition and cognition, and is itself a synthesis of the theories of Benedetto Croce and Giovanni Gentile, the leading philosophers in early twentieth-century Italy. In addition to the countless poets they wrote about and reviewed, important influences on neo-idealistic aesthetics included the Italian Neapolitan Hegelians Bertrando Spaventa and Francesco De Sanctis as well as Giambattista Vico, Alexander Gottlieb Baumgarten, and G. W. F. Hegel.

The influence of Italian neo-idealism is pervasive in contemporary Italian thought among such major figures as Antonio Gramsci, Galvano della Volpe, Gianni Vattimo, Umberto Eco, and Massimo Cacciari. Croce's literary criticism and early aesthetics also attracted international attention as did to a lesser degree Gentile's pedagogy and metaphysics. Nevertheless, Italian neo-idealistic aesthetics did not resonate much outside Italy. Notable Anglophone exceptions include the British philosopher R. G. Collingwood, who thrived in the 1930s and '40s, and American scholar Merle Brown in the 1960s.

ITALIAN NEO-IDEALISM

The term "Italian neo-idealism" designates the Italian school of neo-Hegelianism led by Croce and Gentile that emerged in the late 1890s. In the late nineteenth century, the overall European reaction against positivism was gaining strength, and the Italian neo-idealists were late in joining in. Whereas positivism considers scientifically based facts to be the only authentic form of knowledge, neo-idealism denies any genuine cognitive value to mathematics and natural sciences. For Croce, these disciplines belong within what he terms economic or utilitarian activity, and for Gentile, they are simply expressions of philosophical knowledge. Italian neo-idealism has its roots in the nineteenth-century Neapolitan school of Hegelianism founded by Bertrando Spaventa (Croce's uncle) and Augusto Vera. The school's primary objective was to construct an indigenous line of modern Italian philosophy linking figures like Giordano Bruno, Tommaso Campanella, Giambattista Vico, Antonio Rosmini, and Vincenzo Gioberti in a tradition that runs parallel to the development of German idealism. Spaventa's strict interpretation of idealism moves Hegelian dialectics from objective historical becoming to the inner reaches of self-consciousness, in effect excluding anything, including the natural world, that lies outside the mind.

Together, but in different ways, Croce and Gentile continued to modify Hegel's thinking. In common, they rejected Hegel's notion of a preordained historical becoming, and like Marx they believed that human events regulate the development of history. Nevertheless, they rejected notions of socialism and revolution. Politically, Croce and Gentile were profoundly different. Croce was a conservative liberal, and stood against socialism and radical forms of democracy as well as fascism. Gentile, on the

other hand, was against individualism in favor of nationalism, which he saw as a collective supremacy. He adhered to fascism and became the dominant figure in the regime who spoke on cultural and educational affairs.

After more than a decade of friendship and extraordinary collaboration that began with the founding of the prestigious review *La Critica* in 1903, Croce and Gentile found themselves on opposite fronts. Their philosophical and political positions were militantly opposed and dominated Italian culture life. They effectively marginalized the positivists alongside the grass-root futurists and the poets referred to as *crepuscolari* ("twilight group"). Marxism, which in later decades would be transformed in the work of Antonio Gramsci, could not get a foothold in a fascist state. The only real challenge to Italian neo-idealism was the Catholic Church. Several decades of idealist hegemony gave way in the 1930s to church-supported neo-scholasticism and realism. By this time, Gentile was in a difficult situation, severely compromised by his position in the fascist regime, while Croce maintained his national and international standing, but began to distance himself from an increasingly unfashionable idealism. By the early 1930s, the neo-idealist aesthetics that launched their cultural hegemony and transformed Italian neo-idealism, was a theory without a movement to promulgate and exemplify it.

NEO-IDEALISTIC AESTHETICS

The major concern for Italian neo-idealist aesthetics was whether art is an immediate or mediate subjectivity. The former position was Croce's, the latter, Gentile's. The question hinges on whether one regards thought as a distinction-making or dialectical process. Polemics between Croce and

Gentile over the nature of thought energized neo-idealism in general and nurtured the neo-idealist synthetic aesthetic theory: art is both immediate and mediate subjectivity, a dialectical unity of intuition and cognition created by self-awareness. First articulated in Croce's *The Aesthetic as the Science of Expression and of the Linguistic in General* (1992[1902]) and developed in Gentile's *The Philosophy of Art* (1972[1931]), the neo-idealist aesthetic stresses fundamentally both feeling and thinking. It bridges the emotional and cognitive dichotomy, emphasizes artistic process over product, and relates the artistic process to the self.

M. E. Brown's *Neo-Idealistic Aesthetics* (1966) revitalized the field in part by painstakingly tracking its development, focusing on Croce's theory of art as intuition but also as cosmic and Gentile's theory of actualism and of art as self-translation. Brown also discusses Collingwood's universalist theory of art, which he finds a worthy attempt to move beyond the Italian founders of the movement, but to little purpose.

ART AND INTUITION

Croce's theory of art as intuition is synonymous with expression and is the foundation of his neo-Hegelian philosophy of Spirit, which is presented in three volumes, beginning with *The Aesthetic as Science of Expression and General Linguistic* in 1902 followed in 1909 by *Logic as the Science of Pure Concept* and *Philosophy of the Practical: Economy and Ethics*. *The Aesthetic as Science of Expression* is considered his most important theoretical work. It is a treatise on aesthetics as an independent category of the Spirit, an idea put forward by the eighteenth-century German philosopher Alexander Baumgarten in *Aesthetica*. Whereas both Baumgarten and Hegel viewed aesthetics as inferior to reason, Croce elevated

art to a unique and independent spiritual status that imagines, intuitively, or expresses feelings of pure reality – indeed, a reality *prior to* that of conceptual knowledge and will.

In Croce's quest for his own absolute idealism, he talks of the Spirit as a three-dimensional sphere comprising two halves, theory and practice, alternatively, knowledge and will. These two distinctive halves function in tandem via an inward and outward network of intrinsic and ordered amalgamation or a priori syntheses. The network begins with knowledge, the first manifestation of which is individual, intuitive, imaginary "aesthetics." Aesthetics conceptualized becomes general, universal knowledge, or "philosophy," but retains elements of Vico's perception of art as "fantasia," feeling, imagination, and expression. Philosophical knowledge in turn activates the will or the practical half of the sphere toward particular "economics," which ideally expands to a universal "ethics."

Because aesthetics precedes and is thus independent of philosophy, economics, and ethics, Croce's theory was described as an "aesthetics of autonomy." Some, including William Wimsatt and Cleanth Brooks, declared it a species of "art for art's sake," despite Croce's rejection of aestheticism as self-indulgent, hedonist, and impure. Croce also opposed intellectualized theories of art and the "aesthetics of sympathy" offered up by the British empiricists. He spoke out against identifying types and genres in art, for such identifications are as artificial as they are in the natural sciences. Art is individual and pure, expressed feelings are incommensurate with categories, concepts, and moral absolutism. Like his "mentor," the distinguished nineteenth-century literary scholar and philosopher Francesco De Sanctis, Croce was against pedantry and didactic criticism and focused his literary

investigations primarily on the poetic individuality of the artist. Accordingly, he wrote monographs on authors like Giosuè Carducci, Giovanni Pascoli, and Gabriele D'Annunzio.

Croce's work energized Italian culture and ushered in a powerful neo-idealist movement on the peninsula; he became something of an international sensation, and was invited to write for foreign audiences – notable pieces include the *Breviary of Aesthetics* (2007 [1913]) for the opening of the Rice Institute in Texas and "Aesthetica in nuce," the entry translated by Collingwood as "Aesthetics" for the 1928 edition of *Encyclopedia Britannica*.

Problems with his theory of art as intuition or "expression" arose early. Applied in literary criticism, it was a powerful evaluative tool, but Croce soon discovered that he was boxing himself into individual feeling at the expense of the transcendent nature of art. His emphasis on "the what" of art neglected "the how": how does feeling become art? Croce's rare allusions to artistic activity made it seem like hallucination, and art seem like a passive emotional state. This static view of art pointed to a fundamental problem in his philosophical method, for the intuition/expression model of aesthetics carries with it a passive theory of knowledge.

In his 1909 *Logic*, Croce presents his "nexus" or "dialectic of distinctions," a modification of the Hegelian dialectic blended with Johann Friedrich Herbart's logic of distinctions. For Hegel, the "concept" is formed in a complex opposition between the thinking subject and objective historical becoming. Croce, on the other hand, believed the concept to be the Absolute Idea, a form of spiritual subjectivity. Croce's "intuition" is immediate subjectivity and philosophy is its contradiction, but the manner in which they merge, the mediated subjectivity, is unknowable, referred to only as an "a priori synthesis"

(1917[1909]: 218ff). Croce's dialectic of distinctions was a subject and object with no verb. This was likely due to the fact that for him, action is a contradiction of knowledge further along the spiritual chain of events and thus not a mobilizing process but rather a product of knowledge.

GENTILE'S ACTUALISM

In response to Croce's *Logic*, Gentile published several essays attempting to overcome the weakness of his friend's philosophical method. These not-so-gentle attacks led to a power shift between the two philosophers and divided Italian neo-idealism between them. The younger Gentile referred to his own neo-Hegelian metaphysical system as Actual Idealism or Actualism. As opposed to the Hegelian "Philosophy of Spirit," Actualism was offered up as a "Philosophy as Spirit." Gentile published the details of Actualism in the two-volume *System of Logic as a Theory of Knowledge* (1917, 1922).

Contrary to Croce's problematic division that sets aesthetics apart from concepts and will, Gentile's Spirit (as in Hegel, associated with thought and the Idea) achieves unity. Thinking creates and binds reality simultaneously. In effect, the act of thinking generates thoughts while thoughts simultaneously stimulate thinking and so on. Gentile rejects Hegel's objective historical becoming and embraces the infinite becoming of present and past, the self-creating and self-created Spirit or Mind. To Croce's pseudo-objective reality, Gentile offers an endlessly growing and self-reflective unity of thought; this actualist dialectic is expressed as a synthesis of subjective "thinking-thought" (*pensiero pensante*) positing its object and "thought-thought" (*pensiero pensato*). The act of thinking that is thinking-thought is an ungraspable reality in which positing its opposite, the objective

thought, contradicts the fact that it is an immediate act. Thinking-thought is fleeting and nonlinear; it can never be pinned down and put into an objective series. It is the act that creates immediate reality and transcends it in the very act of conceiving or knowing it. The act of thinking is always greater than the thought produced. It is an activity that is the sum of all its previous thoughts, a continuous process toward the spiritualization of reality. Reality is multiplicity in unity consistently, self-consciously, self-generating. The actualist dialectic established a unified metaphysics of knowledge and action.

Actualism animated Italian neo-idealism and, in the process, gained a large local following, especially among Gentile's students, and garnered some interest internationally, the most noted study being Roger Holmes's *The Idealism of Giovanni Gentile* (1937). In response to Gentile's challenge, Croce's beleaguered camp famously referred to Actualism as "philosophical cretinism," "intellectual narcissism," "philosophical diarrhea," and logocentric mechanistic philosophy about philosophy unable to account for passionate and personal experience (Brown 1966: 110). Behind the provocations there was legitimate criticism: Gentile's dialectic, although dynamic, was missing immediate subjectivity. The subject of his dialectic the "*pensiero pensante*" was fully active and mediated. But the seed, "the what," the initial subject of the thinking-thought itself, was not yet revealed.

ART AND COSMIC HARMONY

As excitement built for Gentile's Actualism, Croce discretely began to speak of art less as individual intuition than as a cosmic, organic, and universal experience. He also elaborated on his notion of the "a priori

synthesis.” In *Nuovi Saggi di estetica*, a series of essays published in 1918, and in a monograph on Ludovico Ariosto, Croce speaks of art as representing the whole of reality. The individual expression as cosmic, of a piece with the Absolute Idea, was reminiscent of Gentile’s notion of thinking as the Actual Idea. But for Croce, art comprised both individuality and universality. Its inherent multiplicity lies in the artist’s personality, which is controlled by many passions, including the powerful passion for cosmic harmony. In the name of cosmic harmony or universality, the initial feeling that inspires the work drives the artist to unify it with the other dominant, competing passions and images that “bombard” the artist. Croce explains that these competing sensations fuse dialectically in such a way that the initial feeling prevails and the artist achieves aesthetic form, a unity of image and feeling.

Croce’s idea of the artistic process progressed from passive reception to creation. But in practical terms, his dialectic continued to emphasize immediate subjectivity and feelings, but lacked the mediating synthesizing activity to explain how the artist’s dominant feeling prevails as expression. Croce hints at an artist consciously at work, yet he does not argue the point to its logical conclusion that art is a self-conscious creation (a knowing and an acting). His aesthetic dialectic of individuality and universality opens the door for philosophical knowledge and practical activity. But “the how” of art, the artistic process, remained incoherent as Croce tenaciously held on to his “aesthetics of autonomy.”

Croce shied away from the implication of philosophical knowledge in artistic creation and continued to disagree with didactic or allegorical readings. Although he reluctantly accounted for morality in his account of art, it was to provide tone, not an activity. In his entry on aesthetics for the *Encyclopedia Britannica*, for example, Croce concludes

that if art is a dialectic of individuality and universality, a poet cannot help but engage moral feelings and ideas. The question of admitting philosophy and action into aesthetics, however, was not seriously entertained. His aesthetic theory could not advance without a significant revision to his philosophical system. Conceptual knowledge and action are distinct from pure aesthetics and the poetic expression of uncensored feelings. A theory of “pure” aesthetics can only founder in any interaction with knowledge and action. As time passed, Croce did not renovate his philosophy of Spirit, nor did he develop his aesthetics further in this direction. Nonetheless, a unifying neo-idealistic aesthetics was emerging from Gentile’s quarter.

ART AS SELF-TRANSLATION

Gentile’s mature theory of art unites Croce’s premise of immediate subjectivity with a modified actualist dialectic. He manages to avoid Croce’s mistake of describing an inactive subdivided reality because the very nature of Gentile’s synthesis is knowledge and action. In fact, Gentile’s synthesis of knowledge and action reframed both Croce’s notion of cosmic art and his own philosophical method. For Gentile, art is similar to other mental activities in that it is an individual expression of the Absolute Idea. But until he arrived at his theory of art as self-translation he was unable to articulate a neo-idealistic aesthetics within a neo-idealist system.

Gentile’s theory of art as self-translation first took shape in two lectures given on Leopardi’s *Moral Tales* in 1927 and published in 1928. Gentile’s position on the pessimist poet went against the critical consensus since De Sanctis that pronounced *Moral Tales* too cold and passionless to be rightly considered poetry. Gentile, by this

time the notorious “philosopher of fascism,” argues that the work is on the contrary not cold and not passionless. To be sure, there is existential frigidity and pain, but the darkness is balanced with the light of pure pleasure and radiance of mature acceptance. The very synthesis of these oppositions creates the poetry. The cold philosophy does not put out the heat of passion. It tempers or disciplines it into art. Without philosophy, the work would be naive, idiosyncratic expression. Crossed with philosophical knowledge, passion matures to universal, poetic expression.

Gentile divides *Moral Tales* into three essential movements, roughly corresponding to the sequence state of grace—the fall—redemption, as the poet descends from pure pleasure to despair and then to an existential acceptance. Torn from nature, from an earlier innocent state, the poet realizes his insignificance in the indifferent cosmos. Through his own engagement with the work’s emotional fall and salvation, Gentile identifies the source of art: its immediate subjectivity, in short, feelings. Gentile’s two-term dialectic, thinking-thought and thought-thought, finally had its immediate subjectivity: pure feeling, seed of the Actual Idea.

Gentile presented his mature theory of dialectic not in a study of philosophical method but in *The Philosophy of Art* (1972[1931]), his only full-length work on aesthetics, which argues, in effect, that art and philosophy are opposed yet dialectically one and the same. This theory presents art as a portion of the Absolute Idea. The mediate self or subject knows and translates the immediate expression of itself into its opposite, an object. The immediate self is akin to Croce’s pure feeling or pleasure, the essence of all art. Its opposite, the antithesis, is objective, the multiplicity of the artwork. The mediate subject, the synthesis of the dialectic, is the critical awareness by which

the artist expresses the feeling and simultaneously evaluates the adequacy of the expression to the feeling. Gentile’s theory of art as self-translation is much like Croce’s theory of art as cosmic – there is immediate subjectivity and universality, but the advantage of Gentile’s dialectic lies in its robust self-generation.

Gentile had in effect concluded the reform of the Hegelian dialectic begun with Spaventa and developed over three decades of exchange between himself and Croce; but the antifascist Croce easily dismissed the idea of a fascist taking on aesthetics. Even former Gentile followers could not accept their leader’s fascist associations. *The Philosophy of Art* was either ignored or disparaged as Gentile’s attempt to remain relevant. The work was not translated into English until 1972 (by Giovanni Gullace). Outside Italy, the British philosopher R. G. Collingwood who admired (and translated) Croce’s work and was the leading proponent of neo-idealism in the English speaking world in the mid-twentieth century, made some attempt to expound Gentile’s ideas, in works like *Speculum Mentis* (1924), which was influenced by Actualism. Collingwood’s experimental efforts with Italian neo-idealism culminated in *Principles of Art* (1938), in which he rails against mass forms of entertainment. His concern is to advance the notion of art as communal therapy and community collaboration, co-creative and co-created, not consumed. He opposes the individualistic approaches to artists as self-reliant geniuses (something both Croce and Gentile do). Artists create by corroborating with other artists, with those who perform their work, and those who “listen” to it. Art, Collingwood concludes, is a communal creation. But art is also an expression of emotion, a necessary function of the human mind. At bottom, it is collaborative: artist and audience come together. The chief problem with this theory is “the object”

of art. Is it a mental expression or a concrete collaborative script between artist, performer, and spectator? What precisely constitutes the art object?

Collingwood's work on aesthetics was cut short by illness and early death. He suffered a series of debilitating strokes the same year he published *The Principles of Art* and died in 1943, leaving many unfinished manuscripts. Critics note that the work of his last five years of life showed defects and inconsistencies that can easily be attributed to his declining health. Collingwood considered his aesthetics "secondary" to his work in history of philosophy, yet his *Principles of Art* has enjoyed a continuous readership since its publication. Although his neo-idealistic theories did not advance beyond his engagement with Croce and Gentile, he makes a convincing case for their continued relevance. The development of Italian neo-idealistic aesthetics illustrates a natural alliance between philosophy and literature, a tempting proposition in times of analytical crisis.

J

Jakobson, Roman

JUSTIN SULLY

Roman Jakobson (1896–1982) was one of the twentieth century's most influential linguists, literary theorists, and semioticians. While he had a considerable impact on the study of linguistics in general, his role in the formation of Russian formalism and in the postwar development of structuralism established him as one of the pioneering figures of literary and cultural theory. His work has been influential in a wide variety of disciplines, including cultural anthropology, psychoanalysis, translation studies, film and media studies, rhetoric, aesthetics, musicology, folklore studies, and art history. A lifelong advocate of the idea that the study of language is essential to the study of literature, Jakobson was one of the figures most instrumental in the “linguistic turn” in critical theory (Jameson 1974). Though his name and work may be unfamiliar to Anglo-American students of poststructuralism, Jakobson's influence on that movement, and in related fields like narratology, was profound.

Born in Moscow in 1896, Jakobson entered the Department of Slavic Studies at Moscow State University in 1914. The following year, he played a pivotal role in founding the Moscow Linguistic Circle

(Moskovsky Lingvistichesky Kruzhok); the Moscow group and the Society for the Study of Poetic Language in St Petersburg (of which Jakobson was also a member) were the primary sites of emergence for Russian formalism. It was at this time that Jakobson developed a linguistic approach to literary theory and, in particular, to the problem of constructing a scientific basis for distinguishing literature from all other forms of linguistic communication. Together with other important figures of the formalist school such as Iury Tynianov and Viktor Shklovsky, Jakobson developed a theory of the “literariness” of literary writing that involved close scrutiny of the phonological, semantic, and metrical “devices” of the work. This linguistic approach to literature represented a radical break from the historical and biographical modes of literary analysis popular at that time. Though his early theoretical framework would be modified in his later work, Jakobson's belief in the unique importance of literature for the study of language and the rigorously formalist approach to literary texts would remain at the foundation of his thinking. His own literary contributions to Futurist publications and his influential role as a theorist of the Moscow avant-garde placed him at the center of a vibrant and far-reaching cultural movement.

In 1920, Jakobson moved to Czechoslovakia and began working toward his doctorate at Charles University in Prague, where he taught for a short while before moving on to teach at Masaryk University in Brno from 1934 to 1939. Like so many others, he fled the Nazi advance into Czechoslovakia, going first to Copenhagen, where he worked with the linguist Louis Hjelmslev, before leaving for the US. It is remarkable that, during this cataclysmic period of history, Jakobson was able to advance the discipline of linguistics as far as he did and at the same time to make so many contributions to other fields. His time in Prague was especially rich. By 1926 he had begun actively to participate in the Prague Linguistic Circle, one of the early centers of research in structuralist linguistics. His involvement in both the formalism of the Moscow Linguistic Circle and the structuralism of the Prague Linguistic Circle enabled him to connect these two pioneering groups in an immediate and productive way. His work in formalism – particularly with the function and purpose of devices in individual literary works and across an author’s oeuvre – became, throughout the 1920s, increasingly indebted to the fundamental assumption of structuralism: that the significance of a text lies in the structures of linguistic difference and binary opposition that shape a reader’s encounter with it. It was also during this period that Jakobson developed his theory of parallelism in literature and literary analysis. His famous collaboration with Claude Lévi-Strauss, in which they used formalist methods to read Charles Baudelaire’s poem “Les Chats,” demonstrates how the parallel relations of similarity and difference between linguistic levels – phonological, syntactic, semantic – contribute to the meaning of a literary work (Jakobson 1981[1966]; Jakobson & Lévi-Strauss 1981[1962]).

In Prague, Jakobson began his lifelong engagement with the work of Ferdinand de

Saussure. While he would ultimately come to disagree with Saussure’s abstract or formalist structuralism, the Saussurean understanding of language – that it operates by relations of difference within binary structures, that language as such is constituted by a paradigmatic dimension (*langue*) and a syntagmatic dimension (*parole*) – remained a crucial element in his functional structuralism. Unlike Saussure’s formalist structuralism, Jakobson’s functionalist variety conceives of language in terms of the contextual function of speech acts or communication, rather than in terms of a pure system of signs. Jakobson’s attention to the function and context of language led him to challenge Saussure’s claim that the abstract, paradigmatic plane of language (*langue*) determined the limits and efficacy of individual usage (*parole*). This challenge, therefore, targeted one of the most striking and influential features of Saussure’s theory, the arbitrariness of the sign. Jakobson proposed a theory of language based on a system of “dynamic synchrony” that would allow him to reintegrate elements of the diachronic axis of language that had been bracketed and relegated to the arena of mere usage in Saussurean linguistics (Jakobson 1971a). Jakobson’s rethinking of Saussure’s idea of linguistic systems permitted both a dynamic conception of language and an objective mode of analysis of its differential and determining structure (Culler 1975; Jakobson & Pomorska 1983; Jakobson 1987; Bradford 1994).

Jakobson’s analysis of “shifters” – elements in a language, such as the personal pronoun “I” and “you” that function only by relation to their context (e.g., “I am here”) – exemplifies his interest in integrating a functional and contextual perspective into a structuralist analytical framework (Jakobson 1981c[1957]). The shifter, for Jakobson, functions structurally, in terms of the conventional, arbitrary relationship of signifier

and signified that Saussure theorized while, at the same time, indexically, as when a pointed finger signifies “you,” thus also breaking with the axiom of the total arbitrariness of the sign. Jakobson marshaled other research, including his work on the sound symbol in poetry (Jakobson 1978), and incorporated Charles Sanders Peirce’s more expansive typology of indexical, symbolic, and iconic signs to challenge what he saw as the limited, monolithic Saussurean conception of language (Jakobson 1971a). More broadly, Jakobson’s insistence on the process of communication and the numerous subcodes which constitute the linguistic function marked a decisive evolution of structuralism away from the strict attention to the atemporal linguistic code (*langue*) and aligned his project with the contributions of other structuralist critics of Saussure, such as the linguist Emile Benveniste and the semiotician Algirdas Julien Greimas (Hawkes 1977).

The essay by Jakobson most familiar to students of literary and cultural theory is doubtless “Linguistics and poetics” (1981b [1960]), the most frequently anthologized and cited of his works. It contains some of his most important contributions to our understanding of how language works: his typology of linguistic functions, his theory of metaphor and metonymy and his definition of the poetic function. His theory of linguistic communication is founded on a division of linguistic function into six aspects: Context (referential), Addresser (expressive), Addressee (conative), Contact (phatic), Code (metalingual), and Message (poetic). While each of these elements is present in any act of communication, Jakobson posits that the function of any individual speech act can be determined according to which of these six elements is dominant. Thus his theory of communication, in turn, leads to a corresponding typology of the six functions of linguistic

communication, each oriented toward one of the constitutive elements of linguistic functionality. The Referential Function is oriented toward the context and describes the majority of linguistic messages, particularly those that make noncontroversial statements about the world, such as, “The temperature today is six degrees.” The Emotive Function focuses on the Addresser, while in the Conative Function the message is oriented toward the Addressee. The Phatic Function describes messages oriented toward contact and serve to establish, terminate, or extend communication (“Hmm” or “I see,” for example). The Metalingual Function is directed toward the code; for example, a definition. The Poetic Function is oriented toward the message itself and, while less common in everyday communication, it is recognizable in puns or word play.

For Jakobson, the poetic function, the most important for the study of literary texts, is determined by the action and interaction of the metaphoric and metonymic poles of language. Jakobson first noted the distinct operation of these poles while studying aphasic disorders, psychophysiological conditions in which an individual is unable, on the one hand, to select an adequate substitute for a word (i.e., metaphor) or, on the other hand, to combine words in order to continue a grammatical sequence (i.e., metonymy). His work with aphasia taught him that the two poles of selection and combination corresponded to Saussure’s syntagmatic and paradigmatic axes of language. His innovation was to argue that speech acts in general correspond to the two fundamental cognitive processes of selection (on the paradigmatic axis) and combination (on the syntagmatic axis). The axis of selection draws upon the set of possible, equivalent terms made available by the linguistic code (e.g., “chalky” for “pale” or “ship” for “car”), which Jakobson

associated with the figure of metaphor. By contrast, the axis of combination relies upon relations of contiguity (cause and effect, temporal ordering, logical sequence), which he associated with the figure of metonymy. In poetry, he argued, the vertical “axis” of selection or substitution predominantly determines linguistic equivalences; as he famously put it in “Linguistics and poetics,” “the poetic function projects the principle of equivalence from the axis of selection into the axis of combination . . . in poetry the equation is used to build a sequence” (Jakobson 1981[1960]: 27). In other words, in the Poetic Function, similarity, rather than contiguity, creates the meaning-effects of literary discourse. Thus rhyme, meter, stanza form, assonance, alliteration, paronomasia, and so on all work to produce effects based on formal and phonological similarity. In the later part of his career, Jakobson argued that the distinction between metaphor and metonymy could be used to analyze all manner of literary, artistic, and cultural phenomena. His speculation about the analogies between metaphorical and metonymic operations in language and the processes of “displacement” and “condensation” in Freud’s theory of the dream work was later taken up by Jacques Lacan who argued the case for the linguistic structure of the unconscious.

Jakobson’s time in the United States, where he lived and worked from 1941 until his death in 1982, was largely spent in refining and consolidating the research he had done in Europe. He held positions at the French university-in-exile, *École libre des hautes études* in New York (1942–6), Columbia University (1946), Harvard (1949–82) and MIT (1957–82). His most influential work of this period, co-authored with Morris Halle, was *Fundamentals of Language*, which proposed a system of 12 binary oppositions that accounted for the

basic phonological distinctions of all languages (Jakobson & Halle 1971[1956]). This successful application of the concept of distinctive features represented a defining moment for the study of linguistics as well as an effective application of Saussurean linguistic theory.

Jakobson’s move to the United States also marked the introduction of Russian formalism and the structuralism of the Prague Linguistic Circle to US and émigré intellectuals. Claude Lévi-Strauss was at this time introduced to structural linguistics through his collaboration with Jakobson at the *École libre des hautes études*, a development that was to have profound effects on structuralist and poststructuralist thought. It was in the US that Jakobson first studied the semiotics of Charles Sanders Peirce. Jakobson’s integration of Peirce’s ideas about signs – particularly his conception of indexical signs and iconic notation – into structuralist theory was an important contribution to the project of fusing the Saussurean and Peircean branches of semiotics.

Jakobson’s importance for literary and cultural theory is difficult to overestimate, in part because his work lies at the foundation of poststructuralism, but also because it informs so much theoretical reflection in the late twentieth and twenty-first centuries. Jakobson’s thinking about language is vital to contemporary theories of gender, sexuality, race, ethnicity, religion, and nationalism insofar as they rely, as on first principles, on the concepts of dynamic, contextual difference, and linguistic function.

Jung, C. G.

ALEXANDER CHIRILA

Carl Gustav Jung (1875–1961) was a psychoanalyst whose most prominent theories concerned the influence of archetypal images on the individual psyche, the existence of a collective unconscious, and a categorization of personality types still employed by psychologists today. His work lies at the origin of archetypal psychoanalysis and criticism, and many disciplines of study refer to his hypotheses regarding the human drive to individuate, and the prevalence of mythic and religious symbolism in human consciousness.

Jung was born in Switzerland, the second son of Paul Jung, a Protestant minister, and his wife, Emilie Preiswerk. Jung’s earliest dreams and recollections expressed an uncanny wealth of elemental and symbolic imagery that would later become crucial to his theories concerning the human psyche. Additionally, they reflected the ambivalence, fear, and awe that Jung felt for Christianity, a religion of imposing, black-robed figures and bloody images of a slain Messiah. These associations engendered an anxiety that he would later resolve by emphasizing the cathartic effects of confronting the “shadowy” side of oneself, one’s unconscious. One particular dream involving a descent into the darkness of an underground tunnel signaled to Jung that “his intellectual life . . . first began to stir in his unconscious” (Brome 1978: 5).

In 1886, two years after his sister was born, Jung entered the Gymnasium in Basel

and was there exposed to a degree of wealth and prosperity foreign to him. Attending classes at the Gymnasium in mathematics, divinity, languages, and art, Jung found that he performed only adequately, if not poorly, in all his subjects save Latin. He felt himself shunned by masters and students alike. His sense of powerlessness and disappointment resulted in the appearance of a second personality within Jung, characterized by the symbolic and transcendent qualities he would later use to describe the primary archetypes: "It was as though a breath of the great world of stars and endless space had touched me, or as if a spirit has invisibly entered the room – the spirit of one who had been long dead and yet was perpetually present in timelessness until far into the future" (1965[1961]: 66). Jung maintained that this incident was an exchange between opposing aspects that happens in everyone. In 1895, he entered the Medical School of Basel University. While previously unwilling to openly discuss his challenging approach to the intellectual beliefs of his day, Jung assumed a more open and aggressive stance upon entering the University. In that same year, his father died, an event that led to Jung's becoming head of his impoverished immediate family. In an effort to balance the pressure of his new responsibilities and deal with the emotional turmoil generated by his father's passing, Jung adopted what he would later identify as an "extraverted" persona.

Jung became interested in the occult during this period, a preoccupation that would continue to inform the development of his psychological theories. The concept of spiritualism as distinct from theology and religion assumed a central importance in his mind, and he thereafter pursued with renewed vigor the subjects of mysticism, parapsychology, and various psychic phenomena. Although his views on the validity of the occult sciences were held in suspicion

in scientific circles, Jung succeeded in gaining the respect of his peers. He continued to insist on a scientific approach to areas that were considered outside the field of proper research, and his exploration of psychic and occult phenomena led him actively to attend and record the séances (ultimately unveiled as fraudulent) held by an adolescent girl. In the new field of psychiatry, Jung discovered an "empirical field common to biological and spiritual facts, which I had everywhere sought and nowhere found. Here at last was the place where the collision of nature and spirit became reality" (1965 [1961]: 111). However, his decision to practice psychiatry at the Burghölzli Psychiatric Hospital in Zurich isolated him from the medical community. He assumed his position at Burghölzli in the winter of 1900, soon withdrawing into his own work, distancing himself from many of his colleagues. Professor Eugene Bleuler, the hospital director, was a prominent psychiatrist who would have a significant influence on Jung. Bleuler believed that "schizophrenia derived from an unknown cause . . . in which heredity played an important part" and thought schizophrenic symptoms were caused by "unknown organic processes" (Blome 1978: 23). Jung, however, took a different approach, emphasizing underlying psychical conditions.

In 1903 Jung read Sigmund Freud's *Interpretation of Dreams* for a second time, an encounter that had a profound impact on the young psychiatrist. Finding that his work paralleled Freud's on a number of key points, Jung wrote to Freud in 1906. Freud replied that he was familiar with Jung's studies: "I am confident that you will often be in a position to back me up, but I shall also gladly accept correction" (Freud 1974: 3). Freud and Jung enjoyed a powerful intellectual relationship that enlivened and excited the two thinkers; but Jung had reservations from the outset

regarding his colleague's dependence on the sexual causes of neuroses. Jung wrote that "Freud was emotionally involved in his sexual theory to an extraordinary degree" (1965[1961]: 117). Jung understood that in academic circles his reputation and career would suffer if he continued his professional association with Freud. But his convictions overrode his serious concerns about the dominance of sexuality in Freud's theory. Never one to doubt his own convictions, Jung stood his ground.

The relationship between Freud and Jung was one of father and son, a bond invested with a great deal of expectation and emotional involvement. It is clear that Freud hoped that Jung would serve as his intellectual heir. However, despite their agreement regarding the most basic elements of the psychoanalytic method, Jung's interest in the paranormal and his disagreement over the causes of neuroses led to a personal and professional schism. Difficulties began with a disagreement between Jung and another of Freud's supporters, Karl Abraham, over the causes of schizophrenia. Abraham followed Freud, while Jung maintained a position nearer to that of Bleuler, the Burghölzli director. Freud was able to negotiate a frail peace between Abraham and Jung, but subsequent events were to drive a wedge between Jung and his mentor. In 1908, both Freud and Jung enjoyed a measure of international popularity encouraged by their collaboration. In December of that year, both men were separately invited to give a series of lectures at Clark University in Worcester, Massachusetts, to begin in September 1909. Before embarking for the United States, the two men, while discussing parapsychology, were confronted with a strange experience. They heard a loud report from the region of a bookshelf. Jung became excited, claiming that they had witnessed a "catalytic exteriorization phenomenon" (1965[1961]: 172). When Freud expressed

his disbelief (he is reputed to have said "Bosh"), Jung predicted that a second report would follow, and to the surprise of both men, one did indeed follow. "It must have come as a considerable shock to a man like Freud," Blome writes, "trained in rational inquisition and the austere discipline of science, to find that his chosen Crown Prince . . . was capable of interpreting such phenomena in supernatural terms" (1978: 134).

On the voyage to America, Freud and Jung practiced dream interpretation on one another, which led to a serious disagreement between them. Freud insisted on analyzing Jung's dream according to his theory of the death drive, while Jung discovered in the imagery of his dream validation of his hypothesis of the collective unconscious. The dream involved a descent from Jung's home to an underground cavern, ancient and primordial. The collective unconscious is a repository of mythic patterns, characters, and concepts subtending individual consciousness, a universal realm of primordial images and archetypes. It is purely abstract and, for this reason, beyond the realm of conscious apprehension. Like the archetypal images that comprise it, the collective unconscious is "identical in all men and thus constitutes a common psychic substrate of a suprapersonal nature which is present in every one of us" (Jung 1975 [1959]: 4). Jung postulated further a connection between it and the individual mind. While the collective unconscious was the region of humanity's primordial origins and its most uninhibited desires, it represented a danger to the social order. But it also represented the ultimate in human potential, a totality of awareness and consciousness that is embodied in the human drive to individuate. The collective unconscious could possess the individual unconscious or the individual can choose to descend into it – a choice narrated in what Jung called the

heroic cycle. This latter option became the basis for his clinical methodology. For Jung, the dream over which he and Freud disagreed “obviously pointed to the foundations of cultural history – a history of successive layers of consciousness . . . it postulated something of an altogether *impersonal* nature underlying the psyche” (1965[1961]: 184).

Despite this methodological disagreement, Jung and Freud both had successful experiences in America and were awarded honorary degrees by Clark University. Upon his return, Jung began seriously to study mythology and archaeology, seeking support for his theories of symbolic archetypes. This research informed his “Symbols of the libido,” a paper that signaled his divergence from Freud’s foundational theories concerning the predominantly sexual nature of psychical energy. “The instinctive, archaic basis of the mind,” Jung wrote, “is a matter of plain objective fact and is no more dependent upon individual experience or personal choice than is the inherited structure and functioning of the brain” (Jung 1956: 185). Further points of conflict involved Jung’s hypothesis concerning the causes of infantile regression and the three phases of life. While Freud regarded childhood trauma as primarily sexual in character, Jung focused on the present life of the patient in relation to echoes of universal and archaic predispositions intrinsic to the human psyche.

By the fall of 1912, the relationship between Freud and Jung had become increasingly strained. Although Jung retained a measure of professional respect for Freud, it was clear that his mentor’s ideas and conclusions were not his own. Freud remained hopeful, however, that his protégé would return to the fold. His hopes were dashed, however, toward the end of that year, when an aggressive letter from Jung confirmed his rejection of the Freudian

school: “I am objective enough to see through your little trick,” he wrote to Freud. “I would . . . point out that your technique of treating your pupils like patients is a *blunder*. In that way you produce either slavish sons or impudent puppies” (Freud 1974: 534–5). Despite Jung’s break with Freudian analysis, a break that Freud regarded as a professional betrayal, the two men attempted to maintain cordial relations. They hosted the last congress of the International Psychoanalytical Association in Munich on September 7, 1913, hoping that there would be no public antagonism. However, later that same year, after a number of veiled and open attacks, Jung resigned his presidency of the Association and formalized his break with Freud and his school.

The decisive break with Freud forced Jung to defend his own position and distinguish his school from that of his former mentor. To this end, he adopted the term “analytical psychology.” In the book that marked his independence from Freudian psychoanalysis, *The Psychology of the Unconscious*, Jung defined two types of thinking: one was deliberate, directed, formulated in language, and the second was chaotic and revelatory, formulated in images and symbols. This second mode of thinking lay beneath the first, a stratum of psychical history that both directed and united the ongoing narrative of humanity. Jung’s methodology embraced a vast array of influences, from ancient epic to the sacred texts, from literature to philosophy, from archaeology to psychology. Indeed, his ability to trace the evolution of symbols and archetypes through a variety of cultures and contexts necessitated a methodology at odds with Freud’s scientific approach.

Though Jung was confident in the efficacy of his own methods, his break with Freud precipitated a mental breakdown that resulted in a long period of self-analysis corresponding to the “long, dark night of

the soul” described by mystics in pursuit of divine union and enlightenment. Jung was plagued by dreams and nightmares throughout 1913 and suffered a state of abandonment that threatened to tear him apart. But it was this very confrontation with the possibility of psychosis, with chaotic unconscious forces, that led him to theorize the concept of heroic individuation that would come to characterize his clinical method. The forces he confronted represented autonomous and independent archetypes, avatars of an unconscious realm subtending individual consciousness. His experience taught him that humanity’s tendency toward neurosis and other psychical imbalances was the result of the individual’s alienation from the mythic heritage of the human race. Jung developed a theory of the Anima figure, an archetypal liaison between the conscious and unconscious minds. He began to carry on a written dialogue with this figure, a rambling exchange that recorded his confrontations with the deeper levels of the psyche. He felt himself near to madness, unable to synthesize the conflicts between his scientific, rational mind and the impulsive, irrational voices of the archetypes. This period of personal transformation signaled a crossroads between potential individuation and complete breakdown. He began to interpret his experience in light of what he believed true of the human psyche in general: that it moved toward growth, evolution, and harmony through an analogous mythic process expressed through symbolic and highly charged interactions.

While they diverged significantly, Jung’s model of the psyche resembled Freud’s to the extent that it postulated a relation between the conscious and unconscious. Individual consciousness is caught between these poles, influenced, guided, and at times possessed by forces beyond conscious control. The personal unconscious, suspended in darkness above the unfathomable realm

of the collective unconscious, begins with instinct. The realm of instinct in the Jungian schema is dangerous because it promises a very specific kind of release; it is the freedom of the primitive, unconcerned with the strictures of conscious order and government. In this space, the mind is vulnerable to the numinosity of the archetypes, spheres of influence that can possess the mind and recreate patterns of behavior and thought analogous to familiar themes recurrent in the mythos of a given society. When actively used by the conscious mind, however, the archetypes can be positive influences, encouraging a range of thought and expression that may lead to transcendence, a degree of composure and equanimity sought by mystics and religious believers of every culture. In their transcendent aspect, the archetypes represent stages along the path of individuation, a path that leads first into the chaos of the unconscious and thereafter ascends into the height of consciousness, a transformation expressed in the religious iconography of transfiguration.

Arriving at these theoretical convictions cost Jung both his professional relationship with Freud and, very nearly, his sanity. However, by 1916, his recovery was assured, and his work prospered between 1917 and 1920. In 1921, he published his influential *Psychological Types*, a resource still used by many psychoanalysts today. Of particular importance is the distinction between introverted and extraverted personality types. In the extraverted personality, subjects orient themselves to objective conditions, identifying with them and accommodating themselves to them. Their thought processes are primarily informed by objective perceptions or ideals, and less by subjective and potentially unconscious sources. “If a man so thinks, feels, and acts, and in a word so *lives*, as to correspond *directly* with objective conditions and their claims, whether in a good sense or ill, he is extraverted” (Jung 1976

[1921]: 192). The extravert is additionally characterized by interest, attention, and accommodation and tends to shape, confirm, and validate objective experience in a process that perpetuates the general psychical frame. By contrast, in the introverted personality, the subject's relationship to the object is one of abstraction and withdrawal. "Whereas the extraverted type refers pre-eminently to that which reaches him from the object, the introvert principally relies upon that which the outer impression constellates in the subject" (217). The introverts is alienated from the object, obstructed by a veil of subjective thinking and feeling based on personal interpretation and experience. Introverts are vulnerable to a peculiar process of conscious subjectification, identifying their ego with the greater Self to such an extent that the deeper, purely objective influences of the collective unconscious are unavailable. The introvert values the subjective factor, plunging into abstractions, and is impassioned by these abstractions, clinging to them with a potentially dangerous intensity. Intuitively, the introvert seeks the objective causes of sense phenomena, and focuses on the details of sense phenomena. Both personality types exist in relation to each other and are often opposed to the universality of archetypes and the collective unconscious. Consequently, both the extravert and introvert find themselves in pursuit of a synthesis that juxtaposes many qualities of both psychological types.

In 1920, Jung took the opportunity to leave Zurich for north Africa; his travels provided him with an opportunity to explore the tensions between his ego-driven European mentality and what he perceived to be a more ritualized culture characterized by an emotional intensity nearer to the archaic, collective self. He became increasingly convinced that modern, Western humanity faced the peril of a terrible emptiness stemming from the inability routinely to

access the store of creative potential locked in the primordial regions of the mind. Jung's desire to explore more archaic systems of belief and practice led him to the *I Ching*, an ancient book of Chinese divination that prompted his theory of synchronicity. Jung believed in the objective truth of "psychic simultaneity," arguing that subjective, psychical processes could affect the external, material world and, by so doing, be reflected in material phenomena. His preoccupations led to a sojourn among the Pueblo Indians of New Mexico, where he found evidence of the nonrational relation between human consciousness and the primordial forces at work in the collective unconscious. A second trip to Africa in 1925 led to his decisive rejection of Christian dogma in favor of a more complete devotion to his model of the psyche. Jung was already influenced by the Indian concept of the mandala as a symbol of transformation and individuation. By the late 1930s, he discovered in Gnosticism and medieval alchemy some of the same elements of the human drive to individuate; this discovery assured him that the collective unconscious was capable of transcending the boundaries of history and culture.

The World War II period was trying and ironic for a man who had little faith in the power of politics to change the lot of humankind. He believed that individual struggle, shared only on the deepest levels of a collective consciousness, could improve and balance the chaos and degradation of modern man. Jung believed the Nazi movement was the result of a mass psychosis, embodied in a highly symbolic ideology. During this time, Jung was absorbed by the study of alchemy, particularly by the similarities between the individuation process and the synthesis of opposites promised by alchemical science. He was certain that alchemy adumbrated the concept of a unified consciousness won through the intense psychi-

cal effort of a ritual discipline. In *Psychology and Alchemy*, the 12th volume of his *Collected Works*, Jung illustrated the interrelations among spirituality, religion, and psychology.

While Jung does not enjoy the same degree of popularity and academic esteem enjoyed by Freud and Jacques Lacan, and their respective schools of psychoanalysis, his work remains influential in many clinical and theoretical fields. His greatest influence can be seen in the popularization of his ideas in the work of Joseph Campbell and in the pages of spiritual and metaphysical treatises. His theories of symbol, archetype, and the collective unconscious continue to fascinate and instruct, offering students of the mind and religious experience alike a theoretical vocabulary and a mode of understanding the world and its works.

K

Klein, Melanie

RANITA CHATTERJEE

Melanie Klein (1882–1960) was an Austrian-born, British psychoanalyst whose theories about early infant attachments helped establish fields within psychoanalysis devoted to children and object relations theory. Klein worked first in Vienna and Berlin before settling in London in 1926. Like her contemporary, Anna Freud, Klein significantly modified Freud's theories. Her theories shifted the focus away from the Freudian emphasis on the little boy and the Oedipal complex (the stage of his development associated with sexual awareness) toward the early infant emotions or drives aimed at the mother, especially her breast. Since Klein was directly involved with children, she devised a therapeutic technique involving free play, which stood in opposition to Freudian free association, in order to observe and analyze her young patients. Play theory assumes that through playing games, preverbal children reveal their urges, fantasies, anxieties, and fears. With her own three children, Klein was able to perfect her play technique to help her disturbed young patients. Her theories of normal emotional and psychosexual human development thus originated in her active interactions with infants and not from the

adult Freudian patient's recollections of infantile experiences. Klein started publishing her findings in 1921 in the *International Journal of Psycho-Analysis* and then published numerous articles and books that were eventually collected and published in four volumes as *The Writings of Melanie Klein* (1975).

In 1925, after being invited by the well-known psychoanalyst Ernest Jones to give a series of lectures to the British Psycho-Analytic Society in London, Klein became the prestigious society's first European member. Since the psychoanalysis of children was still a radical idea in Berlin in the 1920s and in Britain in the 1930s, many psychoanalysts were fascinated with Klein's play technique, whether they agreed with it or not. Her theoretical innovations eventually caused a schism in the British psychoanalytic community. There was a protracted, contentious debate from 1943–4 between the followers of the neo-Freudian model of child psychoanalysis represented by Anna Freud and followers of Klein. Whereas Anna Freud included the parents and other environmental factors in her analysis of children, Klein concentrated solely on the infant's emotions for and idealizations of the mother's body. The debates between the two factions, known as the "Controversial Discussions," were

never completely resolved. Instead three separate groups with their own unique theories and training emerged: the Freudians, the Kleinians, and the Independents whose primary approach was object relations psychoanalysis. Today, these approaches to psychoanalysis continue to be recognized and practiced.

As Hanna Segal (1986) explains, Klein's career may be divided into three phases: in the first, she challenged the Freudian Oedipal complex; in the second, she developed her concept of the "depressive condition"; and in the third, she focused on the earliest stage of infant development, namely the "paranoid-schizoid position." The first phase culminated in *The Psycho-Analysis of Children* (1975b [1932]), in which Klein pushed the development of the Freudian superego back to a much earlier stage of infant development and suggested that the Oedipal complex, with its emotions of remorse and guilt, may be seen in infants much younger than those in Freud's work (where the Oedipal crisis arises between the ages of three and five). The timing of the emergence of the Oedipal complex was a major point of debate between Anna Freud and Klein.

While there are several theories and approaches that go by the name object relations, practitioners in the predominantly British object relations school accept Freud's definition of the object as the other that satisfies a need or that signifies an instinct in a relationship. Klein, Anna Freud, and D. W. Winnicott emphasize the early pre-Oedipal relationship with the mother as opposed to the later relationship with the father that is the focus of Freudian psychoanalysis. Klein's work not only moved psychoanalysis back to the earlier dyadic mother-child relationship, but also demonstrated its crucial influence on the later triadic Oedipal relationship among the child, mother, and father. She analyzed the complexities of the child's inner world

and how objects from the outer world, particularly the mother, could be transformed into a part or whole object invested with intense feelings in the child's psyche.

Unlike Sigmund Freud, who discussed the instinctual energies of the oral, anal, and Oedipal stages, Klein discussed, in the latter phases of her career, two relationship positions that children experience at various times in their development and that may also overlap: the paranoid-schizoid position and the depressive position. According to Klein, in works like *Envy and Gratitude* (1975c[1957]), infants have violent fantasies of attacking and destroying the mother's body during the first four months of life. In this relationship, they split their egos to deal with their ambivalence towards their mother whom they view as a part-object (i.e., the child relates only to a part of the mother, typically the breast). Splitting is a developmental defensive strategy that distinguishes and separates incompatible experiences, such as negative from positive feelings. In splitting, infants project aggression or hatred onto a "bad breast," which in their fantasies is withheld or taken away from them, and they project their love onto a "good breast" that feeds them. In the fantasy, deflecting the aggressive feelings onto a bad breast, however, produces paranoid anxieties of the mother's retaliation. Klein calls the relationship with these maternal part objects the paranoid-schizoid position. Around five months or so, once the fragmented mother's body starts to integrate and to be recognized as a whole object, fears for well-being emerge. Whereas the paranoid-schizoid position is marked by infantile fears and self-preservation, the depressive position of relating to whole objects is characterized by anxieties about the preservation of the beloved mother. The recognition of earlier violent tendencies, along with the acknowledgment that the mother is a complete object in the outer world, leads to experiences of guilt and

depression. Klein associates this position with Freud's Oedipal complex. For her, both the paranoid-schizoid position of splitting and the depressive position of reintegration are crucial for normal emotional development, wherein the positive experiences outweigh the negative. Pathological conditions arise from disturbances in these two positions.

Because she foregrounds the important role of the mother's body in early infant development, Klein's theories have been well received by feminists interested in psychoanalytic, literary, social, and political feminist theory. Her work on the maternal part and whole objects has especially influenced feminist psychoanalytic theorists Dorothy Dinnerstein, Nancy Chodorow, and Julia Kristeva. Klein's understanding of early aggressive tendencies has contributed to social science theories of race relations, particularly in terms of the paranoid quality of racism discussed in Rae Sherwood's (1980) *The Psychodynamics of Race* (Elliott 2002: 87).

L

Lacan, Jacques

SHELLY BRIVIC, GERALD MOORE,
& JEAN-MICHEL RABATÉ

Jacques Lacan (1901–81), arguably the most influential psychoanalyst after Sigmund Freud, pursued throughout his career a rewriting of Freudian ideas that brought to bear on them the insights of Swiss linguist Ferdinand de Saussure’s structural linguistics as well as the insights gleaned from his own highly unconventional clinical practice. He is known for his structuralist theory of psychoanalysis, whereby the self or ego is considered to be far less important than the unconscious. Lacan polemicized against the dominant school of Anglo-American psychoanalysis at the time, which was known as “ego psychology.” He saw the unconscious as being a much more important part of the mind. His great innovation was to compare the operations of the mind to those of language. One of his most famous contentions was that “the unconscious is structured like/as a language.” Lacan’s work was especially influential after the publication of his major work, *Écrits*, in 1966 and is seen by many as being a contributing force to the advent of poststructuralism. He diverted Freudian thinking away from its problematic biological foundation and shifted its emphasis toward the idea of consciousness

defined as a play of delusion and revelatory signification. He emphasized the conflict between the conscious ego (the realm of signifiers such as symptoms or desired objects) and the unconscious (the realm of signifieds such as repressed motives that are unavailable to consciousness). The self is therefore much more complex than the ego, which for Lacan is prone to self-serving delusions and is structurally incapable of seeing the unconscious that is the real locus of psychic meaning. The self therefore should be conceived of in the linguistic sense as a “subject,” one part of a system of utterances and of rules for generating them that extends far beyond the reach of the ego.

Like many French thinkers of his generation, Lacan was indebted to the work of Saussure, who argued that the relations between parts of the language system determine the identity of any one part. The relation between linguistic sign and the thing it names is entirely arbitrary and contingent. In a similar way, Lacan insisted in “The Freudian Thing” (1954; repr. in *Écrits*) that in psychoanalysis one can never perceive anything but relations like those that allow language to function as a meaning-making system. He opposes the idea that one can have immediate feelings without mediation and argues that one can only

feel happy by setting up a scale ranging from sad to happy that resembles the way linguistic meaning is generated through relations of difference between parts of the language. The human subject only exists in and through forms of signification that resemble language. Lacan defines the subject in relation to a totality that he calls the “Other” (or “big Other”). Like the linguistic system that is a context that gives meaning to an individual word, the Other in psychoanalysis is the field of social relations, unconscious processes, and forms of signification that define the individual self. The Other tends to take on authority, even divinity, in Lacan’s formulation. Because the individual human subject is delusional and imagines itself to be a self-determining identity, the purpose of Lacanian analysis is to free the subject from its attachment to fantasy (the ego) by encouraging the subject to come to terms with its place within the larger structure that is the Other. The subject can see the signifiers that are indicators of the work of the unconscious (usually symptomatic behavior), but it can never gain access to the signified of those signifiers in the unconscious itself. As in Saussure’s algorithm – which placed the signifier above the signified with a bar between the two that indicated that signifiers never passed into meaning or signs into things – the way to the unconscious is barred. Lacan expands on Freud in a way that parallels Copernicus’s removal of the earth from the center of the universe. While earlier philosophy and psychology had aimed to unify the subject, psychoanalysis insists that the subject is divided and incomplete, driven by a lack of unity to seek an imaginary reunification. Lacan sees psychoanalysis as the first philosophy to face our fragmentary actuality rather than resting on wish fulfillment.

Lacan’s career can be divided into several periods. The first encompasses his early schooling in philosophy. He was also drawn

to literature, particularly the surrealists. He studied medicine at the Paris medical faculty, and came to psychoanalysis by way of French psychiatry. This work culminated in his doctoral dissertation, *Of Paranoid Psychosis in Its Connection with Personality* (1975[1932]), a close study of a single case of paranoia, a woman whom he was to call “Aimée.” Lacan’s dissertation contains the seeds of numerous insights developed later and testifies to a crucial shift from classical French psychiatry to Freudian psychoanalysis. His investigation included an examination of Freud’s theories about the structure of subjectivity in the name of “personality.” However, the “personality” of the title excluded any belief in a full person; for Lacan, a “persona” functions as a social mask, and “personality” should not be reduced to the “self” or the “ego.” He would usher in a new “science of personality” combining the intentionality of phenomenology, the Freudian topology of a decentered subject, and an awareness of the myths, collective delusions, and social forces that shape individual psyches.

Lacan’s early work was greeted with exuberant praise by surrealists. His innovative treatment of psychoses, together with his materialist approach to psychoanalysis, accorded with a surrealist Freudo-Marxism. His connection with the French literary avant-garde was both intellectual – he was close to André Masson and Georges Bataille and his group of dissident surrealists – and personal, for his second wife had been Bataille’s first wife. One can even argue that Lacan owes a few key concepts, “*jouissance*” above all, to Bataille, whose philosophy of waste, excess, transgression, and amoral eroticism found its way into Lacan’s system.

The second period of Lacan’s career can be identified with his decision to join the International Psychoanalytical Association (IPA). An important early text emerged at

this time, the first version of his paper on the mirror stage, which he presented in August 1936 at the 14th Congress of the IPA at Marienbad. Most of the ideas developed in the 1936 mirror stage paper, of which we have only notes, derived from a collaboration with the philosopher Alexandre Kojève, whose lectures on Hegel's *Phenomenology of Spirit* attracted the best minds of Paris, including Bataille. Their central concern was to link the Freudian topology of the subject with Hegel's concept of consciousness, which Kojève understood as the "subject of desire." This desire is not simply desire for any given object, but for a reciprocal interaction or social recognition. Lacan offered a more developed formulation in his essay on "Family complexes," which discusses related concepts such as identification, jealousy, primal aggression, subjective identity caught in a mirror image, and the narcissistic structure of the ego (2001[1938]). To the "ego" seen as a totalizing image that creates an illusion of a homogeneous selfhood, Lacan opposed an "I" understood as the subject of desire. According to Lacan, the Freudian ego was the source of error and misrecognition, and therefore was not a positive element for therapy; the desire of which the "I" is the subject, however, reveals the truth of unconscious determinations. Lacan was to call the realm of the ego the "Imaginary," because it was lodged only in the virtual space of the mirror and in social interaction and everyday psychopathology. The mirror image presents a reassuring space into which our sense of identity is projected – that is to say, artificially constructed. In a movement parallel to that of Melanie Klein, Lacan approached Freud's topology of the subject by refusing to take any form of ego-psychology as a foundation for analysis.

Lacan's point of departure was a psychological experiment performed in 1931 by

Henri Wallon called the "mirror test," which marks the moment when a child distinguishes his or her body from its reflected image. This recognition presupposes that children grasp the difference between the unity of the image and a more or less precarious identity. Lacan called this the "mirror stage," which implied that it constituted a step in every child's development. Hence, it had the importance of a subjective formation to be added to the sequence of Freud's oral, anal, and phallic stages. Lacan later introduced the acquisition of language as an additional important factor in the development of the self. Language cancels the immediacy of perception, so that the acquisition of a symbol-making capacity occurs simultaneously with separation from the early attachment to the mother. The function of nomination (or naming) arises at this stage, especially when exercised by the father, whose structural role is to lay down the law, in the first instance by breaking the developmental fusion of the mother and the child. Commensurate with this stage is a shift from the "No!" of the father (*le non du père*) to the "name" of the father (*le nom du père*). The symbol (*nom* or name) replaces perceptual experience and comes to stand in for the absent fusion with the mother. For Lacan, the acquisition of a capacity for symbol-making allows the child to move beyond the early fused psychological state with the mother. By substituting for the thing (the mother's body), the symbol frees the child to develop as a separate being.

With the "name of the father," we enter the third period of Lacan's career, marked by his meeting in 1949 with Claude Lévi-Strauss, which was the beginning of a long friendship. From Lévi-Strauss, who introduced him to the work of Roman Jakobson and Saussure, Lacan borrowed the concept of the symbolic and a set of terms (e.g., "sign" and "signifier") derived from Saus-

surean structuralist linguistics that he would put to innovative use. Culture, for Lévi-Strauss, was perceived as having a symbolic efficacy because it organized kinship and totemic structures in terms of systems of differences. The symbolic was culture, determining at the most basic level forms of social alliance and exclusion, deciding what objects, words, and even persons could be exchanged at any moment. If the Oedipus complex, based on the prohibition of incest, was a universal phenomenon, what mattered most was not that the mother was prohibited as an object of desire for the son in some cultures and available in others, but that in every culture a particular individual is taboo.

In the same year that he met Lévi-Strauss, Lacan presented a revised version of his paper on the mirror stage (in Lacan 2006 [1966]) at the 16th Congress of the IPA in Zürich. Now at the forefront of a second generation of French psychoanalysts, Lacan proffered a third path in the midst of a fierce war between the two dominant psychoanalytic schools at the time, the British Kleinians and the American “Anna-Freudians.” This path was characterized by Lacan’s belief at the time that psychoanalysis was a “return to Freud,” whose texts, he claimed, were no longer read by his disciples. Lacan’s weekly seminars, which entailed close readings of Freud’s works, were highly influential and made Lacan himself a highly visible public figure.

Lacan’s theoretical revisions of classic Freudianism were accompanied by a technical revolution, signaled dramatically by his introduction in his own practice of psychoanalytic sessions of variable length, including the short session, which he called a “chipped stone” (2006[1966]: 98, 106). The innovation was condemned as soon as it was known to the French and international societies of psychoanalysis, and Lacan, who had been elected president of the Société

psychanalytique de Paris in January 1953, was obliged to resign. After he joined the new Société française de psychanalyse, the association was threatened with exclusion by the IPA if they kept Lacan in their ranks. He retaliated with his essay “Function and field of speech and language in psychoanalysis,” which he delivered at the Rome Congress, held at the Institute of Psychology, University of Rome, in 1953. This manifesto flaunts a dizzyingly vast cultural knowledge, while introducing the new doctrine of the primacy of the signifier (the material aspect of language) over the signified (the meaning or content of words spoken) (see Lacan 2006[1966]). Psychoanalysis works, he argues, because it is able to touch the human subject or self at the point where words impact the body and the mind. Among other things, the “Rome discourse” justified the practice of the variable-length session. Since time and money were the only factors that granted agency to a psychoanalyst who tried to produce effects on a patient’s life, only by narrowing the session and bringing it to a dynamic “cut” in the patient’s discourse could one hope to highlight a loaded signifier. By speeding up clinical practice itself, the very format of the talking cure was made to signify in a productive manner.

In 1957 this important essay was followed by “The agency of the letter in the unconscious; or, reason since Freud” (in 2006 [1966]), in which Lacan advanced a concept of the unconscious as being founded on the signifier/signified dyad. The Saussurean bar separating the realm of the signifier from the realm of the signified (language from meaning) was, for Lacan, now the same as the line in the mind separating conscious awareness from unconscious processes. One can never move from signifiers in consciousness to the signified unconscious. The unconscious can only be known through signifiers. Therefore, analysis can only move from signifier

to signifier (as in a chain whose parts are connected). One can never arrive at a point where a signified unconscious content manifests itself as itself. Lacan explains how the unconscious operates in a way that resembles how language functions. The two primary mechanisms of dream distortion through which the unconscious is traced in Freud's account – condensation and displacement – correspond to metaphor and metonymy, which Roman Jakobson (1971 [1956]) identifies as the main principles organizing language. Metonymy links things by displacement (e.g., “sail” standing in for “ship”), and metaphor condenses two different things (e.g., “fire” and “love”).

Lacan's visibility became greater in 1966, with the publication of his second book, *Écrits*, consisting of nearly 1,000 pages of previously published pieces. *Écrits* contains a number of influential essays that have had a profound impact on psychoanalysis as well as on literary and cultural theory. Lacan himself related some of these ideas regarding the self to literature. His model of the split self that exists in and through signifiers that emerge from the unconscious becomes in his writings a model for the plot of fictional narrative as a movement of the signifier through stages of misunderstanding. Both the action of the plot and the content of theme constitute a subject that takes its meaning from a series of false positions as it strives toward the true meaning it can never reach. This pattern is unfolded in Lacan's most famous work of literary criticism, the “Seminar on ‘The purloined letter’” (1956; repr. in *Écrits*).

Lacan's reading of Edgar Allan Poe's story underscores the dominance and mystery of the signifier as it traces a series of stages in the transmission of the concealed and stolen letter. Lacan argues that these stages correspond to roles that signifiers pass through in the process of communication. In the first stage, when the queen writes the letter, she

possesses the power to signify (which Lacan associates with the male sexual symbol, the phallus), but must keep it a secret. In the second stage, the minister steals the letter from the queen, thereby coming into possession of the phallic power that now threatens the queen. In the third stage, the detective Dupin steals the letter, so that he possesses the power that in turn threatens the minister. Lacan implies that once Dupin takes pride in possessing the letter, he is susceptible to having it stolen from him. The truth, or any signifier of it, can only exist in a process of circulation among people; however, as soon as one believes that one possesses it, one has lost it. The meaning or power of the letter depends on its position in a structure of human interaction and not on its content. Poe never reveals the content of the letter: it implies illicit sexuality, but for Lacan every signifier implies sexuality, which is always illicit. More important than the content of the letter is its truth, which lies in its circulation among subjects. As Lacan indicates in his twentieth volume of seminars, *Encore 1972–1973*, truth operates in a series of stages, each of which is either an illusion or a denial (see Lacan 1998[1975]: 90).

After 1966, Lacan courageously began questioning his own concepts, mostly in an effort to undo the theoretical closure produced by an all-too “scientific” linguistic structuralism and to test the limits of his own system. He moved away from the simple dichotomy of the signifier and the signified to explore issues of utterance (the “primacy” of the signifier was replaced with the subject's “enunciation” via “shifters” like personal pronouns). With the help of Michel Foucault's historiography of knowledge, he stressed the idea of four discourses that would account for the interactions between power, agency, the unconscious as a hidden knowledge, and the symptom. He was at the same

time interested in the increasingly vocal critique from various feminist groups of the “phallic” domination in Freudian theory. The “phallus” was the symbol that designated the woman’s lack of a penis, something Freud claimed inspired fear and anxiety in boys. By acquiring the symbolic phallus, boys “foreclosed” or did away with both the woman’s lack and their own anxiety. As a response, the “formulae of sexuation,” which aimed at demonstrating that sexuality is not determined by biology, were introduced in the early 1970s (Lacan 1998[1975]). There is, Lacan insisted, a “feminine” position that is not fully underpinned by the phallus and is available to all speaking subjects, whereas the phallic law of castration gives access to normalcy and universality. It is in this context that one can situate his deliberate departure from or critique of Freudian logic. Some of these came early enough, as in the seminar on *Hamlet* from 1959 (1982[1977]), which reversed Freud’s argument about the Oedipal structure of Hamlet’s desire. For Freud, Hamlet could not strike his uncle because the uncle had enacted Hamlet’s own incestuous and murderous wish; Lacan concluded from the same pattern that Hamlet could have wished all the more to strike an Oedipal rival. Thus, for him, the solution to the riddle of the play lay on the side of the impenetrable desire of the mother, or the hidden source of Gertrude’s sexual enjoyment. If Ophelia’s name could be made to exhibit the phallus (O-phalos) it secretly contained, it was a more labile or doomed phallus.

According to Freud, the phallus is linked with the idea of female castration, which does not exist in nature and can be safely relegated to a fantasy. The phallus is thus a cultural construct intended to ward off the imaginary threat of castration; it is a part of the symbolic logic that works through substitutes, which Freud demonstrated by

showing that a child can play the role of the phallus for a mother, while a sports car or a muscular physique can perform the same phallic function for a man. Lacan’s decision to push the logic of the phallus further – that is, to allow for a space not determined by the phallic function – follows his rediscovery in Aristotle’s logic of a theory of “exceptions.” This idea of an exception to the phallic function was meant to ground one of Lacan’s mottos from the late 1960s: “There is no sexual relation.” By saying this, Lacan did not mean that men and women do not engage in sexual activities, but that sexuality is not based on a reciprocal relation or homology. In his view, it was love that had the function of repairing the lack of reciprocity by postulating the redeeming power of a One always missing from sexuality.

For 27 years (1953–79), Lacan delivered an annual series of talks that are still being edited into 26 volumes of seminars by his heir, Jacques-Alain Miller. As of 2010, seven of them are available in English and twice as many in French, though unofficial versions of the rest circulate. Each volume contains 10–20 seminars of about a dozen pages each given during the academic year, but the volumes are referred to as *Seminar I*, *Seminar II*, and so forth. Lacan’s seminars were not restricted to close readings of Freud’s texts, even if most of them, at least in the first decade, were. They also investigated literature, the Bible, love, politics, and sexuality. In all his seminars, Lacan insisted on the sharpness of Freudian insights, whose critical edge he alleged had been dulled by psychoanalytic schools such as “ego psychology,” which urged adaptation to social norms. He always opposed the truth of the unconscious to established knowledge. His increasingly cryptic or oracular pronouncements were delivered in the seminars as a sort of “talking cure” enacted in front of an audience. By these means, he demonstrated that there was no metalanguage – no

way of talking about speech that was not itself speech – and that theory could not be divorced from a performative actualization. This performance was generalized from an “analytic experience” that was no longer limited to the analyst’s couch. It also entailed a new definition of ethics in which the main commandment was “never yield on one’s desire.” Antigone was the figure that best illustrates this. Lacan’s most impassioned seminar, *The Ethics of Psychoanalysis* (presented in 1959–60; published in English in 1992), presented Antigone as an emblem of desire – since she never yields to her desire and refuses to obey the orders of the state – and of radiant beauty. Her brilliance is such that it purifies the imaginary of all the other characters and of the spectators as well. Lacan concluded that psychoanalysis was inseparable from a tragic view of life.

A consideration of key points in the published seminars will highlight Lacan’s most influential contributions to literary and cultural theory. *Seminar II: The Ego in Freud’s Theory and in the Technique of Psychoanalysis, 1954–1955*, develops the three registers of language that make up the subject: the imaginary, the symbolic, and the real. The imaginary is his term for the cognitive processes of the ego, which he sees as a delusional entity that is structurally incapable of knowing the unconscious except through signifiers (often symptoms) that both reveal and conceal unconscious content. Lacan is strongly opposed to analysts who see the ego as something to be strengthened or as possessing an identity that encompasses all that determines it. Such an identity is delusory because much of the self – its truth – is unconscious. The imaginary is the fantasy of identity that constitutes the ego as an essentially narcissistic entity. The symbolic connects the subject to the social order. It is the processes of signification (the emergence of unconscious material as symptoms, for example,

that determine the self without being in the self’s control) that largely make up the self and determine its content. The real is the unknowable dimension of psychological life, the unconscious as well as all the psychological forces such as the instinctual drives that shape the self without being available to the self in the form of conscious knowledge. We can never know it because we can only see through the symbolic. In *Seminar I*, Lacan calls the real “what resists symbolisation absolutely” (1988: 66). In *Seminar II*, Lacan notes that the real is the edge of our awareness, while in *Seminar XX* he says that it can only be perceived as a disjunction of language that surfaces when something does not make sense. The relation of the three orders may be clarified by a simplification: everyone needs to have feelings (I), to depend on a vocabulary (S), and to be capable of being surprised (R) in order to sustain consciousness. Yet these activities use language in ways that are not commensurate with each other, so the imaginary, symbolic, and real must be distinguished. It is often said that Lacan focused mainly on the imaginary during the 1950s, the symbolic (with its social connections) in the 1960s, and the real in the 1970s, though, like anything one says about Lacan, this is a simplification. Indeed, in later seminars, Lacan envisions them as three interlocking rings that make up the subject.

The conceptual complexity of the three registers is captured in Lacan’s consideration of ethics and beauty in *Seminar VII, The Ethics of Psychoanalysis, 1959–1960*. In this text, Lacan ties both ethics and beauty to transgression because it is by going beyond bounds that desire is engaged and civilization advances. At this point, Lacan is moving beyond structuralism toward poststructuralism. The ethical act for Lacan breaks down the established imaginary order to open up new possibilities, and

therefore he credits the Marquis de Sade with showing “that through crime man is given the power to liberate nature from its own laws” (Lacan 1992: 260). But the main example Lacan discusses is *Antigone*. He sees Sophocles’ play as a turning point in the field of ethics because it supports Antigone’s opposition to the state and the law (243). She passes beyond the symbolic order to situate herself between symbolic death and real death. She approaches beauty as she approaches the terrible Real to affirm human independence.

The spatial constitution of the subject in the field of signs is the focus of *Seminar XI: The Four Fundamental Concepts of Psychoanalysis, 1963–1964*, perhaps the most influential seminar volume, sometimes called Lacan’s greatest work. The first section discusses the unconscious, the foundation for explaining irrational motives, starting with the statement that it is “structured like a language” (1978: 20). Lacan argues that the subject is divided by seeing itself as an object because it can only enact itself in words that are external to it. And because the object of desire is shaped by unconscious gender codes, Lacan says that “desire is the desire of the Other” (38), that one does not know where one’s desire comes from, or why one chooses that object. There are conventions that allow one to identify desirable objects, but these conventions are established codes whose meaning we may not understand, and desire often violates them. One may believe that one is logical in desiring an object because it has a conventionally desirable form, but this avoids the question of why certain forms are designated as desirable. Moreover, people are often attracted to forms that are not conventional, as suggested by the song “My Funny Valentine.”

In the second section, “Of the gaze as *objet petit a*,” the interaction between the subject and the invisible object that generates it is

represented through the visual field. Object *petit a*, the small *autre* (other) is opposed to the big Other as the object of desire (other) that stands for the totality of meaning that we cannot reach (Other). The gaze of the other is the object of desire that expresses one’s lack. Lacan says, “We are beings who are looked at” (1978: 75), and if consciousness cannot exist without being watched, Lacan also holds that one cannot perceive a visual field without imagining that it conceals a gaze looking back at one. He diagrams two interlocking cones, the subject looking at the gaze and the gaze looking back at the subject, with the image or screen (what is seen) in the middle where the triangles intersect. Lacan says that a picture is a “function in which the subject has to map himself as such” (100). In the middle of every visual field is a blind spot around which the composition is organized, and that spot is “the object on which depends the fantasy from which the subject is suspended” (83) because it represents the subject’s need. This theory has been used extensively by art and film critics.

The third and fourth sections of this seminar concern the function of the drive – a circular or looping movement outward and back through which the subject appears (1978: 178) – and of the Other in the formation of the subject, whose object is the gaze (182). In the field of the Other, the subject forms itself as a fantasy by stages, looping into the structure of signifiers that make up the field of the Other. Lacan says that the subject derives its meaning, identity, and gender formation from the linguistic constructions in the Other. The idea that identity and gender are derived from language rather than inherent in the subject is one of Lacan’s liberating principles, leading to the awareness that the stereotypes of gender, class, and race are products of historical contingency. This awareness frees one from religion, for the realization that

knowledge resides in language requires that the analyst – and the theorist – know without reference to “a perfect, infinite being” (225).

In *Seminar XX: On Feminine Sexuality. The Limits of Love and Knowledge: Encore 1972–1973*, Lacan confronts the politics of gender and sexuality that he had already touched on briefly in “The Signification of the Phallus.” This text may have been influenced by Lacan’s conflicted relation with the feminist psychoanalyst and theorist Luce Irigaray, who was his student and who claimed that he had impeded her career. Lacan begins by saying that sexual pleasure is not the sign of love (1998: 4). He opposes the idea that men and women are made for each other, thus counteracting traditional patterns of gender that subordinate women. He presents an enigmatic table of mathematical formulas for the two genders. These are explained by Charles Shepherdson in his essay “Lacan and Philosophy” (2003), who notes that while all men are subject to the phallic law of symbolic castration, not all women are. Because this theory is so exclusively about male desire, Lacan sought to right the imbalance in this seminar. In it, he contends that there may be a feminine sexuality beyond phallic sexuality, but it can only be conditional. This accords with Irigaray’s statement that whatever feminine sexuality may be, it has never been seen, for women have always been subjected to male fantasies (1998: 90). As Shepherdson suggests, the possibility of feminine enjoyment may be found in a conception of love that Lacan explores at the conclusion of *Seminar XX*, where love is understood as a shared recognition of our inevitable structural exile from the desired unity with the mother that is represented in the sexual relationship; it is an encounter with the unconscious knowledge of the other (1998: 145), which may occur when each lover encounters the other’s lack or need.

Lacan’s thinking took a decisive turn in *Le Séminaire XXIII: Le Sinthome, 1975–1976*, which is almost entirely about Joyce. As Lacan puts it, “This year will be my interrogation of art” (2005: 22). He derives from Joyce’s relation to his art the *sinthome*, the voluntary and artistic construction of the symptom, the process by which the modern artist projects the symptom into the artwork for a purpose. In this way, the symptom becomes a sin (something chosen) in a tome. This and other similar puns recapitulate Lacan’s point about the mobility and polyvalence of the signifier. At this stage of his work, Lacan made the *sinthome* a central tool of analysis, a way of treating psychological problems in artistic terms so that the formation of the subject is revealed to be tentative or created (a synthetic home), and therefore can be rearranged or reformed. Knots now became the main representation of the subject, and if, for Lacan, the imaginary, symbolic, and real are three circles intertwined in a Borromean knot, the *sinthome* is drawn as a temporary splice that holds them together and can be repositioned, thus facilitating the “rearrangement” of the subject.

Lacan says that Joyce’s work performs the same function as analysis, that of freeing words from their attachment to reality, the signifier from the signified – so Joyce is a saint of man (*St homme*). The *sinthome* is a path one follows until one reaches the real, which can only be perceived as an “impasse of formalization” (2005: 93), or a disjunction in words that indicates, by the very fact of disjunction, what is outside language. In *Seminar XXIII*, Lacan insists that this is the goal of Joyce’s epiphanies (the revelatory moments in his work), because the real, by manifesting impossibility, allows the subject to reformulate itself. The real, symbolic, and imaginary orders are displaced from their prior configuration, and the *sinthome* is a loosening of their connections to each other. Lacan celebrates the

ability of *Finnegans Wake* constantly to invent new words so as to free language from the control of linguistic and literary authority. Established language comes with prejudices built into it, but the unprecedented formulations and connections in Joyce – and Lacan, who uses many Wakean puns in *Le Sinthome* – speak for what has not yet been realized, new kinds of language and thinking, new ways for words to work. In his discussion of *Seminar XXIII*, the Argentinian Lacanian analyst Roberto Harari (2002) goes a long way toward transforming *Le Sinthome* from an enigma to a coherent work, revealing the numerous layers and intricacies that tend to permeate Lacan's texts. Harari says that people always want to depend on the Other as a divinity that responds to them (125), but that Lacan, like Joyce, unmoors humanity by recognizing that the Other is unknowable and urges us toward continuing invention without a foundation in metaphysics, theology or any other totalizing structure.

The confrontation with Joyce also suggested a new clinical tool, for the symptom could be seen as a subject's most singular feature as well as a form of writing through which he or she negotiated with the Borromean figure represented by the interlocking circles of the real, the imaginary and the symbolic. This symptom, since it embodied the subject's utter singularity, should be "enjoyed," as the Slovenian theorist Slavoj Žižek put it (1992). Such a conception of the symptom was indeed revolutionary: if a symptom is something of which the patient initially wishes to be cured, the end of analysis would consist not in eliminating the symptom but in allowing one to do something with it, either creatively or hedonistically. A symptom became a way of enjoying one's unconscious. A psychoanalytic cure should thus work through puns and linguistic equivocation, in that dimension of "fun" brought by the unconscious, in order to

reconnect the bearer of the symptom with a functional Borromean knot.

The encounter with Joyce led Lacan to a final revision of his concepts. *Jouissance* acquired in the late work a more positive meaning, since Lacan no longer saw this excessive enjoyment as being opposed to desire. Lacan's earliest major discussion of *jouissance* comes in a lengthy section entitled "The Paradox of *Jouissance*," in his 1959–60 seminar, *The Ethics of Psychoanalysis* (1992[1986]). Here he returns to one of Freud's major texts, *Totem and Taboo* (vol. 13 in 1953–74[1913–14]), which hypothesizes that the origin of society lies in the murder of a primal father and the sharing of power between his sons, who inaugurate the rule of law. According to Freud, the father's murder is provoked by the monopoly he has over all the tribe's female members, which amounts to a monopoly over pleasures that are denied to the other male members, his sons. The father's murder, which leads him to be elevated to the status of a god, does not bring about the unleashing of pleasure that might have been expected, however. Rather than relaxing their father's denial of access to pleasure, the sons reinforce it through the establishment of laws designed to prevent the emergence of hostile competition between rivals. Lacan denies that this prohibition entails the complete refusal and disappearance of pleasure, since, on the contrary, he argues, beyond the law of the father there was never any pleasure awaiting the brothers' reappropriation. Pleasure is not independent of the law, but made possible by it, in the form of the *jouissance* derived from the repeated frustration of desire.

Underlying this claim is the Lacanian conception of desire as the desire for a lost object, *objet petit a*, which, if attained, would constitute the completion and fulfillment of our existence, but which can never be attained, except in fantasy.

Jouissance is not occasioned by the ownership of an object that would satisfy desire, but, rather, by the pleasure-in-pain of our inability to possess it – that is, by the inevitable frustration of desire. The crucial point of the story is its illustration, on one hand, of *jouissance* as a mythology, the fantasy that desire can be satisfied; that there exists out there a forbidden pleasure to which we don't have access, but which others are enjoying at our expense. On the other hand, it also shows that the prospect of satisfaction or pleasure does not exist independently of the laws that prohibit it. Once stripped of its fantastic, imaginary construction as an actually attainable object, we encounter the highest form of pleasure, *jouissance*, as the paradoxical pleasure derived through being denied it, as nothing other than the experience of desire's frustration. The law that denies us access to this imagined pleasure is thus simultaneously what creates it, allowing us to experience *jouissance* in the transgression of the law that prohibits desire. Lacan will go on to describe *jouissance* as the libidinal satisfaction we take in the constant failure of desire to find satisfaction.

In *Seminar XX: On Female Sexuality, 1972–1973*, Lacan suggests that woman is another fantasy that stands in for the lost object of male desire. His notion of the “*jouissance* of woman” captures the idea of “woman” as an imaginary construct exceeding men's ability to grasp her and enjoying a mystical feminine *jouissance*, or pleasure – the quasi-mythical multiple orgasm, for example – beyond the grasp of the symbolic order of desire. Implicit in this position is Lacan's controversial claim that woman (construed as an essence that can be owned, known, or possessed) does not exist, which has met with considerable resistance from feminists. Writing in *This Sex Which Is Not One* (1985[1977]), Irigaray retorts that woman is not the mere fantasy object of man

and does not require mediation by any patriarchal law of father to gain access to her own *jouissance*. In place of Lacan's *jouissance* of the other, created by our very inability to access and possess the other, Irigaray writes of “*jouis sans loi*,” meaning the imperative: “enjoy without law.”

The main thrust of Lacan's influence on literary theory has focused on his recognition of structures of unconscious motivation as social structures of language. Critics have used many of his concepts – the subject as a construct around an empty center, the phallus, the signifier as purloined letter, the gaze, the Other, the imaginary, real, and symbolic orders, and so forth – to describe the operations of structure and plot as they express class, gender, ethnicity, and other patterns of language in literary works, film, and other art. Rabaté's *Jacques Lacan: Psychoanalysis and the Subject of Literature* (2001) contains eight chapters that examine eight of Lacan's main discussions of literary works, from Hamlet to Marguerite Duras, and also has an annotated bibliography that (among other entries) describes ten books on Lacan and literature. At the beginning of the twentieth century, critics are focusing on the last phase of Lacan's thought, with its emphasis on the real, in order to reveal how literary and cultural works break down existing social structures. Lacan's pertinence to theory will continue to evolve as our understanding of his groundbreaking work itself unfolds.

Leavis, F. R.

ANTHONY FOTHERGILL

From 1930 through the 1970s, Frank Raymond Leavis (1895–1978) was a towering influence in the formation of English studies as a university discipline in England. His impact lay as much in his undertaking a fundamental reevaluation of the prevailing canon of English, and the terms by which he understood its fundamental relation to the broader language and culture, as in the specific judgments he made. Through his teaching and writing while at Cambridge, he had a profound impact on generations of students (“Leavites”), who continued with his missionary zeal to establish the cultural centrality of English as an academic discipline and to transform the teaching of it in schools throughout Britain and in English-speaking countries throughout the world. His rhetorical style was famously authoritative and his judgments of works (and other critics) often iconoclastic and acerbic, but his primary aim was the pedagogic one of creating, by example, a “collaborative community” of “common readers” who shared his foundational vision of (re)creating English literature as the carrier, through its language, of a collective historically grounded national culture.

Leavis was born on July 14, 1895 in Cambridge, of parents who, coming a generation before from rural East Anglia, had established a musical instrument business

situated just opposite Downing College, Cambridge. From his first appointment there in 1929 till his retirement in 1962 Leavis was to teach as a college lecturer (though, much to his chagrin, not as a university professor). Like many of his contemporaries involved in postwar English studies at Cambridge, Leavis had come up as a grammar school “scholarship boy.” Like many others, his was a petit bourgeois background, so different from the “scholar-gentleman” ambiance which had determined English studies in prewar Oxbridge. This social background of nonconformist, upwardly mobile middle-class professionalism had a profound influence on later developments in Leavis’s critique of establishment English culture and its social-cultural elites, including those inhabiting the Cambridge he sought to change and the “dilettante aestheticism” of Virginia Woolf and the Bloomsbury Group. Traces of the influence of his rural craftsmen forebears can be seen in Leavis’s celebration of an “organic community” sharing “traditional” cultural values, a crucial aspect of his critical and moral perspectives. Leavis’s social vision of a (past) harmonious community to be rediscovered through the saving power of literature has in its turn been criticized, mainly by Marxists, as ideologically driven conservative nostalgia (Baldick 1983).

Leavis played a central role in the early development of the “Cambridge School” of English studies, which he pursued with a determination at first of optimistic zeal and later with a sense of witnessing, what was in his view, a decline in national cultural. His writing and its impact cannot be separated from that of his closest collaborator, his wife Q. D. (Queenie) Leavis (1906–81), and her contribution to his thinking and writing in substance and tone was profound. Theirs was a unique and powerful partnership in the furtherance of serious critical thinking about English

literature and the radically new direction they thought it should take. Her own grounding in the history and sociology of popular English fiction (*Fiction and the Reading Public*, 1932) brought to F. R. Leavis’s criticism a growing awareness of the centrality of the English novel as the genre best suited to map an ever-changing English sensibility and culture. His major works of the 1930s, *New Bearings in English Poetry* (1932) and *Revaluation* (1936), focused on poetic language within the English literary tradition. In *New Bearings* he articulates the modern challenge posed by Hopkins, Yeats, Eliot, and Pound toward traditional English poetic forms and diction, insofar as they are in continuity with, or, more assertively and perplexingly, discontinuity with, that tradition and its literary canon. *Revaluation* similarly traces the development of English poetry from Shakespeare to the Victorians, but it is a “development” marked, and Leavis took his cue from T. S. Eliot here, by a “dissociation of sensibility,” symptomatic of the present cultural decline.

Leavis’s explanation for this decline can be found in one of his first publications, *Mass Civilisation and Minority Culture* (1930), which both analyzes the contemporary predicament and offers a revitalized cultural vision, with English literature at its center. For Leavis, the rise in mass literacy had combined with its commercial exploitation through mass-market popular literature to produce a “dumbing down” of the public sensibility and capacity to recognize the “implicit standards that order the finer living of an age” (1930: 5). It is the role of a *minority clerisy* (or intellectual class) to “keep alive the subtlest and most perishable parts of a tradition” and to restore “an informed and cultivated public” (5, 17), imparting the standards and sense of value essential to the health of all society. Strong echoes can be heard here of Matthew

Arnold's cultural diagnostics, and Leavis's position also bears comparison to Theodor W. Adorno's later critique of the "Culture Industry." The importance of Leavis's pedagogical project, embracing not just literary criticism but the cultivation of a "non-specialist intelligence and sensibility" (Leavis 1972: 217) is evident here as much as in those later works explicitly dedicated to the topic, such as *Education and the University* and *English Literature in our Time and the University*. Raymond Williams commends Leavis for having pioneered the serious critical study of the mass media, even if Leavis's attitude, and the minority elite he typified, was anathema to Marxist-leaning critics.

Leavis took an early and commanding role in *Scrutiny*, an enormously influential literary journal in British culture from its inception in 1932 until its demise in 1953. Though not the founder, as editor Leavis set the combative tone and was the leading intellectual light of a journal which was far more than an academic talking shop; it was central to the particular direction English criticism of culture and the arts took through the 1930s and '40s. It provided a platform not only for his own literary criticism and, with his collaborators, the discussion of contemporary English and European literature and music, but also for the radical revision of the traditional canon against conventional evaluations. It achieved, for example, a decisive reorientation of thinking about Shakespeare as a *poetic* dramatist in contrast to the prevailing emphasis, following A. C. Bradley, on character-based criticism. Shakespeare's consummate achievement of creative critical thought through language offered a criterion for the assessment of later writers like Milton, Dryden, and even Dickens (*The Common Pursuit*). But so rooted were Leavis's ideas in a specific reading of English civilization and the role of a minority elite

who might revive its culture, that they did not translate as easily abroad, as did the work of Eliot, I. A. Richards, and William Empson.

Central to Leavis's thinking was, as the title of his journal suggests, the importance of "close reading" and analysis of a text, but always a reading which carried a moral and aesthetic imperative of discrimination and judgment, though the terms he used to describe his criteria were often vague. What he called "moral" judgments some others, like Empson, called "moralistic." In Leavis's view they were self-evident: "life-affirming," "moral seriousness," "compelling concreteness." In using such terms Leavis has been compared, by Michael Bell (1988) to phenomenologists like Husserl and Heidegger whose approach to knowledge of the world shared with Leavis's the view that language was "a form of life" *intuitively* known. Language does not *refer to* "the world" any more than consciousness itself is separable from "the world" it intuitively enacts. Rather it *enacts* it, Leavis argues, just as our sensitively critical reading of a work enacts the world presented to us in the poem or novel. This kind of performativity is apparent in Leavis's mode of argumentation, his rhetorical procedures. He would characteristically offer long quotations "illustrative" of certain judgments he was passing, according to criteria themselves hard to define: "impersonality," "maturity," "felt life," "sincerity," "convincing perfection," and "incontestable" are among his favorites. This implicitly invites his readers to discuss further both the judgments and the criteria. Ideally, the "common pursuit of true judgment" (Eliot) is modeled on what Leavis called "collaborative disagreement." Critical statements, however authoritative – "This is so, isn't it?" – are implicitly meant to invite the reply: "Yes, but ..." (Leavis 1969). However, it has been argued that the very insistence of Leavis's rhetoric

leaves little room for disagreement (Bilan 1979).

Certainly, he refused to offer a theory of literary criticism, “methodology,” or a generalized body of technical terms to be applied to the judgment of works. Such would have been for him a contradiction in terms. Always ready to embrace controversy in the interests of clarifying his own stringent “standards of thought,” he offered a trenchant rebuttal of René Wellek’s generally favorable review of *Revaluation*, in which Wellek had requested Leavis give clear definitions of his terms and the general basis for his evaluations. Leavis responded by arguing that philosophy (Wellek’s terrain) and literary criticism were two quite separate disciplines. The generalization and abstraction inherent in philosophy fail to engage with the holistic concrete experience of a “complete responsiveness” to a literary work which it is the task of the “ideal critic” as “the ideal reader” to enact (Leavis 1952: 211–22).

The Great Tradition (1948) was undoubtedly a landmark work of criticism, not just for Leavis, but for English studies of the novel at mid-century. Its characteristic tone is established “not dogmatically, but deliberately” with its opening: “The great English novelists are Jane Austen, George Eliot, Henry James and Joseph Conrad – to stop . . . at that comparatively safe point in history” (1). This “dogmatism” was a rhetorical ploy to challenge debate and refutation, even if his disciples took him too quickly at his word. For within a few years, Leavis added to this list D. H. Lawrence and Dickens, the latter’s inclusion being a complete revision of his earlier disparagement of Dickens as merely a sentimental popular writer. What these novelists all share for Leavis is their depth of moral vision and “felt lived experience” which is inseparable from the creativity of narrative language and form in which they express it. This profound

correspondence between artistic achievement and the “moral seriousness” of the lived life places Leavis’s idea of “impersonality” at a distance from that of Eliot’s which he earlier on embraced. An impersonal response is one that includes emotion directed outwards, critical intelligence, and self-knowledge, qualities all epitomized in George Eliot. Despite his emphasis on “close reading,” and the rejection of psychologism, Leavis’s eschewal of the idea of the “autonomous work of art” differentiates him from the formalist tendencies of the new criticism. The social and historical foundations of English culture were always for him discernible within the evolving and expressive language of its literature, and could not be “bracketed out” for the purposes (only) of aesthetic judgment.

Leavis’s growing sense of isolation within Cambridge was highlighted, if not caused, by his notorious “Two Cultures” public wrangle with the scientist and novelist C. P. Snow in 1962. For Leavis this epitomized the decline of a common literary and language-borne English culture in the face of “scientism,” the instrumentality of a “technologico-Benthamite” culture (Leavis’s neologism) which Snow and the commercial and technological Establishment represented. Leavis’s ultimate retirement from Cambridge in 1962 was followed by various visiting professorships in English universities and a lecture tour in the USA. His late works, notably *Nor Shall My Sword* (1972), *The Living Principle* (1975), and *Thought, Words and Creativity: Art and Thought in D. H. Lawrence* (1976), are less exercises in cultural criticism than a meditation upon its principles.

Lévi-Strauss, Claude

DOTTY DYE

Claude Lévi-Strauss (1908–2009), French anthropologist, theorist, and essayist, often cited as the father of structuralism, founded the movement known as structural anthropology in which he used linguistics as a theoretical framework to study cultural phenomena. He is considered one of the most important modern French intellectuals for his studies in primitive mythology and for his far-reaching influence on a diverse range of fields including history, psychology, and cultural and literary studies. He was awarded numerous honors including the Erasmus Prize in 1971 for significant contribution to European culture and was elected to the prestigious Académie française in 1973.

Lévi-Strauss studied philosophy and law at the Sorbonne in Paris, although his interests soon led him to pursue a career in anthropology. In 1931 he passed the *agrégation*, a competitive qualification exam for secondary and university level professors in France. He taught in secondary schools until 1934. The following year he accepted a position as Professor of Sociology at the University of São Paulo in Brazil. During his tenure at the university, he and his wife undertook several expeditions to study the indigenous tribes in the interior regions of Brazil; in 1938, after having resigned from his post, he lived among the semi-nomadic tribe, the Nambikwara, for several months. He returned to France in 1939 to serve as a sergeant in the army during World War II.

Demobilized a year later, he took a position in Montpellier until the anti-Jewish laws passed by the Vichy regime (the collaborationist government of France during the war) forced him into exile. He moved to New York where he taught in the New School for Social Research. During the voyage from France he met André Breton and after his arrival met several other notable artistic exiles including Max Ernst and Marcel Duchamp. In 1942 he met and befriended linguist Roman Jakobson, who introduced him to the current scholarship in structuralism, particularly that of Swiss linguist Ferdinand de Saussure. It was Saussure's formal methods of structural linguistics and Jakobson's application of these methods to the rhetorical function of language that later led Lévi-Strauss to devise the foundational theories that would become structural anthropology. In 1949, he returned to France to continue work on his doctoral thesis and to teach sociology and anthropology, and the following year took his final ethnographic trip, sponsored by the United Nations Educational, Scientific and Cultural Organization (UNESCO), to India, Pakistan, and East Pakistan (now Bangladesh).

In 1945 Lévi-Strauss published an essay entitled "L'analyse structural en linguistique et en anthropologie" ("Structural analysis in linguistics and in anthropology"), which introduces the model for structuralist anthropology by describing the similarities of language and cultural phenomenon. His doctoral thesis, which became his first major work, published as *Les Structures élémentaires de la parenté* [*The Elementary Structures of Kinship*] (1969a[1949]), applied this idea to a study on kinship and marriage. In it, he develops a new model of kinship theory by likening gift-exchanges involved in marriage to linguistic structures and arguing that the codes involved in the ritualized exchange of

women between groups constitute a form of communication. The study gained attention outside of anthropology because of its departure from Sigmund Freud's and Emile Durkheim's theories of incest prohibition. It also drew criticism from the anthropological community for what many considered a lack of adequate fieldwork, and later from US feminists for failing to take into account female sexuality and influence.

In *Race et histoire* [*Race and History*] (1952) Lévi-Strauss challenges the idea that contemporary "primitive" cultures were comparable with Western prehistoric cultures. He interrogates the idea of progress itself by challenging hierarchical visions of cultural and social evolution using theories of temporal relativity. His view of history, however, is often critiqued by Marxist critics for its failure to incorporate political realities. By 1955, Lévi-Strauss had become a literary celebrity upon the publication of *Tristes tropiques*. The best-selling, autobiographical account of his ethnographic voyages – including travels to the interior of Brazil, the escape from Vichy France, his exile in the United States, and the UNESCO trip to South Asia – is more than a conventional ethnography. It includes a critique of phenomenology and existentialism, which Lévi-Strauss claims are extensions of the very metaphysics that they are meant to challenge; a poetic section left over from the novel that Lévi-Strauss had originally intended to write; and a preview of his work in aesthetics and art theory, particularly on the "primitivism" of modern art. Taken together, much of the book attacks neocolonial practices and ideologies that continue to destroy indigenous populations. The deeply personal nature and literary quality of the writing prompted an influx of praise. In the *New York Times Book Review*, Richard A. Shweder said that *Tristes tropiques* "transformed an expedition to the virgin interiors of the Amazon

into a vision quest, and turned anthropology into a spiritual mission to defend mankind against itself" (quoted in Doja 2005: 650). Susan Sontag described it as "one of the great books of our century. It is rigorous, subtle, and bold in thought. It is beautifully written. And, like all great books, it bears an absolutely personal stamp; it speaks with a human voice" (1966: 71). It has since faced criticism from deconstructionists and cultural theorists for what some see as racism, essentialism, and the privileging of dominant discourses.

In *Anthropologie structurale* [*Structural Anthropology*] (1963a[1958]), Lévi-Strauss argues that many systems of communication can be understood using structuralist analysis. He contends that an analogy can be formulated between culture and language because both are based on binary systems of logic. "Myth is language," Lévi-Strauss writes, "functioning on an especially high level where meaning succeeds practically at 'taking off' from the linguistic ground on which it keeps on rolling" (1963a[1958]: 210). Using the Oedipus myth as illustration, Lévi-Strauss demonstrates the way that parts of the story can be broken down into "bundles of relations" that are connected by some common element. These "mythemes" can then be used to construct a system of interpretation in order to discover the significance of myths and the ways in which they are developed. By taking into account all versions of a single myth, Lévi-Strauss demonstrates how the "myth grows spiral-wise until the intellectual impulse which has produced it is exhausted" (1963a[1958]: 211). Although there are significant differences between myths, which by and large emerge out of oral traditions, and contemporary literature, the links between the two are significant. Structuralism is well suited to identifying and explaining these links because its main interest is not the content of a given practice or text – at the level of

content there are vast differences between mythic and literary discourse – but the underlying structural components of myth and literature, which are surprisingly similar.

In *La Pensée sauvage* [*The Savage Mind*] (1966[1962]), Lévi-Strauss compares totemic systems of classification with Western systems of taxonomy and argues that the concrete logic of the totemic system is not less sophisticated. Structuralist anthropology allows us to see this logic. Regarding what may seem to be inconsistencies in totemic systems, he writes: "The terms never have any intrinsic significance. Their meaning is one of position – a function of the history and cultural context on the one hand and of the structural system in which they are called upon to appear on the other" (1966[1962]: 55). Later, in the four-volume *Mythologiques* (1964–71), he embarked on a comprehensive study of oppositions, such as raw/cooked, nature/culture, and wet/dry, that are found in numerous indigenous myths throughout North and South America. All modes of thought, for Lévi-Strauss, conscious and unconscious, can be positioned in a meaning-producing structure based on binary oppositions. He uses both linguistic and musical models in the analysis of myth. The musical model permits him to highlight the lack of semantic reference in myth – the myth generates its meaning without being tied to a signified. In the final installment of the series, *L'Homme nu* [*The Naked Man*] (1981[1971]), he explains that although "myths tell us nothing instructive about the order of the world, the nature of reality or the origins and destiny of mankind," they can "teach us a great deal about the societies from which they originate, they help to lay bare their inner workings and clarify the *raison d'être* of beliefs, customs and institutions" and the "operational modes of the human mind" (1981[1971]: 639).

Lévi-Strauss continued to gain recognition and acclaim for his body of work on myth theory and published a number of works throughout the 1970s and 1980s. He was also a popular speaker, traveling to Japan, Mexico, South Korea, Israel, the US, and returning to Brazil in 1985 for the first time since 1939. He spoke at universities and did radio interview series. In 1993 he published *Regarder, écouter, lire* [*Look, Listen, Read*] in which he expounds on his theories of aesthetics and connects it to his myth criticism. He was especially interested in the way that timeless works of literary, visual, and musical art maintain their influence over the human imagination. He discusses the work of painters such as Poussin and Ingres, the music of Rameau, and the poetry of Rimbaud, using the aesthetic theories of Diderot and Rousseau. These timeless European works, he argues, reflect what is essential in the human condition, what transcends national boundaries.

Throughout his career, Lévi-Strauss encountered criticism of his most important theories including myth analysis, “primitive” epistemology, aesthetic theory, and cultural exchange. Nevertheless, his positive influence has been incalculable, and has extended into a number of theoretical arenas: semiotics and structural narratology (particularly the work of Roland Barthes), structuralist Marxism (particularly the work of Louis Althusser), rhetorical formalism, and the poststructuralism of figures like Michel Foucault and Jacques Derrida. His work will continue to inform literary and cultural studies because of the challenge that he waged against the dominant ethnocentric views of the time that failed to see the sophisticated patterns in so-called primitive cultures, and because it continues to put into question the very idea of progress itself.

Lukács, Georg

GERARD COHEN-VRIGNAUD

Georg (or György) Lukács (1885–1971) was a major Marxist philosopher and art critic whose essays on the nineteenth-century novel, realism, and modernism are still widely read in literary studies and whose lucid elaborations of reification, alienation, and class consciousness are considered major advances in Marxist thought. His career may be divided into two phases: his early writings, composed before he joined the Hungarian Communist Party at the end of 1918 and best represented by *The Theory of the Novel* (1916), and his mature critical work as a Marxist activist and intellectual, which produced *History and Class Consciousness* (1923) and *The Historical Novel* (1937).

Born to a wealthy Hungarian family of assimilated Jews, Lukács rebelled at a young age against his banker father and socialite mother. Like his contemporaries in other European countries, this rejection of bourgeois liberal values led him to admire Nietzsche, mystical thought, modernist poetry (in the form of the Hungarian Endre Ady) and the naturalist plays of Ibsen, whom he would meet on a pilgrimage in 1902. In the following years, Lukács would help found a Budapest playhouse where performances of both Ibsen and Strindberg were staged for Hungarian workers, thus anticipating his later commitments to

Marxist militancy. By the end of the decade, Lukács had become suspicious of aesthetic experimentation divorced from direct engagement in the world. His essay, “Aesthetic culture” (1910), finds him proclaiming that “the admirers of ‘form’ killed form; the priests of *l’art pour l’art* paralyzed art” (Lukács 1998[1910]: 366).

The 1910s saw Lukács studying in Germany, which would involve him socially and intellectually with leading sociologists such as George Simmel and Max Weber. Still strongly influenced by Platonic and Kantian idealist thought, Lukács gradually embraced the phenomenological dialectics of G. F. W. Hegel and the Young Hegelian school, and produced *Soul and Form* (1910), followed by *History of the Development of Modern Drama* (1911) and *The Theory of the Novel* (1916). In these works, Lukács contributed to what he would call, in a later preface to *Theory of the Novel*, the “historicisation of aesthetic categories,” though, in many ways, his view of the classical forms of epic and tragedy as outmoded genres in a postlapsarian capitalist world was a legacy of German romanticism. The novel, in his account, was alienated humanity’s version of the epic; in a world abandoned by God, the modern individual could no longer pursue the conventional quest-myth that had reflected and reaffirmed the unitary values of past cultures (in particular ancient Greek and medieval European). Instead, the hero of the bourgeois novel must navigate a world of contradictions and compromises ill suited to the human “soul” and the fullness of its sensibilities.

The fall after World War I of the Communist regime briefly ruling Hungary, in which Lukács served as a deputy minister, led him to flee to Vienna, where he would spend much of the 1920s. During this time, he was one of the leaders of the Hungarian Communist Party in exile, perhaps the most eloquent propagandists for the Marxist cause outside of the Soviet Union. In 1923, he

published *History and Class Consciousness*, considered by many a foundational text of “Western Marxism,” a term coined after World War II by Maurice Merleau-Ponty to distinguish thought inspired by the materialist methodology of Marx from the Soviet Communist orthodoxy that authorized Stalinist persecutions.

Against the doctrinaire economism that was prevailing in Soviet Marxism and which single-mindedly focused on the “base” to the detriment of the “superstructure,” Lukács’s essays showed the importance of cultural critique for understanding the ways capitalism legitimize itself. He greatly expanded the concepts of ideology, alienation, reification, and class consciousness, long before the publication of Karl Marx’s *Economic and Philosophical Manuscripts of 1844* showed the “young” Marx’s theoretical grounding in Hegelian dialectics. His development of reification, in particular, has become a standard tenet of Western Marxism. For Lukács, reification represents the ideological process by which the chief components of capitalist society – such as the division and alienation of labor and commodification – come to appear natural and inevitable. Drawing on Engels, who introduced the concept, Lukács explored the implications of “false consciousness,” a demonstrably false understanding of social life that accepts as objective and unchangeable what are, after all, products of human activity and organization. *History and Class Consciousness* and his biting critiques of modern art in the 1920s and 1930s are the major reasons for Arato and Breines’s claim that Lukács is “the greatest philosopher of Marxism since the death of Karl Marx and the most controversial communist intellectual in [the twentieth] century” (Arato & Breines 1979: 3).

The Historical Novel (1937), the rare monograph in a career marked by essays, represents perhaps Lukács’s most enduring contribution to the study of literature. It is

generally cited for its argument that the sociological realism of great writers like Balzac and Tolstoy depended on the literary innovations of the historical novel, in particular, those of Sir Walter Scott. Lukács argued that Scott’s characters were the first fictional persons imprinted with the historical and social forces of their age: “the great human qualities as well as the vices and limitations of Scott’s heroes spring from a clearly embodied historical basis of existence” (1962[1937]: 50) According to Lukács, the sociohistorical typicality of these characters merges dialectically with their individual idiosyncrasies to recreate the field of potential human action available to the “period” or “age” represented in the novel. The value of the art work, in this schema, stems from its capacity to show the reader not only the ability of persons to act in the world (as the bourgeois English novel of the eighteenth century had already done) but also the social and economic bases for the construction of reality and worldview. This was the same limitation that Marx’s materialist philosophy would soon impose on the triumphal liberalism of the nineteenth century: “men make their own history, but they do not make it as they please” (Marx & Engels 1962[1852]: 247).

While Lukács admired the realist school of fiction, he found naturalist and modernist artworks faulty, for aesthetic and ideological reasons. Much as Roland Barthes would do later in *Writing Degree Zero* (1968[1953]), Lukács saw the year 1848 as marking a fundamental historical rupture, as revolutions by the working classes across Europe were, in his view, violently repressed by a tyrannical bourgeoisie vacating its formerly progressive ideals. Lukács would psychopathologize most of the “alienated” writers who wrote after that year, arguing that antibourgeois novelists such as Flaubert and Zola, the pre-eminent practitioners of naturalism, practiced a form of literary

acquiescence to class domination and capitalist exploitation. For Lukács, this “fatalism,” derided as “sick” or “sterile” in his more tendentious 1930s essays, was evident in the naturalist’s reliance on meticulously accurate descriptions, in contrast to the improbable narrative peripeteia of earlier realist novels. In the former case, socioeconomic forces, which could not be escaped, inscribed human action within probabilistic outcomes that “reified” capitalist structures, while in the latter, the will of individuals dynamically and decisively affected the realization of both plot and reality. This liberal humanist valuation, wherein humanity’s heroic engagement with society and history defines “good” art, left Lukács in the ironic position, which he oft noted, of preferring Balzac, a Royalist reactionary, to Zola, with whom he had far greater political affinities.

Later modernist writers, such as Joyce, Kafka, and Proust, came under even sharper criticism because of the so-called “subjectivism” in their works, confirmed by their use of novel literary techniques such as stream of consciousness or the refraction of reality through highly unreliable narrators. This subjectivism, Lukács argued, represented the solitary individual’s abdication of agency in the world and retreat to the confines of the psyche and, as such, another step in the “decadence” of Western literature. Ultimately, as Lukács puts it in his 1936 essay “Narrate or describe?,” modernist techniques come to resemble those of naturalist writers: “extreme subjectivism approximates the inert reification of pseudo-objectivism” (Lukács 1970: 144). These antimodernist views, for which he remains infamous, in some ways represented a refutation of his earliest aesthetic inclinations. The German novelist, Thomas Mann, was one of the few contemporary writers whom Lukács would allow himself to champion.

Lukács’s relocation to Russia, where he would remain for most of the 1930s and World War II, led to his integration in Stalin’s regime, under whose rule he was forced to renounce many previous essays (including the seminal *History and Class Consciousness*) and to “revise” his opinions when they ran afoul of the ruling party’s orthodoxy (he was arrested more than once and his stepson spent a long stretch of time in the Gulag). He struggled to explain the value of literary classics to a Soviet hierarchy more interested in the instrumentalization of culture and in promoting socialist realism, which became the official style of the Stalinist state. In these years, he published the majority of the literary criticism for which he is known today. In debates with the German Marxists Walter Benjamin, Bertolt Brecht, Theodor Adorno, Ernst Bloch, and other members of the Frankfurt School, he argued against expressionism and other modernist movements, seeing them as inadequate tools for a successful critique of capitalism and class oppression. He viewed these artistic trends as well as the philosophy of phenomenology that was becoming popular across Europe as fueling the irrationalism and mysticism that facilitated fascism’s historical rise. He would later apply a sardonic phrase he coined in *The Theory of the Novel* to these Western Marxists’ endorsement of modernist aesthetics, saying they resided in the “Grand Hotel Abyss” (Lukács 1971b).

After World War II, Lukács returned to Hungary, which was once again ruled by Communists. From this base, he would continue to militate for a Marxist aesthetics and politics. In the late 1940s, Lukács achieved an unprecedented level of fame in France and in the West when he took on Jean-Paul Sartre and his popular case for existentialist philosophy in a series of highly publicized Parisian lectures (published in French as

Existentialisme ou Marxisme? in 1948). It was after this period that most of Lukács's writings were translated in English, starting with a collection of his literary essays, *Studies in European Realism* (Lukács 1950).

In 1956, Lukács actively participated in the Communist revolution that opposed the Stalinist Hungarian government. When this movement was suppressed by the Soviet Union, he narrowly escaped the "purge" that followed. In a technique of survival that had by now become familiar to him, he would practice the "self-criticism" necessary to accommodate himself to the puppet regime that ruled Hungary until his death in 1971.

Despite his failings, in particular his demonization of modernism and his compromises with authoritarian Communism, Lukács remains an important figure in Marxian political and aesthetic thought. His writings have deeply influenced the pre-eminent Marxian literary critics of the twentieth century (including Fredric Jameson, Terry Eagleton, and Susan Buck-Morss). His lucid explanations of literary forms understood as historically contingent remain a mainstay of materialist methodology; and he continues to inspire literary scholars and social thinkers who see art and philosophy as a challenge to the injustices of the modern world. In this light, Lukács's works cannot be disengaged from the political commitments that dominated his life.

M

Marx, Karl

DAVID CERNIGLIA

Karl Marx (1818–83), perhaps the most influential political economist after Adam Smith, was the intellectual force behind communism and socialism. He is famous for authoring, with the philosopher and political theorist Friedrich Engels, the *Communist Manifesto* (1848), but his most enduring accomplishment is *Capital*, the landmark study of capitalism that secured his reputation as the most important political thinker of the nineteenth century. He also wrote dozens of texts on a wide variety of topics, including philosophy, history, economics, and colonialism. Because of the decisive challenge it issued to the status quo in the West, Marxism has been both fervently embraced and violently opposed. Indeed, the originality of Marx's thinking led the French theorist Michel Foucault to identify his achievement, like that of the psychoanalyst Sigmund Freud's, as the foundation of a discourse; he was not simply the author of his works, Foucault insists, but the founder of "the possibilities and the rules for the formation of other texts . . . an endless possibility of discourse" (Foucault 1972: 114). At the basis of Marx's philosophical and economic thought is the

idea that humanity is fundamentally social and that only through social bonds (e.g., class solidarity), could human beings achieve freedom. Because capitalism worked to limit freedom and distort social relations, the critique of capitalism and its social and political implications should have the concrete material effect of restoring genuine social relations and thus individual freedom.

Born in Trier, part of the Prussian Rhineland, Marx grew up in a middle-class family. Heinrich Marx, Karl's father, was a well-respected lawyer who, though Jewish, was forced to convert to Christianity because of a Prussian law forbidding Jews from holding state positions. Marx was schooled at home and then attended the High School in Trier. In 1835, he departed for the University of Bonn to study law, ostensibly following in his father's footsteps; however, because of poor grades, his father decided that he should transfer to the more rigorous University of Berlin, where he began to study in earnest. He soon turned his attention to jurisprudence and philosophy, particularly the works of idealist philosophers Immanuel Kant and J. G. Fichte. In 1837, sick from overwork, he moved to Stralow, a suburb of Berlin, where he began studying the works of G. W. F. Hegel. He was particularly

interested in the direction philosophy ought to take after Hegel. In Stralow Marx began to meet with a group of lecturers and students called the Doctors' Club that would become the backbone of a movement known as the Young Hegelians, or Left Hegelians, the central figures of which included Bruno Bauer and Ludwig Feuerbach.

By 1939, Marx had given up the study of law and embarked on a doctoral thesis in philosophy titled "The difference between the natural philosophies of Democritus and Epicurus," which he submitted to the University of Jena, where he was granted a doctorate in 1841. After working as a journalist, he decided to pursue a university lectureship, so he immediately began to revise his thesis. At the same time, he attempted to publish a very political and highly polemical article opposing the censorship policies of the Prussian ruler Frederick William IV in the *Deutsche Jahrbücher* (German annals), an article which was itself censored. Marx began contributing articles to the *Reinische Zeitung* (Rheinish newspaper) in 1842, including one arguing for freedom of the press; in the same year, he became the paper's editor in chief. The overtly social and political content of the *Reinische Zeitung*, augmented by Marx's increasing interest in socioeconomic issues, made it the constant target not only of rival papers, but of the censors as well. In March, 1843, the paper was closed down for good, though Marx had left before that time because of the general climate of censorship in Prussia.

After leaving the editorial board of *Reinische Zeitung*, Marx worked with Arnold Ruge, a German revolutionary, to form the *Deutsch-Französische Jahrbücher* (German-French annals) and began his critique of Hegel. Following another Young Hegelian, Feuerbach, Marx believed that, while Hegel's dialectical method was useful, the orientation of the dialectic was back-

wards. Whereas Hegel believed that reality was the result of the unfolding of an Absolute Idea – and that social institutions were the result of the development of the state – Marx believed the opposite to be true, that reality preceded the idea. One of Marx's most succinct expressions of his historical materialism comes in his *A Contribution to the Critique of Political Economy*: "It is not the consciousness of men that determines their existence, but their social being that determines their consciousness" (1970a [1859]: 21).

Feuerbach's critique of Hegel was a religious one, arguing not only that humanity created and made itself dependent on God, but also that this dependence prevented humanity from reaching its full potential. In *Contribution to the Critique of Hegel's Philosophy of Right*, Marx extended this argument by making it overtly political, claiming that religion was "the opium of the people" (1970b[1844]: 131) and arguing that the end of religion will force people to discard the illusion of happiness and instead demand actual happiness. Taking on Hegel's politics and his analyses of democracy and bureaucracy, Marx goes on to argue that human beings are *social* beings but also free. However, the state, in order to maintain power, oppressed the great mass of humanity. It was this great mass that needed to be liberated and its communal nature restored.

Disagreements between Marx and his coeditor over the former's radicalism led to the dissolution of the *Deutsch-Französische Jahrbücher* after only one issue. It was during this period that Marx developed a relationship with Friedrich Engels, whom he met in Paris, at the Café de la Régence, in 1844 and who became Marx's long-time collaborator and friend. In the same year, Marx began to write what are known as *The Economic and Philosophic Manuscripts* (frequently referred to as the

1844 *Manuscripts*), which were the preliminary stages of what would become his magnum opus, *Capital*. Marx was reading widely in political economy and much of the 1844 *Manuscripts* is concerned with the alienation of labor. Political economy, in his view, treated labor simply as one of the many components in the economic system. Hence political economy and capitalism dehumanized labor. While he felt that it was in people's nature to be in control of processes of their own labor, they had become alienated from these processes by performing their work for another rather than for themselves. Further, the alienation from their own labor alienated individuals from one another. People, then, were not free, but subject to those who owned their labor. These economic issues were for Marx practical as well as theoretical concerns. One of the most famous propositions in the 1844 *Manuscripts* concerned a solution to the alienation caused by the capitalist mode of production, which Marx called communism, the full realization of which would bring an end to private property.

In his "Theses on Feuerbach" (1845), Marx argues that in the tradition of Hegelian thinking up to Feuerbach materialism considered reality only as an object, not as "sensuous human activity" (Marx & Engels 1972[1932]: 121). Though they address theoretical problems, the "Theses" emphasize the importance of practice for a philosophy grounded in historical materialism: "the philosophers have only interpreted the world in various ways; the point is to change it" (123). In 1848, Marx, together with Engels, published their famous call for radical change, *The Communist Manifesto*, which argues that the history of society has been the history of class antagonisms. Under capitalism, the central conflict is between the proletariat, those who are forced to sell their labor, and the capitalists, those who own the means of production. Marx called

on the workers of the world to revolt against the bourgeoisie and establish "revolutionary dictatorship of the proletariat" (1933 [1891]: 45) to ensure the development of communism. According to Marx, history developed in stages, from primitive communism, through slavery, barbarism, feudalism, and capitalism, to conclude with socialism and communism.

Marx's historical materialism, one of his most important contributions to political thought, is best articulated in *The German Ideology* (1845), which marks his definitive break from the Young Hegelians, and the Preface to *A Contribution to the Critique of Political Economy* (1859). In Marx's view, history must be understood in terms of economic and social processes that entail the interrelationship of the economic base and the social and cultural superstructure. For him, particular base/superstructure relationships like those found in capitalism formed particular modes of production and consciousness.

Though Marx had been studying political economy for some time, it was not until the late 1850s that economics came to dominate this thinking. In this period he worked on the massive manuscript, *Outlines of a Critique of Political Economy* (commonly called *The Grundrisse*), the ideas of which would be fully developed in *A Contribution to the Critique of Political Economy* and the first volume of *Capital* (1867). The scope of *Capital* is immense, encompassing both an analysis of the history of capitalism and the preceding forms of economic organization and the theoretical framework for understanding these developments. Capitalism, in Marx's analysis, is characterized by contradictions and antagonisms, particularly the antagonism between labor and capital, between those forced to sell their labor and the owners of the means of production who profit from it. He explores not only structural economic issues, but the underlying

moral issues as well. Unlike the work of the political economists with which Marx was so familiar (like the English economist David Ricardo), *Capital* takes seriously the fact that workers are human beings and that their exploitation has real personal and social consequences. As capitalists work to accumulate profits, the workers suffer. Marx concludes that labor under the capitalist mode of production does not enhance but limits human productive capacity.

Though Marx's work has had only a marginal effect on mainstream economic thought, it has had wide-ranging influence in other areas of the social sciences and humanities, particularly in the work of early twentieth-century Marxists like Georg Lukács and Antonio Gramsci and more recent figures like Fredric Jameson. Marxist thought has been particularly important for the study of culture. Theodor Adorno and other members of the Frankfurt School employed Marx's ideas in their analyses of culture, as did the early cultural studies theorists associated with the University of Birmingham's Centre for Contemporary Cultural Studies (established in 1964). The "post-Marxism" of the late twentieth and twenty-first centuries reflects a renewed interest in Marx's work in the wake of new economic interrelationships created by globalization and technological innovation. Despite the failures of communism in many instances, socialism remains a viable political framework, and Marxist analysis remains a powerful tool of social and cultural critique.

Materialism

DAVID HAWKES

The term "materialism" has two main philosophical meanings. First, it refers to the belief that matter is all that exists, so that ideas and concepts are illusory. This outlook

is often known today as “eliminative materialism.” Second, it can also designate the belief that ideas are determined by the material circumstances in which they arise and develop. In one sense, the former kind of materialism is a more extreme version of the latter, but there is also an important sense in which the two types of materialism are mutually exclusive, for the former admits the objective existence of ideas, while the latter denies that ideas have any real existence at all.

Materialism is the oldest species of Western philosophy. It is the first position that the Greeks arrived at when they began to consider their situation in conceptual terms. It looks, to the untutored eye, as if matter is all that exists. Such a reaction to experience shows a failure, or an unwillingness, to distinguish between appearance and essence. Primitive materialism assumes that the way things appear is the way they really are. Once it is accepted that everything that exists shares the single characteristic of being material, the natural next step is to identify an *arche*, a single element within all matter, which would provide it with a definitive characteristic and a unifying principle. Thus in the early Ionian school of philosophy, materialism leads immediately to “monism”: the attempt to impose unity on the multifarious, to insist that apparent difference is in fact identity. Hence the monist materialist conclusions reached by the earliest known Western thinkers, the pre-Socratic naturalists. These included Thales, who held that everything was composed of water, and Anaximenes, who believed that everything was made up of air.

This seminal materialism was expanded and elaborated by Democritus, who recognized that matter was composed of atoms. He claimed that atoms are eternal, and take varying forms as the temporal and transitory objects of experience. But Democritus also distinguished between matter and

ideas, producing an account of how material circumstances influence the mind. He suggested that objects transmit images, or *eidola*, that impact the organs of our senses to produce our impressions of the world. Epicurus further refined this atomism, arguing that matter emanated physical images, called *lamina* or *simulacra*, shaped like itself, whose impression on the eye gave rise to our perception of images. In the Roman poet Lucretius, this kind of materialism is used to refute the existence of the gods, and as an antidote to superstition in general. Democritus, Epicurus, and Lucretius move beyond the eliminative materialism of Thales and Anaximenes by acknowledging the objectivity of ideas. They remain materialists, however, because they trace the development of ideas to an origin in material stimulation of the senses.

These early forms of materialism faced formidable, concerted opposition from Platonic idealism. Reversing the approach of the materialists, Plato believed that the realm of ideas creates the realm of matter. Human experience is mediated through ideas, or concepts. It is impossible for a human being to have merely sensual experience, for we inevitably impose concepts on the data that we receive through our senses. Although these ideas do not have any material existence, they nevertheless determine the way human beings experience their surroundings. This reasoning led Plato beyond the contention that ideas determine our material experience, to the conclusion that ideas constitute the only objective reality, and that the material world is a mere illusion.

Platonic idealism became an extremely important influence on Christianity, and for almost 2,000 years materialism was relegated to a minority opinion among Western philosophers. Over the course of the seventeenth century, however, materialism underwent a dramatic resurgence, and for the

past 300 years it has generally been more influential than idealism in both the academy and the popular mind. The scientific empiricism of Francis Bacon depends upon the materialist proposition that our knowledge of the world comes from sensory experience. This led Bacon to advocate a highly successful “instrumentalist” view of science, which would pursue and evaluate theories according to the practical achievements they made possible. At the same time, the atomist physics of Pierre Gassendi was giving rise to a revived materialist approach to scientific theory.

By the middle of the seventeenth century the philosophical implications of Bacon and Gassendi’s scientific theories and practice had been developed by Thomas Hobbes, whose epistemology led him into a skeptical empiricism. Believing that only matter existed, he claimed that experience of matter produced consciousness. However, Hobbes also claimed that there was no reason to believe that our sensory experience gave an accurate impression of its objects. It followed that human knowledge must be regarded as imperfect and provisional, and as guided by the material interests of its advocates rather than by the search for objective truth.

The philosophers of the French Enlightenment took inspiration from Hobbes to construct another eliminative materialist view of the world. As with their ancient predecessors, one of their main motivations was anticlericalism. Thinkers like Denis Diderot, Julien Offray de La Mettrie, and Paul-Henri Thiry Holbach insisted that religion was nothing but a set of illusions and chimeras, designed to keep the common people ignorant and induce them to accept their lowly place in the social order. They developed a notion of human beings as purely material entities, applying the techniques of empirical science to the sensory organs, and claiming that ideas are caused

by purely physical changes in the material body or brain.

This kind of materialism implies a relativist morality, in which human beings are guided by the pursuit of material self-interest. In contrast to Platonists and Christians, who saw the appetites as ethically inferior to reason, Hobbes suggested that the appetites were natural and therefore good. In the eighteenth century this philosophical assumption became the basis of the new science called “political economy.” Early political economists like David Ricardo and Adam Smith believed that if all individuals sought to maximize their material self-interest the cumulative result would be beneficial for society as a whole. By the nineteenth century, political economy was under attack by early socialist theorists, but most of these shared the basic assumption that human ideas were rooted in material self-interest, if not of the individual, then of a particular social class.

The kind of socialism advocated by Karl Marx became closely associated with philosophical materialism. Marx was challenging the idealist thought of G. W. F. Hegel, who had produced a historicized form of Plato’s idealism. Like Plato, Hegel believed that ideas determine people’s experience, but unlike Plato he conceived of ideas as changing and developing in the course of human history. Marx agreed with Hegel’s historicism, but he emphasized the role of material circumstances, especially economic circumstances, in determining historical developments. However, it is misleading to think of Marx as a “materialist,” just as it is to conceive of Hegel as an “idealist.” Both Hegel and Marx were “dialecticians,” which means that they conceived such paired contradictions as the one between ideas and matter as mutually determining. They thought that each pole of the opposition brought the other into existence. It would be impossible to conceive of “matter” unless

we also held the opposite conception of “idea.” It is thus reductionist to claim that either pole of the dichotomy determines or creates the other.

This vital insight has frequently been obscured in subsequent philosophy. The followers of Marx, led first by his friend Engels and later by his most successful disciple Lenin, emphasized the materialist elements in Marx’s argument, and the institutional communism of the twentieth century insisted on a dogmatic and unsophisticated form of doctrinaire materialism. In this philosophy, the “economy” was conceived as material, and as giving rise to the “ideologies” in which social classes understood and advanced their collective interests.

Although communism and capitalism are opposed modes of thought in many ways, they share some core materialist assumptions. In particular they both ascribe determining power to the “economy.” Over the course of the twentieth century the “dialectical materialism” which was the official ideology of the communist world converged with the materialism fostered by the capitalist marketplace, which depends upon the notion that the acquisition of material goods is the natural purpose of human life. As the last century drew to a close, however, the idea that the “economy” was material became harder to maintain, as economic developments were increasingly driven by consumption rather than production, and thus by psychological decisions instead of material activity. The very concept of the “economy” as a discrete field of human behavior began to break down, and with it the materialist determinisms that had dominated twentieth-century philosophy.

But materialism is far from dead. Toward the end of the twentieth century, eliminative materialism became prominent in the study of the mind. Just as astronomy had eliminated astrology, just as chemistry had superseded alchemy, it was claimed that the

insights of cognitive neuroscience, which equates ideas with electronic and chemical reactions in the brain, could and should abolish the “folk psychology” which conceived of ideas as occupying a separate sphere from matter. Ideas were no more real than the elves and fairies of popular mythology. They were in fact merely linguistic constructs, and had no reality outside the language used to describe them. This kind of materialism shared much in common with deconstruction and post-structuralism, which claim that human experience of the world is made possible by and through language. Since language is a material phenomenon, this logic led to the proposition announced by the poststructuralist Marxist Louis Althusser that “Ideas have disappeared as such” (1971: 168).

At the same time as materialism was growing into philosophical predominance however, physics was moving in the opposite direction. Research into the nature of subatomic particles revealed that matter itself was not material, but was rather composed of empty spaces held together by the nonmaterial force of energy. Such discoveries mean that many scientists are now reluctant to call themselves “materialists,” preferring to be known as “physicalists.” The idea that everything can be reduced to energy harks back to the ancient concept of the prime matter, or *prima materia*. This was undifferentiated matter lacking any form and, in monotheistic cosmologies, it was the raw material out of which God created the universe by stamping it with distinct forms. Energy is frequently described as a similarly basic component of all physical existence, and what past thinkers called “matter” thus becomes one of the forms taken by this fundamental force.

There are still many literary and cultural critics who call themselves “materialists,” and “cultural materialism,” a movement largely inspired by the work of Althusser’s

ultra-materialist disciple Michel Foucault, is thriving within literary studies. Philosophically speaking, however, the term is a misnomer, and the term “historicism” might be more appropriate. For cultural materialists are generally quite prepared to admit the existence of ideas, and also the influence of ideas on people’s material activities. Their brand of materialism is concerned to emphasize the historical circumstances in which an aesthetic work is produced, but it does not depend on the tenuous claim that those circumstances are themselves “material.”

Other critics use the term “materialism” to designate a field of interest rather than a theoretical approach. They include “historians of the book,” who analyze the development of printing and the physical shape of books, and those critics with a particular interest in the way objects such as furniture or clothing function within literary texts. On many occasions, the word “material/ism” is used for polemical effect, to indicate the practitioner’s opposition to ahistorical, essentialist, or idealist approaches to the literary artifact. Materialism thus continues to grow in strength and influence within literary theory, even as its provenance in other areas is starting to fade.

Memmi, Albert

CHOUKI EL-HAMEL

Albert Memmi, novelist and one of the earliest theorists of the postcolonial condition, was arguably the first to describe the complex psychological and political interactions between colonized peoples and the colonists who ruled over them. Like that of so many other indigenous intellectuals, Memmi’s own life experiences provided

the foundation of his theoretical point of view. He was born in 1920 in Tunis, Tunisia, to a modest Jewish family. His father earned a meager income as a saddler-maker, an income barely sufficient to provide for a large household of eight children. Memmi, like most Jews under French colonial rule, gained a new status and a relatively better position than his Muslim compatriots because, as Memmi describes it, “The Jewish population identified as much with the colonizers as with the colonized” (Memmi 1991b [1957]: xiv).

In his first novel *The Pillar of Salt* (1991a [1953]), Memmi depicts the complex experience of the Jewish minority in Tunisia under French rule and the impact of this rule on cultural identities. Memmi became aware of class, ethnic status, and colonial hierarchy at an early age when he mingled with socially and ethnically diverse children in a summer camp in Tunisia, which taught him the value of modern education. Memmi received a traditional religious education and then attended a school associated with Alliance Israélite Universelle, an international Jewish organization founded in 1860 dedicated to protecting the human rights of Jews. In 1932, he was granted a scholarship by his community to attend a French educational institution at Lycée Carnot in Tunis, after which he pursued an advanced degree in philosophy in Algiers. His studies were interrupted during World War II in 1942, when Germany briefly occupied Tunisia. Memmi was detained as a Jew and sent to a forced labor camp in Tunisia from which he managed eventually to escape. With the fall of the Vichy regime and the end of anti-Semitic laws that had been enacted in French colonies during the war, Memmi returned to Algiers to finish his MA in philosophy and then moved to France to study at the Sorbonne in Paris.

In 1951, he returned to Tunisia and joined the anticolonial struggles against

France. He was a teacher at the Lycée Carnot in Tunis in 1953, the same year he published *Pillar of Salt*, which was largely based on his experience. In 1955 he published his second novel, *Strangers* (1975b[1955]), in which he explores mixed marriages, a reflection to some degree on his own life marriage to a Catholic French woman, Marie-Germaine Dubach. In 1956, after Tunisia achieved independence, many Jews, including Memmi and his family, fled to France, fearing reprisals from the Muslim Arab state. Once settled there, he took on a variety of occupations, including a research position at the National Center of Scientific Research in Paris and teaching positions in social psychology at the Sorbonne University and at Nanterre University, where he taught until he retired. In the mid-1960s, he made a lecture tour of the US and later spent a year as the Walker Ames Professor at the University of Seattle. Throughout his career, Memmi received many awards for his literary work from the French and Tunisian governments.

The complex identity relations that constituted Memmi as subject – a French educated Jew of African Arab-Berber descent – inform much of Memmi’s work. Of his most important work, *The Colonizer and the Colonized*, Memmi writes, “I undertook this inventory of conditions of colonized people mainly in order to understand myself and to identify my place in the society of other men” (1991b[1957]: viii). Although he acknowledges that his subjection as a colonized subject was crucial for his understanding of the colonial relationship and provided him with critical insights into the predicament of the colonized, he does not universalize or essentialize the colonial experience. Memmi’s critical attitude toward the experience of colonial subjects stems largely from his own sense of being “a sort of a half-breed of colonization, understanding everyone because I belonged

completely to no one" (xvi). Memmi is often inaccurately described in the West as a Western-trained scholar, a description that seems to overlook the cosmopolitan character of the Mediterranean Maghreb, for Memmi is a product of Tunisia, a cultural intersection where Europe, Africa, and the Middle East meet. Understanding the dynamism of complex cultural encounters can be challenging, especially when analyzing the position of the "other" as it is portrayed in colonialist and anticolonialist discourses. North Africans and Europeans each held often distorted views about the other, views shaped by narrow experience, limited understanding, and, in the case of colonization, asymmetrical relations of power. In most cases, colonized peoples had a foreign language and culture imposed on them, but in periods of decolonization they found ways to appropriate these foreign elements as tools to resist colonial rule and, in some cases (and often with undesirable results), to solve postcolonial problems using the language of the colonizers. Memmi pursues this aspect of the colonizer/colonized relationship in *Decolonization and the Decolonized* (2006), in which he turns his attention to the legacy of colonized peoples.

Memmi provides us with a good example of how the colonized subject appropriates the culture and language of the colonizers in order to resist them. At an early age, he expressed his passion for French philosophy; he appreciated the French educational system and the intellectual freedom that it promoted. His education gave him the intellectual tools not only to understand the privileged status and culture of the colonizer but also to liberate himself conceptually from colonial domination. His work focused on this challenging confluence of cultural forces in an attempt to identify what is cultural (derived either from native

or colonialist sources) and what is universal to the human condition

Memmi sought above all to understand the transformational elements in the cultural interactions of the colonial encounter. Though he rejects the binary or "Manichaean" model of colonial relations, he admits that colonialism sought to produce such relations, in which the European colonizer occupies a superior position with respect to the colonized native. In *The Colonizer and the Colonized* (1991b[1957]), Memmi analyzes the structure of colonial relationships through "portraits" of the colonized and of two types of colonizers: those who accept and those who refuse colonial rule. He argues that "Colonization distorts relationships, destroys or petrifies institutions, and corrupts men, both colonizers and colonized" (151). The structure of social life under colonization is characterized by inequality and discrimination. Cecil Rhodes, an ardent imperialist and founder of the De Beers diamond company and the colony of Rhodesia, expresses an attitude typical of the colonizer: "I prefer land to Niggers," he is reputed to have said (Schreiner 1897: 37). "We should not however, delude ourselves," writes French psychoanalyst Octave Mannoni, "by thinking if only the colonizers had been more generous, more charitable, less selfish, less greedy for wealth, then everything would have been very much better than it is now – for in that case they would not have been colonizers" (Mannoni 1964: 32).

Unlike other postcolonial thinkers, Memmi humanizes the colonizer, whom he believe is transformed, along with the colonized subject, by the colonial situation. He describes colonialism as a dysfunctional system that cannot be fixed, filled with contradictions that cannot be reconciled, and hence doomed to failure. For Memmi, the colonizer is an "illegitimately privileged

usurper" (1991b[1957]: 9) and colonial settlers unjustifiably benefited from this forced asymmetry of colonial advantages. In order to preserve the privilege that is at the heart of the colonial enterprise, racism becomes a fundamental part of the colonial system where "the colonized [people] mean little to the colonizer" who "cannot help but approve discrimination and the codification of injustice" (85, 55). As justification for colonization, the colonizer perpetuates the assumption that colonization benefits the colonized, who are forced into a dependency relationship between "assimilation and petrification." Even if the colonized people embrace the European values of their colonizers, the colonized retain the status of an underprivileged native. The exploitative, violent, and oppressive nature of the colonial situation deprives and dehumanizes the colonized subject who, driven to a permanent and open resentment and hostility, seeks liberation from foreign rule, often by adopting the same attitude toward the colonizer that had characterized the colonizer's own attitude. As Memmi describes it, "The colonized fight in the name of the very values of the colonizer, using his techniques of thought and his methods of combat" (129). Colonialism, like other forms of tyranny, carries within it the seeds of its own eventual destruction.

Memmi held to the principle that "as a writer I must state everything, even that which can be used against me" (1991b [1957]: xiii). Not only was *The Colonizer and the Colonized* one of the first major studies of the colonial condition, it brought its author an international audience. It has been widely used among anticolonialist movements as a handbook for the struggle for independence and freedom. The keen interest in this book stems from Memmi's ability to deconstruct the myths of colonization without endorsing the myths

fabricated by either the colonized or the colonizers. This work of deconstruction takes place within an ongoing analysis of the complex motivational factors underlying people's actions and social relations in colonial Tunisia. According to Memmi, within complex human relationships and social realities, five elements – dependence, subjection, dominance, providing, and privilege – are at work in shaping the behavior of individuals, couples (especially of mixed race), and groups. The originality of his work lies in interdisciplinary method, which borrows from psychology, sociology, philosophy, history, and political science, and his passion for defining "the self" (*le Moi*) in a humanistic framework (see Yetiv 1972: 148). Hence, according to Memmi, human beings have a double burden: to be acutely aware of themselves and of their place in the world (Memmi 1969: 206).

One of Memmi's talents as a writer is to bring readers closer to his world in such a way that they see his world as one we *all* inhabit and recognize. What sets him apart from his peers is an analytical assumption that provides the starting point for and shapes his subsequent analyses of the human condition: what we share universally as human beings. For Memmi, our contingent national or colonial identities are secondary and constructed, the outcome of the diversity of times and places within which human life unfolds. During the era in which so many African nations achieved independence, scholars such as Jean-Paul Sartre, Frantz Fanon, and Aimé Césaire advanced Marxian theories of colonization. Unlike many French intellectuals of the 1950s and 1960s, who were committed to a Marxist analysis of class struggle, Memmi was concerned with individuals in specific social contexts. As Jean-Paul Sartre remarked, describing the difference between his and Memmi's analytical framework, "The whole

difference between us arises perhaps because he sees a situation where I see a system" (Memmi 1991b[1957]: xxv).

But there were other differences as well, for Memmi's internationalism, like Fanon's, was not grounded on a common goal for the working class, but rather on a common set of power relations and social structures found within a variety of modern colonial states to which his analytical methodology could find successful purchase. For example, Dickson A. Mungazi, a Zimbabwean scholar, successfully applied Memmi's theory of colonialism to understand colonial conflicts in Zimbabwe (Mungazi 1986). Other influential thinkers who have turned to Memmi's work for inspiration include W. E. B. Du Bois, Edward Said, and Albert Adu Boahen.

Albert Memmi's broad-based influence is due in part to his position as an activist public intellectual whose critique of colonialism stands as a model for the critique of any system of exploitation that degrades human dignity. Memmi reminds us of our common humanity, and is therefore most scathingly critical of racism – which he believes is "the symbol and the sum of all oppression" (Memmi 1991b[1957]: ix) – wherever he found it. In *Dominated Man* (1968), he explored all forms of social oppression, while in *Racism* he stresses that racism is a "lived experience" that is quintessentially human and concludes, "that the temptation of racism is the most commonly shared thing in the world" (2000b[1982]: 129). Memmi's commitment to the humanist tradition and his unrelenting critique of racism and colonialism, because they are so rarely found together, constitute his unique and uniquely valuable contribution to postcolonial studies.

Merleau-Ponty, Maurice

MATTHEW H. PANGBORN

Maurice Merleau-Ponty (1908–61), one of the most influential figures in French intellectual culture after World War II, strove to overcome the impasse between materialism and what he called “intellectualism” by emphasizing the importance of embodiment in human experience. Central to his deeply anti-Cartesian project was a rejection of what he termed *pensées de survol*, or “high-altitude, surveying thought” (1968 [1964]). Merleau-Ponty was, along with Jean-Paul Sartre, one of the leading inheritors of Edmund Husserl's phenomenology. His work has had a tremendous impact on thinkers as diverse as Gilles Deleuze, Jacques Derrida, Michel Foucault, and Jacques Lacan.

Merleau-Ponty passed the *agrégation* in philosophy at the École normale supérieure and tutored there while finishing his thesis

in the late 1930s. It was here that he became interested in how Husserl's phenomenology might help him conceptualize human consciousness neither as purely mechanical nor as disembodied mind. After studying at the Husserl Archives at the University of Louvain in Belgium in 1938, he returned to Paris with enough manuscripts to found an archive of Husserl's work at the Sorbonne. A brief stint in the infantry at the outbreak of World War II temporarily interrupted his research, but he remained active in the resistance during France's occupation. It was at the École normale supérieure that Merleau-Ponty met Sartre and Simone de Beauvoir, with whom he helped to found the influential postwar journal *Les temps modernes*. He served as its political editor until 1952, when his growing disillusionment with the Soviet government and the French Communist Party occasioned a final split with Sartre that had long been coming on philosophical grounds. Merleau-Ponty felt that Sartre's existentialism reintroduced the very subject–object oppositions that, for him, phenomenology abolished.

Merleau-Ponty's published thesis, *The Structure of Behavior* (1963[1942]), establishes as his most pressing concern the philosophy of perception, a focus that was to define his career. He claims that behavior cannot be understood as an isolated, linear process of stimulus–response but rather must be taken as a much more indeterminate whole, a “form” or structure of meaning. He opposes science when it abstracts from experience and claims to be able to make objective observations, a theory and practice that depends upon the same idealism from which it attempts to distance itself. Merleau-Ponty attempts to establish in place of this dualism of mind and world a revision of Husserl's *Lebenswelt*, the “life-world” in which human “form” may be understood to be in its perceptual, lived existence.

This same resistance to philosophical dualism and focus on embodied existence informs Merleau-Ponty's most famous work, *Phenomenology of Perception* (1945), in which he explores a human experience of the world understood as *always already* intentional. There is no human consciousness of the world separable from situation and context, and no human activity without the body. This makes consciousness always a reciprocal interaction, an acting while being acted upon, a perceiving while being perceived. But this also means that consciousness is less a matter of solitary reflection, as Descartes's *cogito* would suggest, than of a situated envelopment of the subject by an action and event. This idea of reciprocation or "reversibility" in perception was to take its clearest form in Merleau-Ponty's *la chair*, or "flesh," a term he uses in his later work to describe the percipient's "woven-ness" into the fabric of what is perceived.

In 1952 Merleau-Ponty became the youngest ever appointee, at the age of 44, to the prestigious Chair of Philosophy at the Collège de France. It is here that his interest in embodied perception began to take the form of an investigation of the intersections of ontology and aesthetics. The essay "Eye and mind," in *The Primacy of Perception* (1964a), explores the ways in which art complicates our distancing, scientific use of vision. *Signs* (1964b) attempts to incorporate a Saussurean structuralist account of language into a phenomenological framework. Both works show the thinker on the brink of a new philosophy, one that has at its focus the relocation of the reflective Cartesian *cogito* into an anonymous Flesh at the intersection of the world and what we would understand to be the individual "self." It was while working on these ideas, in many ways still germinal, that Merleau-Ponty suffered a fatal heart attack, in 1961, at the age of 53.

His notes for the continuation of his project were gathered by Claude Lefort and published in 1964 as *Le visible et l'invisible* (*The Visible and the Invisible*; 1968). In this work, Merleau-Ponty conceptualizes the *écart*, or "gap," between perceiving and being perceived not as an oppositional dichotomy of subject and object but as a condition of reversibility. Most famously, he illustrates this concept by pointing out that what I touch with my hand is not merely an "object" of sensibility but in fact makes me aware of how my hand also is being touched. There is between touching and being touched less a logical contradiction than a relationship of differential exchange, or what Merleau-Ponty calls a *chiasm*. This network of chiasms is the foundation upon which Merleau-Ponty structures his notion of Flesh.

Merleau-Ponty's critique of the central aims of Western thinking has influenced literary theory and cultural theory in a number of ways. Broadly speaking, his work has been instrumental in the study of subjectivity, intersubjectivity, and the Other. Jacques Derrida's deconstructionist critique of Cartesian dualism continues Merleau-Ponty's confrontation of the problem of presence in Western philosophy, while it is possible to regard Foucault's archaeology of knowledge as an elaboration of his concept of "vertical history," and Lacan's theory of the "gaze" as a development, in psychoanalytic terms, of Merleau-Ponty's emphasis on the primacy of perception in embodied experience. However, it is the idea of philosophy as hyperreflection that may be his most important and lasting contribution to theory, as we can see in the work of Gilles Deleuze and Jean-Luc Nancy, among others, who have explored the status of artistic works as reflections on the process of reflection (Merleau-Ponty 1968[1964]). Merleau-Ponty's phenomenology was at bottom both a philosophy of experience

and a meditation on the status of philosophy as experience and artifice, which he summed up in his idea that philosophy was a form of art in its own right.

Mimesis

MATTHEW POTOLSKY

Mimesis is, simply put, imitation, but it also refers to modes of representation in which the external world is presented to the reader or viewer in as transparent a medium as possible. It is among the oldest concepts in literary theory, and continues to be of critical importance in contemporary narrative theory, aesthetics, and philosophy. For Plato (1968), who first brought the term into critical discourse, mimesis refers to the ways in which images and poetry (chiefly epic and tragedy) imitate reality; he did not believe that the imitations were real themselves. Art is secondary and derivative, a mirror of nature. Aristotle largely accepted Plato's assertion that poetry is a form of mimesis, and should therefore be measured against some other reality, but he also reframed the theory. In the *Poetics* (1987), he describes mimesis as a microcosm or simulation of reality itself; a tragic plot is effective and has a sense of reality when the relationship among its events is internally consistent, and thereby accords with our sense of cause and effect. For Aristotle, mimesis imitates rational thought processes, not material or conceptual realities.

Subsequent discussions of mimesis in classical and early modern literary theory tended to focus on artistic and literary imitation: how best to imitate nature or admired ancient writers. By the middle of the eighteenth century, the theory was displaced from its central role in discussions of art and literature by aesthetics and by Romantic theories that stressed poetic expression over the imitation of nature. Indeed, the term largely disappeared from literary theory for much of the nineteenth century, though it was implicitly invoked in the emergence of realism in the middle of the century.

For both Plato and Aristotle, however, mimesis was more than a theory of art or poetry. Plato offers his most detailed discussion of the theory in a political treatise, the *Republic*, where he criticizes mimetic poetry for its power to mislead the rational part of the soul, corrupting the sense of justice and the foundations of the state. Aristotle defended mimesis by comparing tragic plots to animals and natural objects, and pointing to the role of imitation in childhood development and philosophical reasoning. He treats it not merely as an artistic theory but as an essential element of human life.

Early twentieth-century writers, informed by the rise of sociology, psychoanalysis, ethnography, and evolutionary theory in the second half of the nineteenth century, regarded mimesis not simply as a paradigm for artistic and literary imitation, but as a way of describing social, psychological, and biological interaction. They looked for instances of mimesis everywhere: in art and literature, as well as in crowd psychology, hypnotic suggestion, animal behavior, and the practices of non-Western cultures. Even the philosophers and literary critics who contributed to the general revival of the theory in this period, notably Martin Heidegger, Erich Auerbach, and René Girard, locate their consideration of artistic mimesis in the processes of social and cultural life.

Two concepts from social theory were decisive in shaping this reconceptualization of mimesis: ethnographic descriptions of magic, and the Freudian notion of identification. In his influential work of comparative religion, *The Golden Bough* (1922), the Scottish anthropologist Sir James Frazer described systematically for the first time the practice of “sympathetic magic.” This term describes a worldview in which objects and people are bound in a mimetic network of reciprocal influences. What Frazer calls

“imitative magic” is based on the principle that an imitation of a person (e.g., a picture or doll) can profoundly affect the “original.” Sigmund Freud’s theory of identification is given its fullest treatment in *Group Psychology and the Analysis of the Ego* (1953–74 [1921]). Here Freud defines identification as the most basic form of emotional connection with another person. More fundamental to the sense of selfhood than attraction, sympathy, or influence, it describes an unconscious imitation of a person (most often a parent) that profoundly shapes the ego. For Freud, individuals are the collective product of such identifications, their personalities and future choices defined by unrecognized acts of imitation.

Although neither Frazer nor Freud set out to rethink mimesis, their insights brought the theory back into the purview of intellectual discourse. They at once revived the original Platonic interest in the social function of mimesis, and at the same time raised questions about the limits of Plato’s model that later thinkers would exploit. As Tausig (1993) has noted, the idea of imitative magic radically reconfigures the idea of mimesis: the magical copy is no less real and no less powerful than the original. Identification, similarly, makes mimesis a fundamental and primary part of human identity, not a property of art alone.

Walter Benjamin’s essay “On the mimetic faculty” (1978[1933]) offers a suggestive instance of the impact anthropological thought had on mimesis in the twentieth century. Noting that both premodern cultures and children’s play, as well as nature itself, abound with resemblances and correspondences, Benjamin speculates that the mimetic faculty is central to all human culture. Although modern life and adult behaviors seem to rely little on mimesis, and thus indicate a potential decay of the faculty, Benjamin suggests that it is in fact preserved in the structure of language. He

coins the term “nonsensuous similarity” to describe this preservation. The term points to the way similarities may be discerned between things that bear no material resemblance to one another, such as synonyms in different languages, or the sound of a word and its written form. Going well beyond onomatopoeia, the mimetic qualities of language join a word and its meaning, written and spoken language. Reading entrails and reading novels draw upon the same mimetic instincts.

Working in the same intellectual milieu as Benjamin, but drawing on evolutionary theory and psychoanalysis, the French surrealist writer Roger Caillois finds evidence of a similar persistence of mimesis in the way certain insects have evolved to mimic their surroundings. In “Mimicry and legendary psychasthenia” (1984[1935]), an essay that informs Jacques Lacan’s theory of the mirror stage, Caillois argues that such mimicry is best understood neither as an offensive nor a defensive adaptation, a way of luring prey or warding off predators, but as evidence that organisms have an instinctive tendency to imitate their environment. Caillois characterizes this tendency as a biological luxury that leads the organism to make itself similar to its surroundings, rather than setting itself apart. Mimicry produces a sense of depersonalization that, for Caillois, also defines mental illness (“psychasthenia”). The tendency to imitate ultimately returns the organism to an inorganic state, to an effacement of its difference from its surroundings.

Drawing on Benjamin and Caillois, as well as on Frazer and Freud, Max Horkheimer and Theodor Adorno sketch out a speculative history of mimesis in *Dialectic of Enlightenment* (2002[1947]). They regard mimesis as a foundational way in which organisms relate to their environment. By contrast with Caillois, they see mimesis as basically defensive, akin to stiffening or hid-

ing, but they also compare it to adaptive and sympathetic responses such as coaxing and soothing, and tie it to the senses of smell and touch. The Enlightenment, with its devotion to reason, abstraction, and objectivity, brutally represses mimesis, casting it as inhuman or primitive. Mimetic adaptation to the environment gives way to the domination of nature. But this systematic repression of mimesis by enlightened modernity is itself defensive. The mindless repetition of factory labor and the identical uniforms of the fascist mob are the mutilated remnant of a more primal and adaptive mimetic faculty.

Like Horkheimer and Adorno, Heidegger (1979[1961]) also sees a millennial struggle in the modern history of mimesis. In lectures and essays from the 1930s and 1940s, Heidegger elaborates the ways in which Plato’s account of mimesis tells a long-repressed story about the Western subordination of Being to abstraction and rationality. Heidegger argues that Plato’s foundational definition of art as mimesis attests to a wholesale transformation of truth for Western thought. The Greeks originally conceived of truth as sensuous: the true is that which is (or can become) present to the senses. The Platonic doctrine of ideas, by contrast, claims that truth resides only in the rational realm; it is something available to knowledge, not sensuous perception of the world as it is. Art as mimesis reproduces reality as it appears and thus, in Plato’s famous formulation, is three times removed from the truth. The concept of mimesis in Plato is not just a critique of artistic realism, but part of a broader redefinition of truth as rational and abstract.

Two of the most widely influential discussions of mimesis in literary studies are Auerbach’s *Mimesis*, and Girard’s *Deceit, Desire, and the Novel*. Auerbach’s epochal literary history (2003[1946]) surveys two millennia of Western literature, from Homer to Virginia Woolf, establishing

the differing ways writers have represented reality. He describes two mimetic traditions: the classical, in which reality is seen clearly in all its details, but which focuses on the wealthy and powerful; and the biblical, in which reality acquires psychological and spiritual depth, but focuses on the lower orders of society. For most of Western literary history, these two traditions ran on parallel tracks. It is only in the great nineteenth-century novels of Stendhal, Balzac, Tolstoy, and Dostoyevsky that the classical clarity of description blends with psychological realism and concern for average people, to produce a discourse of literary or “novelistic” realism.

Girard (1966[1961]) also explores the tradition of the novel, but sees in it a notion of mimesis as rivalry rather than realism. Drawing upon the works of Stendhal, Cervantes, Dostoyevsky, and Proust, he argues that desire is always triangular. Rather than desiring another person out of need or individual inclination, characters in the works of these novelists desire in imitation of another character, what Girard calls a mediator. Mediators are external or internal. External mediators are so distant historically or socially that characters can openly imitate them; they are akin to role models or admired ideals. Internal mediators are close enough to serve as rivals, inspiring jealousy and conflict. This kind of mediation structures the many love triangles in nineteenth-century novels, which are driven more by mimetic rivalry between men than by desire for the woman. For Girard, both forms of mediation suggest that desire is a product of mimesis. What seems internal to the self is in fact a consequence of our relationships with others. In later writings, Girard would apply the model of desire he finds in the novel to culture more generally, studying the anthropology of scapegoats and sacrifice, as

well as the works of Shakespeare and the Bible.

Modernism

MICHAEL LEVENSON

Modernism was a cultural movement with roots in late nineteenth-century aestheticism and symbolism, prominent in Europe and the US, but with practitioners and theorists around the globe. While there is no general accord as to the precise dating of the “modernist era,” most critics and theorists work within a period that extends from the latter decades of the nineteenth century to World War II. As a cultural movement, modernism was characterized by technical innovations in narrative, dramatic, and poetic forms as well as in the materials and composition of the plastic arts. New and often provocative subject matter, including the critical representation of gender, race, and class, are found throughout the spectrum of modernist cultural practices. In addition to the prominence of nineteenth-century aesthetic movements, the revolutionary aspirations of Romanticism, especially the willingness to contest inherited literary norms and to claim the arts as a historically transformative practice, were one decisive precedent. Equally important were the massive social changes of the nineteenth century – political, technological, economic – which produced, among other effects, a growing and heterogeneous urban culture, where artistic novelty could win small but responsive audiences, indispensable to its experimental ambitions. The emergence of bohemian colonies within the metropolis offered sites for gathering, while an expanding press enjoyed the spectacle of cultural transgression. By the beginning of the twentieth century the recognition of cultural upheaval was inescapable.

Charles Baudelaire is often identified as a “first modernist,” an epithet that captures the significance of his place in mid-nineteenth-century Paris. Baudelaire was

among the first to make “modernity” a subject of reflection; his essay “The painter of modern life” memorably asserted that “Modernity is that which is ephemeral, fugitive, contingent upon the occasion; it is half of art, whose other half is the eternal and the unchangeable” (1951: 33–4). The essay resists the dominance of classical beauty and timeless norms; it asserts the claims of the present tense, “the beauty of the occasion, and of day-to-day existence.” In the poems collected in *Les Fleurs du mal* (Flowers of Evil), Baudelaire created a lyric “I” that seeks, and endures, the desperate extremity of modernity. The strength of this “I” lies exactly in its weakness. Far from the affirmative visions that appear so often among his Romantic precursors, Baudelaire’s moments of assertion flare briefly within a scene of abandonment to the desires and fatalities of the modern.

Baudelaire’s importance to modernism lies as much in his legacy as in his achievement, his example becoming decisive for a next generation of poets who organized themselves under the rubric of symbolism. Stéphane Mallarmé was the most important figure within the movement, one who sustained Baudelaire’s cultural opposition and his devotion to craft, but who carried the example into demanding new directions, underwritten by an austere theory. Mallarmé insisted on a rigorous depersonalization of poetry, writing that the “pure work implies the disappearance of the poet as speaker, yielding his initiative to words (1982[1886]: 75). In poems such as “Hérodiade” or “L’Après-midi d’un Faune,” Mallarmé stages dramas of impossible desire, as his speakers dissolve into their words. As important as the example of these difficult poems were his theoretical writings, which articulated a poetics built on techniques of suggestion and evocation. In a memorable remark, Mallarmé wrote that “To *name* the object is to destroy three-

quarters of the enjoyment of the poem” (1974[1945]: 896). Equally important was Mallarmé’s success in the 1880s in consolidating a sense of common aesthetic purpose on the basis of shared principles and taste. His work emerged within the wider milieu of late-century aestheticism that was often poorly caricatured as “art for art’s sake.” But aestheticism was more than a self-reflexive artistic practice; it was a conception of life committed to keener experiences of aesthetic sensation and perception, a conception found in the work of Walter Pater and Oscar Wilde (in England) and J. K. Huysmans (in France), who devised the terms, images, and sumptuous prose of an aesthetic vocation, a sacred art that would create values once located only in religion.

Impressionist painting had stirred outrage in the 1870s, when a group of painters, among them Claude Monet, Camille Pissarro, Berthe Morisot, Alfred Sisley, and Jean Renoir, broke with academic modes and developed a pictorial style based on visual subjectivism and the subjects of ordinary life. The collective aspect of the impressionist campaign, like the short-lived pre-Raphaelite movement in England at mid-century, prepared for the ambitious project of symbolism. Mallarmé remained the guiding spirit, but he was quickly accompanied by other distinguished poets, notably Verlaine, all committed to a radical reevaluation of literature. The principles of the symbolist critique of materiality and the methods of evocation circulated quickly in Europe, and the challenge of the “Poètes maudits” (accursed poets) was taken up in drama, painting, and music. The recognition of symbolism as a collective “movement,” with its collaborative publications and its sophisticated theorizing, stands as a threshold event in modernism.

The dominant current in the novel followed a quite different course that initially derived from the work of Gustave Flaubert,

who set the terms for modernism in prose fiction. Flaubert’s legendary devotion to the craft of prose and his relentless demand for accuracy of representation became precedents (and later mottos). Realism as a clinical detachment, as an impersonal objectivity, was a vivid statement of the developing narrative aesthetic that manifested itself in many places, including the fiction and theory of George Eliot in England and William Dean Howells in the United States. Toward the end of the century, Émile Zola produced a still more rigorous version of realism, under the heading of a naturalism that would model itself on the methods of science. In his essay on the “experimental novel,” Zola wrote that under the inspiration of analytic science, the novel too aims “to possess a knowledge of the mechanism of the phenomena inherent in man, to show the machinery of his intellectual and sensory manifestations, under the influences of heredity and environment” (1893: 20–1). If Zola was often seen as too frank or too crude in his rendering of sordid misery, still the broader tendency of an austere realism, often identified with Guy de Maupassant, stood as the dominant force in ambitious fiction of the *fin de siècle*. Yet, despite these shared presuppositions, there was little sense of the collective project that emerged through symbolist poetry.

The drama of Henrik Ibsen after his turn to prose in the 1870s, and the early drama of August Strindberg, enacted a parallel movement on the stage. Ibsen expressed contempt for the mystifications of idealism and offered an engaged drama willing to confront the emergencies of modernity; its task was “to awaken individuals to freedom and independence – and as many of them as possible” (quoted in Shepherd-Barr 1997: 21). *A Doll’s House* created a sensation, as its performances spread through Europe in the 1880s. It confirmed and heightened the feminist struggle and attracted as many enemies as

friends. In England, in large part though the proselytizing of George Bernard Shaw's *The Quintessence of Ibsenism* (2009[1891]), the plays were seen as landmark events, changing the basis for art's relation to society. According to Shaw, who was himself a notable practitioner of the form, the invention of the "discussion play" made possible a rational and progressive drama that would accelerate a revolutionary change in the social order.

But alongside the growing influence of this progressively modernizing drama appeared the counterforce of Strindberg, whose plays erupted on the theatrical scene in Paris in a self-conscious challenge to Ibsen. Repudiating the liberal hope in Ibsen's work of the early 1880s, Strindberg wrote, in the preface to *Miss Julie*, that he found "the joy of life in its violent and cruel struggles" (1955: 63). Plays such as *Miss Julie* and *The Father* rendered the battle of the sexes as an entrenched conflict, a struggle for power that undermined any attempt to achieve a new liberal settlement. Friedrich Nietzsche was both an admirer of, and an influence upon, Strindberg, and the massive influence of Nietzsche's writings in the last decades of the century interrupted any liberal consensus emerging within the new movements. The emphases on power and will, the self-defeating character of pity, the inevitability (and glory) of struggle, and the supremacy of strong individuals who must resist the weakness of the rabble – these became indelible provocations affecting the course of many artistic careers.

To this confluence of forces and influences at the end of the nineteenth century, we need to add the name of Richard Wagner. The mythic musical grandeur of his opera was, according to Nietzsche, something "altogether new," appearing with "no warning signs, no transitional events," that "pierced the complacency of modern life. It shattered the feeble art and

literature that had impersonated a living culture" (Nietzsche 1997[1876]: 209). Nietzsche would break with Wagner, but for the generation of young artists, especially for the symbolists, Wagnerian opera was at once an inspiration and a precursor. The rejection of naturalist plots, the movement beyond history and toward myth, the creation of atmospheric tableaux, orchestral transport, and dream vision – these suggested a trajectory of modern art that moved beyond realism toward what W. B. Yeats described as "something that moved beyond the senses," that possesses "the perfections that escape analysis, the subtleties that have a new meaning every day" (1961 [1900]: 164).

The end of the century, then, witnessed a range of modernizing experiments that by no means coincided. Realism/naturalism and symbolism stood out as antagonists. The realist demand to end the mystifications of the ideal ran against the symbolist desire to escape coarse material reality. Yet, even as these positions remained at odds, individual artists moved among them. Ibsen's later drama gave up immediate topicality in favor of elusive symbols (the "wild duck," the "master builder"). Strindberg made an even more extreme movement from the biological realism of his sex-war drama in the 1880s to his late dream-symbolist plays (including *To Damascus*, *A Dream Play*, and *Ghost Sonata*). Yeats became the leading exemplar of symbolism in the English-speaking world, even as he engaged with the local urgencies of Irish politics and the revival of a national culture. Beyond the contrast of competing aesthetics – realist or symbolist, transcendent or local – stood the more general category of the New. In the major capitals of Europe, especially in Paris, the shock effect of novelty was what rallied young artists, attracted small but dedicated audiences, and aroused angry critics. The decade of the 1890s saw a succession of

public spectacles incited by artistic challenge. In 1892, outrage over a Berlin showing of Edvard Munch's paintings closed down an exhibition. The opening of Ibsen's *Ghosts* in London the year before had brought thunderous controversy; in 1893, after a performance of his *Enemy of the People* in Paris, anarchists had brought riot to the streets. In 1896, the Paris opening of Alfred Jarry's absurdist *Ubu Roi* broke down within minutes, with the audience divided between shouting opponents and loud defenders.

Indeed, the case of *Ubu Roi* is telling. On one side, the romping absurdist tale of King Ubu and his appetites was an affront to the suggestive evocations of symbolism. For Yeats and Arthur Symons, who were in the opening night audience, the event was a cataclysm. Yeats later recalled his response, saying "After Stephane Mallarmé, after Paul Verlaine, after Gustave Moreau, after Puvis de Chavannes, after our own verse, after all our subtle colour and nervous rhythm, after the faint mixed tints of Conder, what more is possible? After us the Savage God" (Yeats 1999[1955]: 266). But the play was also a challenge to realism. The masks and the caricature, the imaginary (Polish) landscape, the excessive gestures of violence and desire, broke sharply with the growing precision of realists and naturalists. Jarry's play marks a radicalizing in the culture of experiment; it refuses the conventions of seriousness, the goals of moral and spiritual uplift, in favor of an exuberant delight in expressivity for its own sake.

In registering the accumulating series of provocations, bewilderingly diverse but all falling within the field of experimental novelty, we should avoid seeing a simple conflict between revolutionary art and static bourgeois resistance, a struggle between motion and stasis, change and permanence. The dominant middle-class culture was itself a culture of change, thrusting and ambitious

in its industry, its technology, its empire. To preserve the continuities (religious orthodoxy, economic efficiency, public decorum, or home comfort, often in combination, but sometimes apart) could be as great a challenge as that faced by radical artists. The conflict of modernism was not a collision between novelty and tradition, but a contest between novelties, a struggle to define the trajectory of the new. And yet, even in the midst of pervasive change, transformation everywhere, the new art was seen as a rival and threatening modernity. There was novelty on both sides – that is, the mainstream of art and design and the experimentalism of those who challenged it – but the latter, *modernist* novelty was seen as dangerous and contagious.

The early years of the twentieth century brought an acceleration of modernist challenge that was at the same time a repudiation of the earlier efforts that had brought it into being. In the novel the first changes were gradual though significant. Through the 1890s, Henry James refined a critique of Flaubert's realism, which had mattered much to him, and also that of Maupassant and Zola, which had mattered less. James saw limits in a realism that recorded external events with deadly precision but failed to register the apprehensions of meaning by human consciousness. His own fiction devised characters – alert, sensitive, and garrulous – whose task was to bestow significance on mute events, and James's admirers, Joseph Conrad and Ford Madox Ford, pursued and extended the labor, inventing narrators, reliable and unreliable, who make the workings of subjectivity central to the fiction. The Bloomsbury group – comprising literary artists, like Virginia Woolf, E. M. Forster, and Lytton Strachey, painters and art critics (pre-eminently Clive Bell and Roger Fry), and the economist John Maynard Keynes – elevated intersubjectivity, particularly as it is expressed in

conversation and friendship, to a high art, guided in part by the ethical theories of the Cambridge philosopher G. E. Moore.

The logic that drives literary expression from realism toward subjectivism is one of the deep structures of modernism. Inevitably, it raised a question of skepticism that erupted within the fiction of Conrad and Ford. But beyond the puzzle of skepticism stands a broader concern with the mysteries of consciousness (and unconsciousness). The more ambitious excavations of James Joyce and Marcel Proust broke with norms of exposition that still persisted in James, Conrad, and Ford. In Joyce a central problem was the relation of language to consciousness and the multiple and unsettled conventions that linked them. In Proust it was the deep life of the mind as it spread out through time and memory and as mental life discloses itself, not in a sequence of juxtaposed moments, but in a long circuit, moving backwards as it moves forwards, a cycle of repetitions and returns, a continual process of amplification and revision. After World War I Virginia Woolf and William Faulkner inherited and revised the legacy of subjectivity-in-narration. Among their contributions, the use of polyphonic perspective stands out: the recognition that subjectivities are multiple, that viewpoints compete more often than they coincide, and that “reality” within fiction must be a construction out of these radical pluralities that always unsettle it.

The development of modernism remained uneven, varying its character and its pace in different capitals and within different genres. The modernist novel – from Flaubert to Faulkner – offered a coherent logic of experiment, unfolding over decades with its leading figures most often acknowledging the importance of their predecessors. In poetry, on the other hand, the break with the recent past was sharp and sudden. Guillaume Apollinaire began his

career under the spell of symbolism, but by the end of the first decade of the twentieth century, he was portraying it as a sign of exhaustion. Inspired partly by Jarry and partly by the new painting of Pablo Picasso, Georges Braque, Robert Delaunay and others, Apollinaire called for new techniques appropriate to the modernity of the metropolis. He devised a verse of open forms, half-detached perceptions that move without punctuation and at great speed; the result is a perpetual exposure to new stimulus, a readiness to turn to the next object of curiosity. Meanwhile, across the channel in London, the American poet Ezra Pound led a campaign for the renovation of English poetry. Under the banner of Imagism, he called for a harder, more austere verse, far from the suggestiveness of symbolism, and held that “the natural object is always the *adequate* symbol” (1968[1913]: 5). Hostility to “rhetoric,” to the merely ornamental adjective, and to strictly fixed meters, became a hallmark of Imagism. In contrast to Apollinaire’s longer improvisations, Pound proposed a rigorously compressed verse, even of just a few lines. But the two figures shared a commitment to the avant-garde as a convergence of experiments across the arts. In their separate capitals, they aggressively promoted, and also benefited from, the ideology of the New. Each wrote essays on painting, and each rallied a group of artists to participate in a shared cultural militancy.

Part of what impelled Pound and Apollinaire was an event of 1909 in Paris, when Filippo Tommaso Marinetti published “The founding and manifesto of futurism” in *Le Figaro*. A short tale of a careening car ride, ending in a ditch, followed by a series of aggressive pronouncements – the futurist manifesto became an inescapable precedent for the assaults of the avant-garde. For Marinetti, the new art must trounce the oppressive inheritance of tradition,

“museums, libraries, academies of every kind”: “Why should we look back, when what we want is to break down the mysterious doors of the Impossible?” (1998[1909]: 251). A properly modern art would coincide with technological progress and would live up to the achievements of industrial capitalism. At the moment when the automobile became the index of modernity, Marinetti made it a sign of futurist liberation. Soon he would turn to the airplane with the same exhilaration. Speed, violence, masculinity, and above all novelty – these were the ideals that he carried to the capitals of Europe, winning many adherents, but also inciting other artists to opposition.

Despite the hope held out by many artists, like Pound and Marinetti, for a common program, faction became conspicuous. Over the next few years artists organized into many small sects (Vorticists, Cubo-Futurists, Supremacists, Expressionists, Dadaists) and aggressively defined themselves against one another, as well as against the official culture of the middle classes. The groups differed over certain narrow tenets – fixed or kinetic forms, national or international iconography, mechanical or human imagery – but they shared a resistance, in varying degrees, to the claims of figural representation. In the early years of the avant-garde, conventional forms were still being used across the arts. But by 1913, most notably in the painting of Wassily Kandinsky and Kazimir Malevich, the step toward radical abstraction had been taken. As the English painter David Bomberg said of his own work in a 1914 Chenil Gallery catalogue: “My object is the construction of Pure Form. I reject everything in painting that is not Pure Form” (quoted in Cork 1976: 202).

During these same years, a range of artists turned to the resources of “primitivism.” From Paul Gauguin’s brightly colored painting in Tahiti to Igor Stravinsky’s

Le Sacre du Printemps, we recognize a powerful stimulus in the gestures, motions, and masks of pagan culture. Freud’s publication of *The Interpretation of Dreams* (1900) suggested how a psychoanalytic approach to the mind might recover archaic desires and beliefs congruent with “primitive” thinking. Alongside Conrad’s “Heart of Darkness” and D. H. Lawrence’s *Women in Love*, Picasso’s work, especially in the landmark “Les Femmes d’Alger (O. J.),” defined its modernity through an encounter with the culture of Africa and Oceania. As opposed to the artists committed to the Futurists’ machine aesthetic, those inspired by “primitive” work looked back to human origins and sources, in what seems a reversal of Marinetti’s emphasis on speed and technology. Yet both currents shared a repudiation of realism and the reassuring images of a dominant bourgeois culture; and the stylized postures of pagan iconography often echoed the geometry of the machine.

In the months before World War I, the pace of experiment quickened. The radicalism of the fine arts, especially in the painting of Picasso and Kandinsky, became a model and incitement to other modes and media. Poets attempted to live up to the forms of abstraction; Arnold Schoenberg and Stravinsky transformed principles of musical composition; and the Russian ballet carried its spectacular tableau across Europe. On the very eve of the war, manifestos circulated widely, new exhibitions startled the public, new forms were invented. Far from the defensive posture that earlier modernists had often (necessarily) assumed, those working in 1913–14 were confident, aggressive, unrepentant.

The war, with its accumulated devastations, not only caused the death of many young artists; it also brought the death of uninhibited experiment, particularly among artists who believed that the artwork lay outside the boundaries of history; the

claims of a traumatized world, however, fatally challenged the view of art as self-contained or autonomous. In Germany a group of Expressionist dramatists, influenced by the late work of Strindberg, turned for their themes to the failures of technocratic and bureaucratic modernity, the lust for power, and the taste for mass death. In Zurich in 1916, young artists gathered under the name “Dada” and in the Cabaret Voltaire hurled themselves at the stupidity of war. In their theatrical “manifestations” with simultaneous sounds and outrageous gestures, and in artifacts such as Duchamp’s ready-mades, the Dadaists offended good taste and, more importantly, attacked the category of art itself. The Dadaists George Grosz and John Heartfield (Helmut Herzfelde) transferred the anarchic spirit of the movement toward sustained political critique, especially in the form of satire relying on new methods of photomontage, similar to those being developed by Alexander Rodchenko in Russia. In London Ezra Pound and T. S. Eliot spent their wartime years, readjusting their aims, breaking first with the new norms of free verse, and then straining to invent long forms for more ambitious work. The value of compression that had possessed such attraction in the prewar era gave way to expansive forms and widening goals. Pound’s “Hugh Selwyn Mauberley,” Eliot’s “The Waste Land,” Woolf’s *Jacob’s Room*, Ford’s tetralogy *Parade’s End*, the work of Hemingway and Cummings, all register the war’s catastrophe.

In America, William Carlos Williams offered lyric experiments – especially through alternating rhythms and broken lines – that were rooted in locality and region and that Williams saw as the productive national alternative to a sterile cosmopolitanism, especially the internationalism of Eliot. Wallace Stevens, a long-time resident of Hartford, Connecticut, where he worked as a vice-president for the Hartford Acci-

dent and Indemnity Company, also drew on the native landscape (especially the Florida landscape), even as he relied on European art and philosophy in devising an aesthetics in which imagination and the world lived in a perpetual dance of opposition and collaboration. In a series of major novels of the later 1920s and 1930s, William Faulkner joined a committed regionalism to modernist techniques, with the result that the traumas of the American South served both as occasions for imaginative history and for further developments of narrative point of view and temporality.

As the political crises of the postwar period sharpened – the challenge of communism, the rise of fascism, the crisis of capitalism – older and younger generations turned modernist aesthetics toward encounters with politics. As editor of the *Criterion*, Eliot developed an increasingly keen interest in social and political affairs, particularly as seen from the vantage point of Christianity. Picasso’s monumental *Guernica* brought decades of pictorial technique into confrontation with the trauma of the Spanish Civil War. W. H. Auden began his career by turning the lyric freedom of the previous generation toward political and social meditations. In the Harlem Renaissance of the early 1920s, a group of young writers – including Claude McKay, Langston Hughes, Countee Cullen, Jean Toomer, Zora Neale Hurston – encountered openings for an African-American modernism and also encountered the campaigns for equality and social recognition led by W. E. B. DuBois. Even as Alain Locke insisted on the priority of self-expression over didactic moralism, Du Bois held frankly that “All Art is propaganda” (1995[1926]: 514), leaving the movement balanced uneasily between these competing claims. During this same moment of the 1920s, when Surrealism succeeded Dadaism, its leader André Breton determined to avoid

the disorganized carnival of his predecessors and to produce an affirmative alternative to their negative critique. In what Breton later described as the “heroic” first phase of Surrealism, the group became absorbed in their dreams, spoke in hypnotic states, and attempted to record the desires of the unconscious through automatic writing. But as the social crises deepened, Surrealism was unable to sustain its imaginative vocation in neglect of the social demands and divided sharply over the relative claims of art and politics. Many other figures on both right and left – Bertolt Brecht and Pound notable among them – came to see political urgencies as overwhelming the aesthetic vocation.

A signal feature of a transforming post-war modernism was the appearance of works on a new scale, works of such massive reach as to change the terms of challenge. A few years earlier, the power of art was repeatedly located in concentration and limitation – in the radiant fragment, the luminous detail, the visionary moment. The image, the impression, the symbol, and the vortex were all names for an aesthetic that resisted grand statement in favor of the resources of the miniature. After the war, and partly due to the prolonged creative gestation that it enforced, a succession of newly ambitious works appeared: among them Eliot’s “The Waste Land,” Lawrence’s *Women in Love*, Joyce’s *Ulysses*, Stein’s *The Making of Americans*, Mann’s *The Magic Mountain*, Woolf’s *To the Lighthouse*, Faulkner’s *The Sound and the Fury*, and Proust’s *In Search of Lost Time*. They sustained the willingness to provoke readers through formal difficulty – often through shifting voices and perspectives, through underlying mythic structures that directed narrative away from linear chronologies, and toward universal and abstract patterns of meaning, and through individually complex sentences that defeated immediate comprehension. It’s also fair to say that

these works of the 1920s – like those of the 1930s to follow – no longer content with evocative fragments, often aimed toward comprehensive visions of human value and possibility.

A movement that had so often made claims for its independence from immediate social practice struggled, in the 1920s and ’30s, to retain its separate character. During this late phase of modernism, the wider commercial culture was assimilating much of the language and many of the forms of once radical experiment. Then, too, the artists themselves found it difficult to sustain the ever-new and self-surpassing character of their work. A movement born as an adversarial culture did not simply disappear but receded so far that by end of World War II it had become more memory than desire.

Modernist Aesthetics

GAYLE ROGERS

Modernist aesthetics developed through a series of arguments and practices that rejected both Romantic and realist notions of aesthetics, claiming instead the autonomy of the art object – whether a literary text, a piece of visual art, or a musical composition – with respect to social, political, and historical forces. Modernist writers used this notion of autonomy to produce boldly experimental texts that broke new ground for succeeding literary generations. Their works, in a variety of genres, are characterized by the use of literary strategies such as impressionism, psychological realism, dense and allusive mythological structures, depersonalization, expressive form, antimimeticism, and radically experimental styles. The modernists' interest in innovation went well beyond the merely new object or technique, for they were primarily interested in new ways to create. Ezra Pound's dictum, "make it new," could then be read in a way that emphasized the *making* rather than the made object. Flourishing in a volatile historical moment, modernist aesthetics have shaped the ideas of a number of critical thinkers and schools, and they continue to inform debates in contemporary literary and cultural theory.

Whereas Romantics generally held that the purpose of art was to reveal a higher truth or to reproduce a certain feeling or sentiment, modernists asserted, expanding Immanuel Kant's formulations, that judgments about art must be made within a purely aesthetic realm delimited by the form of the art object itself. One of the most influential articulations of these principles came in the aestheticism of Oscar Wilde, who in turn was influenced by the French symbolists. Wilde proclaimed, in the Preface to *The Picture of Dorian Gray* (1891) that "All art is quite useless" – uselessness thus became a kind of virtue – and that art must be understood as detached from any notion of social utility. Wilde believed that art should have no didactic or instructive purpose; in fact, art has no moral qualities at all, positive or negative. Thus, he wrote, the sole determinant of what makes a novel "good" is its formal character – its properties as a novel and nothing more. This response to a brand of late Victorian positivism that emerged from the ubiquity of the Industrial Revolution was complemented by movements such as William Morris's Arts and Crafts, which sought to restore individual labor in the work of art, separating it from an urban Benthamite utilitarianism.

These claims about the work of art and the literary text were integral to the impressionists, who influenced modernist aesthetics as well. Against the trend in realism to make the media of the representation transparent and to achieve mimetic fidelity to the material world, the impressionists began to foreground their media – words, paint, tones, filmic images. Impressionists often used paint or words to blur the boundaries between objects and between objects and background and thus thematized the unreliability of narration and representation. They depicted fleeting, transient perceptions of a scene or a moment rather than

its putatively "permanent" qualities. Walter Pater provocatively argued that such techniques were not at all immoral (as conservative thinkers charged) and were actually more realistic in their transcriptions of individual experience. His work articulated an English version of Théophile Gautier's *l'art pour l'art* ("art for art's sake") and enabled a number of modernists to cast aside prescribed or inherited rules of order in literature – balance, symmetry, structure, order, logical consistency, identifiable perspectives. Instead, they could now aim to capture what Virginia Woolf called the "incessant shower of innumerable atoms" – the "myriad impressions" that strike the mind on an ordinary day (Woolf 1984[1925]: 150). Modernist aesthetics also aimed to historicize and contextualize realism, which, in many practitioners, appeared as natural, a use of language without literary style.

Drawing also on the theories of Albert Einstein and Henri Bergson, modernist writers depicted or marked the passage of time subjectively, breaking the conventional rules of aesthetic unity. Privileging interiority, experience, and memory (both voluntary and involuntary) over exteriority and action-driven plots, modernists created a style commonly known as the "stream of consciousness," which, they argued, presented a more realistic depiction of the psyche as pioneers like William James and Sigmund Freud explored it. This form of interior monologue, in which a character's thoughts are presented with no appearance of intervention by an authorial hand, both expressed and validated, by its appeal to science and philosophy, the wandering, unstructured, and associative mental processes that realism had suppressed. Woolf and other women writing at the time argued further that the inner lives of women might become legitimate objects of aesthetic creation. In turn, the impressionistic narratives used by writers resisting the dominant

realist style were often nonlinear, cyclical, fragmented, or incomplete, and experimented freely with syntax and punctuation. Modernists like Joseph Conrad, at the turn of the twentieth century, called attention to the status of the text as a limited rather than totalizing representation – to *how* something is perceived rather than to *what* is being perceived. Simply to change subject matter and generic conventions was not enough in the minds of many modernist writers, who sought a comprehensive and even violent break with literary traditions and sought to achieve this goal through claims to aesthetic autonomy.

In many works of the high modernist period (approximately 1912–30), we see a trend toward depersonalization in metaphors that speak of the artistic creator being “refined out of existence” (Joyce 2007 [1916]: 189). A depersonalized aesthetics works to separate the work of art from the circumstances of its production, such as intention, causality, or historical contingency. Joyce’s *Ulysses* and T. S. Eliot’s *The Waste Land*, which both appeared in 1922, the *annus mirabilis* of Anglophone modernism, appeared as embodiments of what Eliot termed the “impersonal” mode of writing. As Eliot noted in his review of *Ulysses*, a mythic method is required for present conditions, for it can give “a shape and a significance to the immense panorama of futility and anarchy which is contemporary history” (1975: 177). Eliot thus called on his peers to write with:

[A] historical sense . . . [and] a perception, not only of the pastness of the past, but of its presence; the historical sense compels a man to write not merely with his own generation in his bones, but with a feeling that the whole of the literature of Europe from Homer and within it the whole of the literature of his own country has a simultaneous existence and composes a simultaneous order. (Eliot 1975: 38)

This “sense” translated into an aesthetic principle, known as the “mythic method”: the universality of myth can reorder the literary-historical past. That is, myths and allusions, regardless of the national, historical, or linguistic origins, could be used for the purpose of rejecting one’s predecessors and creating anew the genealogy of aesthetics. Likewise, the spaces within a text’s “world” were condensed so that lands, cultures, and peoples classical and modern, familiar and unfamiliar, close and distant rubbed against one another, even collided in the present. Pound’s *Cantos* (1915–69) both reflects and makes possible a modernist aesthetics of pastiche and juxtaposition, multiple perspectives and multiple voices represented in a manner that required a bewildering amount of translation, study, and critical commentary. Some modernists, pre-eminently Joyce, commissioned and/or circulated such commentary in order to attract readers (by offering them a means to “decode” the text) and to control their experience. These styles drew also upon the emergence of cinematic aesthetics – montage and rapid shifts in perspective, for instance – and techniques of photographic collage that permeated the arts of this era. These borrowings from other media and fields ultimately augmented, to some writers, the ontological status of the literary text.

Modernist aesthetics also encompassed a host of other variegated and sometimes contrasting innovative literary forms that ranged from abstract idealism to materialist neorealism. Benedetto Croce, for instance, revised Kantian and Hegelian philosophy to foster a neo-Idealist movement in Italy built on aesthetics understood in terms of sensations and lived experience. Yeats, who took the Romantics as his poetic models early in his career, appreciated in Shelley’s poetry its ability to call forth memories already present in the reader’s soul. Yeats read this

Platonic process through and into his own notions of mysticism and transcendental universalism to posit an aesthetics that freed the soul from its material confines, through the agency of symbols and images. Conrad, too, held that his central “task” as an author was “by the power of the written word to make you [the reader] hear, to make you feel – it is above all to make you *see*” (Conrad 1985[1897]: 13) – that is, to elicit a certain abstract, universal insight through visual tropes.

Over against impressionism and idealism stood T. E. Hulme’s abstract neoclassicism, which was shaped by his readings of continental philosophers such as Henri Bergson and Wilhelm Worringer. Hulme advocated a mode of “disciplined” and “precise” poetry of hard, mechanical, geometric lines that, he believed, renovated classicism’s opposition to Romanticism and humanism – ideas that were instrumental in the formation of Imagism, Vorticism and other early modernist movements. Pound and F. S. Flint cofounded the Imagist movement with a call for “direct treatment of the thing itself, whether objective or subjective,” and with a rejection of ornament of any type. Pound admonished his peers to “Use no superfluous word, no adjective, which does not reveal something” (Pound 1998[1918]: 374–375). Another Imagist, William Carlos Williams, also invented a minimalist vernacular style – one that profoundly shaped American verse – that he grounded in the motto “no ideas but in things,” seeing it as a counterpoint to the abstract difficulties of Eliot’s elite modernism (Williams 1991 [1986]: 264). Gertrude Stein used repetitions and tautologies – most famously, “Rose is a rose is a rose is a rose” – to focus on the materiality of objects and, at the same time, the aurality of language and the means by which its signification operates (Stein 1993[1922]: 187). Her highly experimental prose influenced the minimalistic,

allegorical modernist aesthetic of Ernest Hemingway. It also had the effect of defamiliarizing common objects, an effect that the Russian formalist Viktor Shklovsky would describe as central to the formalist project.

High modernist aesthetics, particularly the defamiliarizing component, were pushed further and challenged by European avant-garde movements, most notably surrealism and Dadaism. Artists like André Breton, one of the leading surrealists, experimented ambitiously with aesthetic theories and forms in order to undermine the very notion of art and the category of the aesthetic. Here, an iconoclastic, antihistoricist, and antimimetic aesthetics was often placed in the service of radical political agendas. These cultural productions, from Salvador Dalí’s paintings to Breton’s poetry, also drew on Sigmund Freud’s theories of the psyche in order to express the illogical, irrational, and at times nonsensical. Freud believed that unpleasant memories or experiences were repressed and buried in the unconscious, and the surrealists felt that the imagination could call them forth and place them in dichotomous or contradictory juxtaposition. The result, as with Dadaist experiments, were usually shocking or provocative antiart objects. The surrealist “exquisite corpse” poem or the “found” art object aimed to dismantle prevailing understandings of art and literature, artists and writers, and the texts and capitalist institutions that both made them possible and preserved them. By the same token, avant-gardists more generally also rejected inherited notions of genre or form, or employed them only to parody or mock them, because they required an artificial suppression and controlling of unconscious impulses.

A similarly provocative aesthetics characterized the theatre of the modernist era. Many writers were inspired by Henrik

Ibsen's dramas, which pointed out the hypocrisies and façades of comfortable bourgeois Victorian life, and which were considered scandalous in their day. Controversy itself became embedded in the task of the modernist playwright, a trend that continued with Luigi Pirandello and August Strindberg, both of whom broke long-standing dramatic conventions about plot and character: Pirandello presented *Six Characters in Search of an Author* (1921), while Strindberg's expressionist masterpiece *A Dream Play* (1907) features the daughter of a Vedic god who listens to the grievances of a parade of characters who constantly split and dissolve into one another. Such an interest in "primitive" religions and cultures, also apparent in the allusions in Eliot's poetry, the subjects of Gauguin's paintings, and the angular, driving rhythms of Stravinsky's influential *Rite of Spring* (1913), entwined with the rise of modern anthropology. As in modernist novels, characterization in modernist drama underwent radical changes, resulting in new modes of acting and speaking on stage. From the peasant dramas of Irish playwrights like John M. Synge and Lady Augusta Gregory to the absurdist dramas of late modernists like Eugène Ionesco and Antonin Artaud, character became exaggerated and stereotyped, often in flagrantly unrealistic or allegorical fashion. W. B. Yeats contributed to this development a talent for heroic drama, a sensitivity to new developments in stage decoration, costuming, and dance, and innovative ideas about recitation in verse drama. This is most clearly evident in his use of Japanese Noh theatre, from which he borrowed a stark allegorical form of story-telling, themes of revenge and thwarted love, and modes of representation that included masks, elaborate costuming, dance, and declaimed poetic verse. To some degree, these are strategies of defamiliarization, which have as their aim the desire to

escape bourgeois conceptions of the self and human interaction.

Not all aesthetic advances in modernist theatre were so concerned with matters of style and representation. Some were allied to one or another political movement or set of political beliefs and expressed the necessary connection between politics and aesthetics. Bertolt Brecht revolutionized the theatre further by claiming that the illusion of the "fourth wall" of theatre must be suspended. That is, actors should break out of their roles, dialogue should be self-reflexive, and the audience should be a part of the action rather than separated from it. The Theatre of the Absurd employed these strategies to make existentialist commentaries on contemporary life, using minimal dialogue, flat, affectless characters, spaces without reference to any actual setting, and absence (as in Samuel Beckett's *Waiting for Godot*) to highlight the bleak meaninglessness of existence. In these and other works, modernists incited controversy in many Anglo-European and American contexts for their transgressive, sometimes obscene, texts and statements; their recourse to an aesthetic autonomy characterized by authorial depersonalization provided a means by which some authors could elude personal responsibility for aesthetic crimes against the state. By the same token, it also provided a tool for critiquing the position of the individual in advanced capitalist societies.

The autonomy of the art object was vital to high modernism but was rejected by avant-gardists in the surrealist and Dada movements because it limited the engagement of the artist with the social world and thus limited the *critical* value of the art object. On balance, modernist aesthetics were generally seen as a positive and ultimately emancipating development through the middle part of the twentieth century, especially as literary study was institution-

alized and professionalized. In this way, modernist aesthetics, especially in their valuation of the autonomy of the art object, laid the groundwork for the critical practices of the Anglo-American new critics, who saw the text as a self-sufficient entity that could be explicated and interpreted through its formal properties alone. The new critics, including F. R. Leavis, I. A. Richards, Cleanth Brooks, and W. K. Wimsatt and Monroe Beardsley, argued that literature must be examined by rules governed not by history or biography, but by aesthetic theories of meaning, metaphor, paradox, ambiguity, and so forth. In “The heresy of paraphrase” (1947), for example, Brooks argued that meaning is only intelligible through form and rhetorical figures that resist explanation and cannot be turned into didactic statements. For him, as for other new critics, aesthetic unity signals the degree to which a text successfully integrates content and form in an organic fashion.

Fredric Jameson has argued that aesthetic modernism – the dominant form of modernism in literature and the arts – is the manifestation of a particular transitional moment in the history of capitalism that determines the horizon by which modernist works are best understood (see, e.g., Jameson 2002). In this moment, the economic, political, and cultural spheres that had been relatively independent (or autonomous, in the era of artistic patronage), began to converge with unprecedented intensity. Certainly the continued dominance of modernist aesthetics is evident in the work of art critics like Clement Greenberg and Michael Fried, who flourished in the 1950s and 1960s and who focused on the modernists in new ways. Greenberg saw the abstract expressionists as legitimate and logical heirs to modernist traditions in their effort to explore fully the nature and medium of their work, all the way to the level of the flatness of the canvas, while Fried suggested that minimal-

ism had done the opposite: it betrayed the experimental legacy of modernist aesthetics by refusing to “absorb” the viewer, instead constantly pointing up its status as being viewed and closing itself within its own “theatricality” alone. The ambivalence of modernism had by this time become its salient feature.

The status of the art object in modernist aesthetics was debated in part because the artistic problem it represents – that of aesthetic autonomy – can be as easily a response to as an escape from social conditions. The density, abstraction, and erudition of the modernist art object testified either to its utter isolation from what Eliot called the “anarchy [of] contemporary history” or to its utter emersion in that history. This radical ambivalence characterizes an aesthetics that both values the autonomous status of the art and critiques that value by placing the art object squarely in the social world. Wilde’s *Dorian Gray* (1891) and Woolf’s *Between the Acts* (1941), standing at either end of the modernist period, articulate both the critique (and the ambivalence) of an art object that is resolutely autonomous but rooted in what Yeats memorably called “the foul rag and bone shop of the heart” (1989[1939]: 348).

N

Narrative Theory

MATTHEW DUBORD & GREGORY CASTLE

The term “narrative theory” refers to the systematic study of narrative forms, whether they occur in literary texts (e.g., novels, epic poetry), film, historical works, or other cultural productions. Contemporary theorists (Todorov 1977; Prince 2005) have adopted the term “narratology” to refer to a poetics or “science” of narrative whose origins lie in Russian formalism and the structuralism of Roland Barthes and the structuralist semiotics of A. J. Greimas. Though these points of emergence are varied, they share the same principal aim: to devise a system or “grammar” by which narrative can be described and interpreted according to formal rather than thematic or ideological criteria.

The development of narrative theory from the turn of the twentieth century to the mid-1960s, when the poststructuralist revolution took the field into new directions, is more or less coterminous with the development of formalism and structuralist linguistics. Russian formalists, including Boris Eikhenbaum, Yury Tynyanov, and Viktor Shklovsky, established narrative as an object of analysis in the 1920s as one object of study among many. However, their tendency toward eclecticism, or what Peter Steiner (1984) has called “methodological pluralism,” meant that their methods were

in a constant state of revision. Nevertheless, it is possible to derive general principles, methodologies, and strategies for a theory of narrative that borrows from the work of both formalists and structuralists. Prince (2005) has argued that narratology became systematic only in the wake of the English translation of Vladimir Propp’s *Morphology of the Folktale* (published in 1958), and became something like an academic discipline in 1966 with the publication of a special issue of the journal *Communications* devoted to narrative.

Though Russian formalists helped to spark interest in the study of narrative in Europe and the United States, the first point of emergence for narrative theory was the structural linguistics of Ferdinand de Saussure, whose *Course in General Linguistics* (1986[1916]) laid the groundwork for understanding narrative in terms of a systematic structure. François Dosse reiterates an argument, put forward by the linguist Françoise Gadet, that Saussure’s work was “the lowest common denominator for the entire structuralist movement” because it offered “the descriptive approach, the prevalence of the idea of system, [and] the concern for going from constructed and explicit procedures back to elementary units” (Dosse 1997[1991]: 45). These terms – “descriptive,” “system,” “elementary units” – or versions of them, recur again

and again not only in structuralist theory, but also in the early work of Russian formalists working on narrative.

Saussure's linguistic model provided narrative theory with the important distinction between *langue* (the system of language) and *parole* (individual utterances in that system), which permitted the study and description of what Roman Jakobson (1960) called the "literariness" of literature – the rules and principles governing how linguistic elements are combined into literary utterances. Propp's *Morphology of the Folk Tale* – "the study of forms" in the folk tale – exemplifies this pattern. Its stated aim is to develop a "preliminary, systematic description" (1968[1928]: 5) of the 31 functions of *dramatis personae* of the tale. He isolated and described seven characters (hero, donor, helper, princess and her father, dispatcher, hero, and false hero) whose sphere of action is delineated by certain functions. A function in the context of this work is "an act of character, defined from the point of view of its significance for the course of the action" (21). Propp concludes that all fairytales have the same basic structure and that functions always appear in the same order. In light of these claims, his theory might be thought of as an early attempt at a "grammar" of narrative. Such a grammar would be of limited use, however, because it defines the rules of combination and relation between the elements of narrative in a fixed and rigid manner, not to mention that they apply only to fairytales. This is the objection of the later French structuralists. Claude Lévi-Strauss, for example, criticized the *Morphology* for its rigidity. But Propp's work, whatever the objections of the structuralists, was a major advance in the study of narrative because it avoided the vagaries of interpretation according to historical context (which, in the case of folk tales, was of questionable relevance) and articulated the rules that

govern the form and structure of the folktale as such.

Russian formalists brought to bear on narrative the same techniques they used in the study of poetic form and function. Viktor Shklovsky's work provides us with many of the standard terms for talking about literary narrative. Such is the case with "Art as device," which describes the concept of "defamiliarization," a key term for understanding the interest that both art and poetry evoke in perceivers. Defamiliarization affects the economy of perception, making it difficult and laborious. Art constantly strives to prevent automatized, habitual, or automatic perception that occurs when a perceiver is repeatedly exposed to an object. Even in art, however, perception can become automatic if it becomes habitual. Prose speech, for example, devoid of rhythm and other structuring principles, can elicit habitual responses because it is "economical, easy, correct," whereas poetic speech is "*impeded, distorted speech*" (Shklovsky 1991[1929]: 13). The concept of impeding (or holding back) in poetic speech formed the foundation for Shklovsky's theory of plot and led to his development of the distinction between plot and story. In "The novel as parody: Sterne's *Tristram Shandy*" Shklovsky (1991[1929]: 147–70) argues that plot or *sjuzet* is the artful arrangement of events in the *fabula* or story. Because elements in the *fabula* are arranged to suit the ends of artistic representation, the storyline (the series of represented events as they actually happened) in fictional narratives is impeded, disrupted, and disordered in such a way that it can never be fully recovered. Aleksandr Pushkin's writing provides an example of how a formalist transfers insights about poetry to the analysis of prose fiction. Shklovsky's "Pushkin and Sterne: 'Eugene Onegin'" (1975) explores how these two works parody the form of the novel by using

digression as the primary plot device. He argues that plotting in Pushkin's verse novel arises from the text's self-consciousness about the integration of plot into the form of poetry. Eikhenbaum also seeks to explain why *Eugene Onegin*, Pushkin's most famous work, was also his last major poetic work before he began to write exclusively in prose. This shift proved rather puzzling to most critics prior to Eikhenbaum, who argued that Pushkin's shift to prose is the logical outcome of the author's experiments with plot as it relates to the formal properties of verse (Eikhenbaum 1975[1924]). In his widely anthologized "O. Henry and the theory of the short story" (1971[1925]), Eikhenbaum distinguishes the short story from the novel in terms of a formal issue at the level of narrative. Whereas the novel is a "big form" with "diverse centers," episodes bound together by "linking and welding," and the proliferation of "false endings [and] summations" (232), the shorter compass of the short story requires that its plot be oriented toward the ending. This preoccupation with form, and specifically the notion of plot as it relates to form, constitutes one of the chief contributions of Russian formalism to narrative theory.

Another important formalist, Boris Tomashevsky, makes the same plot/story distinction we find in Shklovsky but considers also the importance of theme and motif in the construction of narrative. His "Thematics" (1965[1925]) examines the difference between plot and story, limited and objective narrators, and relationships between characters and so on, but does so on the basis of an assumption that they are all aspects of *theme*. For Tomashevsky, theme summarizes and unifies the work and engages the reader's interest, while motifs are elementary and irreducible particles of theme. Importantly, it is the relationship between themes and motifs that gives fiction its narrative form. The distinction between

free and bound motifs illustrates the link between plot and theme. Bound motifs are connected in what he calls causal-chronological order, and give a story its coherence. Free motifs, on the other hand, are not necessary to the narrative and may be omitted, but they often contribute to and determine plot structure. Artistry in narrative is the result of the ordering and arrangement of free motifs interspersed among bound motifs. Tomashevsky's rigorous conception of theme provides the foundation for his analysis of other aspects of narrative fiction: theme drives the plot, allows for conflict (the dialectical opposition and resolution of two themes), creates tension, enables character development, and allows for variation in point of view.

Mikhail Bakhtin, arguably the most important Russian influence on narrative theory, was not a formalist though he was influenced both by the formalist's interest in literary forms and by the materialist's interest in the function of ideology in determining such forms. His fierce antagonism to the antihistoricism of the Russian formalists meant that there was not much productive dialogue between them. His work on concepts such as heteroglossia, the chronotope, monologic and dialogic narratives has had a considerable impact on our thinking about novelistic narrative. One of his primary objects of analysis is discourse, in the form of what he terms "heteroglossia" and "dialogism." Heteroglossia, Bakhtin's term for the stratification and differentiation of languages, speech genres, and voices, contributes to the novel's dialogism, that is, the way that these different languages, speech genres, and so on, interact. Indeed, it is this interaction that constitutes the novel as a novel. Bakhtin went further and argued that novelistic narrative evinces distinct relations between time and space, which he categorized as various types of "chronotope." Chronotopes

(*chronos*, time + *topos*, space) are narrative devices that fuse time and space and thereby determine aspects of narrative by serving as “organizing centers” for the events in a novel. Central to his development of a historical poetics, Bakhtin argues that chronotopes are both constitutive of literary genres and determined by historical conditions; only a specific set of chronotopes is available in any historical period and to any given literary genre. Bakhtin identifies many different types of chronotopes – adventure-time, the threshold, the idyll, the road, and the Rabelaisian among others – in each of which time/space exhibits a varying relationship to narrative form. For example, the chronotope of the road, where encounters in the novel often take place, is experienced by characters as both location and duration, both space and time. The chronotope, however, is not stable, for it may signal a different set of conflicts or a different narrative trajectory depending on the historical moment in which the novel in question is composed.

Bakhtin’s influence (his major works were written in the 1930s and ’40s), like that of the formalists, was not felt significantly in the West until the 1960s and ’70s. Tzvetan Todorov was arguably the main force behind the introduction of formalist thought, first to French and then later, through his influence, to other Western theorists. His *Théorie de la Littérature* (1965), together with his translation of formalist studies, introduced not only the key concepts and ideas of formalism, but also continued the emphasis on a formalist “poetics” of prose narrative, which he developed in *The Poetics of Prose* (1977[1971]). In that volume, Todorov discusses popular forms like the detective novel, which is structured around “two stories”: the story of the crime and the story of its investigation. In Todorov’s view, these two stories are elaborations in fictive form of the formalist

distinction between *fabula* and *sjuzet*. Like the *fabula*, which can never be fully recovered because of distortions and disordering created by the plot, the story of the crime is the story of an unrecoverable “absence.” The story of the investigation, on the other hand, is more akin to *sjuzet* but its content has “no importance in itself” because it simply mediates or stands between the reader and the narration of the crime. The two-story structure allows Todorov to classify mystery novels, crime fiction, detective fiction, and several other subgenres of fiction based on the prominence of and interactions between the two stories: thus crime fiction and the thriller suppress the story of the investigation, whereas detective fiction foregrounds the investigation.

Todorov excelled at drawing lines of connection between subgenres of the novel and novelistic narrative as such. In “The categories of literary narrative” (1980[1966]), he analyzes a single novel, Pierre Choderlos de Laclos’s *Les Liaisons dangereuses* (1782), and attempts to derive from it a universal system of narrative. The main thrust of the essay is to “isolate” the intertwined concepts of story and discourse (the latter a common translation of *sjuzet*) from one another in order to understand how the unity of the work is attained. This problem of how to separate story from discourse proved an intractable problem for Shklovsky, and this essay is in part a response to his remarks that it is impossible to isolate them. Todorov subdivides story into two levels: the logic of actions and character relations. Each of these levels can be further broken down into increasingly specific levels, but when examined in this way, actions become disconnected from unifying and linking functions that the concept of character supplies. To correct this problem, Todorov proposes to re-examine the narrative from the perspective of character since character organizes the events of narrative. In his

consideration of discourse (*sjuzet*), Todorov effects another distinction, this one tripartite, between “time of the narrative,” the time of narration and of reading, the “aspects of narrative,” which concern the relationship between narrated characters and the voice of the narrator, and the “modes of narrative,” which concern the narrator’s methods of communication. The denouement and ending of narratives are also important, for in the novel they tend to violate the readers expectations for the characters and this violation simultaneously upholds the reader’s moral conventions.

To a great extent, the history of narrative theory (or narratology) can be read as the attempt to formulate a narrative grammar. A. J. Greimas’s attempt to establish such a grammar in structural semantics in the 1960s and ’70s has done more than anything else to put narrative theory on an objective footing. His *Structural Semantics* (1983 [1966]) developed the concept of “actant,” which is in some respects a revision of the *dramatis personae* in Propp’s *Morphology* and the catalog of dramatic functions identified by Étienne Souriau (1950) in his *Les Deux Cent Milles Situations dramatiques* [Two hundred thousand dramatic situations]. As Roland Barthes notes, “Greimas has proposed to describe and classify characters not according to what they are but according to what they do (whence the name *actants*), in as much as they participate in three main semantic axes (also to be found in the sentence: subject, object, indirect object, adjunct) which are communication, desire (or quest) and ordeal” (1983 [1966]: 106). For Greimas, both Propp’s and Souriau’s inventories of personae and situations are the starting point for a reduction to three actantial categories, which he organizes into oppositional pairs: subject vs. object, sender vs. receiver, helper vs. opponent. These categories represent three different narrative syntagms (a “syntagm” is a

sequence of signs or categories that creates meaning in narrative): respectively, performative, contractual, and disjunctive. The performative syntagm is oriented toward the test that the hero performs and the recovery of the object, while the contractual syntagm establishes the purpose or aim of the narrative situation. The disjunctive syntagm, which concerns power and movement of the subject or object (return and departure, dislocation, concealment and so on), is a “circumstant,” and has a function similar to that of an adverb, in that it inflects the sequence of narrative action but is ultimately of secondary importance to it. In the grammar of actants, one can derive the temporal unfolding of narrative from the relationship of subject to object. Gerald Prince aptly summarizes *Structural Semantics* when he writes that, “according to Greimas, narrative is a signifying whole because it can be grasped in terms of the structure of relations obtaining among actants” (Prince 2005: 116).

Claude Brémont, like Greimas, builds on Propp’s work on the folk tale, specifically on the concept of “function”; but unlike Greimas, Brémont finds Propp’s model limited in its conception of narrative sequence. In “The logic of narrative possibilities” (1980 [1966]), Brémont argues that Propp’s model is too rigid because it presumes a logical necessity internal to actions or events, so that if one action happens a correspondent action must necessarily follow later in the narrative. Brémont’s model, on the other hand, offers a flexible “map” of narrative possibilities that introduces an element of uncertainty internal to the basic narrative unit. This basic unit, what he calls the “elementary sequence,” is comprised of three functions that govern acts and events: virtuality, or the possibility of an action or event taking place; the actualization of that possibility (or the absence of it); and finally the attainment of a goal (or the failure to

attain it). Sequences may be combined with other sequences or embedded within one another to form more or less complex narratives.

In a similar fashion, Roland Barthes devised a structuralist grammar of narrative. In "Introduction to the structural analysis of narrative" (1977[1966]), he argued that narrative is characterized by three hierarchical levels of description – functions, actions, and narration – the meaning of each dependent on their interrelations. Functions are elementary units of content that correlate with other functions, and may be anything from a single word to groups of sentences, even the entire work. Barthes uses a James Bond film to illustrate the different levels. Thus, when "*Bond picked up one of the four receivers*," the action refers not to an object or number of objects but to a specific function linked to a "highly developed bureaucratic technology" (1977 [1966]:91). Functions have several different types (functions proper and indices, nuclei, and catalyzers) and thus a variety of ways of referring to other parts of the narrative. Referentiality does not give them their meaning. As Barthes implies, functions must be "integrated" at higher level of actions – integrated into sequences – in order to realize their full meaning. At the level of actions, we find not the "trifling acts" of characters but "major articulations of *praxis* (desire, communication, struggle)" (107). With the actional level, Barthes wants to correct what he perceives to be a limitation in the models of Brémond and Greimas who restrict perspective in narrative to a privileged class of actants (hero, receiver, etc.). If Todorov avoids this problem, his model only works for one text, *Les Liaisons dangereuses*. Barthes thus wants to revise the categories of the actant in order to make it more flexible and more able to accommodate both the "personal" or "apersonal," "singular, dual, or plural instance of the action" (107).

It is possible to understand the level of actions only through its integration at the level of narration. The level of narration transcends its contents (functions and actions), capping these other levels and effecting a closure of the narrative system, while nonetheless remaining open to the situation (or world) of which its narrative discourse is a part and in which the narrative is consumed. Narrative form, therefore, inheres in the distribution of signs over the length of the work, in the embedding and enveloping of units of sequences (of functions or actions) inside one another in a kind of counterpoint. Thus "the structure of narrative is fugued" (Barthes 1977 [1966]: 103). The distinguishing characteristic of narrative is its ceaseless substitution of meaning for the "straightforward copy of the events recounted" (119). That is, our interest in narrative lies not in learning "what happened" but in the meaning produced by the relations among the various parts of the narrative.

While Greimas, Brémond, and Barthes labored to create a narrative grammar, Gérard Genette considered the more traditional rhetorical aspects of narrative. In *Figures of Literary Discourse*, Genette challenges both Aristotle and Plato, who saw narrative as a weakened form of literary representation and "implicitly reduced the field of literature to the specific range of representational literature: *poesis* = *mimesis*" (1976[1969]: 8). Instead, he argues that quoted speech is *not* representational (or mimetic) because it is either real discourse reproduced without mediation or it is fictional discourse constituted by the work. In *The Republic* and in *Poetics*, Plato and Aristotle distinguished between *mimesis* (Greek, *imitation*) and *diegesis* (Greek, *description, narrative*), Genette collapses the distinction: in narrative literature, *mimesis* is *diegesis*. Genette also attempts to resuscitate the distinction embedded within the

Greek word *diegesis*, which comprises both the verbal representation of actions or events (narrative proper) and descriptions of objects or people. In classical rhetoric, description fulfills an aesthetic or decorative purpose, but in narrative literature description also reveals aspects of the psychology of character. The boundary between narrative and description in literature is thus “internal” and “ill-defined,” meaning that description, as one form of literary representation, may in and of itself be considered narrative. Narrative, however, which is “particular mode” of discourse, never ceases to be discourse, “which is why narrative exists nowhere in its pure state” (Genette 1976[1969]: 7, 11).

THEORY OF THE NOVEL

Primarily a twentieth-century phenomenon, the theory of the novel began effectively with the writings of modernist novelists, and their remarks on the novel typically took the form of prefaces to their own work. In the preface to his *Nigger of the “Narcissus,”* Conrad argued that:

Fiction – if it at all aspires to be art – appeals to temperament. And in truth it must be, like painting, like music, like all art, the appeal of one temperament to all other innumerable temperaments whose subtle and resistless power endows passing events with their true meaning, and creates the moral, the emotional atmosphere of the place and time. (1979[1897]: 146)

For Conrad, the novel is a form of impressionism: passing events acquire their “true meaning” from an exchange of temperaments, which implies the kind of relativistic perspectivism that Walter Pater had placed at the center of aestheticism. Conrad argued that the novel, like all art, should manifest the “magical suggestiveness of music,”

which can be accomplished only by an “unswerving devotion to the perfect blending of form and substance” (146).

The emphasis on impressions was taken up by Henry James in his “Art of fiction,” in which he argues that “A novel is in its broadest definition a personal, a direct impression of life: that, to begin with, constitutes its value, which is greater or less according to the intensity of the impression” (1956[1884]: 9–10). The author’s freedom of expression must not be limited by a priori formal considerations; form “is to be appreciated after the fact” (10). It evolves out of the author’s intense and personal impression of life. James uses the image of the “house of fiction” to describe the interrelations of literary form (the window), the “choice of subject” (the perspective from the window of “the spreading field, the human scene”) and the “consciousness of artist” (“the posted presence of the watcher”) (51). His interest in point of view and literary form had a profound impact on early discussions of fiction, particularly Percy Lubbock’s *The Craft of Fiction*. Like James, Lubbock is concerned with how the novelist creates a literary form out of experience. He uses the word “craft” (as opposed to “art,” which he associates with “a winged word”) in order to emphasize what holds the reader “fast to the matter in hand, to the thing that has been made and the manner of its making” (1955[1923]: v). What is important is the way a novel is made – and not simply how the author chooses to make it, for Lubbock anticipates reader response theory when he asserts that the reader or critic in a sense “makes” the text that the author has provided through his choice of impressions. Echoing Oscar Wilde’s idea that the critic builds upon the work criticized, Lubbock regards the critic’s analytical task as a craft like the author’s, one that allows him or her to see “how the book was made” (274). The critic thus seeks, through

a creative act of reading, to understand the formal design of the work.

Such approaches to the novel emphasize a contradiction between “the thing carved in the stuff of thought” and “the passing movement of life” (Lubbock 1955[1923]: 15). Modernists writing in the 1920s tended to avoid such contradictions by focusing on formal elements of the novel, as Virginia Woolf does in “Modern fiction” (1986–2009[1925], IV:157–65), which emphasizes formal and stylistic innovation. Perhaps the most significant modernist critical work on the novel is E. M. Forster’s *Aspects of the Novel*. Forster is not interested in the thoughts or impressions of historical authors. He wishes instead to avoid the dangers of authorial intent, as well as the “demon of chronology,” and regards novelists as existing in a kind of abstract present, in which they all “work together in a circular room” (1955[1923]: 14). Forster, like so many other modernists, insisted on the humanity of the novel: “The intensely, stifling human quality of the novel is not to be avoided” – and if it is, we are left with little “but a bunch of words” (24). But for him, the emphasis is less on the choice of impressions an author might make, dependent on his or her own experience, than on a “common state” of inspiration: “All through history writers while writing have felt more or less the same” (21). Rather than “craft,” the organic process of composition that critics infer from their own artful reading practices, Forster emphasizes the components or “aspects” of the novel, which are commonly implied by those writers in the circular room. He devotes chapters to “the story,” “plot,” “pattern and rhythm,” “people,” and it is perhaps the latter that has proven most beneficial, particularly his distinction between “flat” and “round” characters: the former are types or caricatures, the latter are psychologically realistic and “more highly organized” (75).

At about this same time, the Marxist critic Georg Lukács, in *The Theory of the Novel*, expressed skepticism about the novel’s ability to create an “embracing design” or to give anything like a pattern or rhythm that can authentically organize social life. Over against the epic, which can provide a totalizing view, the novel stands as “the epic of an age in which the extensive totality of life is no longer directly given, in which the immanence of meaning in life has become a problem, yet which still thinks in terms of totality” (1971[1920]: 56). One way in which novelists attempt to “think” this totality is through a realistic style. Lukács wrote extensively on the realist tradition, with an emphasis on socialist realism, and regarded it as politically more progressive than the experimentation of modernist styles, which he regarded as decadent and bourgeois. By the time of Ian Watt’s *The Rise of the Novel* (1957), the emphasis on realism had shifted from the world represented to the means of representation. The novel is still concerned with human experience – in fact, Watt emphasizes that the novel “attempts to portray all the varieties” of it – but the realism employed in the novel “does not reside in the kind of life it represents, but in the way it presents it” (1957: 11). Unlike James and Lubbock, Watt downplays form, in part because he believes the “absence of formal conventions” to be “the price [the novel] must pay for its realism” (13). What he calls “formal realism” – a set of narrative procedures commonly found in the novel – is the “narrative embodiment” of a premise “implicit in the novel form in general”: if the novel presents “a full and authentic report of human experience,” it is therefore under an obligation to the reader to present the “individuality of the actors” and the “particulars of the times and places of their actions,” in a referential language not “common in other literary forms” (32).

Watt's approach to the novel thus combines literary history with a reading of the novel that is grounded in social and cultural contexts.

The 1960s saw one of the most important developments in the theory of the novel, Wayne Booth's *The Rhetoric of Fiction* (1961). Booth was associated with the Neo-Aristotelian school at the University of Chicago, and his approach to the novel was critical of theories that focused exclusively on form at the expense of the audience and that privileged realism as a "normative" style. His readings of novels by authors as varied as Jane Austen and James Joyce emphasized the relationships among author, narrator, and reader. He is best known for a set of concepts that helped to explain these relations (e.g., the unreliable narrator, the implied author). Booth's followers, including James Phelan and Peter Rabinowitz, have sustained this approach, which came to include an emphasis on pluralism (an abiding concern for the Chicago School) and the ethics of fiction, an approach to rhetoric that insists on the ethical relation between narratives and their readers.

The theory of the novel underwent a sea-change in the poststructuralist era, beginning in the mid-1960s. Part of this change can be attributed to the rise of narratology, which, as we have seen, treated the novel in terms of the structural relations between elements of narrative. M. M. Bakhtin's work, especially *The Dialogic Imagination* (1981[1975]), introduced to the West by French theorists like Tzvetan Todorov and Julia Kristeva, was instrumental in this theoretical development. Though associated with formalism, Bakhtin's approach to narrative (or "prosaics") was implicitly critical of it; his interest in concepts such as dialogism, heteroglossia, chronotope, and carnivalization was grounded both on the unique characteristics of novel forms but also on the ideological pressures placed on language

and discourse. Like Lukács, Bakhtin regarded the novel in relation to the epic; whereas the epic stands as a "pure" genre, the novel appropriates genres and discourse. Bakhtin writes that the singer and listener of the epic are "immanent in the epic as a genre, are located in the same time and on the same evaluative (hierarchical) plane, but the represented world of the heroes stands on an utterly different and inaccessible time-and-value plane, separated by epic distance. The space between them is filled with national tradition" (1981[1975]: 14). The novel, however, touches down on the contemporary moment and therefore lacks the generic "immanence" Bakhtin sees in the epic.

By the 1980s, the New Historicism had made possible new approaches to the novel that emphasized social and cultural contexts in new ways. Pre-eminent in this respect were feminist literary histories like Elaine Showalter's *A Literature of Their Own* (1976) and Sandra M. Gilbert and Susan Gubar's *The Madwoman in the Attic* (1979), which demonstrated not only the importance of novels by women but outlined an alternative history of women's literature. In addition to a critique of literary history, we find also at this time a critique of the historical pressures brought to bear on the novel – or, as the case may be, the pressures brought to bear on history by the novel. D. A. Miller's *The Novel and the Police* (1988) is emblematic of this trend. Miller's study focuses on how the nineteenth-century novel serves as a form of discursive social control, in effect taking on the role of the police in its narrative functions. Similarly, Nancy Armstrong's *Desire and Domestic Fiction* (1987) investigates the novel tradition from the mid-eighteenth to the early-twentieth centuries and charts the emergence of a form of female subjectivity borne in domestic environments but not limited to them. Indeed, her argument is

that novelists were able to rewrite past domestic practices (including intimate relations) in such a way that made possible a new interpretation of social institutions and their value for the development of subjectivity. Critics like Miller and Armstrong demonstrate the historical embeddedness of the novel, emphasizing not only the historical character of the novel as an object in the literary marketplace but also the power of the novel to affect historical transformation. The idea that the novel is a form of historical and social critique has been of particular importance for postcolonial theorists, who regard such authors as Salman Rushdie, V. S. Naipaul, Hanif Kureishi, and Jean Rhys, as engaged in the critical appropriation of Western forms.

Another result of the turn in the 1980s toward historical readings was to reinvigorate our understanding of realism in the novel. George Levine's *The Realistic Imagination* (1981), was a landmark work in this respect, one that also challenged poststructuralist skepticism about generic categories. As Levine noted, "Victorian realism [is] an astonishing effort both of moral energy and of art, and one that must not be diminished by the historical distortions of contemporary critical method or by the Whiggish view of history . . . that we know better now" (1981: 4). Levine is reacting in part to critics like Ihab Hassan (1971) and Robert Scholes (1979), who were turning away from realism and focusing on postmodern innovations like "metafiction." By the end of the twentieth century, critics and theorists began to look closely at genres like the *Bildungsroman* (see, e.g., Castle 2006) and the so-called "subgenres" (e.g., detective fiction, science fiction, romance and so on) – not in order to use such generic categories to organize a wealth of diverse texts but rather to draw on this diversity in order to underscore the complexities and contradictions of such categories and to

offer innovative forms of literary history. Franco Moretti's massive five-volume collection of essays, *Il Romanzo* (2001–3), selections of which are translated as *The Novel* (2006), links literary history to a global perspective. Not content to restrict himself, as had Watt, Armstrong, and many others, to the English literary tradition, Moretti seeks to provide an exhaustive comparative analysis of the novel, one that uncovers the novel's profound role in transforming human experience and behavior, even the way we perceive reality.

Though fundamentally different from one another, narratology and the theory of the novel testify to the enduring importance of narrative for an understanding of human experience and of the discourse that attempts both to record and critique it.

Neo-Humanism

JAMES WALTER CAUFIELD

Variously known as neo-humanism, new humanism, and American humanism, this conservative movement in American literary and cultural criticism came to prominence in the first decade of the twentieth century and largely faded from view by the late 1930s. Neo-humanism was fiercely antimodernist and attacked what it saw as symptoms of materialism, socialism, and relativism in American culture. Neo-humanism opposed itself to virtually every intellectual and artistic development that had occurred in the wake of the European enlightenment of the seventeenth and eighteenth centuries, although its animus was directed particularly against the emancipatory political energies associated with the French Revolution and against nineteenth-century romanticism more broadly, symbolized in the person of the French philosopher Jean-Jacques Rousseau. The neo-humanists also deplored much of the progress made in the natural sciences from the time of Francis Bacon to that of Albert Einstein, in philosophy from René Descartes and Baruch Spinoza to Henri Bergson and William James, and in literature from Michel de Montaigne and William Shakespeare to Émile Zola and Theodore Dreiser. The Anglo-American poet and critic T. S. Eliot was neo-humanism's chief exponent outside the United States and, although he showed at best a qualified enthusiasm for the movement, Eliot's conservative cultural and critical attitudes were nevertheless closely akin to those of key neo-humanists. When Eliot famously described himself as "a classicist in literature, a royalist in politics, and an Anglo-Catholic in religion" (1929: vii), he gave perhaps the most concise expression to the central tenets of neo-humanism.

The neo-humanists couched their conservative opinions in deliberately provoca-

tive rhetoric and hence attracted much criticism from liberal and progressive opponents. One prominent neo-humanist, Norman Foerster, noted that the “Romantics, realists, and skeptics” who opposed the movement mounted their attack on four fronts, branding the neo-humanists academic, un-American, reactionary, and Puritanical (1930a: xi). In order to assess the validity of these charges, it is useful to survey the ranks of the neo-humanists. The *Cambridge History of American Literature* (1921) drew attention to a group of thinkers that it labeled the “new humanists,” and it credited the American cultural doyen and man of letters Charles Eliot Norton with originally inspiring a fervent interest in the humanistic tradition in four of his Harvard students: George Edward Woodberry, John Jay Chapman, Irving Babbitt, and Paul Elmer More (Trent et al. 1921: 491). Although More and Babbitt are today considered the founding fathers of neo-humanism, their ideas having received the most sustained critical attention, it is worth noting that Woodberry taught English literature at the University of Nebraska and published works on Nathaniel Hawthorne, Ralph Waldo Emerson, and Edgar Allan Poe, while Chapman was a prolific essayist, playwright, and political polemicist who also wrote studies of Dante, Emerson, and the American abolitionist William Lloyd Garrison. In youth the mercurial Chapman deliberately burned off his left hand in a fit of erotomania, an event that later became the occasion for a curious essay by one of neo-humanism’s least sympathetic critics, the American journalist Edmund Wilson (Wilson 1938). Another American author often classed among the early or proto-neo-humanists is William Crary Brownell, a journalist and man of letters who wrote widely on French art and British and American prose of the nineteenth century. By far the most outspoken and influential neo-humanists, however, were

Babbitt and More. Both hailing from the American Midwest – Babbitt from Dayton, Ohio and More from St Louis, Missouri – they met in the 1890s as students in the Harvard graduate school and went on to produce the most sustained articulation of the neo-humanist positions, eventually being enshrined as “the twin elder saints of the older school” (Kazin 1942: 78).

At the height of neo-humanism’s popularity, Foerster (1962[1928]), a Babbitt protégé who became the movement’s most energetic polemicist in the 1930s, offered a more extensive list of neo-humanist thinkers. His roster also included contemporaries and former students of More and Babbitt, such as Stuart Pratt Sherman, whose 1917 study of the English poet and critic Matthew Arnold sought to demonstrate the importance of that eminent Victorian as a critical touchstone for neo-humanist opinions and Louis J.-A. Mercier, a Harvard professor of comparative literature, who wrote important introductions, in both French and English, to neo-humanism. The ranks of the neo-humanists were indeed largely drawn from the academic sphere, as the movement’s critics claimed, in spite of later attracting such neo-humanist activists and sympathizers as fascist publisher Seward Collins and literary critics Gorham Bert Munson and Richard Volney Chase.

A range of opinions was discernible within neo-humanism, although all of its advocates generally saw themselves as defenders of classical and Christian standards of taste in art and literature facing a rising tide of democratic and commercial mediocrity in the United States. They lamented the displacement of Greek and Latin literature as the core of a university curriculum in favor of scientific and technical specializations, and they distrusted the socialistic and humanitarian demagoguery of the Progressive movement in American politics. Despising the vulgarity that predominated in

American popular culture, neo-humanists decried the mediocrity and complacency in American society. According to Babbitt, American "idealism" boils down to "having an almost religious regard for the average man and deferring unduly to his opinions as expressed in shifting majorities," and this average man "is increasingly epicurean; he is for making the most of the passing moment with scant regard for any abiding scale of values. 'Good time' are the magic words that many Americans of today seem to see written in great blazing letters on the very face of the firmament" (1981: 113). In the neo-humanist view, critical standards of aesthetic value and artistic excellence were rapidly falling before a juggernaut of Fordism and rampant commercialism that carried all before it. They felt that the classical Greco-Roman literary canon, which they conceived as the concrete embodiment of the highest critical standards of Western civilization, was being swamped by the mass-market power of lowbrow novels and sensationalist, "yellow" journalism.

In order to counter the philistinism that the neo-humanists felt was dominating American culture, they advocated and actively sought to foster an intellectual aristocracy from which the nation could draw its political and cultural leadership. As they conceived it, such a saving remnant would be composed of men – the movement was always robustly and exclusively male – of a quality otherwise unobtainable in a democratic polity devoted to the romantic worship of the average man. More called for a "natural aristocracy" (1972: 220) to govern American political and cultural life, and Babbitt championed "the aristocratic principle, the need of standards and discipline" (1981: 110). Both looked to the educational system as the mechanism for this social amelioration, and both lamented the degradation of standards that seemed to follow the rise of "naturalism,"

"humanitarianism," and "progressivism" in the schools:

If a teacher is humanitarian, with a predominant interest in the underdog, he will at once find himself out of touch with most of the great figures of both ancient and modern literature. I have my doubts as to whether a classical teacher will teach his subject with the fullest understanding and effectiveness if he himself – and I happen to know a number of such classical teachers – is of socialistic or semi-Bolshevistic leanings. (Babbitt 1981: 64)

The neo-humanists claimed that an intellectual aristocracy would form a bulwark against the political romanticism, embodied by Rousseau, to which they attributed America's idolatrous worship of a false and deleterious conception of individual liberty. According to their critique of romanticism, Rousseau wrongly identified the locus of social and cultural conflict in the relation between the individual and the state, a view that seemed to sanction a standing challenge to all traditional, established authority. In opposing Rousseauism, the neo-humanists supposed that the fundamental tension in Western culture was situated instead within the individual, between the higher, spiritual self and the lower, animal self: hence neo-humanism's tireless defense of institutional legitimacy, its deference to established authority, and its constant emphasis on self-control, self-denial, subordination, obedience, and similar self-disciplinary virtues. Babbitt termed this self-governing force the "inner check" and the "*frein vital*," the latter phrase, meaning "vital brake," deliberately chosen to contrast with Bergson's celebrated concept "*élan vital*" or "vital impetus." The classical aesthetic values of balance, symmetry, and calm repose were thus converted by neo-humanism into a rigid philosophy of inhibition for its own sake. The stark dualism that was neo-humanism's most striking

feature purportedly derived from Platonic and Neoplatonic sources, although the movement's critics preferred to think of it as a lapse into self-righteous and sanctimonious puritanism.

Stuart Pratt Sherman's book *Matthew Arnold: How to Know Him* (1917) has led some scholars to overestimate the influence of Arnold's political and social ideas on neo-humanism, since Arnold appears similarly to have sought to recapture the moral quality of past civilizations for service in a modern age of industrialization, materialism, and relativism. Apart from a few borrowed terms from Arnold's critical vocabulary, however, such as his distinction between the "ordinary" and "best" selves and his division of cultural history into eras of expansion and concentration – all used with questionable fidelity to Arnold's original sense – neo-humanism diverged widely from his social, political, and aesthetic views. In contrast to his adventurous liberalism, which sometimes even verged into radicalism, More and Babbitt always drew approvingly on the most reactionary thinkers in the annals of European conservatism. For instance, while they shared Arnold's admiration for Edmund Burke, they also celebrated the authoritarian attitudes of eighteenth- and nineteenth-century Catholic conservatives like Joseph de Maistre, Louis de Bonald, Felicité de Lamennais, and Ferdinand Brunetiere. In his political views, Babbitt was the more flexible of the two, while More has justly been called "America's reactionary" for his staunch opposition to democracy and his "wholly unprogressive" ideological posture (Dimitrovic 2003: 344, 347). His unbending opposition to all forms of humanitarianism, socialism, and "social uplift" movements make More's thought a clear forerunner to contemporary American Libertarianism.

In spite of its vehement anti-romanticism, neo-humanism can itself be seen as a species

of the broadly romantic critique of industrial culture and society that has produced many strange political bedfellows since emerging in the early nineteenth century. In Britain, the degrading effects of industrialization on social and moral institutions were critiqued in works of John Stuart Mill, Thomas Carlyle, John Ruskin, Matthew Arnold, and William Morris, a tradition of British social criticism that Raymond Williams has analyzed in *Culture and Society* (1958). Similar critiques of American society, particularly of the exclusive predominance of commercial values, were already well established as themes in American letters prior to the advent of the neo-humanists, whose attitudes were in many ways pale reflections of opinions more forcefully expressed, for instance, by Mark Twain in *The Gilded Age* (1873), Henry James in *The American Scene* (1907), and Henry Adams in *The Education of Henry Adams* (1906). The Canadian critic Northrop Frye has identified a hallmark of romanticism in "the various mythical constructs that show us Western culture as having steadily declined since the Middle Ages, a historical fall being sometimes associated with a certain phase which the mythologist particularly dislikes, such as the Reformation, the philosophy of Bacon, the secularism of the Renaissance, 'usura' (Pound), or 'dissociation of sensibility' (Eliot)" (Frye 1968: 27). As an effort to regain a golden age of preindustrial cultural stability, the short-lived neo-humanist movement thus appears to have been little more than a late flowering of the genteel tradition in American letters, a communion of "New England Saints," as one sympathetic critic termed the movement (Warren 1956).

By 1930, neo-humanism had inspired both a devout following and a significant resistance. One of its staunchest opponents, Malcolm Cowley, was forced to admit that:

[I]n the midst of their enemies, this doctrinal Humanism has grown in power. To-day there are Humanist magazines, Humanist publishers, Humanist professors in all the larger universities; there are Humanist critics, scientists, and political thinkers (if not Humanist artists); and the movement has even enlisted the editorial support of the *New York Times*, which doesn't quite know what it is all about, but which feels, somehow, that Humanism is safe and reactionary. (1930: 64)

In that same year, C. Hartley Grattan edited a volume that was highly critical of neo-humanism, and included essays by some of the leading critics of the era: Allen Tate, Kenneth Burke, R. P. Blackmur, Yvor Winters, and Lewis Mumford (Grattan 1930). A common criticism is echoed in Wilson's remarks about Babbitt's critical style:

[I]t is not decorous to take a word like Humanism, which has formerly been applied to the great scholars, philosophers, satirists, and poets of the Renaissance, and to insist that it ought to be regarded as the property of a small sect of schoolmasters so fatuous that they do not hesitate to assign schoolmasters' A's, B's, and C's in humanism . . . it is not decorous to assume that you yourselves are the only persons who have taken seriously the vices and woes of your own time and that everybody except yourselves is engaged either perversely or stupidly in trying to make them worse. (Wilson 1952: 457–8)

Although neo-humanism was an American cultural phenomenon, the movement nevertheless bore a strong family resemblance to concurrent tendencies in British and Continental cultural politics between the wars, tendencies that appear in vestigial form among social and cultural conservatives today. In this inclusive sense, neo-humanism was an American variant of a wider movement in twentieth-century cultural criticism, and one can find parallels in the traditional Old Right of other Western

nations. The British literary-critical milieu, for instance, experienced a parallel intellectual development in the 1930s and 1940s in the work of F. R. Leavis and the stable of young writers at the journal *Scrutiny*, for whom the founding assumption of criticism was a rigorous humanism (Mulhern 1979). The same general tendency appears plainly in the work of new critics like I. A. Richards and William Empson, and in modernist poets like Eliot.

The American paleoconservative Russell Kirk, with his anthology *The Conservative Mind* (1953), did much to rekindle interest in neo-humanist political views in the US after World War II, particularly during the era of Joseph McCarthy's communist purges. The movement found continued support in academic circles as well, drawing praise from the former President of Harvard University Nathan M. Pusey, the historian Peter Viereck, and the political philosopher Eric Voegelin, but neo-humanist views were preserved primarily in the conservative journals of opinion during the 1960s and 1970s, as in William F. Buckley Jr.'s *National Review*, Irving Kristol's *Public Interest*, Norman Podhoretz's *Commentary*, and Kirk's *Modern Age*. Various inflections of humanist thought have lately appeared in such widely varied locations as the cultural studies of Edward W. Said, the ethical criticism in Wayne Booth and Martha Nussbaum, and in the crusade for cultural standards mounted by William Bennett and Lynne Cheney. The values of neo-humanism continue to be found in William Kristol's work for the *Weekly Standard* and in the pages of Samuel Lipman's *New Criterion*. Analogous moral and critical views appear to characterize British conservative thought as well. British thinkers such as Peter Hitchens, Auberon Waugh, Antony Flew, and Roger Scruton generally emphasize classicism, stability, and the Burkean inheritance and may be considered broadly sympathetic to

neo-humanist values. Neo-humanist ideas have also found modern expression in Boston Personalism, particularly in the work of Jan Olof Bengtsson, Richard Allen, and Randall E. Auxier. In the view of Babbitt's editor, Babbitt "will go down in history as one of his country's original and seminal intellects" (Ryn 1995: ix), while More's editor finds the sage of Shelburne "panoplied in encyclopedic learning, elevated by such historical vision as is given to few men, and fully convinced of the eventual triumph of the truth of the Ideal world" (Lambert 1972: 13).

Nietzsche, Friedrich

PATRICK BIXBY

German philologist, philosopher, and cultural critic, Friedrich Wilhelm Nietzsche (1844–1900) was, with Karl Marx and Sigmund Freud, one of the thinkers who had the most influence on twentieth-century literary and cultural theory. He challenged conventional beliefs about truth, morality, and modernity (e.g., democracy, progress, rationality) by noting how all knowledge is perspectival and a human interpretation for human ends. He believed that the apparent meaning of a truth statement, a moral value, or a cultural practice conceals the “will to power” that produced it. Humans seek power over each other and over the world

around them, according to Nietzsche. Nietzsche felt the ideals and beliefs of Christian civilization especially were illusions, and he attacked them in a style that is at times polemical, at times aphoristic, at times prophetic, at many times dazzling – a style that departs markedly from standard philosophical argumentation and often veers into literary virtuosity. Nietzsche’s work has influenced a wide range of readers, including literary modernists, conservative ideologues, and existential thinkers, though perhaps its most lasting and powerful impact was on poststructuralist philosophers and literary theorists, who learned from him the importance of style, the pervasiveness of interpretation, and the inseparability of power and knowledge.

The son of a Lutheran minister, Nietzsche was named for the devout King Friedrich Wilhelm IV of Prussia, whose birthday he shared. After attending boarding school at Schulpforta, Nietzsche went on to study classical philology at the Universities of Bonn and Leipzig, where he began to publish essays on Aristotle, Simonides, and other subjects. On the recommendation of his mentor, Professor Friedrich Wilhelm Ritschl, Nietzsche was offered a professorial position at the University of Basel before he had even completed his doctorate. From his earliest writings, the precocious professor of philology expressed not only a highly original vision of Greek antiquity, but also a radical critique of modern European culture and society, which he viewed as a pale imitation of classical Greece. This perspective may be attributed, at least partially, to the young academic’s reading of the pessimistic philosopher Arthur Schopenhauer and to his developing friendship with the romantic composer Richard Wagner. Nietzsche’s first book, *The Birth of Tragedy* (1872), is a comprehensive reinterpretation of the significance of Greek culture, leading to a reflection on the potential rebirth of

tragedy in the modern world, principally in the music-dramas of Wagner himself. According to Nietzsche's argument, classical tragedy was born of the struggle, and occasional reconciliation, between two opposing forces or drives, named after the Greek deities Apollo and Dionysus. The Apollonian, which Nietzsche associates with epic poetry and the visual arts, represents a principle of civil order, moderation, and control that respects distinctions, individuality, and limits or boundaries. The Dionysian, which he associates with music and dance, represents a state of excess and expressiveness that works to destroy distinctions, individuality, and limits: wherever the Dionysian prevailed, according to Nietzsche, "excess revealed itself as truth; contradiction, bliss born of pain, spoke itself from out of the heart of nature" (1999[1872]: 27). But in Greek tragedy, the Apollonian and Dionysian go hand in hand, so that the structured speech and action of the individual actors on stage tempers the exuberant singing and dancing of the chorus. For Nietzsche, the value of tragic culture resides precisely in this harmony, or creative tension, which allowed the ancient Greeks to acknowledge the essential chaos, violence, and amorality of existence, while transforming this pessimistic insight into a profound understanding of the human condition. Modern humanity, however, has been deprived of such insight by a culture that no longer recognizes the inhuman chaos of existence but chooses to focus instead on rational concepts and moral norms.

Nietzsche largely attributes the death of tragedy in Greek antiquity – and the shortcomings of modern European culture – to the emergence of rationalism, which he associates with the philosophy of Socrates. The optimism of rationality, according to Nietzsche, rejects the very nature of tragic culture in favor of a notion of value centered

on knowledge and virtue and derived from scientific or philosophical investigation, which has bequeathed its legacy to the modern world in the form of the "theoretical man" (Nietzsche 1999[1872]). In "On truth and lying in a non-moral sense," an important essay written shortly after *The Birth of Tragedy*, but published posthumously, Nietzsche extends his critique of Socratic rationalism by arguing that human cognition falsifies experience, substituting the general (that is, the abstract or transcendent) for the particular, so that our concepts provide a symbolic identity to innumerable more or less similar cases. We conveniently forget that the basic units of thought, concepts, are necessarily fabrications, founded on a language that bears only an arbitrary and conventional relationship with the world, exchanging something (a word) for something entirely different (the so-called "thing-in-itself"). In an argument that adumbrates much poststructuralist thinking, Nietzsche famously asserts that what we call truth is nothing other than "a mobile army of metaphors, metonyms, and anthropomorphisms" (1999[1872]: 146). Although he does not deny the basic human necessity of *producing* truth in this way, Nietzsche does see it as an inherently coercive process insofar as it leads to the creation of hierarchical conceptual orders and value systems, which privilege particular ways of thinking and living. Truth, he recognizes, has never been entirely free of moral reference.

It could be claimed that Nietzsche spent the rest of his career investigating the consequences of these early insights, albeit in a mode of persistent and searching self-critique that sometimes ventured into self-contradiction. From 1873 to 1876, Nietzsche published a series of long essays under the general title of *Untimely Meditations*, which turned his critical lens on a number of contemporary authors, artists, and cultural movements, most notably the

nineteenth-century interest in historicism. Due to his persistent struggles with illness (and, no doubt, to the cold reception his work received from his academic peers), Nietzsche abandoned his academic career after only a decade. In 1879, he began 10 years of nomadic existence, moving through a series of boardinghouses in Switzerland, France, and Italy in search of conditions favorable for his physical health and his intellectual labor. Not long before leaving his professorship, he published *Human, All Too Human* (1986[1878]), the first volume of a study that marked an important stylistic departure from his earlier writings and the norms of academic discourse, as well as an increasing conceptual distance from the influence of Schopenhauer and Wagner. Composed in the aphoristic manner for which he would become famous, *Human, All Too Human*, and the book that followed, *The Gay Science* (2001[1882]), develop an interpretive approach that Nietzsche calls “perspectivism,” an alternative to the objective notions of truth postulated by traditional philosophical and scientific inquiry. According to Nietzsche, our knowledge is necessarily a product of our human perspective, precisely because we have no other – absolute, unmediated, or disinterested – way of knowing the world. To speak of truth as perspectival, then, is to accept that knowledge is unavoidably implicated with value. This insight has important consequences for his methodology, which employs aphorisms to present various perspectives on or interpretations of phenomena, whether he is addressing our beliefs about moral behavior, our ideas about what it means to be human, or the role of art and artifice in constructing our conceptual systems. Nietzsche’s work during this period emphasizes his “psychologizing” perspective on cultural, intellectual, and especially moral history, seeking to expose the false hopes and bad conscience behind much of modern

culture. For instance, he famously identifies “nihilism,” the feeling that life is meaningless, with what he sees as the general decline of Christianity and European cultural life, along with the spectacular rise of science and technology, in the nineteenth century. This is not to say, as many mistakenly have, that Nietzsche is himself a nihilist. Rather, his psychologizing perspective allows him to recognize a great need in modern culture for a reevaluation of values, which would affirm life in the absence of metaphysical truth or religious significance. It is in this context that Nietzsche makes perhaps his most famous pronouncement: “God is dead” (2001[1882]: 120). As he would later put it, in the Preface to *On the Genealogy of Morals*, “Let us articulate this *new demand*: we need a *critique* of moral values, *the value of these values must first be called into questions*” (1989[1887]: 20).

Thus Spoke Zarathustra (1883–4), perhaps Nietzsche’s most widely read and certainly his most literary book, identifies the task of “reevaluation of all values” with the Overman (*Übermensch*), Nietzsche’s ideal of someone capable of accepting the fact that existence lacks the especially Christian meanings that Western culture assigns to it. *Zarathustra* is a prophetic, sometimes mock-prophetic, work written in the style of the Luther Bible. The title character, who descends from his solitary existence on a mountain top to address the world of men and women below, offers trenchant criticism of just about everything he encounters there, but ultimately defends the possibilities of life by teaching that “man” is something that can and must be overcome. Although the text, with all of its figurative language and fabulistic indirection, presents many interpretative difficulties, *Zarathustra* is ultimately a pedagogical work, offering a guide of sorts for overthrowing the existing order in favor of new interpretations, new values, and new more life-affirming forms

of life. In doing so, it provides accounts of what Nietzsche conceived as two of his most important ideas: the Eternal Recurrence of the Same and the Will to Power. The Eternal Recurrence is a cosmological principle and a philosophical challenge. Christian civilization, according to Nietzsche, denied the natural reality of the world by positing an ideal world, a spiritual realm outside the physical world. The meaning of physical existence supposedly resides in that spiritual realm. According to Nietzsche, no such realm exists. There is only physical reality, and it repeats itself endlessly. Only those with philosophical courage can tolerate that bleak reality. Nietzsche's term for the person who possesses the courage to live without feeling a need to find meaning in the physical world is "the Overman." The Will to Power, according to Nietzsche, is not simply a principle of survival or the inevitability that the strong will dominate the weak. Rather, it is the inhuman productive force that he associates with all existence, a force composed of dynamic relations and processes of becoming, rather than fixed being. The importance of these concepts for Nietzsche is that they free his philosophy from the reactive and teleological elements of Western metaphysical thought that depend on a dualistic ontology, which separates being and becoming, cause and effect, subject and object, physical world and spiritual world.

Although his subsequent books, *Beyond Good and Evil* (2002[1886]) and *On the Genealogy of Morals* (1989[1887]), are widely recognized as his most important and systematic works, Nietzsche conceived them as elucidations and elaborations of the ideas already present in his masterwork, *Zarathustra*. The books continue his challenge to a variety of commonly accepted ideas: that the self is naturally stable and substantive, that truth is inherently valuable and innocent, that democracy is the most

desirable form of social organization, that life ultimately finds its significance in a realm beyond life. Together, these volumes occupy a central place in Nietzsche's larger effort to revalue all values. He is particularly concerned to critique Christianity's promotion of what he calls "slave morality," which extols the meek and downtrodden as good, while denigrating the strong and aristocratic "masters" as evil. This evaluation ("the meek shall inherit the earth"), a form of revenge against aristocratic values, is born out of what Nietzsche famously calls *ressentiment*, a feeling of ill will brought on by impotence and, particularly, by the inability to affirm natural life. To analyze these values, Nietzsche integrates his psychologizing approach with a genealogical one – the latter he reconfigures in order to focus on *emergences* rather than *origins* – and thereby reveals the instability of some of Western culture's most dearly held beliefs. This novel approach to genealogy has had a particular influence on poststructuralism and the work of Michel Foucault, whose method discovers not a timeless and essential secret behind our values, but the secret that they have no timeless ahistorical essence or that their essence was fabricated. Again and again, employing this influential methodological innovation, Nietzsche demonstrates that those beliefs and values are grounded in various forms of self-interested interpretation, rather than ideal or absolute sources. His thoroughgoing critique of modernity entails a rejection of nay-saying morality in favor of an "un-modern as possible, a noble, yes-saying type" (2005: 135) that affirms natural existence, embodied for Nietzsche in the figure of the "Overman." This figure would generate, in the twentieth century, a great deal of controversy and misunderstanding (especially once it was adopted by Nazi ideology), though much of this may be cleared up if we recognize the "Overman" not so much as the ideal end-point of an

evolutionary process, a program of eugenics, or a fascist daydream, but as a model of the “self-overcoming” individual who has the courage to embrace the meaninglessness of natural existence and the fully natural character of existence.

Some of Nietzsche’s most important thinking was conducted in notebooks that were edited after his death and published under the title *The Will to Power*. In these notebooks, he is especially critical of the rage for identity in Western philosophy, the desire to assign conceptual unity to a world that is characterized by processes that are highly unstable and conflictual. The world is agonistic, a place where differences of force count more than stable unities or identities. Nietzsche is harshly critical of the human yearning to find meaning or a spiritual truth in natural existence. The courageous, he argues, accept the fact that there is not a spirit world behind the real world. Only the real physical world exists.

Nietzsche was acutely aware that his philosophy might be misinterpreted and he spoke out against this possibility many times in his writing, especially in the late autobiographical work, *Ecce Homo* (1888). Unfortunately, after he suffered an irreversible mental breakdown in January 1889, he lost the ability to defend his work against misreadings and misappropriations, even those of his sister, Elisabeth Förster-Nietzsche, who did much harm to his legacy with her misguided editorial efforts. In the twentieth century, while he exerted great influence over many modernist writers, including George Bernard Shaw, W. B. Yeats, Thomas Mann, and D. H. Lawrence, Nietzsche also became what his biographer Walter Kaufmann called one of the “great scapegoats of all time” (Nietzsche 1989: 9). From the beginning, his work attracted considerable controversy for its derogation of Christian and democratic values, and later for its association with German mili-

tarism before and during World War I and the Nazi Party in the 1930s. After World War II, Nietzsche’s reputation slowly recovered and his work was evoked with great frequency by important philosophers, political scientists, literary critics, and especially poststructuralist thinkers who have developed a Nietzschean interest in the value and meaning of “man.” Perhaps the continued significance of his work can be best explained by acknowledging it as a point of crisis in modernity, where the problems, interests, and contradictions of a way of thinking and living are revealed, a point where they become glaringly, unavoidable visible. It is this revelation that makes Nietzsche, despite many misinterpretations and misapplications, one of the most important modern philosophers and an incisive critic of history, culture, and the human condition.

O

Other/Alterity

SEVINÇ TÜRKKAN

“Other” and “alterity” are two interrelated concepts. As a condition of “otherness,” alterity is defined as “the state of being other or different; diversity” (*OED*). The term was adopted as an alternative to “otherness” to register a change in the twentieth-century Western perception of the relationship between consciousness and the world outside. Since Descartes, individual consciousness has been taken as the privileged center of identity while “the other” is seen as an epistemological problem, or as an inferior, reduced, or negated form of the “same.” Descartes’s humanist position, based on his well-known proposition “I think, therefore I am” poses the question of “the other” in relation to the subject. In similar manner, “How can I know the other?” questions the existence of the “other” relationally to the subject. The term “alterity” shifts the focus from earlier philosophical concerns with otherness – the “epistemic other” or the dialectical other – to a more “concrete and moral other,” materially located in social and cultural institutions. In social contexts, as in logical systems, the construction of the subject is inseparable from the construction of its other. The *other* is not something outside or beyond the *self*, as the

traditional Cartesian perspective would have it; rather, it is deeply implicated in and with the *self*. Thus we are inclined to ask: “What is my relationship to ‘the other?’” and “How should I act towards ‘the other?’” The term “alterity” suggests that the other involved in these questions is neither an abstract proposition, nor unrelated and therefore irrelevant to considerations of *the self*. It is this emphasis on relationality that gives alterity its value in contemporary critical thinking.

The concept of *the other* finds its early reference in Emmanuel Levinas’s understanding of ethics and metaphysics. In his view, the Western metaphysical tradition has concerned itself primarily with articulating the existence of entities in terms of their relation to the assumed primacy of the self. Levinas urges us to acknowledge the primacy of something that remains outside the domain of the self. The self, in his ethical understanding of alterity, alludes to the tendency of thought to transcend the limits of its own particularity and seek out the other (1998[1961]: 33). According to this view, self-understanding is not grounded in a subjective self-awareness. We are entities driven and constituted by our desire for the other. As such, one’s sense of self is placed in question by and through one’s own desire for the other.

The very language of *self* and *other*, of *inside* and *outside*, is challenged by Levinas, who argues that the other approaches the self “from above,” that is, from an unassailable height. The other’s transcendence resides in the understanding that it lies “above” the self, that it abides in a state of absolute separation that will not yield to the self’s desire for mastery. This “height” is designated by Levinas as “teaching” and what is taught in the transcendence of the “I” by the other is ethics. All human life depends upon the acknowledgement of an ethical prohibition that forbids violence. The implicit recognition of this prohibition involves the acknowledgment of the other. In Levinas’s ethics of alterity, the humanism of the other triumphs over an ethics in which “otherness” is radically severed from the unity of self and experience.

The place of the other in poststructuralism and postcolonial theory is rooted in Freudian and post-Freudian analysis of the formation of subjectivity, most notably in the work of Jacques Lacan. Lacan draws a distinction between the “Other” and the “other.” The other is or resembles the self, which the child discovers when it looks in the mirror and becomes aware of itself as a separate being. When the child, aged between 6 and 18 months, struggling in neuronal immaturity and feelings, sees its image in the mirror, it is overwhelmed by the jubilant feeling of seeing a total body image. This image promises the child the possibility of a unified identity. This fiction of mastery later becomes the basis of the ego, but in this early “mirror stage” it is a fragile formation, and requires the presence of the parents, who serve, psychologically at least, a prosthetic function (Lacan 1977: 4). “The Other” (upper-case O) stands for the symbolic order, but also for the unconscious in Lacan’s understanding of it, and reveals the function of the Law (the “name of the father”) in mediating the child’s access to

the symbolic realm. Fundamentally, the Other is crucial to the subject because the subject exists in its gaze. According to Lacan, human desire is mimetic and the first desire of the subject is the desire to exist in the gaze of the Other.

In postcolonial theory, especially in the important early work of Frantz Fanon, Albert Memmi, and Edward Said, “the other” refers to “the colonized” peoples, marginalized by imperial discourse, identified by their difference from the center of power, and reduced to an image of infantile inadequacy. Something like the Lacanian Other corresponds to imperial discourse and to the very empire itself: it defines the terms in which the colonized subject gains a sense of identity as other and dependent. It is the absolute point of reference, the ideological framework in which the colonized subject understands the world. The ambivalence of colonial discourse lies in the inevitable processes of “othering,” the colonial subject being both a primitive “child of empire” and a degraded subject of imperial discourse.

Postcolonial theorists are especially interested in the distinction between alterity as a philosophical problem and alterity as a result of material and discursive formations. The self-identity of the colonizer, like that of the colonized, is determined by intertwined processes of othering. Spivak identifies “othering” as a social space where “meaning/knowledge intersects power”: “the project of Imperialism is violently to put together the episteme that will ‘mean’ (for others) and ‘know’ (for the self) the colonial subject as history’s nearly-selved other” (1985: 255). As Spivak and others have noted, using the term “other” in a postcolonial context runs the risk of reinscribing the othering process instead of dismantling the very binaries on which it rests. Alterity, by attempting to dismantle binary opposition, offers the opportunity to

see colonial discourse and its others in a relational manner, each constituting the other while simultaneously respecting difference, thereby avoiding the trap of collapsing all distinctions into an abstract, ahistorical polarity (e.g., Manichaeism).

The process of “othering” is described or dramatized in a wide variety of colonial discourses, from imperial adventures and travel writing to academic, scientific, and bureaucratic accounts of empires and “subject races” as Lord Cromer, the British colonial administrator in Egypt (1883–1907) put it, referring to the “colonized other” under British imperial rule. Othering propagates a sense of selfhood among colonizers, who imagine themselves as utterly and absolutely different from the colonized other who is deployed as an “inscrutable” figure or as an unknown and unknowable subject; that is, as an epistemological question. This is particularly apparent in literary accounts such as E. M. Forster’s *A Passage to India* (1924) and Joseph Conrad’s *Heart of Darkness* (1899). Mary Louise Pratt detects examples of othering in travel accounts after closely analyzing their narrative structure. She notes that the people to be “othered” are homogenized into a collective group described as “they,” which later turns into a more meaningful “he,” the standard male specimen. These abstractions are, in turn, employed as the subjects of verbs in a timeless present tense, removed from particularities, and reduced to instances of pre-given customs and traits (1992: 139). Apart from its almost inevitable presence in travel and ethnographic writing, othering can take on more material and violent forms. For instance, in *Waiting for the Barbarians* (1980), South African novelist J. M. Coetzee demonstrates the ways in which imperial discourse constructs its others in order to confirm its own reality. Colonel Joll’s entire mission of gathering information about the “barbarians” is highly absurd because he creates the category “barbarian,” the other,

the moment he begins to search for it. In similar binary terms the empire defines itself against its geographical, racial, and cultural other, through practices of exclusion and marginalization. Significantly, this discourse positions the other outside of discourse and within a world, where the only perspective that matters is the imperial or metropolitan one.

In literary theory, an influential use of alterity appears in M. M. Bakhtin’s description, in *The Dialogic Imagination* (1981 [1975]), of the way in which an author moves away from identification with a character. The novelist must understand his or her character from within, but must also perceive it as other, as apart from its creator in its distinct alterity. It is important to note that in Bakhtin’s formulation, dialogue is central and it is only possible with an “other.” Thus alterity is not exclusion, but an apartness that stands as a precondition for dialogue, where dialogue implies transference across cultures, genders, classes, and other social categories. This is related to his concept of “exotopy” or “outsideness,” which, again, is not alienation, but a precondition for the author’s ability to create a character, and a precondition for the “dialogic imagination” (Todorov 1984).

In a wide variety of poststructuralist theories, the concept of the other played a decisive role in the dismantling of traditional notions of the subject and of a stable and “centered” discourse. Deconstruction, a method of textual analysis associated with Jacques Derrida and other poststructuralists, uncovers the features in any text that subverts or betrays the dominant logic of the discourse, and that opens dominant discourses to the *other voices* that it suppresses. Derrida locates a moment of blindness in the philosophical traditions and logocentric texts of Plato, Kant, and Hegel, by simultaneously granting insight into an alterity that exceeds logocentrism. In Derrida’s work,

deconstruction is not a nihilist celebration of nothingness but an openness towards the other (Critchley 1992: 28). This aspect of openness was developed in Derrida's later work, as he considered the role of the other, in the sense given it by Levinas.

Feminist movements, at least since the 1920s, gave raise to another theoretical and methodological approach to alterity. Feminist theory, which aims to understand the nature of gender inequality, is strongly interested in how male-dominated cultures represent women as *the other*. This approach to the study of gender is exemplified by Simone de Beauvoir, who examined the philosophical and political implications of woman as "other" to man. In some cases, as in the work of French feminists like Luce Irigaray or Hélène Cixous, the category of the *other* takes on a productive dimension and is the site of strategies for overcoming the relentless Manichaeism of sexism and patriarchy. There are few concepts that so thoroughly inhabit literary and cultural theory as the other and alterity, and this persistence testifies to the strong influence of poststructuralist and psychoanalytic theory.

P

Pater, Walter

DUSTIN FRIEDMAN

An art historian and Oxford professor, novelist, and critic, Walter Pater (1839–94) was one of the pre-eminent figures associated with the Victorian aesthetic movement. Famous for his stylistic elegance, his writings were a direct influence on subsequent generations of authors and critics (including, most notably, Oscar Wilde), and his theory of “critical impressionism” would play an important role in the development of literary modernism.

Born in the East London suburb of Stepney on August 4, 1839, Pater attended the King’s School, Canterbury, where he excelled in the study of classics and ecclesiastical history. Entering The Queen’s College, Oxford in 1858, Pater quickly distinguished himself as one of the university’s most promising undergraduates and, for a short time, came under the tutorship of Benjamin Jowett, the university reformer and highly prominent master of Balliol College. After graduating with a disappointing second-class degree in the classical *Literae Humaniores* course of study in 1862, Pater attempted to become ordained in the Church of England. He was frustrated in this ambition, however, when a former friend informed the Bishop of London of

Pater’s unorthodox theological opinions. Consequently, he remained at Oxford to coach students for exams and apply for various fellowships.

It was during this time, in 1864, that Pater became a member of the Old Mortality Society. Including among its members future luminaries such as A. C. Swinburne, John Addington Symonds, and T. H. Green, the intellectual outlook of the Old Mortality was notable for its synthesis of theological and political liberalism in the vein of Matthew Arnold with the German idealist philosophies of thinkers such as Kant, Fichte, and Hegel. The Society’s meetings were largely taken up with readings of essays written by members, many of which concerned authors who would become important touchstones for Pater’s early writings, such as Samuel Taylor Coleridge, Thomas Carlyle, and Robert Browning, as well as recent developments in the history of art. At one such meeting, Pater read the essay on “Subjective Immortality,” now lost, and “Diaphaneité,” published posthumously in *Miscellaneous Studies* (1895). The latter essay is Pater’s attempt to describe the sort of individual who could serve as a “basement” or fundamental “type” that would “be the regeneration of the world” (1920[1895]: 254). Scholars of Pater’s work concur that “Diaphaneité” helps one to

understand his evolving concept of the “aesthetic hero,” as well as his engagement with a tradition of British aesthetic criticism rooted in the writings of Coleridge and Carlyle in the early nineteenth century.

After gaining a Fellowship in Classics at Brasenose College in 1864 (due, in part, to his extensive knowledge of German philosophy, then *de rigueur* in Jowett’s Oxford), Pater began writing for publication, authoring three unsigned review articles for the *Westminster Review*. These early essays develop the unique theoretical outlook that would find its fullest expression in *Studies in the History of the Renaissance* (1873), commonly referred to simply as *The Renaissance*. In “Coleridge’s writings” (1866), Pater critiques the conservative, antimodern “struggle against the application of the relative spirit to moral and religious questions” as, indeed, a “struggle against the increasing life of the mind itself” (1866: 49), a comment that indicates Pater’s allegiance to evolutionary theories of social and scientific development advocated by the radical *Westminster*. “Winckelmann” (1867), which would eventually become the penultimate chapter of *The Renaissance*, is an account of the life of Johann Joachim Winckelmann, the late eighteenth-century German art historian famous for his critical studies of ancient Greek sculpture and for being an initiator of the Hellenic revival in German literary culture. This essay presents what is perhaps Pater’s most direct account of the qualities to be found in the ideal aesthetic critic and, in its description of Winckelmann’s “romantic, fervent friendships with young men” (1980[1873]: 152), it serves also as the most explicit statement of the homoerotic sensibility that would permeate Pater’s subsequent writings. The last quarter of the review essay “Poems of William Morris” (1868) would eventually become the “Conclusion” to *The Renaissance*, Pater’s most famous and enduring

piece, as well as an unofficial manifesto of the Victorian aesthetic movement, with its famous injunction “to burn always with this hard, gem-like flame” (1980[1873]: 189).

In the late 1860s, Pater began writing signed articles for the prestigious *Fortnightly Review* that would eventually form the core of *The Renaissance*, including “Notes on Leonardo da Vinci” (1869), containing his famous description of the *La Gioconda*, “A fragment on Sandro Botticelli” (1870), “Pico della Mirandola” ([sic]; 1871), and “The poetry of Michelangelo” (1871). In this period Pater began to win recognition from his colleagues at Oxford and from notable literary figures, including Dante Gabriel Rossetti and A. C. Swinburne. Yet when *The Renaissance* was published in 1873, the appearance of the supposedly hedonistic “Conclusion” under Pater’s imprimatur as Fellow of Brasenose College caused a considerable amount of controversy both in the press and in the pulpit, as well as among his Oxford colleagues.

The controversy surrounding *The Renaissance*, combined with Pater’s involvement in a homosexual scandal with undergraduate William Money Hardinge, had a negative effect on his career at the university, leading him to be passed over for the post of Proctor in 1874. The damage done to his reputation was only compounded by the publication of former Balliol undergraduate W. H. Mallock’s novel *The New Republic* (1876–7), a satire of notable Oxford figures that included a parody of Pater in the figure of the lascivious “Mr. Rose.” These personal attacks led him to withdraw his name from consideration for the Professorship of Poetry in 1877 and were a contributing factor to his unsuccessful bid to replace John Ruskin as Slade Professor of Fine Art in 1885.

At the same time, however, many aesthetes, artists, and critics of the younger generation were inspired by Pater’s radical

opinions on aesthetics, including his assertion that “the first step towards seeing one’s object as it really is, is to know one’s own impression as it really is, to discriminate it, to realise it distinctly,” and that “art comes to you proposing frankly to give nothing but the highest quality to your moments as they pass, and simply for those moments’ sake” (1980[1873]: xix, 190). This group of admirers included Oxonians such as Oscar Wilde, Lionel Johnson, and Richard Le Gallienne, London-based authors such as Arthur Symonds, George Moore, Vernon Lee, Mary Robinson, and Katherine Bradley and Edith Cooper (aunt and niece who wrote poetry under the name “Michael Field”), as well as his more distant acquaintance, American author Henry James. Pater’s growing fame among the aesthetic avant-garde, a desire to spend more time working on his fiction, and a strained relationship with Oxford led him to resign his tutorship in 1883, and to take a house in London in 1885.

After 1873, Pater stopped writing essays on Renaissance subject matter (with the exception of “The School of Giorgione,” published in the *Fortnightly* in 1877 and included in subsequent editions of *The Renaissance*) and turned his attention to critical essays on English literature (many of which appear in the 1889 volume *Appreciations, with an Essay on Style*) and Greek mythology, collected posthumously in *Greek Studies* (1895). He also began to direct much of his creative energy toward the writing of fiction, in the form of what he called “imaginary portraits.” Pater made the first ever published reference to this phrase in *Macmillan’s Magazine* in 1878, in his short story “Imaginary portraits 1: The child in the house.” This semiautobiographical study, which presents a young man’s recollections of his childhood, has often been discussed as an important pre-psychoanalytic account of the effects of

childhood experiences and impressions on adult psychological development.

In 1885, Pater published the novel *Marius the Epicurean: His Sensations and Ideas*, a work many believe to be his crowning achievement. Pater’s narrative, which he composed as an elaboration and defense of the “hedonistic” theories presented in *The Renaissance*, focuses on the development of an aesthetically inclined Roman youth’s subjectivity as he experiences various “sensations and ideas” elicited by the multitude of intellectual and philosophical systems proliferating during the reign of the emperor Marcus Aurelius. Pater draws on Epicurean and Hegelian philosophy, as well as current scientific theory, in order to draw explicit parallels between two times of transition: one, from a pagan to a Christian worldview, another from a largely agrarian to a fully industrialized economy. By focusing the narrative intensely through the perspective of one character’s “sensations and ideas,” *Marius the Epicurean* anticipates the modernist narrative technique of free indirect discourse, which would later characterize the works of Henry James, Virginia Woolf, and James Joyce.

Pater’s interest in historical fiction is evident in the stories he published in *Macmillan’s* which were eventually collected in the volume *Imaginary Portraits* (1887): “A prince of court-painters” (1885), “Sebastian van Storck” (1886), “Denys L’Auxerrois” (1886), and “Duke Carl of Rosenmold” (1887). These pieces are notable for their use of elaborate narrative framing devices that relate the “imaginary portraits” of the historical figures named in the title to the overall “spirit of the age” in which they lived. Pater would try his hand at novelistic fiction again in 1888, publishing the first five chapters of *Gaston de Latour* in *Macmillan’s*. Set in sixteenth-century France, *Gaston* was meant to be the second part of a trilogy beginning with *Marius*, but

remained unfinished at Pater's death. He continued to write essays on classical and contemporary subjects, as well as two strongly homoerotic short stories, the semi-autobiographical "Emerald Uthwart" (1892) in two parts in the *New Review*, and the mythological "Apollo in Picardy" (1893) in *Harper's New Monthly Magazine*. The last volume Pater published in his lifetime was *Plato and Platonism* (1893), a work based on a series of lectures that were greeted respectfully by classicists, but subsequently came to be valued for their literary rather than scholarly merits. Pater died, of pleurisy brought on by rheumatic fever, on July 30, 1894.

Pater's literary reputation reached its zenith in the decades immediately following his death, with William Butler Yeats declaring *Marius the Epicurean* to be "the only great prose in modern English" (Yeats 1999 [1955]: 235). Although he would continue to be respected by a select number of homoerotically inclined authors in the early twentieth century, such as W. Somerset Maugham, Rupert Brooke, and E. M. Forster, his literary reputation reached its nadir in the era of high modernism, mostly due to an anxious homophobia elicited by his association with the disgraced Oscar Wilde. T. S. Eliot said of Pater that he "propagated some confusion between life and art which is not wholly irresponsible for some untidy lives" (1932: 390). The modernist rejection of Pater also set the tone for academic scholarship in the first half of the twentieth century; thus, even as late as 1965, René Wellek could claim that "today Pater is under a cloud" (1957: 29). The rehabilitation of Pater's critical reputation began in the 1960s, when critics such as David DeLaura began to place him within the tradition of Victorian religious humanism. Pater's recuperation continued throughout the 1970s and 1980s, when major critics such as J. Hillis Miller made a compelling

case for his role as forerunner of deconstructionist criticism and Wolfgang Iser's phenomenological reassessment of Pater's critical practice was translated into English. By the 1990s, the advent of queer theory in literary studies made Pater a popular figure for exploring the development of a homoerotic literary sensibility in the late nineteenth century, at the very moment when modern categories of sexual identity were first coming into existence. Today Pater is understood to be one of the most important authors writing during the transitional period between nineteenth- and twentieth-century aesthetic and literary thought, as well as a key figure in the history of sexuality and gender.

Peirce, Charles Sanders

MICHAEL PETERS

Charles Sanders Peirce (1839–1914) was one of the foundational theorists of pragmatism and semiotics. He was born in Cambridge, Massachusetts, the son of Benjamin Peirce, a Harvard University mathematics professor who helped found the US Coast and Geodetic Survey and the Smithsonian Institute.

He attended Harvard, graduating in 1859 with a degree in philosophy, and in 1863 received a degree in chemistry. He took a position at the US Coast and Geodetic Survey, which he held until 1891; he taught mathematics intermittently at Harvard and, for a short period in the early 1880s, at Johns Hopkins University.

Most accounts describe a figure at odds with the academy, working outside it just as philosophy was becoming a profession in America. Some of his academic colleagues, however, like his friend William James, revered him and promoted his career. His position at Harvard was due in part to his friendship with James, from whose pragmatism Peirce sought to distinguish his own theory by calling it “pragmatism.” In Peirce's view, pragmatism was a historical construct driven by an implicit logic. His concern for methodology – for example, how hypotheses took shape – owed much to his background in mathematics and science. Moreover, his interest in the intersection of science and religion led to an awareness that belief could create methodologies for interpretation and standards for meaning. His understanding of the role of language in “fixing” beliefs helped to determine his understanding of logic, which he believed to be another name for semiotic, “the quasi-necessary, or formal, doctrine of signs” (1956[1940]: 98). He believed that a process of abstract observation of signs led to “statements, eminently fallible . . . as to what *must be* the characters of all signs used by a ‘scientific’ intelligence”; this “faculty . . . of abstractive observation is one which ordinary people perfectly recognize, but for which the theories of philosophers sometimes hardly leave room.” In this way, Peirce pursued, in the name of philosophy, a logic suited to “an intelligence capable of learning from experience” (98). Though his pragmatism focused on what “ordinary people” recognize, the erratic

nature of his publishing – indeed, much was left unpublished – and the interdisciplinary nature of his methodologies contributed to a pervasive sense of enigmatic intellectualism.

Through his study of statistics, quantification theory, and set theory, Peirce made profound advances in logic and mathematics at the same time as the German mathematician Richard Dedekind was making advances in abstract algebra and algebraic number theory and the Russian mathematician Georg Cantor was developing the principles of set theory. The combination of language theory and mathematical logic led Peirce to construct a statistical, quantifiable system that prefigured information theory and cybernetics. From the morphic framework of Peirce's inferential logic, innovative notions of growth, progression, and development arose. He believed that language possessed its own logic and was fundamentally mathematical in its ability to determine the condition of things, particularly the comprehension of event perceptions. His investigation of semiotics (the study of signs and their functions) not only included written language, but elements of the material world and sounds – all the physical indices in one's environment. This conception of semiotics was embedded in his theory of logic, which was the means by which Peirce understood not only the function of signs, but equally important, the effects of logic on individuals and, by extension, the greater community of users that participated in the ongoing creation of meaning and the processes by which beliefs become habit.

Peirce's understanding of language and its adherence to logic means that *language is indexical*. Signs establish relations – the probable connections marking “the junction between two portions of experience”: “Thus a tremendous thunderbolt indicates that *something* considerable happened,

though we may not know precisely what the event was” (Peirce 1956[1940]: 109). Signs accomplish this relation-making process through a system of relations between the three general sign-types: “icon,” “index,” and “symbol.” In “A sketch of logical critics,” Peirce writes:

I had observed that the most frequently useful division of signs is by trichotomy into firstly Likeness, or, as I prefer to say, *Icons*, which serve to represent their objects only in so far as they resemble them in themselves; secondly, *Indices*, which represent their objects independently of any resemblance to them, only by virtue of real connections with them, and thirdly, *Symbols*, which represent their objects, independently alike of any resemblance or any real connection, because dispositions or factitious habits of their interpreters insure their being so understood. Of sensuous qualities and, indeed, of Feelings generally, Icons are the sole possible *ultimate* signs. (1998b: 459–60)

The triadic division, by refusing to allow for syntheses and equivalencies associated with Hegelian dialectics and traditional syllogistic logic, opened up the possibilities for signification. Peirce's syllogisms help to explain the possibilities of grouping and redistribution, the logical mechanisms by which thoughts develop and take new shapes. It is this “room” for possibilities – indeed, for the infinite – that makes possible the generation of thought along a continuum which Peirce called “synechism,” an inferential process determined by the structures of mathematical and semiotic logic.

For Peirce, the possibility for growth extends well beyond the individual mind, for “A symbol, once in being, spreads among the peoples. In use and experience, its meaning grows” (1956[1940]: 115). Clearly, his model of the potential development of the sign was not the static one of classical analysis; the idea of change,

specifically social change, lies at the heart of Peircean logic. "Logic," he wrote, "is rooted in the social principle" (1998a[1923]: 73). John Dewey, the American philosopher and psychologist, described Peirce's notion of the potential for change in logic as "creative evolution" (Peirce 1998a[1923]: xxv). This conception of the sign and signification contrasts dramatically with the structural theory of signifier/signified relations in the work of the Swiss linguist Ferdinand de Saussure. To some degree, Peircean semiotics looks forward to poststructuralist theories of language, particularly with respect to the vexed question of the relation between subjectivity and language. Language is quantifiable, statistical material, capable of shaping as much as being shaped by human social experience. Communication is more than a static, performative iteration, Peirce insists; language requires users, who are caught up in the endless chain of cause and effect. Only habit can arrest the possibly infinite acts of interpretation – that is, of sign making – and the creation of meaning.

According to Peirce's semiotic logic, interpretation is a process of argumentation structured along the lines of inference. Inferences – deduced, abducted, induced – were abstractions by which meanings and beliefs were created. He argued that "consciousness, the entire phenomenal manifestation of mind, is a sign developing according to the laws of inference" (1956[1940]: 248). With his theory of mind in which the "phenomenal manifestation of a substance is the substance" (248) – a manifestation governed by the laws of inference – Peirce moved beyond deductive and analytic reasoning toward a form of *synthetic inference*. His revision of Immanuel Kant's transcendental idealism, which placed "substance" outside the realm of "phenomenal manifestations" in the mind, coupled with adjustments to Boolean algebra and logic, enabled him to fashion an inference-producing logic

by way of a tangible, statistical, and quantifiable method of knowing. Unlike classical analysis, synthetic inference could activate growth. He called the awareness of this mode of inference "reflexional experience," which accounted for the indexical, communal nature of language use. It was the process of making an assertion in terms of "abstractive observation." The inherent growth capability of an open-ended logic of abstraction created an awareness of dynamism by the generation of "chance," which for Peirce meant the probabilities by which one could aim at an ideal.

Peirce's thought had a profound effect on American philosophy, especially in the pragmatic tradition of William James, Josiah Royce, John Dewey, and George Herbert Mead. He also influenced major figures in British analytic philosophy, including Bertrand Russell and Alfred North Whitehead. Roman Jakobson, who began to study Peirce when he arrived in the US in 1941, mediated the Saussurean and Peircean strands of semiotics, which guaranteed Peirce's longstanding presence in late twentieth-century literary theory. Finally, in the later twentieth century, we see Peircean ideas behind the cybernetics of Norbert Weiner and others in a process of "abstractive observation" that accounts for both logical structure and phenomenal change.

Phenomenology

DONALD A. LANDES

Phenomenology is a philosophical tradition that begins with the work of Edmund Husserl and has produced some of the most important thinkers of the twentieth century, including Martin Heidegger, Jean-Paul Sartre, Maurice Merleau-Ponty, and Paul

Ricoeur. Taken in its literal sense, “phenomenology” names the science of phenomena, just as “biology” names the science of life. In practice, however, phenomenology describes our experience of things as they appear to us, without allowing our presuppositions about the world to shape that description. It is the radical attempt to get “back to the things themselves” (*zurück zu den Sachen selbst*); but the subject is a key component in this process, for phenomena appear *to* a subject. Phenomenological description, then, differs from a subjective description of inner feelings and from a scientific description of the objective world. Thus phenomenology is at the crossroads between subjectivity and objectivity, between passivity and activity, between idealism and empiricism.

ORIGINS OF PHENOMENOLOGICAL METHOD

Phenomenology is often characterized as a philosophical method rather than a doctrine. Beginning with the work of Husserl, it has given rise to a wide range of concepts and a number of internal divisions, something Husserl foreshadowed in his recognition of the “infinite tasks” of description demanded by the appearances of “the things themselves.” An account of phenomenology demands an exploration of the evolution of the phenomenological method – particularly its openness to rigorous description and interdisciplinary perspective – and its major figures and concepts.

The term “phenomenology” was employed prior to Husserl – most famously (though in quite a different sense) in Hegel’s *Phenomenology of Spirit* (1979[1807]) – but the use that best foreshadows his own can be found in the work of his teacher, Franz Clemens von Brentano. By attempting to place the Scholastic Aristotelian tradition

into dialogue with modern psychology, Brentano suggests that philosophy could be considered a “rigorous science” (a phrase Husserl would embrace) if it carefully restricted itself to the self-evidence of consciousness. In other words, Brentano brackets “external” explanations of the underlying causal structures of consciousness, leaving such an investigation to the empirical sciences, in favor of a pure description of experience using only the resources of the phenomena in their appearing to consciousness.

In *Psychology from an Empirical Standpoint* (1995b[1874]), Brentano distinguishes between mental and physical phenomena by establishing a notion of “intentionality.” For Brentano, a mental phenomenon always includes the “intentional inexistence” of its object, which means that we find in every mental act a “reference to a content” or, at the very least, a “direction toward an object.” There is no purely active consciousness, and no merely receptive consciousness; all consciousness is an act of *intending* an object and thus “includes” the intended object. All “loving” aims at something that is loved; all “desiring” involves something being desired. The objective existence of this “loved” or “desired” thing is not the concern of descriptive psychology; whether or not this something exists in the real world, its appearing to consciousness cannot be questioned. The phenomenon has, at the very least, an “immanent objectivity.” Moreover, consciousness is always a form of self-consciousness: that is, I am *conscious of being conscious of something*. This allows Brentano to avoid the need for “introspection” in order to understand consciousness; no additional faculties of mind have to be posited to ground empirical psychology. Although particular mental phenomena are resolutely subjective, the description of prevailing types of acts and the structure of the appear-

ing objects of these acts can provide the materials, according to Brentano, for a sufficiently rigorous science of phenomena. In his lectures between 1887 and 1891, later published as *Descriptive Psychology* (1995a [1988]), he argues that such a science is logically prior to empirical psychology.

Notwithstanding the foundational importance of Brentano for phenomenology, Husserl is undoubtedly its center of gravity. His production of written material was indeed massive – there are more than 40,000 pages in the *Husserl Archives* in Leuven, Belgium. Husserl self-consciously fashioned himself as the authoritative founder of the movement and conceived of his students as applying his method to various “regional ontologies” of human experience. He felt betrayed when these applications strayed from his perceived control or influence. Paul Ricoeur is correct to conclude that, “phenomenology is the sum of Husserl’s work and the heresies issuing from it” (1967: 4). Understanding the evolution of phenomenology in Husserl’s thought is thus key to understanding phenomenology.

Husserl’s first book, *Philosophy of Arithmetic* (2003[1891]), which predates his properly phenomenological writings, was scathingly critiqued by Gottlob Frege, a founding figure in analytic philosophy. Frege accused Husserl of “psychologism,” the name given to theories in logic or mathematics in which the laws of that discipline are explained by psychological or neurological facts. Although not explicitly acknowledging Frege’s critique, Husserl’s self-proclaimed “breakthrough” work in phenomenological method – his seminal two-volume work entitled *Logical Investigations* (2001[1900/01]) – begins with a long “prolegomena” attacking psychologism. Husserl argues that if logical laws are derived from empirical observation of how individuals actually think, then the status of these laws will always remain merely probable,

whereas the laws of logic are not merely probably true, but are rather absolute truths with a priori validity. Logic, argues Husserl, is normative; it tells us how we *ought* to think, not how we *do* think. Logic is, therefore, the science of the very possibility of valid knowledge in any empirical science, including psychology – that is, logic is the “science of science,” a claim Husserl would defend throughout his career, returning to it some 30 years later in *Formal and Transcendental Logic* (1969[1929]).

Phenomenology is often (correctly) associated with the study of perception. Husserl’s *Logical Investigations* not only begins with a reflection on logic, but also represents a detailed study in the philosophy of language. Following the “prolegomena,” *Logical Investigations* consists of six interconnected studies of various questions or concepts requiring phenomenological grounding in order to secure the possibility of a “pure phenomenology of the experiences of thinking and knowing” (2001[1900/01], 1: 166). Since all thought is expressed in language, Husserl begins by clarifying the concepts of expression and meaning. For Husserl, an expression is meaningful when accompanied by an intentional act that brings it to life. In *Investigations II* through *IV*, Husserl studies the logical concepts of parts and wholes, individuals and species, and the possibility of a formal and even universal grammar. He then explores the fundamental notion of “intentionality,” which he felt remained ambiguous in Brentano’s use of the term “immanent objectivity” and in his distinction between physical and mental phenomena. For Husserl, the intended object of a mental act is never “contained” in consciousness. To say that consciousness is always consciousness of something means that it is always pointing toward something that *transcends* it. I do not see pure color sensations in my mind, I see a colored object; I never hear pure

sounds, but rather a singer’s voice, a train in the distance, and so forth. Thus Husserl’s early account of intentionality is a subtle form of realism, that is, a commitment to a real world beyond consciousness. By abstracting the essences of any phenomena whatever from the particular acts, phenomenological description gives access not to a haphazard collection of subjective feelings, judgments, or perceptions, but rather to an a priori science of the structure of feelings, judgments, and perceptions as such.

TRANSCENDENTAL PHENOMENOLOGY

If *Logical Investigations* was his “break-through,” Husserl’s mature phenomenological approach crystallized in his book *Ideas Pertaining to a Pure Phenomenology and to a Phenomenological Philosophy* (1998 [1913], *Ideas I*). This text introduced a shift from a descriptive psychology and underlying realism toward an idealist theory of subjectivity, including a transcendental ego in the tradition of Kant and Descartes. This shift began shortly after the publication of the *Logical Investigations*, with Husserl’s 1905 lectures on the experience of time. The present, argues Husserl, is not a punctual moment supplemented by memory images. A temporal experience involves what he calls the “retentional and protentional horizons.” Consider a temporal object, such as a melody. According to the traditional account, the listener hears the present tone of the melody and the past notes are stored in memory. But if the listener tried to remember the melody (all the notes) in a single present moment, the result would be a chord, not a melody. Husserl argues that even hearing a note requires some temporal thickness, since each note spans many punctual “now-points.” Each moment sinks into a retentional field. This field is neither actually

present nor contained in memory; it is present *as pushed back*. As a second note arrives and subsequently sinks into the retentional field, the first note is modified and pushed back again. The sinking back of the retentional field is mirrored through the protended direction of anticipation, a field itself fulfilled or disappointed by the arrival of subsequent notes. Without retention, there would be no melody as such; without protention, every new note would be an utter surprise, appearing as if from nowhere. Insofar as we perceive a melody, we must be able to hold it in consciousness in its pushed back form, and there must be something like a transcendental ego that guarantees the unity and place of this temporal consciousness.

In *Ideas I*, Husserl solidifies this shift by introducing the “phenomenological reduction” or *epochē* (Greek, “cessation”) and the *noesis/noema* distinction (Greek, “act of thought” and “object of thought”). Phenomenological method, he argues, requires a shift in attitude or focus. In everyday life, or scientific investigation, consciousness is swept up in the “natural” or “natural theoretical” attitude. We spend our everyday life focused on our activities and attending to a world full of objects that we believe exist in themselves, *out there*. Phenomenology, seeking only the *appearing* of phenomena as such, requires a radical alteration of this natural attitude, namely, an *epochē* (bracketing, excluding, or “putting out of action”) of all theories and beliefs that we have about the world. Husserl names the commitment to rely only on the pure appearances the “principle of all principles,” and suggests that we thereby reach a transcendently purified realm of consciousness. Every conscious act involves a *noetic/noematic* correlation, that is, an act of intending and an object intended. From within the rigor of the reduction, particular *noema* present a certain “essence,” or *eidos*, and so the resulting

description of reduced *noema* can now be clearly seen to provide a “transcendental clue” to the activities of the transcendental subject (or consciousness) that constitutes this and any possible object.

Although Husserl never rescinded the transcendental formulations of *Ideas I*, even extending transcendental phenomenology in his *Cartesian Meditations* (1999 [1929]) to include the experience of intersubjectivity, many of his subsequent analyses attempted to take into account additional aspects of our experience or offered different entries into phenomenological thinking. If the description so far represents a “static” phenomenology that attempts to establish the essential structures of intentionality, Husserl increasingly saw the need to include genetic aspects to phenomenology, such as embodiment, habitualities, history, and a rich account of the life-world (*Lebenswelt*). The second volume of *Ideas*, published posthumously, contains extensive accounts of constitution (usually the activity of the transcendental ego), but it also introduces the lived body as an essential component in that constitution. Husserl distinguishes between a material body (*Körper*) and a living, animate body (*Leib*). In *Ideas II*, the living body becomes the center of orientation, the bearer of localized sensations, and the source of expressive action. Objects are organized in relation to the body, and the body has a peculiar role of both touching and being touched, possessing *Empfindnisse* (roughly, “feelings” or “sensings”). As the oriented acting body, we experience our body as an “I can,” a source of projects and capabilities.

Genetic phenomenology also includes social and historical aspects constituting our experience and the recognition of different entrances into phenomenological reflection. Perhaps the most strikingly different entry is Husserl’s book, *The Crisis of the European Sciences and Transcendental*

Phenomenology (1970[1936]). This study explicitly breaks with the transcendental or Cartesian approaches, presenting instead a teleological reading of history as genuine phenomenological reflection. Husserl argues that even scientific truths exist, in some sense, historically. The “crisis” of the title is the isolation of scientific inquiry from a vital significance for our lives, which occurs when causal or empirical methods contaminate the human sciences (when the error of psychologism is repeated in history, sociology, etc.). To overcome this crisis, philosophy must reach a deeper understanding of the life-world as the source of all human activity, including science. Pursuing this project, phenomenologists are the “functionaries of mankind” (1970[1954]: 17), called to a teleological project of systematic self-understanding of the kind that an early Husserl decried in Hegel. It remains an important question whether the inclusion of the life-world and history pose problems for the phenomenological method as conceived in *Ideas I*.

HEIDEGGER’S PHENOMENOLOGICAL ONTOLOGY

Among Husserl’s many brilliant students, Martin Heidegger stands above the rest. In their early relationship, beginning in 1913, Heidegger was an enthusiastic phenomenologist and Husserl was eager to engage in *sym-philosophiein* (philosophizing together) with this “most valuable philosophical co-worker” (Kisiel 1993: 75). Husserl explicitly conceived of Heidegger as his natural successor as leader of the phenomenological movement. Yet despite its dedication to Husserl, the publication of Heidegger’s *Being and Time* (2001a [1927]) represented an important shift away from Husserlian transcendental phenomenology and eventually led to

a definitive break between the two thinkers. Heidegger’s discovery of phenomenological ontology makes him a thinker of the first order, while his falling out with Husserl, his well-documented embrace of the ideology and rhetoric of National Socialism, and his silence on its horrific consequences, make him a notorious character in the history of philosophy.

In *Being and Time*, phenomenological ontology is structured around a single question, the *Seinsfrage*, or the “question of Being.” The history of metaphysics, argues Heidegger, has been a progressive forgetting of the *Seinsfrage* to the point that we no longer recognize this forgetting. Reopening the question of Being requires recognition of what Heidegger calls the ontic and ontological priority of *Dasein*. The ontic concerns beings (things existing in the world), while the ontological concerns Being or existence as such (“Being” is often capitalized when referring to the ontological dimension). *Dasein*, which literally means “being-there,” is the name Heidegger gives to an ontic being in the world (such as a human) who is concerned with or questions its own ontological Being. *Dasein*, understood as the place of this ontic/ontological difference, supplants Husserl’s notion of the transcendental subject. *Dasein* is always involved in the world as a factual opening onto that which transcends it, and so Heidegger argues that the analysis of *Dasein* must focus on its primary mode of existence, namely, its *average everydayness*, something Husserl would exclude, or bracket, as the natural attitude.

For Heidegger, “phenomenology” does not begin with Husserl; he sees a method of questioning the “things themselves” already present in ancient Greek thought. He interprets the Greek *phainomenon* to indicate anything that can or does *show* or *manifest itself in itself*, something the Greeks associated with beings (*onta*) that show

themselves in some mode. They do not act as signs pointing toward something else, such as an essence. The other root of the term “phenomenology,” *logos*, usually translated as “language” or “discourse,” is taken by Heidegger to emphasize the function of *making manifest*. Language may have a material side (sounds, printed letters), but its primary function is to make something appear to someone. Combining these roots, phenomenology would let that which shows itself or shines forth be seen for itself; hence the imperative: “back to the things themselves!” This ontological understanding of phenomenology does not focus on the structures of subjectivity, but rather on removing that which conceals the showing forth of phenomena, and “truth” is thus the process of “unconcealment,” what the Greeks called *alētheia*.

As suggested by the title *Being and Time*, Heidegger identifies “time” as a fundamental manner in which *Dasein* understands itself. Seeming to shift some of Husserl’s insights on “temporality” to an ontological register, Heidegger argues that *Dasein* is a temporal structure. *Dasein* is thrown-projection, that is, *Dasein* finds itself thrown into a meaningful world and history that it did not create or choose, and it is projected toward its possibilities for being. Clock-time, for Heidegger, is derived from this fundamental temporal opening of *Dasein*. Thus *Dasein* is its history, and the layers of history sediment in such a way that *Dasein* forgets itself in its historical possibilities, beginning with the forgetting of the *Seinsfrage* itself. Heidegger proposes a “destructuring” of the layers of metaphysics shaping *Dasein*’s self-understanding, a precursor to Jacques Derrida’s notion of “deconstruction.”

The first division of *Being and Time* is an extended exploration of one of Heidegger’s key contributions to the history of philosophy, namely, his notion of “being-in-the-world” (*In-der-Welt-Sein*). For Heidegger,

the things in our world appear structured by our involvements with them. A hammer, to use his example, appears as “ready-to-hand” for the project of nailing a board, or rather, it disappears insofar as we *use* it for a task. If the hammer breaks, or is too small for the job, the hammer emerges from its readiness-to-hand and is presented as “present-to-hand.” This presence, however, is derivative to the primordial world of involvements, and the world of involvements is not a “solipsistic” world, but a world of “being-with” others, or *Mitsein*. Even if the fundamental structure of *Dasein* is care or concern for one’s projects and for others, this world of involvements remains anonymous. Heidegger thus characterizes the average everydayness as “the They” or “One” (*das Man*), as in the phrase “one does not cry in public,” and the average everydayness of *Dasein* is the way this anonymous though historically determined “one” does things or sees things at a particular historical moment.

Heidegger describes the existential structure of *Dasein* as thrown into the being-in-the-world of “the They” and as projected toward its own possibilities as *Verfallen*, literally “fallen,” or “falling prey.” This average everyday Being of *Dasein* is characterized as “inauthentic.” Existing authentically, however, is not a rejection of this mode of *Dasein*; indeed, authenticity is predicated upon a more primordial inauthenticity. So, as a thrown-projection, *Dasein* exists toward its possibilities for being, it “cares” about its possibilities, it is fundamentally *anxious*. In the second division of *Being and Time*, Heidegger argues that *Dasein*, as projected toward its possibilities, is thereby fundamentally projected toward its own death as the possibility of its own impossibility. Authentic existence, then, is the resolute embracing of one’s own factual and historical Being.

As Heidegger's thought evolved away from phenomenology in his later work, he shifted away from the analysis of *Dasein* toward a more fundamental thinking of Being and Language (in itself) as the house of Being. Thus it is arguable whether his own "literary criticism," such as his readings of Hölderlin's poetry, in which he focuses on the work of poetry as an unveiling of "Being," "Earth," and the "Sacred," is more metaphysical than properly "phenomenological."

HERMENEUTICAL PHENOMENOLOGY

Hermeneutics is the science of interpretation, emerging primarily from the work of Friedrich Schleiermacher and Wilhelm Dilthey. Although Dilthey himself saw Husserl's *Logical Investigations* as an inspiration for his later work on the interpretation of lived experience, it is Heidegger's *Being and Time* that first establishes an "ontological" branch of hermeneutics, known as "hermeneutical phenomenology." As a hermeneutic of *Dasein*, or of "facticity," *Being and Time* argues that *Dasein*, as being-in-the-world, must have a grip on that world, that is, an unarticulated *understanding* of the world. Heidegger characterizes this grip as the "fore-having," "fore-sight," and "fore-conception" of the world that is implied in *Dasein*'s being as fundamentally an understanding of its own possibilities. This practical or prereflective hold calls for "interpretation." By interpreting its own being-in-the-world, *Dasein* articulates its own *meaning*. The traditional "hermeneutic circle" – the fact that any interpretation involves both an understanding of the part of the text in light of the whole and *simultaneously* an understanding of the whole text in light of its parts – is transferred to *Dasein*'s fundamental situation as being-

in-the-world: to understand the world, we must understand *Dasein*; to understand *Dasein*, we must understand the world. Hermeneutics is thus the study of the ontic/ontological difference as a nonvicious circle that does not, like a circular argument in logic, commit a fallacy or reduce to absurdity. The ontological-hermeneutical task is the direct result of Heidegger's understanding of the structure of intentionality. In his later works, Heidegger's focus on the relation of language to Being continues the spirit, if not the methodology, of hermeneutical phenomenology.

Hermeneutical phenomenology is pursued by Heidegger's student, Hans-Georg Gadamer, particularly in his book *Truth and Method* (1989[1960]). Accepting Heidegger's account of *Dasein* as thrown-projection, Gadamer argues that interpretation always involves the prejudices contained in the language and tradition into which we find ourselves thrown. Attempting to rehabilitate the concept of "prejudice" (and also "authority," "tradition," and "taste"), Gadamer invokes the concept of *Bildung* (cultural education and formation) and *phronēsis* (the Greek concept of practical wisdom). The hermeneutic circle becomes, for Gadamer, a certain type of play between the text and that which we bring with us, and a proper interpretation results in a "fusion of horizons." Since human experience is always mediated through language, hermeneutics offers a general theory of understanding human meaning. Paul Ricoeur continues Heidegger's hermeneutical phenomenology, although he is also influenced by Husserlian phenomenology, existentialism, structuralism, and psychoanalysis. Ricoeur, focusing on the question of "self-understanding" given the inseparable nature of the material and psychical aspects of human being, develops a phenomenologically inspired "hermeneutic anthro-

pology,” arguing that all self-understanding must involve an understanding of the world of that experience. Ricoeur develops concepts of action and understanding through the notions of temporality, discourse, narrativity, and self.

EXISTENTIAL PHENOMENOLOGY

Existentialism refers to the philosophy of existence that targets traditional “essentialist” metaphysical theories of human nature. While Husserl’s transcendental phenomenology appears decidedly not existentialist, Heidegger’s existential analytic of *Dasein* through the *Seinsfrage* is a key moment in this tradition. The seemingly paradoxical term “existential phenomenology” refers primarily to the work of Jean-Paul Sartre, Maurice Merleau-Ponty, and Simone de Beauvoir. It involves the attempt to bring phenomenological description, even more or less Husserlian approaches, to bear on the contingency of human nature and experience.

For Sartre, existentialism begins with the claim that “existence precedes essence.” In other words, there is no eternal human essence. Individuals create their essence through actions and decisions in the world, and so existentialism must come to grips with notions such as the absurd, nothingness, freedom, and angst. In his book *The Transcendence of the Ego* (1957 [1937]), Sartre both accepts the basic structure of intentionality and rejects Husserl’s shift to include a “transcendental ego.” For Sartre, the “ego” is an object in the world, a “relative existent,” available to consciousness like any object. Sartre’s epic “phenomenological ontology,” entitled *Being and Nothingness* (2003 [1943]), springs from his critique of the transcendental ego in Husserl and his understanding of *Dasein* in Heidegger. Sartre divides “being” into two essential types:

“being-in-itself” (*être-en-soi*), which is basically consciousness, and “being-for-itself” (*être-pour-soi*), encompassing all nonconscious things. Humans are ambiguous because we are in both categories, both *factual* (in-itself) and *transcendent* (for-itself). Sartre also saw the importance of human existence “for-others” (*être-pour-autrui*), which ensures the social structure of human existence. Consciousness is, then, *no-thing*; it exists as the infinite negation that allows the space for the actual appearing of the things that I am not. As such, consciousness is absolutely empty and absolutely free. With this freedom, we can decide to take up our Being authentically, or inauthentically to “play a role” determined from the outside, that is, to exist in “bad faith.” Sartre’s own contribution to literary criticism, *What is Literature?* (1988[1947]), is more of an existential intervention than a phenomenological one. Sartre argues that writers “use” words to perform an *action*, and thus must take responsibility for their response to their historical and cultural situation, and he urges the writer of *littérature engagée* to present human nature as something to be established through every human action.

Merleau-Ponty’s particular approach to existential phenomenology – which he contrasts with the “*penser de survol*” (high-altitude thinking), his term for objective or transcendental philosophy – involves a rigorous account of the role of embodiment in the constitution of our experience and situated freedom. In *Phenomenology of Perception* (2002[1945]), he explores the coimplication of the subject and the object, contrary to Sartre’s rigid division between the two. Drawing on concepts from Husserl’s late work, such as the double sensations of the lived body, the role of language in institution and tradition, and the life-world, Merleau-Ponty develops an existential and phenomenological account of human existence as fundamentally

ambiguous: both subject *and* object, nature *and* culture, determined *and* free. For Merleau-Ponty, we exist in dialogue with the world and with others through a pre-predicative system of orientation and gesture, culminating in language and culture. Thus, given that we are essentially embodied, Husserl's complete phenomenological reduction is impossible. There is no pure constituting subject. The real world, argues Merleau-Ponty, is a "closely woven fabric," and the subject emerges from this world (2002[1945]: xi). The lived body *inhabits* space, is the center of spatial orientation, the source of action, and the place of expression and situated freedom: "Our freedom does not destroy our situation, but gears itself to it" (2002[1945]: 514). Merleau-Ponty's work after *Phenomenology of Perception* continued to interrogate the possibility of this intertwining of the subject with the world, culminating in a phenomenologically inspired ontology of the flesh of the world in his posthumously published *The Visible and the Invisible* (1968 [1964]). The role of expression and language remains central in his late work, especially in *The Prose of the World* (1973[1969]), a text intended as a response to Sartre's *What is Literature?*

Simone de Beauvoir also explores an existential form of phenomenological description and critique. In *The Second Sex* (1989[1949]), she argues that the attempt to ground existentialism as a universal discourse obscures the radical individuality of each person. Her writings always demonstrate a phenomenological sensitivity to lived experience and the irreducible contribution of social structures in the formation of that experience. Beauvoir also introduces the sex/gender distinction with her famous claim that "one is not born but rather becomes a woman" (1989[1949]: 267). Such a position perhaps offers something of a reconciliation between the absolute existential freedom of Sartre's

phenomenological existentialism and the situated embodiment of Merleau-Ponty's existential phenomenology, and is a key development in feminist philosophy.

PHENOMENOLOGY AND LITERARY THEORY

By turning the phenomenological gaze toward questions in hermeneutics and existentialism or toward literary and cultural objects, phenomenologists have made significant contributions in many fields, including aesthetics and literary and cultural studies. Best known for his reflections in *The Literary Work of Art* (1931), Polish philosopher Roman Ingarden resisted Husserl's transcendental turn, preferring to continue to work within the realist structure of *Logical Investigations*. He conceived of four strata of being: absolute being (God), ideal being (ideas, numbers), real being (temporal things), and purely intentional being (language, aesthetic objects). For Ingarden, the examination of the literary work of art as a paradigm of the fourth layer, a "purely intentional object," was a precursor to establishing his general ontology. The literary work, he argues, is ontologically dependent upon the creative activity of the author who configures the physical and linguistic materials into a work of art and the reader who accomplishes or "concretizes" the work of art into an aesthetic object. The distinction between the (physical) "work of art" and the "aesthetic object" as an intentional object was embraced by Mikel Dufrenne in his book *The Phenomenology of Aesthetic Experience* (1973[1953]), although Dufrenne rejected the category of "purely intentional objects." Unlike Ingarden, Dufrenne focused exclusively on phenomenological aesthetics, and thus chose to shift the analysis from the creative (*noetic*) act of the author to the

perspective of the reader or spectator. This gave Dufrenne a more direct access to the aesthetic object itself, and also avoided “psychologism,” which in aesthetics consists in a conflation of the psychological fact of the author’s subjective intention with the *meaning* of the artwork. The phenomenological tradition outlined above, along with Ingarden and Dufrenne, are important influences on the “Geneva School” of literary theory, and particularly on the work of Georges Poulet. Poulet attempts to “bracket” his contribution to a reading in order to allow the *cogito* of the writer (the one envoiced in the text, not the historical person) to shine through. In addition, both Husserlian and Heideggerian phenomenology, particularly as practiced by Gadamer and Ricoeur, influenced literary theorists, such as members of the “Constance School,” as well as developments in Reader-Response Studies and Reception Theory.

Point of View/Focalization

HEATHER M. STEFFEN

Point of view, in literary studies, describes the position from which a narrative is told; it is the vantage point from which its events, situations, and characters are presented to the reader. Always a concern for fiction writers, point of view has been a major topic for literary critics since the early twentieth century when Henry James wrote about it in a series of prefaces to his novels (later collected as *The Art of the Novel* [1934]) and Percy Lubbock elaborated on it in *The Craft of Fiction* (1921). Lubbock, following James, called point of view the "relation in which the narrator stands to the story" (1955 [1921]: 251). Point of view remained a popular and vital element of criticism through the 1970s, in no small measure due to the centrality of the concept in Wayne Booth's *Rhetoric of Fiction* (1961). By the late 1960s, in his *Figures*, Gérard Genette had introduced the concept of focalization, which is related to point of view, but makes a clear distinction between the position of the narrator (the point from which the story is told) and the position from which events of the narrative can be viewed. A single text may contain several points of view or kinds of focalization at different moments in the narrative.

In presenting a narrative to readers, an author may use one or more of the three points of view: first, second, and third person. One can identify a story's point of view by taking note of the pronouns used by the narrator. A first-person point of view is

indicated by the use of “I.” It gives the sense that the reader is being told firsthand about the story’s events by someone who has taken part or is taking part in them. While a first-person point of view can make a story seem more immediate, it only allows the reader access to the emotions, thoughts, and experiences of one character in the story. A good example of first-person narrative is Mark Twain’s *The Adventures of Huckleberry Finn* (1885), which is told from Huck’s point of view. This technique allows Twain to convey Huck’s experiences in the voice and words of a boy on a grand adventure, adding to the excitement of the tale while at the same time showing how Huck learns to think differently as events unfold. Autobiographies commonly employ a first-person narrator.

Third-person point of view is marked by the narrator’s use of the pronouns “he,” “she,” “it,” or “they.” It presents a much wider view of the story’s events than first-person narration. There are two major kinds of third-person narration: omniscient and limited. A story with an omniscient third-person point of view is related from the position of someone who has total access to all events related to the story, as well as the ability to go inside the minds of characters to report their thoughts and emotions. Omniscient narrators are typically not characters in the narrative, as their privileged access to others’ minds would make this implausible. An interpretation of a story with an omniscient third-person point of view may also consider whether the narrator is intrusive or unintrusive. An intrusive narrator comments on and evaluates the events, situations, and characters as he or she relates the story. Now felt to be a rather old-fashioned technique, intrusive narrators were frequently employed by Jane Austen, Charles Dickens, Fyodor Dostoevsky, and Leo Tolstoy. In contrast, an unintrusive narrator (sometimes called an objective

narrator), like the one in Gustave Flaubert’s *Madame Bovary* (1857), only reports on events, situations, and characters’ actions and thoughts without commenting on them. Extreme instances, in which the narrator’s point of view does not include the characters’ inner lives, can be found in Ernest Hemingway’s short stories (“The killers” and “Hills like white elephants,” for instance) and in Alain Robbe-Grillet’s novel *Jealousy* (1957).

Limited point of view has produced two variations that were of special interest to late nineteenth- and twentieth-century novelists: first, “free indirect style,” in which a third-person narrator takes on the tonalities, word choices, and other language markers of a particular character, and thus blurs the boundary between narrator and character. James Joyce’s *Portrait of the Artist as a Young Man* (1916) uses free indirect style to represent the subtle changes in the protagonist’s thought process as he matures. It is central to Monika Fludernick’s *The Fictions of Language and the Languages of Fiction* (1993), a study of point of view and the discursive means of representing it. Fludernick follows in a tradition of narratology pioneered by Dorrit Cohn in *Transparent Minds* (1978), a groundbreaking study of the representation of thought, consciousness, and speech in narrative fiction. A second variation of limited point of view is “stream of consciousness” narration, a radical version of free indirect style in which the boundary between character and narrator is effaced altogether. Stream of consciousness narration represents the flow of thought and emotion as experienced by a character. Thus the events of the narrative are only related as they filter into and impact this flow of thought, giving a radical sense of immediacy to the narrative and often demanding a fragmented or aleatory presentation of events. This device was particularly favored by modernist authors and is found in the

work of William Faulkner, James Joyce, and Virginia Woolf, among others.

The least common point of view is second person (“you”). Second-person point of view is used to draw a reader into the story as the protagonist (main character); the meaning of the story thus depends on the tension between the reader’s own identity and the identity associated with the character (“you”) that the reader becomes by virtue of the narrator, who alone knows what events, situations, emotions and thoughts will be attributed to “you” during the story. Sustained use of second-person narration calls attention to the act of narration itself, and for this reason is found in postmodern novels such as Italo Calvino’s *If on a Winter’s Night a Traveler* (1979) and Jay McInerney’s *Bright Lights, Big City* (1984).

An alternate term for point of view is “focus of narration.” Focus of narration was introduced by Cleanth Brooks and Robert Penn Warren in their 1943 textbook *Understanding Fiction*. They identify four types of narration: (1) *first person*, in which a person tells his or her own story; (2) *first person observer*, in which a first-person narrator relates a story he or she has observed or heard; (3) *author observer*, which is equivalent to unintrusive third-person narrator; and (4) *omniscient author*, which is equivalent to omniscient third-person narrator.

In *Narrative Discourse: An Essay in Method* (1980[1972]), Genette critiqued the idea of narrative focus in Brooks and Warren and others who, in his view, conflated *mood* with *voice*. He described the difference between mood and voice as the difference between answering “who sees?” and “who speaks?” For Genette, that which speaks or tells a story is the narrator, and it should not be confused with the perspective from which the events, situations, and characters are viewed, which he called “focalization.” Focalization describes only the perceptual position from which the story is related,

regardless of who is narrating those perceptions for the reader. For instance, *Daisy Miller* is focalized through the character Winterbourne (his thoughts and perceptions are those the reader receives), but it is narrated in the third person by an unknown voice outside the story. Genette claims that it is important for our interpretation of the story that we keep in mind the difference between Winterbourne’s focalization and the narrator’s reporting of it.

For Genette, there are three major kinds of focalization. The first is “nonfocalization” or “zero focalization,” which means that the reader cannot locate a specific entity focalizing the story and that the focalization does not seem to constrain how the story is told. Zero focalization is used often in classical narratives, such as William Thackeray’s *Vanity Fair* (1847) and George Eliot’s *Adam Bede* (1859). “Internal focalization,” by contrast, may be fixed (located only in one character, as in *Daisy Miller*), variable (located in different characters as they perceive different events, as in James’s *The Golden Bowl* [1904]), or multiple (located in different characters who perceive the same events, as in Wilkie Collins’s *The Moonstone* [1868]). “External focalization,” like unintrusive or objective narration, is limited to perceiving settings, events, and characters’ actions, but not the character’s thoughts or emotions. Hemingway’s “The killers” is an example of external focalization.

Among the many responses to Genette’s codification of focalization, Mieke Bal’s in *Narratology: Introduction to the Theory of Narrative* (1997[1980]) is the most important because of her continued emphasis on focalization as fundamental to interpreting all narrative texts (not only what is conventionally understood as “literature”), but also for integrating a theory of *fabula* into her discussion of narratology. For Bal, focalization describes the relationship between the agent that perceives (the focalizer) and the

objects, persons, and events perceived (the focalized). So in *Daisy Miller* the focalizer is Winterbourne and the focalized is, often, Daisy Miller and her words and actions. Focalization can be of two types for Bal: character-bound/internal (within a character in the story, here Winterbourne) or external (located in an unnamed agent outside the events of the narrative, as in “Hills like white elephants”).

Recently, narrative theorists have begun to draw heavily on the insights of cognitive psychology and the philosophical theory of possible worlds. These two strains come together in David Herman’s *Story Logic: Problems and Possibilities of Narrative* (2002). He refers to the focalizer as a narrative’s center of consciousness and sees focalization not just as how the story and its world are perceived, but as a set of “propositional attitudes” to the storyworld (the fictional world in which narrated events take place). In other words, focalization for Herman is part of how the reader interprets a narrative because it carries with it clues to the logical, causal, interpersonal, and other rules of the narrative’s fictional world. Herman’s understanding points to the key issue in talking about point of view or focalization: because the concepts ask us to consider what intercedes between the reader and a story’s events, characters, and settings (fictional or not), they are crucial for analyzing the mechanics of representation in narrative.

Poulet, Georges

GREY ANDERSON

Georges Poulet (1902–91), teacher and literary critic, is known for his application of the phenomenology of consciousness to critical practice and theories of reading and interpretation. He was born in Chênée, Belgium, and received his doctorate from the University of Liège in 1927. Over the course of his long career, Poulet taught at the University of Edinburgh, Johns Hopkins University, the University of Zürich, and the

University of Nice. Along with his younger colleague at Hopkins, Jean Starobinski, Poulet was closely associated with the Geneva School, a group of critics including Albert Béguin, Marcel Raymond, Jean-Pierre Richard, and Jean Rousset. The members of this circle, loosely centered around the University of Geneva, shared an indebtedness to the philosophical tradition of phenomenology and a commitment to personal, empathetic forms of reading. As the group's most prolific and well-known representative, Poulet's "criticism of consciousness" has exercised a significant influence on French literary scholarship as well as on some aspects of reader-response studies.

With the publication of the first of his four-volume *Studies in Human Time* (1956), Poulet established himself internationally, following three years later with a second volume, *The Interior Distance* (1959). Despite the great range of authors treated in these texts, spanning much of the French canon, Poulet's method remains consistent. Through a series of essays on individual authors from Montaigne to Sartre, Poulet assembles reflections on a few central themes (time, space, the relationship between inner consciousness and social self), which are then seen to develop across periods and genres. In forming his critical judgments, Poulet considers no evidence from outside of the literature written by the individual authors under examination. In this respect, marginal examples of an author's writing may be considered just as relevant as major works, with each essay proceeding in the accumulation of thematically relevant passages drawn from a wide variety of different sources, including personal correspondence and manuscript drafts. For Poulet, literature is best understood not in the examination of formal or aesthetic characteristics, but rather in the investigation of what he describes as the

work's *cogito*. This *cogito*, while it is a creation of the author's consciousness, is never reducible to that consciousness in the fashion of biographical criticism; it describes something like the spirit invested in the text at the moment of its inception, the "point of departure" which will be re-experienced in turn by the reader.

Poulet's criticism, by focusing on the act rather than the object of reading, differs both from European traditions of literary history and philology and from the Anglo-American new criticism. If – in the *Studies in Human Time* as well as in book-length volumes devoted to Proust, Baudelaire, and Rimbaud – Poulet speaks of identification with the author, this authorial consciousness is not to be confused with the historical figure responsible for composing the texts in question. Likewise, although Poulet's analysis is concerned exclusively with the world created by literature, this world cannot be conceived of simply in terms of its linguistic form. The tenets of this approach are set forth most programmatically in the essay "Phenomenology of reading" (1969), first published in *New Literary History*. For Poulet, the consciousness of a work of fiction differs from the consciousness of other objects: the former is "open," capable of collapsing the distinction between self and other that normally structures our perception. Generally speaking, we treat the ideas that occur to us as our own, even if they may be just as well thought by others. When reading, however, we are obliged to think ideas that have undeniably been conceived by someone else. By voluntarily entering the world created by the text, the reader temporarily surrenders his or her notion of selfhood, achieving not just identification but "fusion" with the authorial consciousness responsible for the text's existence. "I am thinking," Poulet writes of the experience of reading, "the thoughts of another" (1969: 56).

The task of criticism, in Poulet's view, is to capture at a second degree the critic's personal experience of this fusion of reader and work. While different interpretations may be more or less successful in their access to the *cogito* under consideration, they are all equally dependent upon the text's intrinsic priority – that is, there is something that precedes and limits interpretation. This dependence, which often appears in Poulet's writings in metaphors drawn from the vocabulary of courtship or romantic love (the submission of the reader, the entwining of critic and text), distinguishes his work from the more dialectical formulations of Jean-Paul Sartre or practitioners of reader-response theory such as Wolfgang Iser or Hans Robert Jauss. For theorists like Iser and Jauss, the reading process involves the mutual struggle as well as implication of the reader's expectations and the text's innate qualities, Poulet, by contrast, believed that this relationship existed only in terms of textual activity and readerly passivity.

Long subject to criticism by formalists on account of its disregard for linguistic complexity, Poulet's scholarship was further challenged in the 1960s by the new wave of structuralist criticism. The accessible, self-identical *cogito* in Poulet's phenomenological criticism would not prove to be a popular notion in an age that heralded the "death of the author." Structuralist and poststructuralist theorists rejected the supposition that language merely veils from perception an intact, self-sufficient consciousness. Subjectivity itself, the foundation of Poulet's approach to literature, was found, in the writings of Roland Barthes and the linguist Émile Benveniste, to be no more than an effect of language. As critics turned increasingly towards questions of rhetoric and textuality, Poulet's fascination with authorial personalities and grand thematic questions was likewise largely consigned to history. With his own criticism fallen out of

fashion, Poulet's influence has nevertheless been avowed by critics such as J. Hillis Miller and Paul de Man. Indeed, it is possible to view in some of the partial, poetic manifestations of deconstruction an echo of Poulet's "literature about literature" criticism which seeks to best approximate the experience of reading that furnishes its own point of departure.

Pound, Ezra

CHRISTOPHER RIZZO

Ezra Pound (1885–1972), a poet, critic, translator, essayist, and editor, played a major role in the development of the modernist movement. An American expatriate in Europe, he proved adept at finding out extraordinary new talent in poetry and fiction, and used his influence on editorial boards to bring the young T. S. Eliot and James Joyce to wider audiences. His primary interests included aesthetics, politics, religion, economics, and education as they inflected the condition of modern culture. Pound was born in Hailley, Idaho, and began his studies, in 1901, at the University of Pennsylvania, where he met W. C. Williams and H. D. (Hilda Doolittle), both of whom would later be acknowledged as major modernist writers. After only two years of coursework, however, Pound transferred to Hamilton College. Upon completion of his PhD in 1905, Pound returned to the University of Pennsylvania to earn his MA in Romance Philology in 1906. After a brief professorship at Wabash College, Indiana, he set off for Europe, eventually residing in Venice. In 1908, Pound self-published his first book of poems *A Lume Spento* and, in the same year, he moved to London and self-published his second, *A Quinzaine for This Yule*. Although Pound would later call his early works “stale creampuffs,” they clearly established his ambivalent relation to medieval Romantic literature and the Romanticism of the classical literary tradition firmly established by nineteenth-century verse (Pound 1976: vii).

In London, Pound met a number of figures who would inflect his literary career.

Ford Madox Hueffer (later Ford Madox Ford) and T. E. Hulme, for example, encouraged Pound to modernize his form through the use of objective, concrete, and economical language. During this period, Pound spearheaded the Imagist movement, along with H. D., Richard Aldington, and F. S. Flint. Counted among the earliest practitioners of free verse, Imagists rejected the metered discursiveness of nineteenth-century verse and argued for the direct treatment of material reality through arresting imagery and precise diction and rhythm. In 1915, Pound published *Cathay*, a collection of free verse translations from classical Chinese that exemplified the Imagist method of focusing upon concrete things to disclose their essence. The brevity and concision of these Imagist lyrics subsequently led to Pound’s association with Vorticism. Pound enthusiastically contributed to the short-lived but influential Vorticist magazine *Blast*, brought out by Wyndham Lewis in the early war years of 1914–15. Vorticist artists, such as Henri Gaudier-Brzeska, encouraged Pound to consider how juxtaposed masses and planes could formally constitute a more complex and dynamic kind of poetry. Imagism and Vorticism underwrote Pound’s oeuvre, particularly *The Cantos*, and bore out a general trend in Anglo-American modernist literature toward fragmentation (perceptual and structural) and formal techniques like collage and pastiche (pre-eminently in the long poem, a form in which Pound and other modernists excelled).

Perhaps the most prominent figure to befriend Pound in his London years was W. B. Yeats. Ultimately, Pound would serve as his secretary and, during World War I, the two spend three winters together at Stone Cottage in Sussex during the period 1913–16. They both took great interest in the papers of the late Ernest Fenollosa, Professor of Political Economy

and Philosophy at Tokyo Imperial University. Entrusted to Pound, the Fenollosa papers consisted of translations from Chinese verse and selections of Japanese Noh drama, the latter of which especially engaged Yeats. Pound would go on to edit Fenollosa's *The Chinese Written Character as a Medium for Poetry*, which argued for the pictorial concreteness of metaphor in versification. Fenollosa premised his argument upon the founding principle of scientific positivism, namely that knowledge is empirically grounded. His treatise on the Chinese ideogram attacks the discursive formations of syllogistic logic, which led Pound to develop the Ideogrammic Method. Outlined in *The ABC of Reading* (1987), the Ideogrammic Method replaces the dualism of mimetic representation with juxtaposed concrete images to collectively represent one abstract essence. Pound discovered, in a methodology predicated on juxtaposition, a way to use images concisely and dynamically and to interpolate fragments of narrative, quotations, allusions, and so forth into a free-form poetic structure.

Disenchanted by the war, Pound left London for Paris in 1920. At this time, two major works were published, *Homage to Sextus Propertius* (1919) and *Hugh Selwyn Mauberley* (1920); the latter, arguably his single strongest work, has aptly been described as the poet's farewell to London. While in Paris, Pound became acquainted firsthand with Dada and Surrealism, both active avant-garde movements at the time. He befriended Marcel Duchamp, Tristan Tzara, and the violinist Olga Rudge, with whom he would develop a lifelong romantic relationship despite his marriage to Dorothy Shakespear in 1914. Pound continued to develop his major work begun in 1915, *The Cantos*, which he described as "an epic poem which begins 'In the Dark Forest,' crosses the Purgatory of human error, and ends in the light" (1973: 167). Unlike

Dante's *Divine Comedy*, however, *The Cantos* deploys the Ideogrammic Method to construct a dynamically fragmented and multilayered narrative. He also continued to cultivate his relationship to Eliot, whom he had met in London. Pound edited *The Waste Land*, for example, and Eliot in turn dedicated the work to Pound.

After four years in Paris, the poet returned to Italy, residing in Rapallo until the end of World War II. By the 1930s, he had turned his attentions to economics, as both *The Cantos* and *ABC of Economics* (1933) demonstrate. To Pound, the war was caused by unrestricted capitalist forces, and his concerns were reinforced, in part, by the Social Credit theory of Major C. H. Douglas, which argued that a state credit system would disenfranchise unethical banking practices. Pound also turned his attentions to Mussolini, whose policy on economic reform resonated with the Social Credit theory. The force of Pound's economic invectives in *The Cantos* ultimately turned on the point of usury, which he described as the unnatural corruption of creative faculties. His attack on usury, as many critics have pointed out, was troublingly anti-Semitic.

By 1938, Pound had written *Guide to Kulchur*, a treatise on cultural values that, as he comments in an added prefatory note, "make life worth living" (1970). Akin to Eliot, Pound considered cultural values constitutive of tradition on the one hand and, on the other, historical change. The cultural commitments outlined in *Guide to Kulchur* and the point of view he acquired while translating Confucian social theory, shaped and directed his politics. An active supporter of the Mussolini regime, he spoke against United States involvement in the war. Pound's infamous broadcasts on Rome Radio addressed a range of cultural issues, perhaps the most salient of which was laissez-faire economics.

As a result of his wartime activities, Pound was arrested by US forces in 1945. Detained at the Disciplinary Training Center in Pisa on charges of treason, he drafted the majority of *The Pisan Cantos*, which would controversially receive the inaugural Bollingen Prize in 1949. After repatriation to the United States, Pound was found mentally unfit to stand trial and, subsequently, the contentious poet was incarcerated in St Elizabeth's Hospital, Washington DC, where he remained from 1946 to 1958. After his release, Pound returned to Italy. Although *The Pisan Cantos* marked the themes of cultural collapse and the failure of his own epic program, Pound continued work on *The Cantos*. In St. Elizabeth's, he produced *Section: Rock-Drill, 85–95 de los Cantares* and *Thrones: 96–109 de los Cantares*. Published in 1968, *Drafts and Fragments: Cantos CX–CXVII* concluded *The Cantos*.

Pound died in Venice in 1972 at the age of 87; he remains one of the central and most controversial modernist figures.

Propp, Vladimir

DAWN SECKLER

Vladimir Iakovlevich Propp (1895–1970), one of the most important thinkers in the formalist tradition, who devised a revolutionary methodology for analyzing folk tales, was born into a family of German heritage in St Petersburg, Russia. After graduating from St Petersburg University in 1918 with a degree in Russian and German philology, he taught German in a high school. In 1932, four years after publishing his best-known work – *Morphology of the Folktale* – he returned to his alma mater, renamed Leningrad University, as a professor of folklore. Propp's preference for a methodological approach based on evidence and fact aligns him with the Russian formalist tradition, which strove for scientific rigor in the analysis of literature.

In 1966, reacting to Claude Lévi-Strauss's critique of *Morphology*, Propp said of himself: "I am a mere empiricist, but a true empiricist" (1976[1960]: 278). However, despite this assertion and despite the fact that many scholars have labeled him a Russian formalist, Propp's career began as the formalist movement was curtailed by the shift in politics that accompanied Joseph Stalin's rise to power.

Morphology of the Folktale not only sustains a formalist approach, but suggests new directions for the formalist analysis of genre. The title indicates the two scholarly trends of particular influence: Soviet folklore studies and the morphological branch of formalism. Prior to the Russian Revolution two major research centers dedicated to folklore studies were active: the Tale Commission (*Skazochnaia Komissia*) in Leningrad and The Commission on Popular Literature (*Komissia po narodnoi slovesnosti*) in Moscow. The Tale Commission existed as a department within the Russian Geographical Society (established in 1845). Its main tasks were to collect and publish folk tales, describe peasant life, and document folk traditions that were quickly disappearing owing to the encroachment of civilization into rural backwaters. The Society held in its archive the materials that comprised Aleksandr Afanas'ev's impressive collection of more than 600 tales compiled between 1855 and 1864 and entitled *Russian Fairy Tales* (*Narodnye russkie skazki*). Approximately 100 of these tales constituted the primary material on which Propp based his research for *Morphology*. The vast and varied material provided by Afanas'ev's and others' compendiums led folklorists to two main research fields: (1) the sociological study of the particularities of peasant communities; and (2) the comparative analysis of collected materials with the goal of creating a system to categorize the hundreds, often thousands, of stories. Propp pursued the second of

these two fields. Responding to the shortcomings of earlier folklorists' attempts to establish a satisfactory categorization system of folktales according to content – for example, to plot or motif (as Antti Aarne in 1911 or R. M. Volkov in 1924) – Propp felt it necessary to shift away from a focus on content, which was infinitely various, and to concentrate on the structure of the tales.

The Russian formalist movement, the second dominant intellectual influence on Propp, advocated this text-based perspective. Russian formalism flourished roughly from the 1910s through the 1920s and, apropos of its historical moment, revolutionized the focus of literary criticism. Formalist analysis rejected the validity of any influence extraneous to the text. For example, the Russian formalists rebelled against psychological, biographical, sociohistorical, and political approaches to literature, favoring, instead, an empirical method that scrutinizes literary texts from the point of view of their construction and structure. The "Morphological School" – the branch of the multifaceted formalist movement with which Propp was most closely associated – followed the example of eighteenth-century biologists like Carl Linnaeus, who established a taxonomy of living organisms based on a description of the function of their individual parts.

Propp's analysis of the folktale did precisely this: it created a taxonomic explanation of the genre. Propp disregarded all factors extraneous to the text (e.g., author, ideology, historical moment, in which the tale was written or recorded), in order to supply "a description of the tale according to its component parts and the relationship of these components to each other and to the whole" (1968[1928]: 19). He identified an unvarying, chronological sequence of plot events that comprises every magical fairy tale, which allowed him to make the claim that "all [magical] fairy tales are of one

type in regard to their structure” (23). Propp labels these constants – standard, sequentially arranged plot components – “function.” In contrast, the variable elements of fairy tales are “*dramatis personae*” or characters.

While Propp’s scholarship always focused on folk literature and culture, political pressure forced him to abandon his formalist methodology. In his second book, *Istoricheskie korni volshebnoi skazki* [*The Historical Roots of the Magic Tale*] (1946), which he considered to be the second volume of *Morphology*, he moves away from a purely synchronic (ahistorical) treatment of the folk tale’s composition and attempts to find reasons for the genre’s uniform structure. With formalism officially denounced by the Stalinist regime, Propp was forced to adopt an ideologically acceptable methodology. Unsurprisingly, then, his argument in *Historical Roots* is rooted in “Marxism-Leninism – the method of Marx, Engels, Lenin, and Stalin” (1984: 100). Propp sets out to discover the magic tale’s genesis by investigating the possible historical sources of individual motifs. He identifies motifs as originally belonging to myths told during ritual events (e.g., a boy’s initiation into manhood; a young woman’s entry into marriage; death) in a precapitalist society. Propp argues that when these myths no longer served a purpose in ritual customs, they were reinterpreted and used in folktales.

Although Propp dutifully adopted a materialist approach in *Historical Roots*, the book was nonetheless lambasted as “cosmopolitan” and “bourgeois,” due to his copious reference to English and German scholarship. Therefore, in his next major publication – *Russian Heroic Epic Poetry* (1955) – Propp maintained a decidedly Russian focus. He describes a uniquely Russian genre, the *bylina*, or heroic epic poem. The *bylina* conveniently

conforms to one of the main demands made by Soviet socialist realism: it features a difficult heroic struggle that results in a victory, not for the individual warrior, but for the nation. Moreover, this distinctive Russian genre is augmented, according to Propp, by “national and original” song and “accompanied by the national Russian instrument called the *gusli*” (1984: 150). As if this patriotic focus was not conformist enough, Propp went so far as to retreat from twentieth-century European folkloristics, and followed, instead, the lead of Soviet-approved, nineteenth-century Russian socialist reformers like Vissarion Belinsky, Nikolai Dobroliubov, and Nikolai Chernyshevsky, who praise the *bylina* as “an original creation of the Russia folk genius, in which the people expressed itself, its historic aspirations, and its national character” (1984: 155). His last monograph, *Russian Agrarian Holidays* (1963), maintains a materialist point of view in order to assess the economic relevancy of the Russian folk calendar.

It was not until 1958 that Propp’s *Morphology of the Folktale* was translated into English, an event that garnered Propp an international readership and renewed interest in his formalist methodology. Propp’s analysis of the magical folk tale’s structure can be considered as an antecedent to French structuralism, which sought to identify universal narrative structures. Coincidentally, in 1955, the French anthropologist Claude Lévi-Strauss published an article, “The structural study of myth,” that employed a structuralist methodology reminiscent of Propp’s. In an attempt to discover why myths from different cultures bear such strong resemblances to one another, Lévi-Strauss, like Propp, downplayed the varied content of different myths and concentrated on their shared narrative structures. What Propp called the function – the most basic narrative unit – Lévi-Strauss

labeled a “mytheme,” a neologism derived from Ferdinand de Saussure’s theory of structural linguistics.

Although Lévi-Strauss’s essay predates the publication of Propp’s *Morphology*, both works approached the analysis of culture and literature in remarkably similar ways. This similarity has been noted by scholars in folklore studies and structuralism (Lieberman 1984; Dundes 1997), and by the authors themselves. In 1960, Lévi-Strauss responded to Propp’s *Morphology* with both enthusiastic praise and harsh criticism. Recognizing Propp’s achievements and impressive anticipation of the structuralist method that developed 30 years later, Lévi-Strauss nonetheless questioned his choice of the folk tale over myth, and concludes that his lack of disciplinary training is the cause: “As he is not an ethnologist, one can suppose that he had no access to or control over mythological material collected by him and among peoples known to him” (Lévi-Strauss 1984[1960]: 177). He also faulted his lack of historical reference. Propp responded to these criticisms by noting that “no scholar can be forbidden to do one thing and urged to do another” (1984: 69) – an ominous statement considering Propp’s own history with the Soviet censors – and by correcting Lévi-Strauss by pointing out that he does take up the question of history in *The Historical Roots*, at that point not yet translated.

Despite Propp and Lévi-Strauss’s dispute, Propp continued to influence French structuralism. The theorists Claude Bremond, Roland Barthes, and Tzvetan Todorov all adopt Propp’s concept of the function, each modifying it to fit their individual attempts to identify universal narrative structures, not limited to any specific genre. The revival of Propp’s work in the West was especially important for film studies. American film scholars researching Hollywood genre cinema sought, like some structuralists, to

identify invariable narrative structures and employed Propp’s *Morphology* as a model for their scholarship. Will Wright’s *Six Guns and Society*, for example, employs a “liberalized version of a method originated by Vladimir Propp” in his analysis of the Western (1975: 25). Others make claims about the relevance of Propp to structural analyses of entire genres, like detective films. The trouble with many such appropriations of *Morphology* is the unreflective (and often minimally modified) mapping of Propp’s functions and character types, which relate to one specific genre – the Russian magical fairy tale – onto a wide variety of genres, and even to individual films. While many Hollywood films may, in fact, resemble fairy tales with their happy endings, one must be careful not to equate the morphology of one narrative type with the morphology of all others (Bordwell 1988).

Psychoanalysis (to 1966)

GREGORY CASTLE

Psychoanalysis is distinguished from psychology, which is concerned with the conscious operations of the mind, and cognitive science, which is concerned with the mind's neural architecture, by its concern for the dynamic interactions between the conscious mind and the unconscious, and between the human subject and its social environment. Literary and cultural scholars who use psychoanalysis usually focus on the way the unconscious manifests itself in character, story, symbol, and theme and on the way character in literature is interactive, a nexus of desire directed toward others that often emerges from the uncon-

scious. Sigmund Freud first formulated the scientific principles of psychoanalysis in the early twentieth century. His major discovery was that the conscious mind is only one component of the self. He discovered the unconscious by examining the symptoms of mental illness and ordinary dreams. Each, he found, were ways for conflicts, concerns, desires, and fears to emerge into consciousness. In certain forms of mental illness such as hysteria, the clue to the illness was to be found in how symptoms related to memories or concerns that had been banished from consciousness. Similarly, dreams, Freud found, were places where unconscious material manifested itself in quasi-conscious form. The repercussions of these early discoveries by Freud were enormous, and a new science grew out of them.

Psychoanalysis grew out of a convergence in the late nineteenth century of psychology, sexology, psychiatry, literary criticism, and dream interpretation. It was founded on Sigmund Freud's early clinical practice. Psychoanalysis is a form of psychotherapy that stresses what "Anna O," a patient of Freud's colleague Josef Breuer, called the "talking cure" (Breuer & Freud 1955[1895]: 21–47). Psychoanalysts must learn to interpret what their patients ("analysands") are trying to say. For Freud, as for many of his students, the analytical session was designed to bring to light repressed information; free association and dreams provided important points of access to unconscious thoughts and wishes. A wide array of concepts and terms used to describe the conscious and unconscious portions of the mind (e.g., ego/superego/id, repression, repetition compulsion, the death drive) were developed in Freud's work and elaborated on and revised by C. G. Jung, Anna Freud, Melanie Klein, Ernest Jones, Jacques Lacan, and a host of others. Finally, psychoanalysis has become a powerful tool in literary and cultural theory, in part because Freud himself was

drawn to literature, where he discovered some of his most useful concepts, in part because the psychoanalytic method relies on techniques of interpretation and representation that are analogous to those in literary and cultural studies.

Freud initially theorized a “topographical” relation between the “ego” and the “unconscious”; the former encompassed consciousness and the individual’s contact with the external world, while the latter was a quite different space of instinctual drives, sexual energy – which Freud called “libido” – and repressive mechanisms. In the topographical model, the ego and the unconscious occupied different areas and the problem was to understand how libidinal energy moved back and forth between the two. Much of Freud’s early work centered around the analysis of neurotic symptoms (particularly hysteria), which he believed were derivatives of memories that had been repressed and existed only in the unconscious. (“Neuroses” are psychological disorders involving issues between self and world; they include hysteria, obsessive and compulsive disorders, depression, phobias and so on; they are the focus of psychoanalysis and can be treated. “Psychoses” are more serious disorders, often with an organic basis, that involve a breakdown of some kind in the balance between conscious self and unconsciousness and are typically not treatable by psychoanalysis. The most common psychoses are schizophrenia and bipolar disorder.)

The early case histories – for example, “Dora: A case of hysteria” and “History of an infantile neurosis (wolf man)” – show the development of Freud’s thinking about unconscious processes and the way in which dreams provide insight into the etiology, or cause, of neurotic symptoms. The case studies provided a wealth of information on symptoms and their links to the unconscious. In the “History of an infantile neu-

rosis (wolf man),” Freud concludes from the patient’s symptoms that he has a passive attitude toward his father (a sexual aim, desire *for* the father), which is repressed; fear of the father is substituted for a Wolf phobia. According to Freud, his patient suffered from repression driven by “narcissistic genital libido, which, in the form of concern for his male organ, was fighting against a satisfaction whose attainment seemed to involve the renunciation of that organ” (1953–74, 17:46). This “threatened narcissism” yields his masculinity. This psychic state of affairs manifested itself in dreams and memories that centered on the Roman numeral V, which Freud found merged or overlapped with a memory of a butterfly (also a V) and of seeing a maid on her knees from behind (her legs forming a V). The interpretation of these signs led Freud to clues regarding the source of the patient’s illness.

Like the symptom, the dream is an indirect or coded message, the interpretation of which holds the key to the meaning of the dream. Freud argues that dreams have two kinds of content, the “manifest” and the “latent.” The manifest level is the dream itself, the object of interpretation; the latent level is the actual thought that cannot be known or expressed consciously because it has been repressed or “censored.” The censor, primarily a function of the superego, the internalization of social and parental authority, maintains psychic equilibrium by preventing some unconscious material from reaching the level of consciousness. Censorship may block unconscious content that has to do with things that in certain cultures are embarrassing (sexuality, for example) or antinormative, or it may prevent personal memories or traumas from offending the ego. Freud associated unconscious content with wishes of various kinds, and though some content may be blocked, enough can pass through the censor during

dreams to give expression to wishes, from the banal to the forbidden: "a dream is not an intention represented as having been carried out, but a wish represented as having been fulfilled" (1953–74, 7:85). The distortions that convert wishes into often bizarre and obscure dreams Freud called the "dream-work," a process in which unconscious material is allowed a disguised or coded expression during sleep, when the dream-censor relaxes its vigilance. This dream-work entails the primary mechanisms of "displacement" and "condensation" by which unconscious material is formed into the manifest content of the dream. In other words, the dream-work performs what many (including Freud) recognize as a literary activity in which metaphor, metonymy, and other figures represent in a disguised form the secret wish that lies hidden in the unconscious. In order to comprehend the manifest content of the dream, the analyst must lead the analysand to the latent level of unconscious, repressed meaning. It is a difficult and time-consuming process, and the analysand very often will resist the analyst's interpretations. The analyst must be a skilled interpreter, able to work back from the dream to the underlying wish: "The dream's interpretation had to disregard everything that served to represent the wish-fulfillment and to re-establish distressing latent dream-thoughts from these obscure remaining hints" (1953–74, 15:225).

Dreams are important because they hold the key to neurotic symptoms that usually originate in an individual's earliest experiences of instinctual satisfaction and repression. For this reason, childhood sexual experiences are fundamentally important. Freud's *Three Essays on Sexuality* argues that these experiences are structured diphensively, which means that sexual development is interrupted by a latency period that effectively separates it into two distinct

phases, pregenital (oral and anal states) and genital, each incorporating multiple stages and, quite often, regressions to prior stages. Children are "polymorphously perverse" and can therefore respond along a number of erotic pathways (or "sexual aims") to a number of "sexual objects" (including the child him or herself). For Freud, "normal" development entailed the integration of the component "perversions" (scopophilia and exhibitionism, autoerotism, sadism and masochism) into a healthy, heterosexual instinct. He was also well aware that normal sexuality and sexual identity were not often achieved, that an individual could fixate at one or another of the early stages; but he strongly believed that this norm was best suited to fulfill the destiny of the human species, to fend off death and produce more life. The "pleasure principle," which is the pure and unfettered energy of the sexual instinct, motivates childhood polymorphous perversity. In normal sexual development, particularly during the genital phase and the "dissolution" of the Oedipus complex, the narcissistic pursuit of pleasure associated with early sexual development "comes under the sway of the reproductive function" and the instincts are "organized" more firmly "towards a sexual aim attached to some extraneous sexual object" (1953–74, 7:197). This form of "primary narcissism," which refers to the autoerotic tendencies of infants, is to be distinguished from "secondary narcissism," the unhealthy fixation of the ego on itself at later stages of sexual development. The "reality principle" keeps individuals from succumbing to the whim of their sexual instincts and forces them either to sublimate some of their libido in non-sexual or nonviolent activities (art, religion, philosophy) or to repress the desire for such activities through "reaction-formation," the mental forces that come into play to oppose or block perverse impulses (moral reactions

like disgust and shame). Under the influence of the reality principle, the child learns to direct sexual libido away from the ego (in order to avoid the danger of secondary narcissism) and onto a suitable sexual object.

For Freud, the central event in early male childhood development was the “Oedipus complex,” which allows the individual male child to overcome “incestuous phantasies” and permits “one of the most painful, psychical achievements of the pubertal period . . . detachment from parental authority” (1953–74, 7:227). The theory of the Oedipus complex springs from Freud’s reading of Sophocles’ *Oedipus Rex*, the tragic story of a man who unknowingly kills his own father and marries his mother and who, upon driving himself to learn the truth, puts out his eyes. Out of this tragic myth, Freud derives an understanding of desire that is essentially triangular: the young male child desires his mother, but feels thwarted by the father with whom he must ultimately identify, but only at the cost of giving up his mother. The father is perceived as a threat to the child’s bond with the mother, a threat that for Freud was akin to a fear of being castrated. A “normal” dissolution of the Oedipus complex would involve the male child repudiating his mother and identifying with his father. His desire must now find another object. For young girls, this process is doubly traumatic, for girls must not only turn away from their initial love object, they must also shift their desire from female to male objects. For boys and girls, according to Freud, the Oedipus complex installs “repression” as a means by which to manage prohibited desires; it involves “the transformation into affects, and especially into anxiety, of the mental energy belonging to the instincts” (1953–74, 14:153). The onset of repression is simultaneously the destruction of the Oedipus complex. Subsequent repressions are made under the aegis of the super-

ego that emerges as a result of a successful Oedipal experience. The super-ego is thus “the heir of the Oedipus complex” (1953–74, 19:36).

Though the Oedipus complex was central to many of Freud’s works, especially studies like *Totem and Taboo* (1953–74, 13) and *Civilization and its Discontents* in which Freud speculates on its origins and its relation to “man’s sense of guilt” (1953–74, 21:131), the chief and enduring elements of his thinking – the unconscious, the instincts, neurotic symptoms and defenses, dream interpretations – are grounded in psychoanalytic therapy, the chief object of which is to bring to light the origins of neurotic symptoms that Freud believed lay in the traumas of sexual development. There can be complications, of course, including the analysand’s resistance to the uncovering of repressed material and the process of “transference,” in which the patient reimagines the structure of neurotic symptoms in the analytical situation itself. In transference, libidinal investments in a repressed object (which is known at first only in terms of its displacement onto dream images or symptoms) are transferred to the analyst, who is then in a position to draw out, through association, the latent wish or desire that is at the root of the original neurosis. As Freud put it in the famous case history of Dora, transferences are “new editions or facsimiles of the impulses and phantasies which are aroused and made conscious during the progress of the analysis; but they have this peculiarity, which is characteristic for their species, that they replace some earlier person by the person of the physician” (1953–74, 7:116). This potentially problematic interaction between analyst and analysand is, in a sense, the goal of the analytical process itself, the point at which the analysand can be led to recognize his or her own repressed desires and confront them at the level of

consciousness. Once confronted, these desires are no longer repressed and can no longer interfere with mental or bodily health by manifesting themselves as injurious symptoms.

As he developed the theory of the ego, especially in such controversial later works as *Beyond the Pleasure Principle* (1953–74, 18) and *The Ego and the Id* (1953–74, 19), Freud formulated a “structural” theory of the mind, one in which the ego, the super-ego, and the id (his new term for the unconscious that included now the drives or instincts) signify certain kinds of relationships between conscious and unconscious elements of the ego. According to this structural model, significant portions of the ego are unknown; in a sense, then, the subject is internally split and displaced. Fundamentally linked to the structural theory of the ego is the theory of instincts or drives. In the earlier topographical model, there were two primary instincts: *sexual*, linked to fantasy, wish fulfillment, and the pleasure principle; and *ego*, linked to consciousness and the reality principle. The revised theory of instincts offered in *Beyond the Pleasure Principle* subsumes the ego and sexual instincts into a single sexual instinct towards self-preservation (*Eros*) and offers a new category, the death instinct (*Thanatos*), which is dedicated to the paradoxical quest of short-circuiting the sexual instinct and ending life: “an instinct is an urge inherent in organic life to restore an earlier state of things which the living entity has been obliged to abandon under the pressure of external disturbing forces; that is, it is a kind of organic elasticity, or, to put it another way, the expression of the inertia inherent in organic life.” The death instinct seeks to return to an original *inorganic* state: “the aim of all life is death” (1953–74, 18:36, 38). The pleasure principle, because it seeks the repetition of desires and wishes that could bring harm to the individual, appears

to be in the service of the death instinct. Because instincts constitute the limit of what can be studied scientifically, the aim of psychoanalysis is restricted to “demonstrating the connection along the path of instinctual activity between a person’s external experiences and his reactions” (1953–74, 11:136).

Though his later work, especially *Civilization and its Discontents* and *Moses and Monotheism* (1953–74, 23), was highly speculative and dealt with the origins of civilization and religion rather than individual psychology, Freud believed that psychoanalysis was a science. But not everyone agreed on the importance of key concepts (especially the Oedipus and castration complexes). Almost as soon as it became a legitimate field of study within the medical establishment (that is, around the time of World War I), psychoanalysis experienced schisms and factional movements that reduced Freud’s centralizing authority and made psychoanalysis more varied, more popular and more accessible. C. G. Jung’s break with Freud in 1913 was due mainly to their divergent views on sexuality and the unconscious; because it occurred early in the development of psychoanalysis, Jung’s own subsequent work in “analytical psychology” is not usually regarded as revisionist Freudianism. The more serious threat to Freud’s theoretical hegemony came from ego psychologists, like his daughter Anna, and object relations theorists like D. W. Winnicott and Melanie Klein.

Klein’s theories about early infant attachments originated in her active interactions with infants and not from the adult Freudian patient’s recollections of infantile experiences. Whereas Anna Freud included the parents and other environmental factors in her analysis of children, Klein concentrated solely on the infant’s emotions for and idealizations of the mother’s body. Both Klein and Anna Freud accepted the Oedipal

complex, but shifted its time of emergence to a much earlier phase of childhood and shifted attention away from the complex itself to the period before it (the “pre-Oedipal phase”) and the relations between infants and the world around them. Klein analyzed the complexities of the child’s inner world and how objects from the outer world, particularly the mother, could be transformed into a part or whole object invested with intense feelings in the child’s psyche. Winnicott also focused on early childhood development and introduced into psychotherapy concepts like “transitional objects” and “good-enough mothering.” The transitional object is something in which the infant is emotionally invested, such as a blanket or a teddy bear, that enables the child to slowly relinquish his or her dependence on the mother. These transitional objects, which are neither purely subjective nor purely external, are created by the child insofar as they are actively chosen for comfort and security. They are the infant’s first “not-me possession,” which enables an awareness of the spatial distinction between itself and its external environment. Winnicott’s theory describes the “good-enough mother,” who creates a protective “holding environment” of shared emotions and mutual understanding so that the infant’s autonomous identity can eventually emerge. Without such mothering the child’s “true self” will not emerge, and a “false self” will develop that has serious ramifications for later object relationships, preventing infants from successfully distinguishing themselves from their environment. This disintegration of self that may begin with the mother’s failure thus breeds isolation. While the emphasis on mothering in psychoanalysis was welcomed by many, Winnicott was criticized by some who found his theory put all the pressure of parenting back on the mother who could now be blamed for her children’s failures.

Object relations theorists reject the priority of the Oedipus complex and emphasize instead the mother–child relationship. Another group, the “ego psychologists,” attempted to regain the whole ego through a purging of the divided self, especially in the “self psychology” of R. D. Laing and Heinz Kohut. Jacques Lacan, a major French structuralist psychoanalytic theorist who advocated a “return to Freud,” was critical of some of these developments, especially ego psychology, which for him had become distracted by the “sociological poem of the ‘autonomous ego’” (2002[1966]: 162). For this and other reasons, he advocated returning to fundamental concepts like the Oedipus complex and the unconscious.

At the center of Lacan’s revision of Freud, which was strongly influenced by Saussurean linguistics and Claude Lévi-Strauss’s structuralist anthropology, was the idea that the operations of the mind are like a language. The unconscious is like a signified that belongs to an entirely different realm from signifiers, such as dreams and symptoms. It can be indicated by signifiers but never reached or brought into the realm of perception and knowledge. All we can do is follow a chain of signifiers when we try to know ourselves and at the origin or end of the chain is something unattainable. For Lacan, that was the original fused state of the child with the mother, which fostered a quasi-narcissistic sense of a pleasurable plenitude, a unity of self and other. That fusion is ruptured by the “No” of the father, and the child at that point gives up the mother and enters the Symbolic realm, by acquiring an ability to symbolize. Symbolization means that a sign takes the place of the thing. To symbolize therefore is to give up the object. If the longing for fusion with the mother defines what Lacan calls the Imaginary dimension of the psyche, the entry into the Symbolic Order through the “Name of the Father” installs the mother

in the realm of the Real – something unattainable that resists symbolization. Lacan believed that all children undergo a “mirror stage” in which the ego is formed out of narcissistic fantasies. The ego is therefore a realm of delusion; the “truth” of the human psyche resides in the unconscious.

Psychoanalysis has been especially productive as a method of analysis for feminist theorists such as Juliet Mitchell, Julia Kristeva, Luce Irigaray, and Jane Gallop. Kristeva (1982[1980]) posits a realm called the “abject,” the material underpinning of civilization that must be pushed away and kept at bay as we enter the symbolic order of civilization. Certain writers allow us to glimpse the abject by breaking down our normal assumptions and beliefs. The general tendency away from the Oedipus complex, especially in Kristeva, signals a repudiation of patriarchy and phallogocentric thought and a privileging of the maternal body. In “Stabat Mater,” she asks, “If it is not possible to say of a *woman* what she *is* (without running the risk of abolishing her difference), would it perhaps be different concerning the *mother*, since that is the only function of the ‘other sex’ to which we can definitely attribute existence?” (Kristeva 1987[1979]: 234). Irigaray, a philosopher as well as a psychoanalyst, reviews the Western philosophic tradition from a feminist psychoanalytic perspective and finds that woman is associated consistently with the material world that is the basis for philosophic speculation, which is always defined in male terms as a seeking of identity that rises above and transcends maternal matter.

Gilles Deleuze and Félix Guattari, a philosopher and a psychoanalyst respectively, have mounted a similar attack against the centrality of the Oedipus complex. In *Anti-Oedipus* Deleuze and Guattari argue that the “oedipalized subject” is an imperialized subject, the perfect victim of capitalist and

fascist states. “The Oedipal triangle [‘mommy, daddy and me’] is the personal and private territoriality that corresponds to all of capitalism’s efforts at social reterritorialization. Oedipus was always the displaced limit for every social formation, since it is the displaced represented of desire” (1983 [1977]: 266). In other words, the mechanisms of repression and conscience that are unleashed by the Oedipus complex are perfectly suited to those of capitalism: both destroy traditional structures and both create new pathways and economies of desire.

Psychoanalysis continues to be an important method for treating mental illness in the Anglophone world, and it continues to generate interesting theoretical work regarding such conditions as narcissism, the borderline personality, and such pathologies as incest. Psychoanalytic theorists have turned to narrative theory especially to help explain how patients order their mental lives. Plot is a way of seeking causes, but it is also a way of deflecting attention in a defensive action to avoid confronting trauma. Trauma studies has become an especially important school of psychoanalytic literary criticism.

Psychoanalysis has long attracted critics and theorists of literature. Freud was himself drawn to literary works, and interpretations of them were important in the formulation of some concepts (e.g., the Oedipus complex). Marie Bonaparte’s *The Life and Works of Edgar Allen Poe* (1949[1933]) was one of the first full-scale psychoanalytic studies of an author and his work. Poe also attracted Lacan [1972], who argued that Poe’s “The purloined letter” was about the unconscious, whose symbolic machinery (“the letter”) is always in plain site. Early archetypal criticism, like Maud Bodkin’s *Archetypal Patterns in Poetry* (1934), borrowed from Jung’s work and made popular in literary criticism the idea of reading for archetypes like the Hero and the Shadow.

Studies like Norman O. Brown's *Life Against Death* (1985[1959]) and Herbert Marcuse's *Eros and Civilization* (1987[1955]) were highly influential among literary scholars and students of literature in the 1960s. In the Anglo-American tradition, the most visible literary critics using psychoanalytic theory were Frederick Crews (though he would ultimately turn away from theoretical approaches to literature) and Harold Bloom, who saw an "anxiety of influence" in literary history.

By the 1970s, the poststructuralist revolution had ushered in Lacan's "return to Freud" and numerous new approaches to literature influenced by Lacan, as well as by Irigaray, Jean Laplanche, and others in a new generation of theorists. Shoshana Felman's *Literature and Psychoanalysis* (1982) shows the variety of approaches that appeared both to critique Freud and Freudian psychoanalysis and to claim both as a contested origin. Lacan's turn in the 1970s to James Joyce, who he claimed was the inspiration for a new theory of the symptom (or *sinthome*), has resulted in a strong Lacanian trend within Joyce studies. Critics like Jean-Michel Rabaté, Joseph Valente, and Sheldon Brivic, have made Lacan's work central to a theoretical understanding of Joyce's texts. In the twenty-first century, psychoanalytical literary and cultural criticism remains vital, in part due to Slavoj Žižek's approach to Lacan, which uses popular culture to exemplify complex psychoanalytic and philosophical concepts. Žižek has famously applied Lacanian theory to everything from Kant to Hitchcock and has developed a unique perspective on European nationalism indebted to Lacan's theory of lack and the relation of lack to the Symbolic order. His study of Lacan and Hollywood, *Enjoy Your Symptom!* (1992), has had an invigorating effect on how film is interpreted, especially with reference to the Lacanian

concepts of the "gaze," repetition, and the Other. His work has been instrumental in making psychoanalytic theory useful again for literary criticism.

Much of value from Freud remains – concepts like repression and the unconscious, instincts and drives, theories of neurotic symptoms and dream interpretation – but innovations and critical revision have amended the Freudian project and helped create a dynamic and varied field of psychotherapy.

R

Reification

DAVID HAWKES

Reification is the form taken by commodity fetishism when the market has become the dominant mode of economic organization. To the degree that the market rises to power within the economy, the economy rises to power within society. As it rises to economic pre-eminence, the market projects its economic assumptions onto other areas of life and thought, so that commodity fetishism comes to influence politics, philosophy, aesthetics, psychology, and everyday social life. When generalized and expanded to noneconomic spheres, the term “commodity fetishism” becomes inadequate to capture the range of this phenomenon’s effects, and “reification” is used to designate the universal form of this ideological condition.

The philosophical roots of the concept lie in Kant’s distinction between the “for us” and the “in itself.” The most basic, and the most common, of philosophical errors is the claim that we are able to perceive the “noumenal” thing-in-itself, rather than the humanly constructed or “phenomenal” thing-for-us. In the era of market capitalism, that error takes the form of reification. The reified consciousness assumes that what we experience through immediate perception is reality, and that reality is a natural,

even an immutable, state of affairs. It thus fails to recognize that the “commodity form” or “exchange-value” attributed to the objects of perception are humanly constructed inventions, and it mistakes the manner in which things are immediately presented to sense perception for their inherent, essential nature.

The modern sense of “reification” derives from Karl Marx, who used the German term *Verdinglichung* to describe the general psychological orientation arising from commodity fetishism. According to Marx, the seminal form of reification is the representation of human labor power in the alienated form of financial value. The fully developed form of reification occurs when autonomous financial value dominates a society’s entire economy. The West reached this stage in the eighteenth century and, although its global triumph was delayed until the late twentieth century, today the condition of reification is virtually universal.

Commodity fetishism involves a distortion of the relationship between the subject (that which experiences) and the object (that which is experienced). Subjective human activity is objectified when sold as a commodity, and the objective products of human labor attain a subjective agency when they are fetishized. Like commodity fetishism, reification is a two-way process

whereby relations or concepts are conceived as things and, as a result, things appear to come alive. In reified thought, however, this error spreads through every sphere of thought and activity. The definitive analysis of this process is found in Georg Lukács's *History and Class-Consciousness* (1971 [1923]), which shows how reification stamps bourgeois science, law, philosophy, and psychology with the imprint of commodity fetishism.

Lukács's version of the concept was expanded by other Marxists, notably the theorists of the Frankfurt School such as Theodor Adorno, Max Horkheimer, and Herbert Marcuse. They argued that reification's philosophical correlative was empiricism: the belief that the world as it is immediately given to our senses is real, so that sense experience is the source of truth. Such thinking erases the distinction between appearance and essence, just as the fetishization of a commodity obscures its inherent use value behind a symbolic exchange value. Reified thought applies the positivist methodology of the natural sciences to the social sciences, treating society as an inert object to be studied like a gas or a chemical. In pseudo-scientific forms that have ranged from phrenology to cognitive neuroscience, reified thought even treats the human psyche itself as a material object.

In a society based on commodity exchange, the products of human labor take on a precisely quantifiable form, so that human activity can be studied as if it were a thing. This is the approach taken by neo-classical economics, whose concept of "human capital" perfectly encapsulates the ideological consequences of reification. Neoclassical economics begins from the assumption that the pursuit of rational self-interest is hard-wired into human nature. Reified thought takes this allegedly natural economic behavior and applies it

to every aspect of society, producing widespread popular materialism. The idea that human beings are purely biological entities, to be distinguished from other animals by the size or complexity of our brains rather than through our possession of an immortal, rational psyche, has achieved an unprecedented credibility in the reified societies of the West.

In the intellectual realm this objectification of the subject gives rise to an "eliminative materialism," which denies the ontological existence of anything that is not physical. Entire disciplines such as sociobiology and evolutionary psychology have been founded on the assumption that biology and genetics hold the keys to all human behavior. Postmodernist philosophy is characterized by its insistence on the "material subject," which reduces the human self to a nexus of discourses and physical desires. Reification is the most virulent form of what Adorno called "identity thinking." It freezes fluid processes into static entities, producing an ahistorical mindset which assumes that things have always been, and must always be, the way they currently appear to be. Reification consists in the false naturalization of humanly created cultural institutions and practices, just as commodity fetishism involves the false objectification of the products of human labor.

There are two possible antidotes to reification. One is the intellectual process of dialectical thinking. Dialectics undoes reification by considering every object in relation to the "totality": the historical, linguistic, and social context from which every essence is derived. Reification's other antidote is the practical process of anticapitalist politics. If the grip of the market economy could be broken, then the illusions of commodity fetishism might be exposed, and the murky cloud of reification expelled from consciousness. At present, however, only

the most sanguine of radicals can hope that they will live to see that day, and the effort to escape reification through thought alone seems beyond all but the most strenuous dialecticians. It appears that Lukács's gloomy pronouncement that reification is "the necessary immediate reality of every person living in capitalist society" (1971 [1923]: 197) is truer today than ever before.

Richards, I. A.

BRIAN MEREDITH

Ivor Armstrong Richards (1893–1979) was a Cambridge professor whose theoretical

work helped shape English studies in the twentieth century, and whose influence can still be felt in the fundamentals by which high school and college students are taught to read literature. This legacy was built on Richards's prolific publications from the 1920s and '30s. Two books in particular, *Principles of Literary Criticism* (1925) and *Practical Criticism* (1929), pioneered a conceptual framework for detailed analysis of both language and language form, enabling equally attentive discussion of the reading experience. The former is a variety of close reading that has affinities with critical methods in the new criticism. His influence may also be traced in teachers' ubiquitous use of concepts like the tenor and vehicle of metaphor, the distinction between a poem's speaker and author, or the idea that a poem's meter can "cooperate" in the production of meaning. At the same time, the formal system for literary study that Richards designed, much of it drawn from other disciplines like psychology, contributed to the general trend in English studies to emulate research methods and techniques found in the natural and social sciences.

The importance of Richards's own teaching in this effort cannot be overemphasized; much of his published work presents the finely tuned results of theoretical and methodological speculations put into practice in the classroom. His first major works were products of both wide reading and conversations with collaborators like C. K. Ogden, a Cambridge student who had convinced Richards to study moral philosophy as an alternative to a history degree. Together with an artist, James Wood, they published *The Foundations of Aesthetics* (1922), a book that tackles its subject with a concise survey of 16 ways to understand the word "beauty." This would be Richards's frequent approach to abstract problems, one that the authors codify and advocate later as the theory of

definition in *The Meaning of Meaning* (1923).

The final definition in *The Foundations of Aesthetics* describes synaesthesia as an experience of “equilibrium” and “harmony” in the responses excited by the contemplated object. In a state of synaesthesia, beauty leads us to an objective, “impersonal” experience of ourselves, as individuals more or less free from conflicts, narrow interests, and other distractions produced by our emotional lives and our interactions in society. The factors that routinely steer our interest are now left in harmony or work together in equilibrium. We thus become more ourselves in the sense that our interest “becomes ready instead to take any direction we choose” (Richards et al. 1925[1922]: 78). To put it another way, an important effect of beauty on those who contemplate it is improved management of “impulses,” the neurophysical element in mental life. This latter is a term Richards frequently used, the idea of the mind routinely handling millions of these impulses perhaps helping readers to imagine why they were vulnerable to “frustration” and “interference.”

This vision of the mental life suggests the utility of a social function for language and poetry at a time when science – and scientific discourse – dominates how people order their lives. While for Richards science achieves valuable ends, it does so by using only a limited number of the linguistic functions available to human communication. He charges that this linguistic repression threatens our capacity to interpret and interact in situations that demand responses other than those offered by scientific explanations. Still, Richards’s own theoretical schemes emulated the technical character of a science, and his discussions remained pragmatic, frequently peppered with disdain for the mystifications of philosophical idealism and for superstitious views of language, or “word magic.” His esteem

for poetry assumed that there is room, and need, for both poetry *and* science in a lifetime of communicating, an idea which received its most popular treatment in *Science and Poetry* (1926). Richards and Ogden had made a similar point in *The Meaning of Meaning*, which argues that language, in regard to poetry and science, reflects different but necessary ends. Its ambitious subject is “the influence of language upon thought,” though it also seeks pragmatically to help people convey what they mean in as “convenient” a manner as possible. The focus of this broad, interdisciplinary inquiry is the volatile conditions under which people conduct the most common linguistic interactions. In their contextual theory of signs, for instance, words receive their meanings based on their use in actual situations, and their subsequent reuse and habituation. Dictionaries may be written later, when we discover that even accepted meanings are inevitably the outcome of a complicated and contingent history of use. Believing the alternative, that words have a standard, essential, or correct connection to their meanings, serves as but another example of “word magic.” The variety of meanings that accrue to any given word explains much about the “verbal” confusions in using symbols. Variety interferes with the function of the verbal signs by which people intend to convey some sort of factual or referential truth. Richard and Ogden’s theory of definition, then, provides a helpful measure to take when meaning goes awry.

It should be borne in mind, however, that the authors do not intend to resolve confusion once and for all; indeed, they advocate for the rich creative process that results when new, unfamiliar meanings emerge in the chance ties that our usage forges between words and meaning. In *The Meaning of Meaning* they explore the nonsymbolic uses of language. These are cases where language is not intended for referential or

empirical purposes, such as a statement of fact or description of the actual world. Rather, these instances involve the manifestation of emotions and feelings. This emotive use of language is best exemplified in poetry, and it stands in stark contrast to the symbolic language used in scientific discourse.

Finally, there is allusion here to a larger idea that will drive Richards's labors through his entire career, the idea that the human ability to use language in effective ways will diminish. People, he concludes, require an improved conception of language if they are not to be swallowed up in their own progress, and taken advantage of by the cooptation of their own words by dominant discourses. The growing power of new media technologies served as conspicuous evidence of this potential, even in 1925, when Richards published *Principles of Literary Criticism*, which gives criticism a theory of artistic value that assigns an enduring social and political role to the poet, that older, more authentic word manipulator. One can find a special place reserved for the poet already in *The Foundations of Aesthetics*, in the distinction made there between untouched "objects of nature" and art as a creation resulting from artistic choices. The artist thus controls how art is perceived by the audience, exhibiting a superior ability to organize experience and remove conflicting tensions in refined expression.

Value in *Principles of Literary Criticism* rests more or less on this principle of organization. For instance, Richards describes the ability to organize perception as if our minds were "clearing houses," thereby satisfying the most important and greatest number of stimuli. Intricate organizations of response can come about in poetry because poetic language does not isolate the semantic content of a statement, but instead, functioning as emotive language,

also draws meanings from feeling. Richards calls these responses "attitude," an ability to respond to the constant myriad of impulses with action that is "imaginal or incipient" as opposed to actual. In such cases, physical expression tends to rank below mental activity because, for Richards, action commits one to "the irrelevant accidents which attend overt responses" (1925: 112) and thus to waste. A refined attitude emphasizes the appeal of organization by reaping the maximizing of satisfaction from a given moment of stimuli. A reader can acquire something of this same capacity by reading good poetry, itself a product of these attitudes. It follows then that the ideal critic described (or prepared) by *Principles of Literary Criticism*, who is able to respond appropriately to the poem, acts not only as a judge, but, like the poet, as a role model for living. It is in this connection that Richards's frequent appeals to education can be understood, for helping people to become better critics may improve their lives, and collectively, the fortunes of our world.

Perhaps none of Richards's work displays its fidelity to these goals more explicitly than in *Practical Criticism: A Study of Literary Judgment* (1929), with its marriage of theoretical premises to concrete research and problem solving. Beginning from the assumption that readers ignore or misunderstand extratextual clues to meaning, he conducted an experiment in 1925. He asked 120 Cambridge undergraduates to write "protocols," responses to eight poems whose authors were kept anonymous. Many excerpts from these appear in *Practical Criticism*, along with scrupulous analysis by Richards, constituting, in a sense, the close reading of mistaken reading. The problems stem from failure to heed four sources of meaning: authorial intention, the attitude of the author to subject, of the author to reader, and of the accepted sense or reference of the words used.

Yet poor reading, as Richards insists at the conclusion, should not be derided as a shortcoming in language use; the difficulty of understanding, rather, is the norm. Whether in poetry or in prose, language use is by its very nature a perilous affair. In a late work, *The Philosophy of Rhetoric* (1936), Richards puts forward the concept of “interanimation,” which asserts that meaning hangs precariously on the interaction of words upon one another. His theoretical interests led to an emphasis on interpretation in the classroom, which he explored in *Interpretation in Teaching* (1938). Much of this work carried over into the efforts of his best-known students, William Empson, F. R. Leavis, and Q. D. Leavis, but in different respects. Empson expanded upon the literary approach, the Leavises upon the social critique that was implicit in Richards’s theory of criticism. Many new critics in America looked to Richards as a founding figure, though they generally disagreed with his insistence on scientific methods.

In *Coleridge on Imagination* (1935), Richards was able to return to his own critical mentor in an attempt to round out the system of thought he had been developing for well over a decade. But after this period his career changed course, and he dedicated himself to improving English language learning. He chose this path after teaching in China and realizing how much misunderstanding came from cultural differences, not just semantic ones. He believed the problem could be addressed only at a

more fundamental level, and, as a result, advocated tirelessly for Basic English, the system of simplified English developed by his old collaborator Ogden.

S

Sartre, Jean-Paul

DOTTY DYE

Jean-Paul Sartre (1905–80), French novelist, playwright, and philosopher, formulated an existential phenomenology that had a profound impact on European intellectual life in the decades after World War II. In the final year of the war, he delivered a lecture in Paris, *L'Existentialisme est un humanisme* [*Existentialism is a Humanism*] (2007 [1946]), in which he defended existentialist ideas against the Communist reproach that existentialism was a bourgeois philosophy because it amounted to “a state of quietism and despair” (Sartre 2007[1946]: 27) forcing a purely contemplative state rather than a productive one. He also addressed the objection from Christian critics that a perspective denying all eternal values leaves us to our own devices, unable to condemn the actions or perspectives of another. Finally he addressed the challenge from both sides that existential thought failed to encompass the whole of the human experience, having focused attention on all that is base about humankind, forgetting both the beauty and solidarity of which it is capable. The lecture was received enthusiastically by an audience who regarded it as a kind of manifesto for the movement. Though his contemporaries Martin Heidegger and Albert Camus would later repudiate the title of “existentialist

philosopher,” Sartre remained committed to existentialism. Although he was a prolific and celebrated writer of fiction and won numerous awards including the Nobel Prize for Literature in 1964, which he refused, he was also influential throughout his life as a literary critic, biographer, and political activist.

Sartre was greatly influenced by his grandfather, Charles Schweitzer, with whom he and his mother lived after the death of his father. As he recalls in his childhood memoir, *Les Mots* [*The Words*] (1963), his grandfather instilled in him a great passion for literature but also incited the antibourgeois sentiment that would inform his philosophical and political writings throughout his life. Despite his interest in politics and literature, Schweitzer thought the career of a writer to be unconventional and unstable, but his grandson defied his wishes. Sartre’s disenchantment with what he saw as the hypocrisy of the bourgeoisie prompted him to study philosophy at the prestigious Parisian academy, l’École normale supérieure, which he entered in 1924, and five years later he passed the *agrégation*, a competitive qualification exam for secondary and university level professors in France. In the period between 1929 and 1939 Sartre taught at le Havre, then in Laon and later at the Lycée Pasteur in Paris.

In 1932, Sartre took a short break from teaching to study at the Institut Français in Berlin, focusing on the work of German philosophers. Of particular importance was his work on Edmund Husserl's phenomenology, the study of consciousness, and the possibility of "necessary truths" observable by but not reducible to consciousness. He was also influenced by the work of Martin Heidegger, with whom Sartre shared a belief in the idea that individuals are continuously creating identities and – in contradiction to Husserl's assumptions – the importance of history in philosophical inquiry and the value of historical examination of social change as a means for improving the human condition.

While at École normale supérieure, Sartre met Simone de Beauvoir who became his lifelong companion; their lives were closely intertwined, both intellectually and romantically. De Beauvoir was also a philosopher, and while she could be said to have worked in Sartre's shadow, she was a significant existentialist in her own right; indeed Sartre has acknowledged her as a major influence on his own intellectual development. Her landmark work, *Le Deuxième Sexe* [*The Second Sex*] (1949), with its emphasis on the political and philosophical implications of gender oppression, has long been regarded as a foundational text for twentieth-century feminism.

SARTRE AND EXISTENTIALISM

Existentialism is a mode of philosophical reflection that enjoyed both academic and popular success in France during World War II and the two decades that followed. The war had caused tremendous upheaval in France during the occupation and created an atmosphere in which intellectuals sought new ways to understand the human condition, specifically by proposing that thinking

about existence requires categories not available in other philosophical frameworks. Sartre's existentialist philosophy claims that for human beings existence comes before essence. He explains this idea in *Existentialism is a Humanism*: "What do we mean here by 'existence precedes essence?' We mean that man first exists: he materializes in the world, encounters himself, and only afterward defines himself" (2007[1946]: 22). This outlook places an emphasis on personal freedom in a meaningless, godless universe and the importance of moral responsibility for actions. Sartre's most important philosophical work, *L'Être et le néant* [*Being and Nothingness*] (1943), offers philosophical explanations through fictionalized scenarios and distinguishes between being-in-itself, which refers to things or nonconscious being, and being-for-itself, which refers to human consciousness or conscious being. The primary difference is in the negative activity of consciousness that Sartre calls "bad faith." With freedom of choice comes absolute responsibility for one's actions; the anxiety prompted by this responsibility leads many to ignore both their freedom and responsibility by allowing others to make choices for them, resulting in "bad faith."

One of Sartre's most notable characteristics is his ability to portray philosophical ideas in fictionalized scenarios. While *Being and Nothingness* used such scenarios to illustrate aspects of his larger argument, his novels and plays dramatized existentialist principles and problems. One of his first fictional explorations of existentialism is his first novel, *La Nausée* [*Nausea*] (1938), in which the protagonist, Antoine Roquentin, becomes aware of the indifference of the physical world to human aspirations, a realization that tortures him with the absurdity of his own existence. He tries to infuse meaning into his life by attempting to write a novel, a solution that reflects his

early contention that authenticity in life can be attained through aesthetic means. The play *Huis Clos* [*No Exit*] (1944), perhaps Sartre's most widely read literary work, exemplifies an existentialist philosophy by portraying three characters who, condemned to reside under one another's gazes, find the constant scrutiny restricting; two of them fall prey to "bad faith" by failing to act upon their freedom of choice either to leave when the opportunity arises or to refuse to be defined by their essence. The result is a virtual "hell," a representation summarized in the famous line, "*L'enfer, c'est l'autre*" ("Hell is other people").

SARTRE AND "LA LITTÉRATURE ENGAGÉE"

If Sartre's early work reflected the phenomenological background of his philosophical study and the development of an existentialist perspective, the period following World War II is characterized by the development of an activist existentialism. In his later writings, he explored the possibility of overcoming the feeling of malaise or uneasiness that an individual experiences upon discovery of the absurdity of existence, by engaging in social activism, which prompts a disruption of the normalization of social roles. His exposure to the atrocities of wartime, especially his nine months as a prisoner of war, increased his awareness of the impact of historical and political events on social conditions. In 1945 he stopped teaching and founded *Les Temps Modernes*, a journal devoted to political, literary, and philosophical ideas, in which he published one of his most important works on literature, "What is literature?" (1949). In it he called for "*la littérature engagée*" (engaged writing) as a means of raising social consciousness. Engagement for Sartre involved taking freely made choices and adapting

them to positive social aims. The position was a reaction to the turn-of-the-century aesthetic movement promoting Walter Pater's ideal, "art for art's sake." Engaged writers choose to take responsibility for the audience in and through their writing which affects the type of writing and the subject matter that they select.

During the war, Sartre began to work on an idea for a series of novels, part of which he wrote during his imprisonment. The project expanded into a series entitled *Le Chemin de la liberté* [*The Road to Liberty*] the first two volumes of which, *L'Âge de raison* [*The Age of Reason*] and *Le Sursis* [*The Reprieve*], were published in 1945. A third volume, *La Mort dans l'âme* [*Iron in the Soul*] and fragments of a fourth, were published in 1949 but the series was never completed. *Le Chemin de la liberté* is concerned primarily with the relationship between individual and collective freedom as well as the dread that accompanies the moral responsibility attendant upon the freedom of choice. It demonstrates, in literary terms, the philosophical shift made by Sartre from an existentialism that was abstract and aesthetic to one that was socially active and relevant. During the 1950s and 1960s Sartre focused on social activism and a search for Marxist solutions to social problems. In the last productive period of his life, from the 1960s to the early 1970s, Sartre focused primarily on political and biographical writing. His last philosophical text, *Critique de la raison dialectique* [*Critique of Dialectical Reason*] (1960), was an attempt to combine existentialist and Marxist thinking, to find new solutions to social ills as well as to posit an innovative approach to historical analysis. He also weighed in substantially on the question of independence in the colonies, American involvement in Vietnam, anti-Semitism and the student uprisings in May of 1968.

Jean-Paul Sartre lost his eyesight in the early 1970s and became increasingly infirm

until his death in 1980. His funeral in Paris was widely attended, attesting to the significant influence his ideas had come to wield in academic as well as popular spheres. References to him, his works, and his ideas abound in popular and literary culture. He continues to be the subject of numerous studies including biographies, political commentaries, and wide-ranging literary studies. His fictional works and philosophical ideas continue to spark controversy and inspire critical inquiry in literary and cultural studies.

Saussure, Ferdinand de

JOANNE A. HSU

Ferdinand de Saussure (1857–1913), one of the founders of modern linguistics, transformed the discipline's historical and comparative methodologies, grounding them in a structuralist approach that focused on systems and the relations of words within them. He introduced a view of language in which the sign, consisting of a signifier and a signified, constitutes the basic unit of linguistic analysis. By viewing language as a system based on signs, Saussure also defined the foundational principles of semiotics. His theory of language, outlined in his *Course in General Linguistics* (1916), so dominated the field in the human sciences that it gave rise both to structuralism and its ongoing critique, poststructuralism.

Saussure was born in Geneva to a prominent family. Both his mother, the Countess de Pourtalès, and his father, Henri de Saussure, came from aristocratic backgrounds. In addition, many of Saussure's immediate and extended family members were known for their contributions to the natural sciences as well as to public affairs. Henri de Saussure, for example, was a zoologist and entomologist known for his travels in Central America, and Saussure's uncle Theodore de Saussure was mayor of Genèthod, Switzerland.

Even in his childhood, Saussure was a bright student who showed an interest in languages, a pursuit encouraged by his family background and the connections it afforded. Adolphe Pictet, a friend of the Saussure family, introduced the young Saussure to linguistics, and by age 12 Saussure had read parts of Pictet's *Origines indo-européennes* [Origins of Indo-European

Languages]. By age 15, Saussure knew Greek, French, German, English, and Latin. He also started studying Sanskrit while in school. As a teenager, Saussure even attempted to outline a general system of language in a paper titled, "Essay on languages." Developing a general system of language became a topic to which Saussure would repeatedly return throughout his career, though this ambitious first attempt most likely served only to amuse Pictet.

Despite his early interest in linguistics, Saussure entered Geneva University in 1875 intending to study the natural sciences as others in his family had before him. He continued to take courses in Greek and Latin grammar and eventually decided to focus on a career in languages. With the help of some family connections, Saussure joined the Linguistic Society of Paris and, in the fall of 1876, began his studies in Indo-European linguistics at the University of Leipzig. His two-year stay in Leipzig was to have a significant effect on his critique of linguistics, for he discovered there a group of young linguists – including Karl Brugmann, Hermann Osthoff, Karl Verner, and Wilhelm Braune – known as the Junggrammatiker or Neogrammarians. The Neogrammarians rejected the idea that language developed organically, that in fact it *decayed*; they studied a wide array of Indo-European languages in conjunction with their earlier stages or parent forms to track sound changes that occurred in the various languages. In doing so, they concluded that language change is systematic and occurs through use, the level of language Saussure would later call *parole*. While he embraced the Neogrammarian view of language as dependent upon social practice, he later wrote that he regarded the work as incomplete, in that the Neogrammarians continued to use the comparativist apparatuses that they had disavowed.

At Leipzig, Saussure showed that his thinking could be as influential as that of the most creative minds working in the field. Karl Brugmann's well-respected article titled, "Nasalis sonans in der indogermanischen grundsprache" ["Nasalis sonans in the original Indo-European language"], must have seemed familiar to Saussure, for, as a schoolchild, he had drawn conclusions similar to those in the article. He had not then pursued the idea that the parent language of Germanic languages had syllables without vowels because it conflicted with the work of established linguists of the time. He later regarded his early inactivity on this topic with regret.

While his work at Leipzig and at his subsequent appointments showed that he was a linguist of very high caliber, none of Saussure's publications indicated that he would later initiate a revolution in thinking. Before the publication of the *Course in General Linguistics*, he was best known for his highly regarded *Mémoire sur le système primitive des voyelles dans les langues indo-européennes* [Thesis on the primitive system of vowels in Indo-European languages]. Though the *Mémoire* was praised for its ambition and methodological rigor upon its publication in 1878, its influence was limited to studies on Indo-European morphology. It took an entire generation for scholars to accept that the *Mémoire* had larger theoretical implications. For some scholars, Saussure's dissertation on the use of the genitive case in Sanskrit did not measure up to the high standards set by the *Mémoire*; nevertheless, it was sufficient for Saussure to complete his doctoral studies. After passing his doctoral examination *summa cum laude* in February 1880, he left Leipzig for Paris, where he began a well-regarded and stable career. From 1881 to 1891, he remained in Paris where he taught as a lecturer at the *École pratique des hautes études*, an institution of higher education.

His lectures in Gothic and Old High German, Sanskrit, Latin, Persian, and Lithuanian attracted many students, including Antoine Meillet, Maurice Grammont, Paul Passy, and others who also became distinguished linguists. He remained active in the Linguistic Society of Paris, where he had begun publishing papers during his university studies.

In 1891, despite being named Chevalier de la légion d'honneur (Knight of the Legion of Honor) by a group of older colleagues that included the eminent French philologist Gaston Paris, Saussure left Paris for his native Geneva, where he was offered the professorship of the history and comparison of Indo-European languages at the University of Geneva. Saussure held this position until 1896, when he was offered the chair of Sanskrit and Indo-European. Each year, he taught courses on Sanskrit, in addition to other courses on Greek and Latin phonology and morphology, the history of the Indo-European verb, Greek dialects, German dialects, and other subjects. Through teaching, he sometimes revealed scholarly interests that he otherwise kept private. A fascination with Germanic legends, for instance, would have remained unknown to others had he not included the topic in his course on German language and literature.

In Switzerland, Saussure became more preoccupied with what he perceived as fundamental problems in linguistics, though he did not publish anything on the subject. By then, he had married and fathered two sons and published very little at all. In a tribute written soon after his death, Antoine Meillet remarked that after publishing the *Mémoire* at the uninhibited age of 21, Saussure had become more careful with his publications, wanting to understand a system completely and coherently before putting an idea in print (Meillet 1966). But even caution

does not fully explain his lack of scholarly productivity, for he was also becoming increasingly frustrated with his field. In 1894, he wrote a letter to Antoine Meillet about the “inadequacy” of linguistics and his wish to write a book “in which I shall explain without any enthusiasm or passion why there is not a single term used in linguistics which has any meaning for me” (Benveniste 1964: 95–6). Saussure never completed or published this proposed book, but he did give a series of lectures in 1907, 1908–9, and 1910–11 that later became the *Course in General Linguistics*. He became ill in 1912 and died in February of the next year at the age of 56.

While Saussure is best known for the *Course in General Linguistics*, it is curious that at the time of his death, he appeared to have neither written this book nor taken any steps to prepare some form of it for publication. Students and colleagues wishing to memorialize Saussure were not even able to find detailed notes that corresponded to his lectures. The task fell upon two of Saussure’s former students, Charles Bally and Albert Sechehaye, to organize the notes of those who had attended his lectures into a publishable manuscript. In the resulting *Course*, first published in 1916, Saussure proposed that, rather than taking a historical and comparativist approach to language, linguistics should focus instead on how language works as a system. In other words, he wanted to examine the function of the relationship between words and their referents across languages. Saussure thus proposed two fundamental changes to the study of linguistics: first, he advocated a synchronic rather than a diachronic approach; second, he drew a distinction between *langue*, the abstract principles of language that exist in the mind, and *parole*, instances of individual utterances that are expressions of *langue*.

Because he wanted to understand the nature of language, Saussure focused on the system of *langue* rather than on the particular instances of *parole*. He introduced the sign, a link between a concept known as a signified and a sound pattern known as a signifier, as the basic unit of the *langue*. The relationship between the signifier and signified, according to Saussure, is neither necessary nor natural. It is entirely arbitrary. A sign becomes meaningful only because signifiers acquire meaning from their differentiation and opposition within a system. This approach to language as a sign system is the foundation of Saussure's semiology.

Saussure's critique of linguistics and his desire to understand human behavior in relation to language resulted in his proposal of a new science that examined the role of signs in social life. Coined from *sēmeîon*, the Greek word meaning "sign," semiology encompasses language as one of many sign systems. To understand fully the system of language, however, Saussure argued that other systems, including rites, customs, and other cultural behaviors, also needed to be identified and examined. One of the key ideas in the *Course* is that human behavior acquires meaning through a system of arbitrariness and differentiation. The link between language systems and other cultural systems made possible the development of structuralist analysis, which, like semiology, focuses not on instances and examples akin to *parole* but on the patterns and relations designated by *langue*.

Of course, crucial to evaluating Saussure's influence on linguistics and other fields is the assumption that the *Course* is an accurate representation of his thought. While scholars generally agree that it was a groundbreaking book, its method of "assemblage" resulted in contradictions and unverified claims. Converting oral lec-

tures into a book presented challenges for Bally and Sechehaye, because Saussure's notes did not outline or explain his theories and ideas. They ultimately decided to reconstruct his general theories by focusing on the third course and integrating material from his previous lectures and any extant notes. Such an editorial decision has predictably led to debates over what Saussure's core ideas really are. Some, for instance, have critiqued Saussure's view of language as asocial and ahistorical, while others have remarked on his inconsistent explanations of *langue*. The discovery in 1996 of *Écrits de linguistique générale* [*Writings in General Linguistics*], a manuscript form of the lectures written in Saussure's own hand, has settled some of these debates. The *Écrits* demonstrates that while Saussure upheld language as fundamentally historical, he also thought it necessary to depart from historical linguistics, at least temporarily, to better understand the functioning of language. Moreover, the *Écrits* allows us to trace the development of *langue* from Saussure's early lectures to his written manuscript and finally to the 1907–11 lectures that formed the basis of the *Course*. This trajectory shows a use of *langue* that is at first tentative but over time is used more confidently, though it is not consistently defined.

Saussure's handwritten manuscript goes a long way toward legitimizing the 1916 *Course*, despite the criticism leveled at Bally and Sechehaye's methods. In any case, it remains a touchstone in twentieth-century literary theory; its influence on linguists as well as anthropologists and literary critics is indisputable. Indeed, the "poststructuralist turn" in the mid-1960s demonstrated just how powerful his influence was. The structuralist concept that meaning was *constructed* through cultural systems resulted in the transformation of analytical methodologies across the human and social sciences.

During the heyday of poststructuralism (roughly 1960–80), French scholars such as Claude Lévi-Strauss, Roland Barthes, Jacques Lacan, Michel Foucault, and Louis Althusser redefined the disciplines of anthropology, literature, psychoanalysis, political philosophy, and the history of thought through critical applications of Saussure's thought.

Jacques Derrida's incisive critique of the signifier/signified relation, which lies at the foundation of deconstructionist analysis, is only the most famous example of Saussure's legacy. Drawing on Aristotle, Rousseau, Hegel, and other thinkers, Derrida demonstrated the prizing of speech over writing implicit in linguistic studies. He called into question the priority of speech over writing, which he found throughout the history of linguistics, including Saussure's *Course*. In a groundbreaking deconstructionist critique, he used Saussure's theory of the arbitrariness of the sign to disrupt this priority. By focusing on writing rather than speech, he was able to demonstrate the temporality of language (its "spacing" of differences through time). That the signified is always deferred allows for an openness of interpretation, the ability to *deconstruct* a text and examine what has *not* been written. This emphasis on the creation of meaning in textual gaps, or aporias, is characteristic not only of deconstruction but of poststructuralism generally. By the end of the twentieth century, the concepts of difference and textuality that emerged from poststructuralism remain vital to our understanding of literary and cultural theory.

Semiotics/Semiology

LAHCEN E. EZZAHER

“Semiotics” and “semiology” are terms used to refer to the general science of signs and signification. The term “semiology” is associated primarily with the work of the Swiss linguist Ferdinand de Saussure, while the term “semiotics” is often linked to the American philosopher and mathematician, Charles Sanders Peirce. In both cases, the thrust of semiological study is to explore how signs, understood as social constructs, are shaped by and through language. The study of signs has been taken up by academic disciplines such as linguistics, information theory, formal logic, and structural anthropology, though semiotic analysis is a common strategy across the spectrum of poststructuralist theories.

The world we live in is populated with signs, which are communicated to us through all types of media: books, television and cinema, billboards, newspapers and magazines, and online environments of every description. But their ubiquity in contemporary society is founded on an ancient understanding of the sign as fundamental to logical thought. The concept “sign” (Greek, *sēmeion*) can be traced back to Book I of Aristotle’s *Rhetoric*, in which he discusses the nature of signs. For Aristotle, signs constitute an essential part of syllogistic reasoning and therefore he includes them in the category of enthymemes, in addition to what he calls “probabilities.” Aristotle demonstrates the logical nature and rhetor-

ical force of the sign when he distinguishes between a sign “that bears the same relation to the statement it supports as the particular bears to the universal” and one whose relation is the reverse, “the same as the universal bears to the particular” (1984: 1357a–b). The “infallible” sign – that which provides “complete proof” (*tekmērion*) – is the basis of syllogistic logic. Aristotle explains:

Now the one kind of Sign (that which bears to the proposition it supports the relation of particular to universal) may be illustrated thus. Suppose it were said, “The fact that Socrates was wise and just is a sign that the wise are just.” Here we certainly have a Sign; but even though the proposition be true, the argument is refutable, since it does not form a syllogism. Suppose, on the other hand, it were said, “The fact that he has a fever is a sign that he is ill,” or, “The fact that she is giving milk is a sign that she has lately borne a child.” Here we have the infallible kind of Sign, the only kind that constitutes a complete proof, since it is the only kind that, if the particular statement is true, is irrefutable. The other kind of Sign, that which bears to the proposition it supports the relation of universal to particular, might be illustrated by saying, “The fact that he breathes fast is a sign that he has a fever.” This argument also is refutable, even if the statement about the fast breathing be true, since a man may breathe hard without having a fever. (1984: 1357b)

Thus in Aristotle’s framework, signs are primarily grounded in language (*logos*), for they are derived from discourse practices and their main function is epistemic since they are essentially concerned with the production of knowledge and proof.

In Book VII of his work *Lives of Eminent Philosophers*, third-century BCE Greek biographer Diogenes Laertius informs us of a book *Of Signs* (*περὶ σημείων*) written by pre-Socratic Greek philosopher Zeno. In the same book, Diogenes relates what the Stoics say in their theory of language and tells us

that, for example, Chrysippus takes the subject of dialectic to be “signs and things signified” (1959, II:62–4).

Saint Augustine, in *On Christian Doctrine*, reiterates the classical view that signs play a role in the knowledge-making process when he indicates that “things are learnt by means of signs” (1977: I:ii). “No one uses words,” he writes, “except as signs of something else” (I:iii). For Augustine, signs are the conventional means by which people show “the feelings of their minds, or their perceptions, or their thoughts” (II:ii). To misinterpret signs is to be “misled by error” (II:ix). Saint Augustine regards the sign less as a component of syllogistic logic than as the locus of a hermeneutical understanding of language. His treatise offers both a general theory of signs and a guide for understanding and interpreting sacred scriptures.

Classical and theological conceptions of the sign remained constant until the late nineteenth century, when new developments in logic and linguistics led to the reconceptualization of the sign at the center of a new science. The term “semiology” was first proposed by Saussure, who used it to define a science that “studies the role of signs as part of social life” (1983[1916]: 15) within systems of signification. In *Course in General Linguistics*, Saussure establishes the arbitrary nature of the sign, which he describes as the result of a relationship between the “signifier” and the “signified.” The sign does not exist independently of language; it consists in an arbitrary link “between a concept [signal] and a sound pattern [signification]” (1983[1916]: 66–7). The arbitrary nature of the sign is the organizing principle of structuralist linguistics and semiology. As Saussure puts it, “the main object of study in semiology will . . . be the class of systems based upon the arbitrary nature of the sign” (68). Though arbitrary, signs nevertheless exist in specific kinds of relations to each other: “paradigmatic,” in which words sub-

stitute for each other, and “syntagmatic,” in which words are contiguous to each other. Saussure also points out that language is a social practice, conditioned by the conventions of social institutions like schools and churches (1983[1916]: 21). Neither the individual nor the community can exercise their authority to change even a single word of a linguistic system. “The community, as much as the individual, is bound to its language” because language, understood as “a semiological phenomenon” is a “social fact” (71, 77). Saussure suggests that a great number of signs are necessary to constitute a language, that language constitutes a complex system, and that a system of linguistic signs must have a strong sense of stability to gain the status of a social institution. Structuralist linguistics prompted a new wave of inquiries into the nature and function of the sign as a social phenomenon, for it paved the way for new research questions and new fields of practice.

Well before Saussure gave his famous lectures on general linguistics, Charles Sanders Peirce had proposed a complex classification of signs which can be grouped into three broad categories: symbols, icons, and indices. According to Peirce: “A sign stands for something to the idea which it produces, or modifies. . . . That for which it stands is called its object; that which it conveys, its meaning; and the idea to which it gives rise, its interpretant” (1934–48, 1:339). Semiosis is thus the “cooperation” of the sign, its object, and its interpretant: “this tri-relative influence not being in any way resolvable into actions between pairs” (5:484). The “interpretant” performs the crucial function of completing the relationship that the sign has with its objects. The Italian semiotician Umberto Eco cautions us not to confuse interpretant with interpreter. “*The interpretant is not the interpreter*” he insists, “The interpretant is that which guarantees the validity of the sign, even in the absence of

the interpreter" (1976: 70). He goes on to point out that establishing the interpretant requires naming it by using another sign, which has its own interpretant, in what Eco calls, "a process of *unlimited semiosis*" (70).

Following Saussure and Peirce, a number of scholars from different disciplines took up the concept of the sign and broadened the scope of structuralism and semiotic study. One of the earliest developments came from the new critic I. A. Richards who, writing with C. K. Ogden, argued that there could be no theory of language without a theory of signs. Ogden and Richards define the sign as "a stimulus similar to some part of an original stimulus and sufficient to call up the engram formed by that stimulus" (an engram is "the residual trace of an adaptation made by the organism to a stimulus") (1923: 53). In cognitive functions, the "engram" adapts to its referent; it is what the sign signifies. Interpretation of signs, the authors suggest, is made possible by recurrent external or psychological contexts (1923: 57). M. M. Bakhtin, like Richards, considered human language the most fundamental characteristic that humans possess; but Bakhtin's approach to the problem of signification is rooted in a Marxist methodology that regards context in terms of ideology and material relations. Valentin Voloshinov's *Marxism and the Philosophy of Language*, which was greatly influenced by Bakhtin's theories, explains that "side by side, with the natural phenomena, with the equipment of technology, and with articles for consumption, there exists a special world – the *world of signs*" (Voloshinov 1986[1929]: 10). For Bakhtin and Voloshinov, the ideological, by its nature, signifies: "it represents, depicts, or stands for something outside itself. In other words, it is a *sign*" and "*without signs, there is no ideology*" (9). Consciousness, moreover, is possible only in so far as it arises in the "material embodiment of signs"

(11); it is where the body and the external world meet. Bakhtin's chief contribution to the study of signs is his insistence on the materialist dimension of language and his belief that a philosophy of language is in fact a philosophy of signs.

By the middle of the twentieth century, the concept of the sign had entered the mainstream of linguistic thought, from which it spread outward to influence a wide variety of disciplines, from anthropology to psychoanalysis, literary criticism to rhetoric and stylistics. The impetus of this wide-ranging influence was the idea that signs operate systematically. For example, Emile Benveniste, in *Problems of General Linguistics*, defines language as a system in which a unit is "defined by the relations which it maintains with other units and by the oppositions into which it enters" (1971[1966]: 19). Benveniste believed that the systematic nature of language allows speakers to use basic linguistic elements in an infinite number of combinations, which will be identifiable to the speakers because they share the same system. Claude Lévi-Strauss, in *Structural Anthropology*, emphasizes the importance of a close connection between linguistics and anthropology, for "anthropology aims to be a *semeiological* science, and takes as a guiding principle that of meaning" (1963[1958]: 364). Lévi-Strauss, like Saussure and other structural linguists, was concerned that the "objective basis of language (*sound*)" would be separated from the "signifying function (*meaning*)" (364–5). His chief innovation with respect to semiotics was to point out the similarity between kinship and phonemic systems, for, as in language, the "observable phenomena" of kinship systems "result from the action of laws which are general but implicit" (34). He concludes that "kinship terms not only have a sociological existence; they are also elements of speech" (36).

The semiotic conception of the sign – its arbitrary nature, its differential construction, its social character – has led to a wide range of theoretical projects focusing on signification and signifying systems. As Jonathan Culler explains in *Structuralist Poetics*, “Social and cultural phenomena are not simply objects or events but objects or events with meaning, and hence signs” (1981: 4). Culler explains that structuralism and semiology are inseparable, since studying signs is possible only by studying the systems in which they enter into differential relations with other signs. Signification was an essential preoccupation for Roland Barthes, who used linguistics as a model in the analysis of other social and cultural phenomena. He was engaged in a series of structural analyses that aimed at defining a number of nonlinguistic languages. For example, in *Mythologies* (1972b[1957]), he examines the signification of various cultural objects and practices in French popular culture such as wrestling, advertising, film, clothing, and food in order to expose their ideological content. In *Elements of Semiology* (1968[1964]), he groups the elements of this science under four major headings, which he borrowed from structural linguistics: Language and Speech, Signified and Signifier, Syntagm and Paradigm, Denotation, and Connotation. He argues that these binary classifications are characteristic of structuralist thought. Social and cultural practices become systems of signification that can be analyzed by the four major categories. For example, to illustrate how Saussure’s distinction of language/speech works in the study of the food system, Barthes notes that “alimentary language” includes exclusions and taboos, binary oppositions, “rules of association” or rituals that function as an “alimentary rhetoric.” Speech concerning food is marked, he argues, by a richness of variation that concern preparation and association (1968[1964]: 27–8).

The application of semiotics in literary criticism has led to an emphasis on literary signification or literary semiotics by theorists such as Culler, A. J. Greimas, Julia Kristeva, and Michael Riffaterre. In this sense, literary criticism has become, as Culler (1981) has labeled it, “a pursuit of signs.” Semiotics provides a working vocabulary that will enable readers to understand how systems of signification are constructed and how they work. Of course, as early theorists had established, signs are constructed in social and cultural contexts. For Culler and the poststructuralists, context was often regarded as *discursive* and encompassed language systems, discourse formations, and intertextual relations. As Culler points out, to read is “always to read in relation to other texts, in relation to the codes that are the products of these texts and go to make up a culture” (1981: 12). In this sense, the signs that make up literary works acquire a signifying function by which such works “participate in a variety of systems – the conventions of literary genres, the logic of story and the teleology of emplotment, the condensations and displacements of desire, the various discourses of knowledge that are found in a culture” (Culler 1981: 12). For Culler, a semiotics of literature would analyze signification of literary texts within a larger discourse or “institution” of literature.

Such modes of signification are described by Riffaterre, with special focus on poetic discourse. According to Riffaterre, the semiotic process takes place in the reader’s mind and involves two levels or stages of reading: first, the reader moves through the text “from top to bottom” in a process of unfolding; at this stage, the reader’s linguistic competence, entails the ability to identify tropes and figures. Literary competence – “the reader’s familiarity with the descriptive systems, with themes, with his society’s mythologies and above all with other texts”

(1978: 5) – comes into play at this stage as well. At the second stage “retroactive reading” takes place, during which “the reader remembers what he has just read and modifies his understanding of it in the light of what he is now decoding. As he works forward from start to finish, he is reviewing, revising, comparing backwards. He is in effect performing a structural decoding” (1978: 5–6). Riffaterre distinguishes between units of meaning, which may consist in single words or phrases, and the “unit of significance,” which is the text as a whole. For this reason, “ungrammaticalities,” like the surprises identified by reader-response theorists, constitute meaning at the level of the “higher system” of the text – a meaning that would be lost or occluded at the level of the single word taken in isolation.

While Saussure and the structuralist school in general have developed theories of signification based on the differential relationship between signified and signifier, Jacques Derrida, the leading proponent of deconstruction, has attempted to rethink the idea of difference. In *Writing and Difference*, he asks: “But is it by chance . . . that the meaning of meaning . . . is infinite implication, the indefinite referral of signifier to signified? And that its force is a certain pure and infinite equivocality which gives signified meaning no respite, no rest, but engages in its own *economy* so that it always signifies again and differs?” (1978[1967]: 25). In fact, he suggests that there are two ways of erasing difference in signification: one “consists in reducing or deriving the signifier, that is to say, ultimately in *submitting* the sign to thought,” the other consists in deconstructing the very system in which the signifier is reduced, specifically, the “opposition between the sensible and the intelligible” (1978[1967]: 281). Deconstruction, in short, recognizes and revalues the fundamental instability of the sign and the infinite deferral of the signified.

Despite the radical critique of the sign by deconstruction, semiotics has remained a productive and viable discipline. The International Association for Semiotic Studies, whose official journal is *Semiotica*, was founded in 1969 and held its first meeting in Milan in 1974. The founding members included Greimas, Kristeva, Benveniste, Eco, Roman Jakobson, Thomas A. Sebeok, and Juri Lotman. The Semiotic Society of America, which publishes *The American Journal of Semiotics*, is another significant interdisciplinary professional organization that brings together a diverse community of scholars with common interests in the study of signs and sign systems. Other journals include *Semiotics* and *Journal of Biosemiotics*, whose main focus is semantic biology, a field that examines biological messages more closely. The connection with biology indicates the extension of semiotics across the disciplinary spectrum. In addition to linguistics, anthropology, literature, philosophy, and other humanities disciplines, semiotics has been applied in the fine arts, communication, pedagogy, mathematics, and law as well as new fields of academic research such as cognitive semiotics, verbal semiotics, and more recently zoosemiotics, biosemiotics, and physiosemiotics, branches that examine thought as an environmental phenomenon. As Greimas and Joseph Courtés put it, “Recognizing that there is no language without thought, nor thought without language, does not imply that we have to consider natural languages as the only receptacle of ‘thought’: the other, non-linguistic, semiotic systems are also languages, that is, signifying forms” (1982 [1979]: 284).

Shklovsky, Viktor

BRIGITTE FLICKINGER

Viktor Borisovich Shklovsky (1893–1984), Russian literary theorist, critic, and writer of experimental prose, film scenarios, and memoirs (on Lev Tolstoy, Vladimir Mayakovsky, and Sergei Eisenstein), was one of the initiators and leading representatives of Russian Formalism. Stimulated by his experience of Russian Futurism, he gave formalism many of its crucial concepts and key words. His theoretical works and analyses of literature and film influenced the

Prague Linguistic Circle, morphology, and structuralism. Shklovsky coined the term “*ostranenie*” (остранение, estrangement), one of the most important “devices” of poetic language and an essential concept for the “scientific method” of formalist textual analysis. Though he was well known in Russia from the late 1910s, it was not until the 1950s that Western thinkers began to take notice of his provocative ideas about literary form.

Shklovsky was born in St Petersburg into a family of Russian-German-Jewish origin and grew up in the Tsarist capital where his father worked as a mathematics teacher. He studied philology and history at St Petersburg University during the economically meager but culturally rich years of World War I. During the war, Shklovsky volunteered for the Tsarist army, then later joined the Socialist Revolutionary Party and served on the Petrograd Soviet and fought in the civil war (1918–21) against the Bolsheviks. In contrast to the revolutionary atmosphere of the period 1905–17, the academic environment upon his return to the university was still committed to traditional literary history: dealing with authors, their biographies, and most of all with the ideas they present. Young students, however, in a euphoric mood of innovation, wanted to tread new paths. They gathered in private circles to discuss the literary works themselves, especially contemporary futurist poems. In his seminal study *Russian Formalism*, Victor Erlich described the atmosphere of creative excitement of this period: “There was an air of intellectual excitement about these unique gatherings, combining the earnestness of the linguist’s laboratory with the buoyant flippancy of a literary café” (1980 [1955]: 69). Inspired by Russian Futurism and its experimental use of language (by Mayakovsky and others), Shklovsky developed his own original theses on literature. His first public appearance was character-

istic of his later nonacademic professional career. It occurred after midnight on December 23, 1913, in the St Petersburg avant-garde artists’ nightclub and cabaret, the Stray Dog, where he presented a paper on “The place of futurism in the history of language” to a mixed audience of bohemian intellectuals. This atmosphere of “scientific sociability” suited Shklovsky’s own evolving style: astute, witty, trenchant, telegrammatic, but vivid and full of ideas and associations.

Shklovsky’s many books and thousands of articles in the following years documented his creative and scholarly ambitions (Sheldon 1977). His first, groundbreaking Stray Dog article was incorporated into “The resurrection of the word” (1914), in which he asserts a fundamental linguistic difference between poetic and common language. While the word in everyday speech is “petrified” (fossilized) through “habituation” and restricted to merely cognitive understanding, poetry succeeds in “revitalizing” the word, making it perceivable. By creating “new forms of art,” the poet makes us “see, not only recognize” (Shklovsky 1973b[1914]: 42–6).

Shklovsky developed a fundamental component of Russian formalist theory – a methodology for analyzing literary devices – and defined the task of formalist criticism. He met weekly with Boris Eikhenbaum, Yury Tynyanov, Osip Brik, and the linguist Lev Yakubinsky, in what from 1916 was called the “Society for the Study of Poetic Language” (OPOYAZ). This was a forum for debating and for publishing on formalist subjects: on words, sounds, style, plot, and story. Such investigations into poetic devices could make sense even of the trans-rational, “trans-sense-language” poetry of Velimir Khlebnikov, who postulated the primacy of sound over meaning and saw the aesthetic experience in the phonetic instrumentation and rhythm of a poem

(Shklovsky 1919[1916]). In cooperation with Jakobson's Moscow Linguistic Circle (MLK), Shklovsky and the OPOYAZ developed a full-fledged formalist theory.

Shklovsky's seminal article "Art as device," first published in an OPOYAZ anthology in 1917, was regarded as the "manifesto of formalism," in which Shklovsky illustrates how, in contrast to common language, poetic language achieves its "resurrection." Among other devices (such as retardation or digression), *ostranenie* (making strange) is the essential artistic principle. As a neologism, this Russian word *ostranenie* is itself "estranging" – and is not easily translatable: the most common translations in English are "alienation," "estrangement," "enstrangement," and "defamiliarization." *Ostranenie* in literature has a double effect. First, by different means it counteracts the usual automation of our perception, prevents habituation, and "lead[s] us to a 'knowledge' of a thing through the organ of sight instead of recognition." Second, defamiliarization makes us conscious of the literary *form* itself which is the actual object of art and criterion for aesthetic value. "By 'enstranging' objects and complicating form," Shklovsky writes, "the device of art makes perception long and 'laborious.' Art is a means of experiencing the process of creativity. The artefact itself is quite unimportant; the object is not important" (1990a[1917]: 5–6).

In the 1920s, Shklovsky clarified in greater detail how "sjuzhet" (plot) construction – the organization of motifs within a narrative – is decisive for the specific "zhanr" (genre), be it a fairy tale, parody, adventure story, or film. "Sjuzhet devices" like repetition, retardation, and parallelism build a "staircase construction" of increasing effectiveness. As such "the form creates content for itself" (1973a: 54, 56). This thesis, too rigidly understood by Soviet politicians, was soon considered untenable. Towards the end of the 1920s, formalism

and Shklovsky were accused of neglecting the real task of art: to educate the "new socialist man." But Shklovsky was no apolitical, otherworldly theorist. From early on he engaged actively in the political movements of the time, and the range and versatility of his output was inextricably linked to the momentous political and cultural changes in Russia throughout his lifetime.

In 1920 Shklovsky was appointed as a lecturer at the Institute of Art History in Petrograd and lived in the House of Arts, the center of active literary life in the city. He also initiated, together with Maxim Gorky, Evgeny Zamyatin, and others, the young writers' group the Serapion Brothers, to support the writing projects of 12 gifted writers. But by the end of 1921, the experimental character of the Serapions' prose lost official backing; in the following year, when the secret police began to arrest members of the Social Revolutionist Party, Shklovsky fled into exile. Like so many political refugees he went to Berlin, where he published *A Sentimental Journey* (1970 [1923]). The title, in a double sense ironical, alludes to Laurence Sterne's novel of the same name, but Shklovsky's journey was far from being "sentimental." It was a journey through war, famine, illness, and death, an account of the atrocities of the civil war and of the early Bolshevik regime. Though he narrates like Sterne in a disjointed, episodic way, full of digressions, his style is distant and impartial. The book includes fascinating portraits of artists and writers whom Shklovsky had met during these years – including Nikolai Gumilyov, Alexander Blok, and Osip Mandelstam.

Shklovsky's second book published in Berlin, *Zoo, or Letters Not About Love* (1971[1923]), is an autobiographical novel in 30 "letters" from the unhappy émigré, alien and lonely in Berlin after World War I. The book reflects on the author's unrequited love for a beautiful young

Moscow émigré (Elsa Triolet, later wife of the French writer Louis Aragon), by creating a distant and unfamiliar poetic picture of the crisis-ridden, though culturally lively, capital of Germany. The startling final letter is addressed to the Party Central Committee, begging for permission to return to his home country. Shklovsky's involuntary stay in Berlin lasted from April 1922 until June 1923. With the help of Gorky and Mayakovsky he obtained an amnesty that allowed him to return to Russia.

In Moscow Shklovsky joined the arts group Left Front (LEF), an alliance of Marxist-Futurists, Constructivists, and Formalists, organized by Mayakovsky in 1922. It was founded to oppose the growing influence of conservative groups like the Russian Association of Proletarian Writers (RAPP). Convinced that avant-garde literature was the most appropriate expression of the new and liberated revolutionary mind, LEF insisted on the freedom of art. Shklovsky's autobiography, *Third Factory* (2002[1926]), reflects the crisis – and does so in futurist style. In 1925, and again in 1929, Shklovsky was able to reprint some of his most important articles on formalist theory in the anthology *Theory of Prose*. But politically formalism was already on the decline.

When, towards the end of the 1920s, Stalin strengthened his political position by forcing the unity of all spheres of social and cultural life, “proletarian writers,” supported by the political authorities, gained primacy over “avant-gardists” at the “cultural front.” The all-embracing Union of Soviet Writers, founded in 1932, put writers politically and economically under party control. At their first All-Union Congress in August 1934 in Moscow, the political statement came first: Andrei Zhdanov, Secretary of the Communist Party, defined the role and responsibilities of writers in society. After him Gorky declared “socialist

realism” to be the basis of the literary program and the obligatory style. Shklovsky, who was not a party member, spoke at the sixth session. In a short but original contribution he pleaded for a new humanism and the admissibility of sentiments in literature. In 1934 Stalinist purges began.

Respecting Shklovsky's integrity, Richard Sheldon remarks in his introduction to *Sentimental Journey* that Shklovsky “dutifully recited and nominally heeded the official formulas required during the Stalinist era, but he never completely surrendered his early positions” (1970: xxiv). His adaptability, originality, prolific productivity, and popularity in Russia contributed to Shklovsky's survival in the Stalin years. He never stopped writing, but cautiously concentrated on literary prose, memoirs, and film scripts instead of literary theory (Sheldon 1977).

Shklovsky's influence has been wide ranging. Bertolt Brecht, who used the term “*Verfremdungseffekt*” (“alienation effect”) in his theoretical writing on theatre in 1936, probably came across Shklovsky's term *ostranenie* while visiting Moscow in 1935 (Trebbess 1989). In Prague, Jan Mukařovský developed Shklovsky's formalist thoughts into structuralism, as did Yuri Lotman in Tartu, Estonia, with his structural-semiotic method. In the West, Erlich's analysis (1955) laid the groundwork for further scholarly investigations (Sheldon 1966; Striedter 1969, 1989). From the mid-1960s, as an increasing numbers of formalist theorists were being introduced to the West and as interest in Marxism and revolutionary Russia was being renewed, Shklovsky's work was translated and widely disseminated among a diverse field of scholars and critics (Jameson 1972; Bennett 1979).

Speech Acts

STEPHANIE DEGOOYER

Modern speech act theory derives from the work of Oxford University philosopher John Langshaw Austin and his student

John R. Searle. In the 1950s, Austin argued against the main tenets of logical positivism – that philosophical language should be purely factual, that the meaning of a word should be tied down to a reference in the world – by revealing types of verbal utterance that *do* or make things happen rather than simply name or report them. Although Austin himself did not originate the term “speech act,” his lectures, collected posthumously in *How to Do Things with Words* and *Sense and Sensibilia* (both published in 1962), develop key concepts for contemporary theories of performative speech in literary criticism, linguistics, and philosophy of language.

Austin outlined his theory of the speech act in a series of lectures delivered at Harvard University in 1955. He distinguished between two types of utterance: constative and performative. Constative utterances are statements that are thought to be true or false; they name, report, or simply describe a fact or a state of affairs: “the woman wears black” or “the Declaration of Independence was written on paper.” Performative statements, on the other hand, are utterances that cannot be thought of as true or false. They do not describe an event or state of affairs; their utterance makes an event happen or creates a state of affairs. For example, in *How to Do Things with Words*, Austin argues that “I do” in the context of a marriage ceremony is an action rather than a statement: “When I say, before the registrar or altar, &c., ‘I do’, I am not reporting on a marriage: I am indulging in it” (1962: 6). Other examples of the speech act include making promises, declarations, asking questions, cursing, betting, exclaiming, and giving orders.

Austin offered the word “performative,” coined from a combination of the verb “perform” and the noun “action,” to signal an utterance that uniquely performs its action. But in further attempting to separate

performative from constative utterances he encountered the problem that under the right circumstances *all* verbal utterances can be implicitly performative. The performative verb alone – “I swear” or “I order” – does not make an utterance performative because a person can always be ordered to turn right with the simple statement “turn right.” The same goes for seemingly constative statements. “You are offside,” for example, might be a description of a person’s location in a football match or a truncated version of the referee’s “I now pronounce you offside.” In an effort to finesse his theory of the speech act and further pinpoint its performativity, Austin replaced the distinction between performative and constative utterances with a study of the speech act broken down into three components. This mature theory takes into account the actual meaning of a speech act (its phonetic, syntactic, and semantic features), the force and intended effect of its utterance (the conventions and authority that make a speech act “felicitous”), and the actual success or “misfiring” of its intention – respectively, the speech act as defined by “locutionary,” “illocutionary,” and “perlocutionary” actions.

In 1969, American philosopher John Searle published *Speech Acts*, a systematization of Austin’s theory of the illocutionary act. Though much of Austin’s work was held to be at odds with Anglo-American analytic philosophy, Searle set out to prove not only that speech acts create realities but that they are based on transcendental rules of language. Searle argues that though the propositional content of an utterance might be the same, its intentionality (whether it is intended as a statement, question, command, or expression of desire) profoundly shapes how the utterance is received or satisfied. In his endeavor to conceptualize a transcendental core for speech acts, Searle elaborated on Austin’s claim that speech

acts must be defined by the seriousness of their utterance. Austin had already excluded from consideration statements uttered in poetry, on stage during theatrical performances, or made in jest; Searle continued the argument that performative utterances must be issued in “ordinary circumstances” with the claim that his theory would ignore “marginal, fringe, and partially defective promises” (1969: 55). This recuperation of an “ordinary circumstances” philosophy of language was crucial for setting off a debate with French philosopher Jacques Derrida, who, though he valued Austin’s work on performativity, argued that his representational system could not so easily jettison figurative, literary, or “nonserious” language. In Derrida’s seminal essay “Signature, event, context” (in Derrida 1988), he deconstructs Austin’s terms to reveal that a statement can only be considered language if it has the ability to be repeated or quoted – Derrida’s preferred term is “iterated” – in a nonserious or literary fashion. In order to succeed as a performative utterance, a statement must already be a “sign”; that is, it must stem from a pre-existent discursive practice or set of conventions. For Derrida, the very possibility of a speech act’s success is guaranteed by its ability to be cited in multiple circumstances, serious and nonserious.

Conflicting interpretations of Austin’s work on speech acts illustrates the rift between analytic and continental philosophy. In the late 1970s, Searle published a defense of Austin against what he perceived to be Derrida’s misreading of Searle’s mentor. Derrida, in turn, unleashed a lengthy response, in the form of a deconstruction of Searle in *Limited Inc* (1988). The intractability and fiery tone of this debate have made it a famous example of the divergent responses of continental and analytic philosophies about the nature and function of literature. Despite Searle’s insistence on the

transcendental structure of speech act theory, thinkers in the late 1980s and early 1990s – an age skeptical of transcendentalism of all kinds – have incorporated Austin’s insights into their own theories of performance and performativity. Judith Butler, for example, turns to Austin’s and Derrida’s theories of the performative, not as a model of individual utterance (as for Austin and Searle), but as a model outlining the performative constitution of subjectivities and social identities. Butler raises the stakes of speech act theory by showing how performative utterances function as ideological norms (“It’s a girl!”) that interpellate and name women into social existence. It now seems that the most pervasive and persuasive theories of speech acts (e.g., Shoshana Felman’s and J. Hillis Miller’s work on the subject) champion the role of literature for its ability both to make and create social worlds and to help us understand the norms of social behaviors.

Structuralism

JACK SOLOMON

Structuralism is the name given to a variety of analytic methods and practices that, in the first half of the twentieth century, dominated studies in linguistics, anthropology, literary theory, and semiology. According to structuralist theory, human knowledge and practice is constituted by structural relations between terms in a system governed by codes that assign meaning to each term. The figure most often associated with origins of structuralism is Swiss linguist Ferdinand de Saussure (1857–1913), whose *Course in General Linguistics* (1916) advanced the then novel idea that language is a system that is present in its entirety in each individual utterance. Linguistics after Saussure shifted from the study of utterances to the study of the rules that give rise to utterances. The idea that language use is governed by a linguistic system and that meaning is a function of difference *within the system itself* has had a profound effect on literary and cultural theory.

Saussure proposed a new way of looking at language. The linguists of his day looked at language referentially and historically, and were concerned primarily with the relations between words and things and with the history of linguistic development. A predominant pursuit for these linguists was to determine how most modern Euro-

pean languages could be traced back to a single, long-vanished, Indo-European source language. This historical viewpoint yielded what Saussure called a *diachronic* analysis of language. His main interest, however, was in what he called *synchronic* analysis, a new approach that would consider language ahistorically; for example, rather than focusing on how modern English evolved historically, synchronic analysis would look at how it works as a language system (what Saussure called *la langue*) apart from its history of usage. This elision of history from linguistic analysis would have enormous implications for the future of structuralism in disciplines like anthropology and literary studies, for it suggested that the most important elements of study were formal, even universal, features whose nature and function within linguistic and cultural systems could be isolated from the temporal processes that determined everyday usage.

Saussure's work challenged certain key assumptions regarding language and its relationship to the world. At the time that Saussure was offering the series of lectures that were published after his death as *The Course in General Linguistics*, the common attitude towards language was referential. That is, it was assumed that words referred to things and that the referential connection gives words their meaning. Saussure contended instead that words operate by linking a sound image or signifier with a mental image or signified. That link of sound to concept is what allows words to have meaning, not the reference of word to thing. He used the word "sign" instead of "word" to name his more scientific description of what words are and how they function. Moreover, he noted that all words in a language depend for their identity on other words. Without "hat" or "rat," "pat" could not be distinguished as a sound with meaning. It depends on its difference from adjacent

words in the language system to be able to function as a sound with meaning. According to Saussure, difference makes identity possible. Without differences there can be no identities – at least in language. The relationship between words and things is in fact entirely arbitrary. There is no reason why “tree” should mean what it does in English. The French use an entirely different sound/word – “arbre.” So there is no intrinsic link between language and reality. Our conventional agreements allow sounds to refer to things. As Saussure put it in one of the most famous passages in the *Course*: “in language there are only differences without positive terms. Whether we take the signified or the signifier, language has neither ideas nor sounds that existed before the linguistic system” (Saussure 1966[1916]: 120). Such systems are self-enclosed structures of differentially related signs, with the meanings of those signs being derived from those relations, not from references to things (i.e., positive terms) outside the system.

The postulation of a linguistic system (*la langue*) required a theory of the sign that operates according to *relations* within a signifying system rather than referential connections between signs and objects or concepts outside that system. For Saussure, the sign was ultimately an entirely psychological phenomenon (which is why he regarded what he called “semiology” as a potential new branch of psychology). That is, the signifier, for Saussure, constituted a *sound image* – that is, a sound that the mind recognizes as significant. That sound image is itself composed of the minimal signifying sounds within a language system that Saussure called “phonemes” (an example of a phoneme is the sound that we symbolize with the letter /t/), and each phoneme acquires its value through its differential relations to other phonemes within a language system (for example /t/ is not /r/, and

from the difference between the two we get their phonemic values). Combining phonemes produces “morphemes,” as when /t/ is combined with /r/ and with the long “e” sounding phoneme /i/ to produce “tree” (/tri/). When the morpheme /tri/ is uttered it becomes a signifier at the instant it is heard and recognized, mentally, by a listener. It is recognized by an English-speaking listener because the sound /tri/ is assigned a value in English, and that value is already contained in the English language system, or *langue*.

One consequence of structuralist linguistics is that it allows us to see that all knowledge is conventional. Linguistic signs function because we agree as a community that certain sounds will evoke certain mental images (“tree” will mean a leafy thing, rather than a quadruped, for example). If all knowledge occurs in and through language, then all knowledge depends on similar agreements regarding the words used and the ideas or mental images associated with them. All knowledge is both system-determined and arbitrary in the same way that language is. Ethologists do not carry around a bag of things when they converse about early human history. Rather, they use words like “hominoid” and “Homo sapiens” – sounds that the conventions of ethology allow to have particular meanings, which have the value and function of allowing thought and discussion and research to occur in this field of academic endeavor. Our knowledge of things is always mediated by the language system within which concepts and names within the knowledge field are constructed.

The rise of Russian formalism was instrumental in promoting the adaptability of structuralist principles to the analysis of literary and cultural texts, which could themselves be regarded as self-contained systems of signs. But the most influential application of structuralist principles occurred in the work of the anthropologist

Claude Lévi-Strauss, who used Saussure's linguistic semiology to analyze a wide variety of social and cultural phenomena, from kinship systems to food preparation. This work was innovative and provocative, and it influenced scholars and critics in disciplines throughout the human and social sciences. "Structural linguistics," Lévi-Strauss wrote in 1945, "will certainly play the same renovating role with respect to the social sciences that nuclear physics, for example, has played for the physical sciences" (1963a [1945]: 33). Though he recognized the utility of linguistic structuralism in the study of culture, he recognized also that the "phonemic method" associated with linguistic analysis could not be easily "mapped" onto anthropological objects of study like kinship systems. "The superficial analogy between phonemic systems and kinship systems is so strong," he notes, "that it immediately sets us on the wrong track" (35). The "structural law" of the linguist, which constitutes what Lévi-Strauss calls a "system of terminology," must be accompanied by another system, "both psychological and social in nature," that he called a "system of attitudes" (37). This innovation, which allowed social scientists to take advantage of the objective rigor of structuralist analysis, was to have profound effects throughout the social sciences and, with the advent of poststructuralist theory, the human sciences as well.

Perhaps Lévi-Strauss's most enduring contribution to literary and cultural studies was the study of narrative structures and language that constitute "myth." For Lévi-Strauss, myth is a secondary language system built upon a primary one; for example, the story of Oedipus the King is a secondary system built upon the primary system of Greek, the language in which the story was first told. Though Lévi-Strauss brought to his analysis of myth a rigorous structuralist method, that method was conjoined to

a Marxist understanding of the social function of myth, according to which social contradictions are resolved symbolically through mythic representation. In "The structural study of myth" (1963b[1955]), Lévi-Strauss breaks down the Oedipus story into basic meaning units that he calls "mythemes" (elements within a story that he parallels to the linguistic phoneme), differentially relating each mytheme with another in binary pairs. His interpretation of these mythemes led him to the conclusion that everything from the actions of Oedipus's ancestor, Cadmos, to Antigone's burial of her brother Polynices constituted an attempt on the part of the ancient Greeks to resolve the contradiction between their belief that human beings originated in the earth and their knowledge that human beings actually come from the sexual relations between men and women. In *The Raw and the Cooked* (1983[1964]), Lévi-Strauss expanded on this function of mythic interpretation when he proposed that human societies face a fundamental contradiction in the opposition between life in a state of nature and life in a state of culture. He finds the means to resolve this contradiction in his analysis of aboriginal South American tales, which he reads through the lens of myth. In these tales, social contradictions manifest themselves in the form of a code in which raw food symbolizes *nature* and cooked food symbolizes *culture*. Though some critics find Lévi-Strauss's sociological use of structuralist methods unduly complicated, if not implausible, essays like "The structural study of myth" remain classic examples of structuralist interpretation.

Like Lévi-Strauss, theorists as diverse as A. J. Greimas, Tzvetan Todorov, and Roland Barthes used structuralist methods to analyze cultural texts that offered challenges quite different from those found in the study of languages. Just as structural linguists sought to analyze language in terms of

phonemes, morphemes, signifiers, and signifieds analytically aligned in oppositional pairs, so the structuralist literary critic sought to describe the meaningful units of literary language – for example, distributional and integrational units of narrative (Barthes 1977[1966]: 92–3) – in terms of differential relations. Literary theorists using structuralist methodologies seek to describe the overall conditions of the literary equivalent of *la langue*, and have thus been more successful at describing the conditions of literary discourse than at analyzing individual texts (which would constitute the literary equivalent of *parole*, Saussure’s term for individual speech acts within a language system).

The variety of attempts to find the literary equivalent of the phoneme has led to innovative studies of narrative function. A. J. Greimas, for example, pursued an underlying semantic structure for literary narrative, building upon the work of the Russian proto-structuralist Vladimir Propp. Propp, in his *Morphology of the Folktale* (1975 [1928]), analyzed the fundamental structures of Russian fairytales and devised a typology of characters, such as “the villain,” “the hero,” “the helper,” a “sought-for person,” and so on (Propp’s work has been highly influential in the analysis of cultural texts like the *Star Wars* film series, in which such character types can be easily discerned). Greimas rearranged and simplified Propp’s analysis in order to call attention to the “grammar” of narrative functions; he argues that narratives are constructed around three basic oppositional pairs that he called “actants” (e.g., in one actant Propp’s “hero” becomes Greimas’s actantial “subject” who is opposed to an “object,” or Propp’s “sought-for-person”). Thus every narrative *parole*, so to speak, can be seen as the expression of a simple set of underlying relational structures within the system of narrative itself. Tzvetan Todorov

proffered a similar analysis in his *Grammaire du Décaméron* (1969). In the course of his description of the underlying “grammar” of all narrative, he treated the narrational elements in Boccaccio’s stories as if they were sentences or paragraphs (e.g., a character acts as a noun and an action is equivalent to a verb). Gérard Genette’s theory of narrative discourse offers less a grammar than a set of narrative conditions that operate through fundamental oppositions – for example, narrative “diegesis” vs. dramatic “mimesis,” and “narration” vs. “description” (Genette 1982[1966–72]).

Structuralists like Todorov and Genette are regarded as “narratologists,” insofar as their work focuses on the structures of literary narrative. The most influential structural analyses of poetry appear in the work of the Russian formalist Roman Jakobson. In a collaboration with Lévi-Strauss, he produced a structural analysis of Charles Baudelaire’s sonnet “Les Chats” (Jakobson & Lévi-Strauss 1988[1962]), which broke the poem down into a sequence of binary structures based on grammatical and prosodic elements. His most influential contribution came from work he performed while studying the condition of linguistic aphasia, a condition that blocks an individual from using language properly. Studying aphasiac children with Morris Halle, Jakobson concluded that there were two ways in which language use was affected: he noted, on the one hand, an inability to link words together correctly into sentences and, on the other hand, an inability to see that different words could be substituted for other words within a given sentence. For example, an aphasiac child might know the words “the,” “gray,” “cat,” and “is,” but cannot form the sentence “the cat is gray.” Another aphasiac may be able to form the sentence “the cat is gray,” but cannot see how to substitute “gray” for another color or to differentiate between “the” cat or “this” cat. The first is

a syntactical disorder, the second is lexical. Structural linguistics had already analyzed these dimensions of language into the binary pair of “syntagmatic” functions (which link words syntactically) and “paradigmatic” functions (which make substitutions possible). In “The metaphoric and metonymic poles” (1971[1956]), Jakobson associated the syntagmatic function with *metonymy*, which involves the connection or continuity between parts and wholes (e.g., the White House is connected to the President, and so we can say “the White House said today”), and the paradigmatic function with *metaphor*, which allows the substitution of one thing for another). Jakobson then theorized that all of literature could be analyzed as oscillating between metaphor (e.g., symbolic poetry) and metonymy (e.g., narrative realism).

One of the most influential theorists to use structuralist methodologies was Roland Barthes, whose eclectic and heterogeneous career included a structuralist phase in the 1950s and early 1960s. His work on contemporary mythologies and narrative structures helped bring structuralism to the attention of American literary scholars and pioneered the application of the structuralist methodology to such nontextual phenomena as popular culture, thus introducing the structuralist viewpoint into cultural studies. Works like *Mythologies* (1972[1957]) and *The Fashion System* (1985[1967]) use structuralist methods to analyze cultural sign systems. *Mythologies* analyzes the social practices of bourgeois society (including popular culture) as “mythological” signs that act as a kind of secondary language system whose meanings lie in a systematic ideology. In a famous analysis of the cover of the popular French magazine *Paris-Match*, Barthes argues that the image of an African soldier wearing a French military uniform and saluting bears a significance that goes far beyond the

apparent surface meaning. For at the level of “mythology” (which can be translated roughly as “ideology”), the image of the soldier sends the message that the French empire is benevolent and all of its subjects (including those in African colonies governed by France) are socially equal. Barthes’s treatment of mythologies as ideological language systems with their own internal codes of meaning may well constitute one of structuralism’s most lasting contributions to contemporary semiology and cultural studies. *The Fashion System* demonstrates that even the most common and seemingly banal aspects of culture convey complex messages. Surveying the photographs and captions in the French fashion magazine *Elle*, Barthes notes how some fashion features – say, the piping on a woman’s dress – are emphasized in the caption accompanying a photograph, thus setting up a binary relation between the article of clothing that has the emphasized feature and one that does not. Within the binary relation piped/unpiped, the *difference* between a dress with piping and one without piping signals that a given dress is fashionable or unfashionable within the fashion system. Synchronic in its approach, Barthes’s analysis is essentially formalistic, concerning itself solely with the internal meanings generated by a system.

Structuralists like Barthes and Lévi-Strauss demonstrate that as apolitical as structuralism is in its Saussurean manifestation, it can have political applications as well, which is made explicit in the work of Louis Althusser, who is often referred to as a “structuralist Marxist.” Althusser’s structuralism is grounded in his reconstruction of Marx’s classic *base/superstructure* model of society. Social and political institutions like art, education, government, the judiciary, the economic system, he argued, do not rest on a single economic “base”; rather, they exist in a simultaneous system

of relations in which each element influences the other without any single institution dominating. In Althusser's model, then, social institutions relate to each other, and create each other's value, much as the signs function differentially within a language system (*la langue*).

While the antiempiricism and antirealism inherent within the structuralist enterprise constitute its most daring challenge to conventional thought, they also constitute its greatest weakness. For by positing that the sole ground for meaning lies within self-enclosed systems of semiological relations, structuralism cannot support itself by any empirical evidence. What is more, through his proposal for a synchronic analysis of semiological systems, Saussure inaugurated an essentially ahistorical enterprise. Thus, while structuralists believe that they can find support for their antiempiricism in such works as Thomas Kuhn's *The Structure of Scientific Revolutions* (1996[1962]) – a study of the history and philosophy of science that argues, in effect, that scientific theory emerges from the paradigms (or systems) of scientific thinking rather than from direct empirical discovery – structuralism is essentially cut off from the mainstream of modern scientific inquiry. Moreover, the ahistoricism of structuralism has put it at odds with contemporary trends within the social sciences and humanities toward historically grounded analysis and research. But in spite of these shortcomings, structuralism has left an enduring legacy in its wake, one that continues to influence in profound ways the political and historical programs of contemporary research in the humanities through its poststructuralist successors.

There is something paradoxical about the legacy of structuralism, especially in American literary scholarship. On the one hand, it could be said to have been a failure, having never really caught on in American critical

practice, being too generalized for an American literary community accustomed to the particular textual exegeses propounded through the new criticism. Structuralists were always more concerned with the dimensions of a literary *langue* than they were with any particular *parole*; indeed, Jakobson and Lévi-Strauss's uncharacteristic foray into practical criticism, with their analysis of "Les Chats," came in for immediate criticism by Michael Riffaterre, theorist of poetics and aesthetics (Riffaterre 1966). The contradictions at the heart of structuralism, especially its claim to be a universal science for the decoding of language systems while at the same time arguing, in effect, that all sciences are the expressions of the societies whose particular languages they employ, made it an uncongenial methodology for American literary critics. For unlike linguistics and anthropology, which embraced structuralism long before this contradiction became wholly apparent, American literary critics paradoxically became most aware of structuralism at the same time that they became aware of the poststructuralist critique of structuralism's inherent contradictions, especially in such books as Jacques Derrida's *Of Grammatology* and Jonathan Culler's *Structuralist Poetics*. It was Derrida who also pointed out that if the center upon which meaning is generated in a language system is the relational property of semiological *différance*, then language systems cannot be said to generate stable meanings at all, due to the fact that there can be no end to a string of differences if every sign takes its meaning from its difference from another one. What Derrida found within structuralism, in other words, was not the grounds for an analysis of the construction of meaning but rather for its *deconstruction*.

The enduring legacy of structuralism, therefore, lies in its own undoing by poststructuralists such as Derrida who accept the

basic premises of structuralism only to point out the contradictions that such premises entail. The historical analyses of Michel Foucault can also be seen as part of the structuralist legacy, for while he resisted the limitations and contradictions of structuralist theory, his work tacitly accepts the basic structuralist idea that knowledge is always contained within systems of language (what Foucault calls the “archive”) and is not the product of empirical experience. Foucault’s insistence on the social construction of reality also owes much to the structuralist enterprise, even while it introduces historical conditions and pressures into the analysis of knowledge systems, which he demonstrates in “archaeological” works like *The Order of Things*. In a similar way, Jacques Lacan’s rethinking of Freudian psychoanalysis reveals, in theory and in practice, both the resilience of the concept “structure” and the many ways that structure can become destabilized by the very relations that constitute it. Lacan’s insistence that “the unconscious is structured like a language” (1978[1973]: 20) did not lead to the conclusion that the unconscious is a stable system but rather suggested that its “relational” nature guaranteed endless possibilities of signification. His reliance on Jakobson’s principles of metaphor and metonymy, which enabled him to explore the implications of Freud’s theory of dreams, reminds us that the central premise of structuralism – that meaning is a function of relations of difference – determines even the most troubling and unknown regions of human experience.

T

Totality

KOONYONG KIM

The terms “totality” and “totalization,” as they are used in literary and cultural theory, refer to the possibility and practice of complete, unified closure. Typically associated with social and cultural formations, totalization defines the processes by which disparate and unrelated phenomena are understood in connection with a larger complex totality. Often contrasted with a wide array of disunifying forms and practices, such as fragmentation, alienation, atomization, reification, and the like, totality and totalization have been for some Marxist critics a long-sought-after ideal while for others, especially poststructuralists and postmodernists, these terms represent an imperializing or mystifying authority that attempts to annihilate difference. Western philosophy has long offered holistic perspectives, though it was not until the time of G. W. F. Hegel that the concept of totality enters modern philosophy through the theory of dialectics.

In an effort to resolve the anatomies latent in Immanuel Kant’s philosophical system that posits abstract dichotomies between the thing-in-itself (noumenon) and its appearance (phenomenon), between the conceptual and the sensible, between the subject and the object, Hegel employs dialectical

and speculative reason (*Vernunft*) as a synthetic and totalizing mode of thinking. His dialectical reconciliation of opposites and emphasis on totality is illustrated in his *Phenomenology of Mind*, in which he traces the ways in which the Absolute Spirit (also translated as Absolute Mind or Idea) simultaneously grasps a certain phenomenon and understands such knowledge as part of a comprehensive, evolving, rational whole. The Absolute Spirit thus undergoes a dialectical cancellation and sublation (*Aufhebung*) and recognizes the world as its own emanation, thereby approaching the culminating moment of absolute knowledge. This totalizing and dialectical vision is summed up in the preface to the *Phenomenology*: “The truth is the whole” (1967[1807]: 81).

Hegel’s conceptualization of totality was criticized by Karl Marx for its idealist elements. Marx inverts Hegel’s dialectic by making it materialist rather than conceptual, by looking at actual social conditions as part of a dialectical process. He claims that it is our social existence that determines our consciousness, not the other way round, and proposes that human beings should *change* the world, instead of simply interpreting it. From the viewpoint of such historical materialism Marx analyzes capitalism as a total, intricately connected social process in which capital (re)produces not just commodities and surplus values but also social relations

between capitalist and wage-laborer. As he remarks, in *A Contribution to the Critique of Political Economy*, “In the social production of their existence, men inevitably enter definite relations, which are independent of their will, namely relations of production appropriate to a given stage in the development of their material forces of production. The totality of these relations of production constitutes the economic structure of society” (1970[1859]: 20). Marx’s view of historical reality as a totality enables him to critique bourgeois thought for its incapacity to see a total picture of meaningful social relations, and leads him to affirm human history as class struggle.

Totality is further developed as a concept central to Western Marxism in the early twentieth-century Georg Lukács. In *The Theory of the Novel*, he regards the Greek epic as a pristine starting point, where the I and the Not-I were reconciled, and where the individual had meaningful and effective access to a social totality (representation, *Darstellung*). Such a totality, Lukács explains, is not immediately given in the modern age and the novelistic form is “the mirror-image of a world gone out of joint” (1971b[1916]: 17). In *History and Class Consciousness*, he attributes the fragmented totality to bourgeois thought grounded in the autonomous individual subject, whereas the proletariat as a collective subject-object of history can have access to the social totality and play a crucial role in the emancipation of humankind.

The Hegelian or Lukácsian vision of totality has since been repudiated by numerous thinkers. Theodor W. Adorno, for instance, casts into doubt the belief that philosophy can grasp the totality of reality. Most notably in his polemic with Lukács, he holds that Lukács’s totalizing claim forces a unity when there is none in reality and therefore is nothing but “reconciliation under duress . . . at the heart of absolute idealism” (Adorno 2007

[1958]: 176). His critical stance on totality is more substantively articulated in *Negative Dialectics*, in which he distanced his thought from the identitarianism of Hegel’s philosophy and argued instead for a theory of negative dialectics, which calls for “a dialectics no longer ‘glued’ to identity” or “the constant sense of nonidentity” (1973[1966], 31, 5). In thus criticizing the totalizing impulse in Hegel and Hegelian Marxism, Adorno reverses Hegel’s adage: “the whole is the false” (Adorno 2005[1951]: 50).

The French Marxist Louis Althusser draws on theoretical insights from structuralism and psychoanalysis and attempts a scientific and antihumanistic revision of the Hegelian totality. In *Reading Capital*, he theorizes what he terms “structural causality,” which, far from being a mechanical or expressive articulation of an inner essence or cause, underscores the relational structure and allows for the relative independence of various levels or instances. His structuralist approach permitted a rereading of the social totality envisioned by Marx, a reading that describes a decentered totality with neither a point of origin nor a destination, neither *locus* nor *telos*, and in which different structural levels have their relative autonomy. Althusser’s stress on the structural nature of totality also denies any human agency, for “history is a *process without a subject* . . . the dialectic at work in history is not the work of any Subject whatsoever, whether Absolute (God) or merely human” (1971: 81–2).

Totality has come under fierce attack by poststructuralist and postmodernist critics. A host of contemporary theorists such as Jacques Derrida, Gilles Deleuze, and Michel Foucault probe the ways in which the notion of totality has an essentializing tendency and represses difference and alterity. Such an antitotalizing sentiment is best exemplified by Jean-François Lyotard who in his dispute with Jürgen Habermas calls for “a war against totality” (1984[1979]: 82). His

vitriolic position toward totality is also enunciated in *The Postmodern Condition*, where he defines postmodernity as incredulity toward totalizing master narratives.

In such a situation, where the concept of totality seems to have generally been discredited and consigned to the historical dust heap, Fredric Jameson [1967] resolutely seeks to retain it not as a regulative notion, but as a useful conceptual tool with which to diagnose the totalizing logic whereby capitalism penetrates into the entire globe. In defining postmodernism as a cultural logic of late or global capitalism characterized by the unprecedented fragmentation of totality and the resultant crisis of representation, he proposes “cognitive mapping” that calls for a revitalization of a new form of representation that maps out the global totality.

W

Wimsatt, William K. and Beardsley, Monroe C

CECILY SWANSON

William Kurtz Wimsatt (1907–75) and Monroe Curtis Beardsley (1915–85) are best known for their co-authorship of “The intentional fallacy” and “The affective fallacy,” essays that articulate what have come to be considered the fundamental tenets of the American New Criticism. Originally published in the *Sewanee Review* in 1946, both essays were reprinted in their seminal formalist study, *The Verbal Icon: Studies in the Meaning of Poetry* (1954). Wimsatt and Beardsley co-authored a third essay, “The concept of meter: An exercise in abstraction” (1959), which was reprinted in Wimsatt’s *Hateful Contraries* in 1965. This text has generated much less debate than the essays on the fallacies, but it did produce some heated discussion immediately following its publication. Although none of the three essays are as commonly taught, nor as frequently referenced, as they were once, their ideas continue to lie at the heart of most literary criticism and instruction. As Jonathan Culler has commented, “In a sense, whatever critical affiliations we may proclaim, we are all New Critics now, in that it requires a strenuous consciousness of effort to escape notions of the autonomy of the literary work, the importance of

demonstrating its unity, and the requirement of ‘close reading’” (Culler 1981: 3).

In “The intentional fallacy,” Wimsatt and Beardsley argue that literary works should not be understood as products of an author’s intention. While poems, like other created objects, are to be judged on the basis of their efficacy, this does not mean the critic is able to infer, or should infer, the intentions of a creator. Indeed, the very concept of “meaning” is called into question in this essay, insofar as meaning is tied to an author’s intentions. “A poem should not mean but be” (1954: 81), the authors write, which is another way of saying that the *being* of a poem, its existence as a verbal object (or “icon”), is its meaning.

Wimsatt and Beardsley were by no means the first critics to make such a claim about the author’s intentions; as they themselves remark. *The Personal Heresy* (1939), a series of essays by C. S. Lewis and E. M. W. Tillyard, had previously shed light on the question of textual autonomy. But it was “The intentional fallacy” that first articulated a clear and forceful argument for treating literature as a self-sufficient object. The authors make five distinct claims: (1) that while an author’s intent may be the cause of the poem it should not be considered grounds for critical inquiry; (2) that intent is impossible to recover; (3) that literary communication does not depend upon

intention in the same way that “everyday” communication does; (4) that we should regard the literary utterance as belonging to a persona, not a biographical author; (5) that what is achieved in a text is never the same as what was intended, even if the author believes that he or she is getting better and better at realizing his or her literary goals. These claims underwrite the foundational paradox of literary study: that “what is (1) internal is also public” and that “what is (2) external is private and idiosyncratic; not a part of the work as a linguistic fact” (Wimsatt & Beardsley 1954: 10). A scholar should take seriously the “semantics and syntax” of the text since these features are available to all readers, but should dismiss “letters or reported conversations . . . about how or why the poet wrote the poem” (10) since such findings are neither public nor reliable.

This paradox stimulated much of the critical furore over “The intentional fallacy.” Early reviewers of the essay rejected it, arguing that textual objectivity ignores the actual experience of reading; they maintained that such a clear-cut separation of text and author was an impossible task. In any case, were it possible, it would prove a detriment to aesthetic pleasure and historical knowledge. In “Against theory,” Steven Knapp and Walter Benn Michaels launched a sophisticated critique of authorial intentionality. Through a series of logical deductions, they show how an author’s intended meaning and a text’s meaning are one and the same: “once it is seen that the meaning of a text is simply identical to the author’s intended meaning, the project of *grounding* meaning in intention becomes incoherent.” They go on to argue that the possibility of moving from intention to meaning is illusory: “One can neither succeed nor fail in deriving one term from the other, since to have one is already to have them both” (Knapp & Michaels 1982: 724). Authorial

intention and textual meaning are trapped in a hermeneutic circle that abolishes the distinction between them. Paul de Man’s “Form and intent in the American new criticism” (1983) offers another important re-evaluation of “The intentional fallacy.” De Man claims that Wimsatt and Beardsley erred in treating literature like a natural or found object when in fact it possesses a teleological character. Just as a craftsman designs a chair so that it can be sat upon, a poet designs a poem so that it will be read in a special manner, as a distinctly aesthetic, patterned piece of literary language. The vagaries of the poet’s psychological state may be immaterial, but it does matter that the poem is intended to be studied *as a poem*. Recent scholarship tends to view “The intentional fallacy” more sympathetically. Douglas Mao (1996), for example, suggests that the materiality of the text remains a foundational concept for literary study. The new critic’s tendency to sever literature from its historical and authorial context is often regarded as an elitist maneuver, since such a severance tends to rarefy and mystify the aesthetic object. Mao points out that Wimsatt and Beardsley’s work can with equal justification be understood as demystifying the conventions of scholarship, since it frees students from the burden of extratextual knowledge. Furthermore, as Mao astutely observes, “The intentional fallacy” does not reject extratextual material as forcibly as some dissenters have claimed; for him, the essay is less about the ontological status of the text than it is about the efficacy of the critic’s engagement with literature.

Wimsatt and Beardsley’s second co-authored essay, “The affective fallacy” has attracted less critical attention, partly because its basic premise seems to have been more readily accepted and partly because portions of its argument are less clearly laid out. The authors argue that the reader’s

phenomenological experience of the text should not be confused with the text itself. "The Intentional Fallacy is a confusion between the poem and its origins," they write, "The Affective Fallacy is a confusion between the poem and its results" (1954: 21). Their main concern is both the logic and the relevance of affective readings. They claim that whatever emotional valence we assign to words is in fact no different than their meaning, so discussions of the psychological effects of language are redundant. There is no evidence, they write, that "what a word does to a person is to be ascribed to anything except what it means" (1954: 26). "The word 'athlete' may be said to *mean* one interested in sports, among other things, but merely to suggest a tall man." But of course, as the authors point out, athletes need not be tall. In the first instance, meaning is tied to the "*descriptive* (or *cognitive*) function of words"; in the second, the *emotive* function is grounded in "suggestion," for which "there is no linguistic rule to stabilize responses" to it. In short, the emotive function is "noncorrelative to and independent of the descriptive (or cognitive) meaning" (1954: 22–23). It follows that a reader's idiosyncratic reactions cannot be verified, and thus are extraneous to the objective assessment of literature. The literary critic is not a statistician, attempting to collect a representative sample of possible reactions, but is rather "a teacher and or explicator of meanings" (1954: 34). The essay is characterized by a general suspicion of literary historians, who in Wimsatt and Beardsley's estimation, are no better than cleverly masked affective critics. A "historical scholar" might disregard psychological reactions of present-day readers of Shakespeare but will remain interested in researching the nature of such reactions in Shakespeare's contemporary audience. For the authors, then, the historical scholar displaces affective response onto a historical

audience, in a sense reframing it as historical evidence.

Debate about "The affective fallacy" has been predictably polarized, as in the exchange between Mark Spilka and John V. Hagopian in 1965. Spilka argued, in "The affective fallacy revisited," that Wimsatt and Beardsley's essay is a symptom of a cultural denial of feeling in what he calls our "suppressive wasteland times" (1965: 14). Wimsatt and Beardsley have inhibited their critical project at the cost of a more imaginative engagement with literature. Hagopian's "In defense of the affective fallacy" countered that we must make a distinction between the reader's investigation of how emotions function in the text and the reader's scrutiny of his or her own emotional response to it. Wimsatt and Beardsley are, for Hagopian, not denizens of an emotional wasteland, but rather critics who astutely contemplate rather than reflexively respond to literary texts. Mao's estimation is perhaps the most persuasive and least tendentious: the new critical challenge to both authorial intention and readerly emotion "serves as the major alternative – or better, complement – to the only other such foundation currently in play, the idea of the unconscious" (Mao 1996: 14).

Wimsatt and Beardsley's final co-authored essay, "The concept of meter: An exercise in abstraction" (1959), offers a more detailed explanation of poetic language than do their more theoretical texts. They criticize both musical and by extension temporal approaches to understanding meter. As with the fallacies, their complaint boils down to the question – and, in their opinion, threat – of extratextual evidence. Music, and the idea of musical timing, is an inappropriate metaphor for meter because it introduces values that are not necessarily features of poetry. Poems are indeed patterned, but since they have no set score a reader will not necessarily "experience this

pattern . . . in equal lengths of time" (1959: 590). Music has to account for a time signature and relative stress, poetry only the latter. And unlike skilled musicians with a score, different readers may read the same poem in vastly different ways since the poem is governed by more flexible rules of performance. In framing this argument, Wimsatt and Beardsley take greatest umbrage at prosodists who appeal to isochronism, the "processing or adjustment of syllables" to produce lines of nearly equal length, as proof that poems inherently keep time (589). Isochronism, the authors maintain, is a general feature of the English language, and thus it insufficiently differentiates poems from other linguistic utterances. Moreover, they doubt whether readers of poetry ever actually do produce isochronic performances. In sum, the essay argues, if a poem were read in time to a metronome it would fail to fulfill its function. Poetry is more interesting for its tensions than its regularities.

The reception of "The concept of meter" has been critical. For example, Harris Friedberg (2005) identifies a repressed Romantic strain in Wimsatt and Beardsley's work. For Friedberg, Wimsatt and Beardsley's discomfort with the idea of the poet as a timekeeper aligns them with Romantic poets who worried that meter's artificiality could distract from true feeling. Despite their objections to subjective literary analysis, the authors, like their Romantic forebears, nevertheless appear worried that a fixed concept of meter will override discussions of poetry's capacity to "buck against" rules (Wimsatt & Beardsley 1959: 596). Other scholars have objected to the imprecision of their terms. J. K. Hendren, in an essay cowritten with Wimsatt and Beardsley (1961), suggests that they have exaggerated the possibility for idiosyncratic departures in poetic performance. Even expressive readings may not depart significantly from a regular rhythmic

principle. In a similar vein, Elias Schwartz (1962) argues that they fail adequately to distinguish meter, the theoretical pulse of a line, from rhythm, the departures from this ideal time. For this reason, timing, even if it is never actualized in performance of the poem, cannot be dismissed. We could not hear the departures from a normative sense of timing, Wimsatt and Beardsley conclude, were it not for our sense of an organizing, metrical structure.

If most critical responses accuse Wimsatt and Beardsley of reductionism, Wimsatt's single-authored essays in *The Verbal Icon* (1954) and *Hateful Contraries* (1965) offer an acquittal in the form of a subtle engagement with the more polemic claims of the fallacies. Indeed, Wimsatt challenges the coherence of many of the new critical tenets that contemporary criticism associates with his work. Despite his critique of intentionality, he admits that readers will inevitably imagine a poem's speaker and that critics will inevitably make recourse to certain "facts about human psychology" (Wimsatt & Beardsley 1954: 82). And perhaps most importantly, Wimsatt rejects what has become the chief tenet of new criticism: that the literary text should be treated as a unified, material object *tout court*.

This rejection is most forcibly articulated in "The Chicago Critics: The fallacy of neo-classic species," in which Wimsatt criticizes a dogmatic strain of Aristotelian materialism that he sees most notably displayed in the works of R. S. Crane and Richard McKeon. Aristotle's conception of the poem as "an 'artificial thing' is very curious," Wimsatt writes, for "if anything about poetry is clear at all it is that a poem is not really a thing, like a horse or a house, but only analogically so . . . a poem is a human act, physical and mental" (Wimsatt & Beardsley 1954: 50). And not only does Aristotle's formulation ignore the ineffable dimensions of verbal art, but it also leads to the fetishism

of literary unity. Chicago critics have overstated the importance of “whole ‘objects’” and rigid generic distinctions at the expense of the partial and fluid literary structures that defy theoretical principles. As Wimsatt repeats later in *The Verbal Icon*, “Extreme holism is obviously contrary to our experience of literature” (238).

In light of this sustained objection to notions of literary resolution and coherency, the title of a work like *The Verbal Icon* may seem less an expression of the text’s ontological status than a parodic ventriloquism of the neo-Aristotelianism Wimsatt abhorred. His discussion of metaphor in “The concrete universal” most forcibly voices his objection to critical efforts that dissect and isolate aspects of literary art, rendering it falsely coherent. Starting with a seemingly irreproachable truth – that “behind a metaphor lies a resemblance between two classes, and hence a more general third class” (Wimsatt & Beardsley 1954: 79) – Wimsatt launches a rigorous critique of the alleged distinctions between figurative and literal language, between style and substance, divisions that critics require for arguments about unity, balance, and reconciliation. Attempts to define terms like metaphor, he argues, endlessly produce new metaphors. Instead, we should simply acknowledge how “all discourse is to some degree mixed” (138): In *Hateful Contraries*, Wimsatt continues to question principles of aesthetic totality, specifically the critical overinvestment in stable antitheses such as ironic tension. In “The Augustan mode in poetry,” he argues that the neoclassical poets were less concerned with rule-making than rule-breaking and demonstrates how even the most agreed-upon examples of poetic irony can in fact be hard to parse. If Wimsatt and Beardsley’s co-authored essays offer strategies for how to best make sense of the literary text, then Wimsatt’s essays in both *The Verbal Icon* and *Hateful Contraries*

warn against too much sense-making. In its no-nonsense suspicion of far-reaching theory, Wimsatt’s new criticism is informed by an older, American pragmatism, but one that points nonetheless towards the aporias and the polysemy of the poststructuralism to come.

Winnicott, D. W.

RANITA CHATTERJEE

Donald Woods Winnicott (1896–1971), a British pediatrician, child psychiatrist, and psychoanalyst, introduced into psychotherapy key innovations concerning early child development, particularly concepts like “transitional objects” and “good-enough mothering.” He argued that the early interactions with the mother or primary care giver are crucial for a child’s healthy growth and development. In his 40 years working as psychoanalyst and pediatrician at Paddington Green Children’s Hospital in London, Winnicott saw several thousand infants, children, parents, and grandparents. Influenced by Melanie Klein and Sigmund and Anna Freud, Winnicott focused on the role of what he called the “facilitating environment” in the healthy formation of identity. The infant’s relationship with the mother dominates this early environment. Winnicott’s famous remark that “there is no such thing as a baby” (1958: 99) stems from his observation that in the early stages of human development, before an auto-

nous identity is created, the infant exists solely through its various relationships with his or her mother. Winnicott not only trained in psychoanalysis with Klein, but also helped articulate a middle position during the protracted “Controversial Discussions” (1943–4) between Anna Freud and Klein. Although Winnicott did not develop a theoretical system – many of his ideas, collected and published in 1958, were first presented as lectures at professional meetings and as informal talks on the radio – his work on mothers and the environment that they do or do not create for their children are associated with the object-relations school of psychoanalysis.

Like Freud, Winnicott noted that infants start from a position of “unintegration.” To develop a stable independent identity, they need a comforting relationship with their mother who acts as a mirror adapting to their every need and gesture. This safe and secure external environment allows infants to experience a narcissistic and omnipotent control over their surroundings and, consequently, to relate to their world subjectively and thus to create a representational world of fantasy and mental objects. The freedom to produce a rich inner world is the first step toward maturation. Unlike Freud, who emphasized instincts at this early stage, Winnicott focused on the infant’s interactions with his or her environment. Since infants have no concept of reality and must create their own world, they depend on their instincts being gratified through their relationship to an object in their external environment, who is most often the mother. As long as the mother satisfies the infant’s needs and wants, she enables the infant’s sense of control over his or her environment. This is how the environment facilitates the slow development of a distinct identity, which progressively lessens the dependence of infants on their environment, and thus the mother.

The mother's primary function, then, is to cater to her infant's needs so as not to impede the formation of an illusory, but necessary, sense of self. This continual adaptation to her infant's world is what Winnicott described as her "primary maternal preoccupation" (1958: 300–5). By being the unobtrusive foundation for the baby's forays into the world of reality, the mother is the key element in her child's growth and development. However, Winnicott did not want the mother to experience this responsibility as a burden or to attach feelings of guilt to the role of mothering. Neither did he want to give mothers an impossible, idealized model of motherhood which would promote feelings of inadequacy. Thus he coined the term "good-enough mother" to describe her role of sufficiently meeting her infant's needs and gestures. Winnicott called this nurturing, maternally created atmosphere a "holding environment." It is from this protective environment of shared emotions and mutual understanding that the infant's autonomous identity can eventually emerge. For Winnicott, the mother's successful response to her infant's gestures and needs, her effective "good-enough" mothering, also facilitates the infant's creation of a "true self." With a "true self," infants have a positive feeling of wholeness and can start to engage with reality spontaneously to produce "me" and "not-me" relationships with objects in their world, such as the mother's breast, their bottle, and so on. If the mother fails to provide "good-enough mothering," infants will develop a "false self" that complies with environmental demands, such as their mother's desires and feelings, while hiding their own real needs. This early alienating false self has serious ramifications for later object relationships, preventing infants from successfully distinguishing themselves from their environment. This disintegration of self that may begin with the mother's failure thus breeds isolation.

One of Winnicott's most significant contributions to psychoanalysis is his notion of the "transitional object," which bears some similarity to Jacques Lacan's transitional mirror stage. Winnicott argued that the movement from an inner, illusory world of omnipotent control to an external world of object relationships takes place in a "potential space" in which fantasy meets reality and the infant self meets its other. This bridge space between inner and outer worlds is created through "transitional objects," which are psychically part of both worlds. A "transitional object" is something in which the infant is emotionally invested, such as a blanket or a teddy bear, that enables the child to slowly relinquish his or her dependence on the mother. These transitional objects are created by the child insofar as they are actively chosen for comfort and security. They are neither purely subjective objects, for they have a material existence, nor purely external objects, for they are invested with the infant's illusory satisfaction of his or her needs. Winnicott further describes these transitional objects as the infant's first "not-me possession," which enables an awareness of the spatial distinction between itself and its external environment. For Winnicott, culture, and social life are created within this potential space where the inner world is creatively linked to an external world.

Winnicott's emphasis on the early mother–infant dyad and his focus on the mother's functions have produced much debate among feminist theorists, such as Nancy Chodorow. Winnicott is simultaneously praised for discussing the significance of the mother in psychoanalysis and criticized for placing women back in the regressive role of mothers who can be blamed for their children's failures. While Winnicott's ideas do not relate well to other psychoanalytic theories, they do shed light on the practical experiences of mothers and

their babies, as opposed to the Freudians and Kleinians who propose complex theories of the infant's psychic, unconscious instinctual drives and energies directed to the mother.

Woolf, Virginia

ANTHONY FOTHERGILL

Virginia Woolf (1882–1941) was a novelist whose innovations in narrative form and point of view have earned her acclaim as one of the most accomplished modernist writers. She was also an active literary critic, who composed nearly 500 critical pieces (more than 1,000,000 words) over almost 40 years as a professional writer. Her essays, reviews, lectures, journalistic articles, biographical studies, and two books – *A Room*

of One's Own (1929) and *Three Guineas* (1938) – also mark her out as one of the greatest of English essayists. If it had not been for the central role played by her novels in defining the literary revolution of “high Modernism” and in forming a crucial model and inspiration for feminism and women's writing since 1920, Woolf's essays alone would have guaranteed her a central position in twentieth-century literature.

At least four interlinking areas of interest can be identified in Woolf's theoretical thinking: her critique of “traditional” realist conventions of novel writing and the need for new forms of representation; her “materialist” argumentation regarding the historical conditions which determine cultural production; her radical engagement with women's writing and “female language”; and finally, her view of the creative role of the reader in the production of the text.

However, to call Woolf a “theorist” would belie both the form and occasion of her writing. Hers is not a conceptualized model of critical understanding to be “applied” to particular texts. Rather, her “theory” consists in a formidable and thoughtful account of how literature might relate to the broader social and political concerns of the age. Most important, she argues that the new conditions of modernity (in all its political, gendered, and class dimensions) require new aesthetic representational *forms* as well as political change. Her essays often embody radical stylistic innovations that resist the critical conventions of argumentation in formal academic discourse. Her style is demotic, self-questioning, hesitant in making broad universal judgments; it is in constant and affirming conversational “dialogue” with “the common reader” even when she is talking of so-called high culture.

Woolf did not hold hard to genre distinctions and her critical ideas on writing

and culture can be found as much embedded in the self-reflexive nature of her novels (especially *To the Lighthouse*, *The Waves*, and *Between the Acts*) as in her nonfiction writings, and this crossing of boundaries is essential to Woolf's purpose. She writes critical essays which contain extensive imaginative fictional elements; novels which self-reflexively foreground their own status; conversational pieces on the active, productive role of reading; light sketches and quasi-biographies – all of which establish her theoretical interests and interventions. Her resistance to definition is what defines her. The prevailing tone, style, and substance of her writing undermine hierarchical and patriarchal order to the exclusion of other ways of thinking and being.

Woolf grew up in a privileged, intellectual upper-middle-class family, the daughter of Sir Leslie Stephen, compiler of the *National Dictionary of Biography* and the liberal patriarch model for Mr Ramsay in Woolf's novel *To the Lighthouse* (1927). As a woman she was denied access to the public school and university education enjoyed by her brothers and their male friends – a crucial aspect of her critique of cultural production in *A Room of One's Own*. But she exploited the riches of the extensive family library and was formidably well read, though more or less self-educated. Later, as a member of the Bloomsbury group – among whom were her brother Thoby and his Cambridge friends Leonard Woolf, Maynard Keynes, Lytton Strachey, Roger Fry, Clive Bell, and, on the periphery, E. M. Forster – Woolf was able to recognize and come to challenge what she realized was a male elite, albeit a liberal and “permissive” one. Her intellectual position, both inside and outside of this elite, undoubtedly influenced her awareness of class and gender relations in the literary and political life she variously wrote about. She married Leonard Woolf in 1912 and in 1917 they established the Hogarth Press.

They not only published her own works but also, crucial for their cultural ambiance, the first translations of Sigmund Freud. They introduced Russian writers (Leo Tolstoy, Anton Chekhov, Fyodor Dostoevsky, Maxim Gorky) to an English readership and helped establish modernist experimental works by T. S. Eliot, Gertrude Stein, and Katherine Mansfield.

Woolf's first critical piece appeared in 1904 in the *Guardian* (a clerical weekly newspaper) and she subsequently wrote numerous (anonymous) reviews for *The Times Literary Supplement*, *The New Statesman*, and other leading publications in England and America. Many of her essays appeared in collections during her lifetime in *The Common Reader* and *The Second Common Reader* (1925 and 1932). Most were later edited by Leonard Woolf in *Collected Essays* (1966–7), categorized (roughly) as literary critical essays (volumes 1 and 2) and biographical essays (volumes 3 and 4). These essays have recently been re-edited, fully annotated, and reorganized (by date of publication) by Andrew McNeillie (and latterly Stuart N. Clarke) in *The Essays of Virginia Woolf* (1986–), which includes many hitherto unpublished pieces. Of the many essays that shed light on Woolf's critical aesthetic, the following are generally recognized as central: “Modern fiction” (1919), “On re-reading novels” (1922), “Mr Bennett and Mrs Brown” (1924), “How should one read a book?” (1926), “The narrow bridge of art” (1927), and “The leaning tower” (1940). A much-cited passage in “Modern fiction” is taken not only as an expression of Woolf's own aesthetic but as a literary manifesto for modernism with its emphasis on interiority, on the rendering of the subjective, psychological reality of individual consciousness rather than on the externalities of social documentation more characteristic of earlier nineteenth-century realism. The

lines are often taken as defining the “impressionist” method of “stream of consciousness” writing which her novels are thought to exemplify:

Examine for a moment an ordinary mind on an ordinary day. The mind receives a myriad impressions – trivial, fantastic, evanescent, or engraved with the sharpness of steel. From all sides they come, an incessant shower of innumerable atoms. . . . Life is not a series of gig lamps symmetrically arranged; life is a luminous halo, a semi-transparent envelope surrounding us from the beginning of consciousness to the end. (Woolf 1986–, 4:160)

After this “look within” comes a call to arms for the modern writer: “Let us record the atoms as they fall upon the mind in the order in which they fall, let us trace the pattern . . . which each sight or incident scores upon the consciousness” (160–2).

The “myriad impressions” referred to here, which echo Walter Pater’s idea of heightened consciousness and the “moment of vision,” characterizes her “stream of consciousness” mode of narration. But this was what some critics, for example F. R. Leavis, complained about, taking up Woolf’s word “trivial” against her, saying it lacked “moral seriousness” and that her preoccupation with the subjective mind was pursued at the expense of ignoring “all the ranges of experience . . . with an external world.” Her writing was merely a “sophisticated aestheticism” (Leavis 1968[1942]: 99).

A different problem that this passage raises is that of the idea of the mind as a *passive receptor*, of consciousness as a blank tape recording “impressions.” This is in contrast to the *active intentionality* of consciousness and conscious artistic construction, reminiscent of phenomenologists like Roman Ingarden, which Woolf asserts elsewhere is the case (e.g., through the novelist Bernard in *The Waves*). The intentionality

of the artist, and in turn that of the creative reader in constituting meaning, is what the portrayal of modern “reality” is about and hence Woolf’s emphasis on the representation of psychological *interiority*.

We find this passive/active contradiction embodied in Woolf’s seminal essay “Mr Bennett and Mrs Brown” (1924), which criticizes the preceding generation of novelists – Arnold Bennett, John Galsworthy, and H. G. Wells – as the “materialist Edwardians” against whom Woolf placed herself and other “Georgians” (Forster, Eliot, James Joyce, D. H. Lawrence) who represented the *avant garde* in literature. In an essay which characteristically makes reference to real people but also creates a fictional “Mrs. Brown,” Woolf claims that, when trying to realize the (fictional) Mrs. Brown sitting in a railway carriage, all the “Edwardian” writers do is *record* features of her “external” life: the rent she paid, the buttons on her dress. She becomes an object of their observations. These empirical facts are, in Woolf’s view, superficial. Her aesthetic theory demands a different form of representation which captures the “real” inner life of Mrs. Brown. It is noteworthy that Woolf’s aims are still towards a form of *realism*, as Erich Auerbach (1953[1946]) pointed out. But she is redefining what the “real” really means and why it requires new modes of artistic expression and freedom from old restrictive conventions of genre and form.

This would-be antimaterialist position seems to stand in contrast to *A Room of One’s Own*, where Woolf offers a forthright materialist account of cultural production, the social and economic position of women, and the possibilities of women’s writing. But terminological consistency is not uppermost in her mind: she adopts a rhetoric of dialogic play with the reader when she develops her analysis of the historical position of the English woman writer and her

relative absence from the literary canon. What the woman writer lacks, Woolf argues, is not imagination, talent, or energy, but rather the material necessities for the writer's profession – the privacy of her own space to create (a room) and financial independence (£500 a year). The essay is by turns polemical, self-ironizing, and witty. She addresses the reader directly, as if she were a listener, which may reflect the origin of the text in a series of lectures at two women's colleges (Newnham and Girton) at Cambridge University in 1928. Fictionalizing for the sake of "reality," she invents the life and plight of the would-be dramatist "Judith Shakespeare" to contrast with her brother's fame; by so doing, she becomes a "deconstructionist" *avant la lettre*, in her undercutting of an authoritative "I" subjectivity. This essay has been highly influential in articulating ideas later taken up by feminist thinkers, particularly since the 1960s (the advent of so-called "second wave" feminism), although attempts to wed her feminism with a Marxist materialism has been disputed (Barrett 1979).

Woolf's argument for "the woman's sentence," a quintessentially female language and style of writing – she cites Jane Austen as exemplary – has been positively taken up particularly by those influenced by French thinking on the concept of *écriture féminine* (writing the feminine, writing the body). *A Room of One's Own* ends with an arguably contentious ideal of "androgynous" writing (found in Shakespeare, Coleridge, and Proust) that transcends alleged gender differences. This has sometimes been criticized variously as utopian or as contradicting the exclusiveness of "female writing" (Showalter 1978; Bowlby 1997[1988]; Moi 2002).

Near the end of her life, Woolf published an even more forcefully polemical long essay, *Three Guineas* (1938), which is a critique of patriarchal political and cultural

institutions, including academia and the law, particularly as they existed in the shadow of fascism. It forsakes the earlier fictional playfulness to voice Woolf's strong feminist, pacifist, and internationalist beliefs, a radicalism criticized by F. R. Leavis and Q. D. Leavis as "nasty," "dangerous," and "preposterous." As the response to her work indicates, critical attitudes toward Woolf's thinking can be extreme. By the beginning of the twenty-first century, these critical debates tend to mirror divergent opinions within feminist theoretical writing about an essentialist or heterogeneous understanding of feminist political and artistic positions. "Third wave" feminism (or "postfeminism") tends to be less doctrinaire and more accepting of the subtleties of her position than some of their predecessors.

Woolf took her own life by drowning on March 28, 1941.

Volume II

Literary Theory from 1966 to the Present

Edited by Robert Eaglestone

 **WILEY-BLACKWELL**

A John Wiley & Sons, Ltd., Publication

Notes on Contributors to Volume II

Marian Aguiar is an associate professor in the Literary and Cultural Studies Program, Department of English at Carnegie Mellon University. Her forthcoming book, *Tracking Modernity: India's Railway and the Culture of Mobility* (2011), explores cultural representations of modernity by looking at images of railway space in colonial, nationalist, and postcolonial South Asian contexts. Her articles have appeared in *Cultural Critique*, *Modern Fiction Studies*, *Journal of Modern Literature*, and *Rethinking Marxism*, as well as in edited book collections.

Frederick Luis Aldama is Arts and Humanities Distinguished Professor of English at the Ohio State University and Director of Latino Studies. He is the editor of five collections of essays and the author of seven books, including *Postethnic Narrative Criticism* (2003), *Brown on Brown* (2005), and the MLA-award winning *Dancing With Ghosts: A Critical Biography of Arturo Islas* (2005), *Why the Humanities Matter: A Common Sense Approach* (2008), *Your Brain on Latino Comics: From Gus Arriola to Los Bros Hernandez* (2009), and *A User's Guide to Postcolonial and Latino Borderland Fiction* (2009). He has published numerous articles, co-edits the series "Cognitive Approaches to Literature and Culture" (UTexas Press), and sits on the board for the Americas book series (Texas Tech University Press).

Eva Aldea obtained her PhD from Royal Holloway, University of London in 2009. She is currently teaching at Goldsmith College, University of London and Westminster University. She is the author of *Magical Realism and Gilles Deleuze: The Indiscernibility of*

Difference (2010) and co-editor (with Geoff Baker) of *Realism's Others* (2010).

Shahidha Bari is a lecturer in English and philosophy at Queen Mary University of London. She works in the fields of literature, philosophy, and politics, with particular interests in Heidegger, Derrida, and Nancy. She has a literary specialism in the romantic poetics. She is the author of *Keats and Philosophy* (2011), is a co-founder (with Nemonie Craven Roderick) of *How to Live* (www.htlblog.com) and is a co-author of the *How to Live* guidebook to modern life.

Oliver Belas has taught at the University of London, where he completed his PhD, and now teaches in London. His research interests include genre writing (particularly crime and science fiction, and science writing), literary and cultural theory, African American literature, and pedagogy. He has contributed to the *Journal of American Studies*, and is currently co-editing and contributing to a volume provisionally entitled *Rethinking Genre*.

Arthur Bradley is a senior lecturer in literary and cultural theory in the Department of English and Creative Writing at Lancaster University. He is the author of *Negative Theology and Modern French Philosophy* (2004); *Derrida's "Of Grammatology": A Philosophical Guide* (2008) and *The New Atheist Novel: Fiction, Philosophy and Polemic After 9/11* (2010). He is currently working on a book on the philosophy of technology from Marx to Stiegler.

Gabriel Noah Brahm, Jr. is an assistant professor of English at Northern Michigan

University and a research fellow in Israel studies at Brandeis University. His published works have appeared in *Critical Studies in Media Communication*, *Democratija*, *Nineteenth-Century Literature*, *Poetics Today*, *Rethinking History*, and elsewhere. He was one of the founding associate editors of the journal *Politics and Culture*.

Daniel Burgoyne is a professor at Vancouver Island University. He is the co-author (with Christine Hult and Richard Gooding) of *The New Century Handbook* (2005) and an associate author of Janet Giltrow's *Academic Writing: An Introduction* (2nd edn. 2009). He co-directs the Literary Theory Research Group at VIU and is editing the Broadview Press edition of James De Mille's *A Strange Manuscript Found in a Copper Cylinder*. He has published and given talks on romanticism, the gothic, literary theory, and hoaxes. His research focuses on scientific romance.

Joseph Carroll is Curators' Professor of English at the University of Missouri-St Louis. He is the author of *The Cultural Theory of Matthew Arnold* (1982), *Wallace Stevens' Supreme Fiction: A New Romanticism* (1987), *Evolution and Literary Theory* (1995), and *Literary Darwinism: Evolution, Human Nature, and Literature* (2004). He has produced an edition of Darwin's *On the Origin of Species*. He is a co-editor (with Brian Boyd and Jonathan Gottschall) of *Evolution, Literature, and Film: A Reader* (2010), and he co-edits an annual journal, *The Evolutionary Review: Art, Science, Culture*. A collection of his recent essays, *Reading Human Nature: Literary Darwinism in Theory and Practice*, is in press.

Andrew Clark is a PhD student and part-time lecturer in European thought at the University of Portsmouth. His doctoral thesis considers the idea of the autobiographical in the work of the French philosopher

Jacques Derrida. His research interests include the essence of argument, of history, of ethics, of personal identity, and of psychological problems.

Claire Colebrook is Edwin Erle Sparks Professor of Literature at Penn State University. She has published books and articles on literary theory, feminist theory, continental philosophy, and the poetry of John Milton. Her most recent book is *Deleuze and the Meaning of Life* (2010).

G. Thomas Couser is a professor of English and founding director of the Disability Studies program at Hofstra University. He is the author of *American Autobiography: The Prophetic Mode* (1979), *Altered Egos: Authority in American Autobiography* (1989), *Recovering Bodies: Illness, Disability, and Life Writing* (1997), *Vulnerable Subjects: Ethics and Life Writing* (2004), and *Signifying Bodies: Disability in Contemporary Life Writing* (2009), as well as about 50 articles or book chapters. He is currently writing a book about contemporary American "patriography" (memoirs of fathers by sons and daughters) and a memoir of his own father.

Marcel Danesi is a professor of semiotics and anthropology at the University of Toronto. Currently, he is the editor-in-chief of *Semiotica*, the official journal of the International Association for Semiotic Studies. Among his many books are *Vico, Metaphor and the Origin of Language* (1993), *Cool: The Signs and Meanings of Adolescence* (1994), *Understanding Media Semiotics* (2002), *The Quest for Meaning: A Guide to Semiotic Theory and Practice* (2007), and *X-Rated: The Power of Mythic Symbolism in Popular Culture* (2009). He was elected a Fellow of the Royal Society of Canada in 1998 for his work in semiotics.

Anne Donadey is a professor of European studies and women's studies at San Diego State University. Her research area is fran-

cophone and anglophone postcolonial feminist writers. She is the author of *Recasting Postcolonialism: Women Writing between Worlds* (2001), co-editor (with H. Adlai Murdoch) of *Postcolonial Theory and Francophone Literary Studies* (2005), and editor of a special issue of *L'Esprit créateur* on the works of Assia Djebar (Winter 2008).

Lisa Downing is founder and director of the Centre for the Interdisciplinary Study of Sexuality and Gender in Europe (CISSGE) at the University of Exeter, where she is a professor of French discourses of sexuality. Her research specialisms include sexuality studies, critical theory, and modern French literature and film. She is the author and editor of numerous books, including *Desiring the Dead: Necrophilia and Nineteenth-Century French Literature* (2003) and *The Cambridge Introduction to Michel Foucault* (2008).

Robert Eaglestone is a professor of contemporary literature and thought at Royal Holloway, University of London. He is the author of four books, including *Ethical Criticism: Reading after Levinas* (1997), *The Holocaust and the Postmodern* (2004), *Doing English* (3rd edn. 2009), and the editor or co-editor of a further four books, including (with Simon Glendinning) *Derrida's Legacies* (2008), and (with Elleke Boehmer & Katy Iddiols) *J. M. Coetzee in Theory and Practice* (2009). He has published widely on contemporary philosophy, contemporary literature, literary theory, and historiography, and on the Holocaust and genocide. He is the series editor of *Routledge Critical Thinkers*.

Claire Feehily teaches cultural memory, humanities, and literary studies at Birkbeck College, and at the School of Advanced Studies, University of London. She is currently working on a book about the British New Right's cultural politics and has pub-

lished in the fields of European contemporary culture and war memory.

Finn Fordham is a lecturer at Royal Holloway, University of London. He specializes in James Joyce, twentieth-century literature and theory, and has written two books: *Lots of Fun at "Finnegans Wake"* (2007) and *I Do, I Undo, I Redo: The Textual Genesis of Modernist Selves* (2010). An edited volume, *James Joyce and the 19th Century French Novel*, is due out in 2011.

Anthony Fothergill is a senior lecturer at the University of Exeter, where he teaches English literature and cultural theory. He has also taught at the University of Heidelberg and at Kenyon College, Ohio. He has written widely on modernism and modernity. His most recent book is *Secret Sharers: Joseph Conrad's Cultural Reception in Germany* (2006). He has published a book-length study on Conrad's *Heart of Darkness* (1989; 2000) and has edited works by Conrad and Oscar Wilde.

Monica Francioso obtained her PhD in 2005 from Royal Holloway, University of London. She has taught at several UK universities, as well as at University College Dublin. She has published on the development of narrative theory in postwar Italy, the Italian literature of migration, postmodern novels and theories, and on the works of Enrico Palandri and Gianni Celati.

Katie Garner is a PhD student and postgraduate tutor in English literature at Cardiff University. Her doctoral thesis looks at women writers' imaginative and scholarly responses to the medieval revival in the late eighteenth and early nineteenth centuries.

Greg Garrard is Chair of the Association for the Study of Literature and the Environment (UK) and author of *Ecocriticism* (2004). He was awarded a National Teaching Fellowship in 2005 for his work on

education for sustainable development, and is a senior teaching fellow at Bath Spa University.

Anna Gething lectures part time in English at Bath Spa University. Her research falls into four overlapping areas: contemporary women's writing, gender studies, postcolonial writing, and the senses in literature. Current work focuses on the writing of Kate Grenville. She has also published on the abject and grotesque in Angela Carter and Jonathan Swift, rites of passage in the fiction of Jamaica Kincaid, the gendering of smell in literature, women and violence in *The Sopranos*, and domestic dystopias in popular culture.

Mrinalini Greedharry is an assistant professor in the Department of English at Laurentian University. She is a graduate of the University of London and has taught in universities in Finland, the UK, and Canada. Her most recent book, *Postcolonial Theory and Psychoanalysis* (2008), examines how we might turn from psychoanalytic readings of colonial culture to an interrogation of psychoanalysis as a colonial discourse. Her current research focuses on questions of methods in interdisciplinary scholarship and how theoretical approaches can be realized as new pedagogical practices.

Gavin Grindon is postdoctoral research fellow in visual and material culture at Kingston University, and has previously taught at Manchester and Goldsmiths universities. He has published articles in *Third Text*, *Art Monthly*, and the *Journal of Aesthetics and Protest*, and is currently writing a history of art and activism in the twentieth century which orients itself around the theory of revolution-as-festival.

Nicole M. Gyulay is currently publications editor at the Institute of Education, University of London. She obtained her PhD in postcolonial literature in 2007

from Royal Holloway, University of London. Her publications include "Writing for the West: V. S. Naipaul's religion," in the *South Asian Review*, and "Multiplicity destroyed by singularity: Salman Rushdie and religious hybridity," in *Spiritual Identities: Literature and the Post-Secular Imagination* (2010).

Matthew T. Helmers, candidate for a PhD in English and American studies at the University of Manchester, is currently working on the constructions of gender, sexuality, and temporality that inform the literary, legal, and psychoanalytic understandings of homosexual panic.

Jonathan Hensher is a researcher in French studies at the University of Manchester, specializing in text-image relations and the illustrated book. His publications include "From innocent to indecent: Eroticism and visual punning in Cochin's illustrations to *Roland furieux*," in S. Donachie & K. Harrison (eds.), *Love and Sexuality: New Approaches in French Studies* (2005) and "Engraving difference: Pierre-Clément Marillier's oriental illustrations in the *Cabinet des Fées*," *Journal for Eighteenth-Century Studies* 31 (2008).

Ken Hirschkop is an associate professor of English at the University of Waterloo, Ontario. He is the author of *Mikhail Bakhtin: An Aesthetic for Democracy* (1999) as well as many articles on Bakhtin, and he co-edited (with David Shepherd) the collection *Bakhtin and Cultural Theory* (2005).

Joe Hughes is a lecturer at the University of Minnesota. He is the author of *Deleuze and the Genesis of Representation* (2008) and *Deleuze's Difference and Repetition* (2009).

Ian James is a fellow in modern languages at Downing College and a lecturer in the Department of French at the University of Cambridge. He is the author of *Pierre*

Klossowski: The Persistence of a Name (2000), *The Fragmentary Demand: An Introduction to the Philosophy of Jean-Luc Nancy* (2006), and *Paul Virilio* (2007).

John J. Joughin is a professor of English literature and is Pro Vice-Chancellor (Research; Acting) at the University of Central Lancashire, Preston. He is editor of *Shakespeare and National Culture* (1997) and *Philosophical Shakespeares* (2000), and joint editor (with Simon Malpas) of *The New Aestheticism* (2003).

Jane Kilby teaches in the School of English, Sociology, Politics and Contemporary History at the University of Salford. She specializes in the interdisciplinary question of violence, trauma, and testimony, and, more generally, the politics of feminist theory and methodology. Her publications include *Violence and the Cultural Politics of Trauma* (2007), *The Future of Memory* (co-edited with Antony Rowland and Rick Crownshaw, 2010), as well as articles on violence, trauma, the body, and feminism.

Koonyong Kim is a James B. Duke Fellow and PhD candidate at Duke University. He has published on critical theory and post-modern global culture. He is also the Korean translator of Fredric Jameson's work.

Jennifer Lewis was awarded a PhD by the University of Warwick in 2001 for her work on Zora Neale Hurston. She is currently writing a book on place and the body in African American literature. She teaches English and American literature at Bath Spa University.

Simon Malpas teaches English Literature at Edinburgh University. He is the author of *The Postmodern* (2005) and *Jean-François Lyotard* (2003), editor of *Postmodern Debates* (2001) and *William Cowper: The Centenary Letters* (2000), and co-editor (with John Joughin) of *The New Aestheti-*

cism (2003) and (with Paul Wake) of *The Routledge Companion to Critical Theory* (2006). He has also published work on aesthetics, romanticism, continental philosophy, twentieth-century literature, and Victorian nonsense.

Anita Mannur is an assistant professor of English and Asian/Asian American Studies at Miami University, Ohio. She is the author of *Culinary Fictions: Food in South Asian Diasporic Cultures* (2010) and co-editor of *Theorizing Diaspora* (2003). She has published articles on the cultural politics of Asian American literature in *Amerasia Journal*, *MELUS*, and several anthologies.

Nick Mansfield is a professor in critical and cultural studies at Macquarie University in Sydney. His books include *Subjectivity: Theories of the Self from Freud to Haraway* (2000), *Theorizing War: From Hobbes to Badiou* (2008), and *The God Who Deconstructs Himself: Subjectivity and Sovereignty Between Freud, Bataille and Derrida* (2010). He is one of the general editors of the journal *Derrida Today*.

Martin McQuillan is Dean of the Faculty of Arts and Social Sciences at Kingston University, London. His publications include *Paul de Man* (2001) and *Deconstruction After 9/11* (2009), and the edited volumes *The Politics of Deconstruction: Jacques Derrida and the Other of Philosophy* (2007) and *Deconstruction Reading Politics* (2008).

Kaye Mitchell is a lecturer in contemporary literature at the University of Manchester and course director of the MA in Contemporary Literature and Culture. Her research covers twentieth-century and contemporary literature, critical theory, and gender and sexuality. She is the author of *A. L. Kennedy* (2007) and *Intention and Text* (2008), and has published various articles on contemporary literature and theory. Recent projects include articles

and chapters on 1950s lesbian pulp fiction, on contemporary erotic memoirs by women, and on the figure of the archive in twentieth-century gay fiction.

Gerald Moore is a lecturer in French at Wadham College, Oxford, having previously taught at Université Paris-12 (Val de Marne). His book on poststructuralist politics, *Politics of the Gift*, is forthcoming (2011). He has also published on Michel Houellebecq and translated works by Henri Lefebvre, Michel Foucault, and Georges-Didi Huberman, among others.

Simon Morgan Wortham is a professor of English at Kingston University, London. His recent books include *Counter-Institutions: Jacques Derrida and the Question of the University* (2006), *Experimenting: Essays with Samuel Weber* (co-edited with Gary Hall, 2007), *Encountering Derrida: Legacies and Futures of Deconstruction* (co-edited with Allison Weiner, 2007), *Derrida: Writing Events* (2008) and *The Derrida Dictionary* (2010).

Stephen Morton is a senior lecturer in English at the University of Southampton. His publications include *Gayatri Spivak: Ethics, Subjectivity and the Critique of Postcolonial Reason* (2007), *Salman Rushdie: Fictions of Postcolonial Modernity* (2008), *Terror and the Postcolonial* (co-edited with Elleke Boehmer, 2009), and articles in *Textual Practice*, *Interventions*, and *New Formations*.

John Mowitz is a professor in the department of Cultural Studies and Comparative Literature at the University of Minnesota. He is the author of numerous texts on the topics of culture, theory, and politics, including *Re-Takes: Postcoloniality and Foreign Film Languages* (2005) and the co-edited volume, *The Dreams of Interpretation: A Century Down the Royal Road* (with Catherine Liu, Thomas Pepper, & Jakki Spicer,

2007). In 2009 he collaborated with the composer Jarrod Fowler to transpose his book *Percussion: Drumming, Beating, Striking* (2002) from a printed to a sonic text. His current project, *Radio: Essays in Bad Reception*, is forthcoming. He is also a senior co-editor of the journal *Cultural Critique*.

Aris Mousoutzanis is a sessional lecturer at the Faculty of Arts and Social Sciences, Kingston University. He has researched and published on areas such as critical and cultural theory (especially psychoanalysis and trauma theory), technoculture and cyberculture, media and globalization, popular culture, science fiction, and the gothic.

Ankhi Mukherjee is a CUF lecturer in the Faculty of English Language and Literature at the University of Oxford and a fellow of Wadham College. Her specialisms include Victorian and modern literature, critical and cultural theory, particularly psychoanalysis, and postcolonial studies. She is the author of *Aesthetic Hysteria* (2007), co-editor (with Laura Marcus) of *A Companion to Literary Criticism and Psychoanalysis* (2011), and has several articles in refereed journals such as *PMLA*, *MLQ*, and *Textual Practice*. Her latest book project, *What is a Classic?* (2011), examines canon wars and other contestations of literary value in twentieth- and twenty-first-century English literature and literary criticism.

Rebecca Munford is a lecturer in English literature at Cardiff University. She is the co-editor (with Stacy Gillis and Gilliann Howie) of *Third Wave Feminism: A Critical Exploration* (2007), and special issues of *Literature Interpretation Theory* (2009) and *Women: A Cultural Review* (2009). Her forthcoming work includes the book *Decadent Daughters and Monstrous Mothers: Angela Carter and the European Gothic*.

Alex Murray is a lecturer in twentieth-century literature at the University of

Exeter. He is the author of *Recalling London* (2007) and *Giorgio Agamben* (2010), and he is one of the founding editors of *Parrhesia: A Journal of Critical Philosophy*.

Mary Orr is a professor of French at the University of Southampton. Her monograph, *Flaubert's Tentation: Remapping Nineteenth-Century French Histories of Religion and Science* (2008), reflects her current research interests in the "intertextuality" of scientific writing of the period, whether by women in science prior to Marie Curie, or by writers of fiction and poetry.

Lisa Otty is a postdoctoral research fellow at the University of Dundee, working on an AHRC-funded project entitled "Poetry Beyond Text." She has published articles on aesthetics and the relationship between literature and visual art in journals such as *Litteraria Pragensia* and *Interdisciplinary Humanities*.

Robert Dale Parker is James M. Benson Professor in English at the University of Illinois. He has written *How to Interpret Literature: Critical Theory for Literary and Cultural Studies* (2008) as well as books on American literature and American Indian literature.

Jason D. Price is a teaching associate and a candidate for a PhD in literature at Arizona State University. He received his MA from Seton Hall University after receiving a BA from the College of New Jersey.

Abigail Rine is a PhD candidate and ORSAS scholar at the University of St Andrews, as well as a visiting assistant professor of English at George Fox University. A recent participant in the doctoral seminar of Luce Irigaray, her work on women's writing and feminist theory appears in *Forum for Modern Language Studies*, as well as the forthcoming book collections *Sex, Gender and Time in Fiction and Culture* and *Mortified: Representing Women's Shame*.

John Paul Riquelme is a professor of English at Boston University. His work on literary theory, the gothic tradition, and literature of the long twentieth century includes guest edited issues of *New Literary History* and *Modern Fiction Studies*, editions of *Dracula*, *Tess of the d'Urbervilles*, and *A Portrait of the Artist as a Young Man*, and books and essays on Wilde, Yeats, Joyce, Eliot, Beckett, Iser, and postcolonial theory. He is currently writing a study of Wilde and early modernism.

Adam Roberts is a professor of nineteenth-century literature at Royal Holloway, University of London. He has published a number of studies of Romantic and Victorian topics, as well as a *History of Science Fiction* (2005), an introductory *Fredric Jameson* (2000) and more than a dozen science-fictional, postmodern-ish novels.

Mark Robson is an associate professor of English at the University of Nottingham, where he founded and directs the Analysis of Democratic Cultures Research Group. He is the author of *Stephen Greenblatt* (2008) and *The Sense of Early Modern Writing* (2006), co-author (with Peter Stockwell) of *Language in Theory* (2005), editor of *Jacques Rancière: Aesthetics, Politics, Philosophy* (2005) and co-editor (with Joanne Morra and Marquard Smith) of *The Limits of Death: Between Philosophy and Psychoanalysis* (2000).

Nemonie Craven Roderick holds a Westfield Trust Interdisciplinary Studentship at Queen Mary, University of London, where she is completing a PhD thesis on the work of Emmanuel Levinas. Her essay "Subject to memory? Thinking after *Caché*" is published in David Sorfa and Ben McCann (eds.), *The Cinema of Michael Haneke* (2010). With Shahidha Bari, she is creator and co-founder of *How to Live* (www.htlblog.com) and co-author of the *How to Live* guidebook to modern life.

Deirdre Russell is a film studies lecturer at the University of Glamorgan. She received her PhD in French studies from the University of Manchester. Her thesis, "Narrative identities in contemporary French autobiographical literature and film," explores the social dimensions of European autobiographical identity. She has published book chapters on autobiographical film.

Michael Ryan teaches in the School of Communications at Temple University. His most recent essay, "Are liberals mutants? Human history as evolutionary history," appeared in *Politics and Culture* (2010). He has written several scholarly monographs, including *Marxism and Deconstruction* (1982) and *Politics and Culture* (1989), and edited several university textbooks, including *Literary Theory: An Anthology* (co-edited with Julie Rivkin; 2nd edn. 2004), *Literary Theory: A Practical Introduction* (2nd edn. 2007), *Cultural Studies: An Anthology* (2008), and *Cultural Studies: A Practical Introduction* (2010).

Laura Salisbury is RCUK Research Fellow in Science, Technology and Culture and a lecturer at Birkbeck, University of London. She has published on various topics, including Samuel Beckett and neuroscientific conceptions of language; Beckett, poststructuralist ethics and comedy; and the philosophy of Michel Serres and science fiction. With Andrew Shail, she is the editor of *Neurology and Modernity* (2010). Her major research project is on the relationships between aphasiology, modernism, and modernity.

Danielle Sands is completing a PhD on Derrida at Royal Holloway, University of London. Her publications include an article in *Textual Practice* entitled "Thinking through *Différance*: Derrida, Žižek and religious engagement."

Michael Snyder is a professor of English and humanities at Oklahoma City Commu-

nity College and has taught at the University of Oklahoma, where he received his PhD. His work focuses on twentieth-century American and Native American literature and culture and his dissertation is entitled "Mixedblood metaphors: Allegories of Native America in the fiction of James Purdy." His essays on Gerald Vizenor appear in book collections for Broadview Press and the University of New Mexico Press, and other pieces have appeared in *Studies in American Indian Literatures*, *American Indian Culture and Research Journal*, and *Critique: Studies in Contemporary Fiction*.

Robin Stoate is a doctoral candidate in English literature at Newcastle University. His research focuses on technocultures and wider issues relating to theorizing the subject in cultural and critical theory, along with literature, film, and on the internet. He has published on such topics as fictional representations of nanotechnology, and relationships of care between human beings and machines. He is the co-author (with Andrew Shail) of the BFI classics book *Back to the Future* (2010).

Khachig Tölölyan is a professor of comparative literature and cultural theory at the College of Letters at Wesleyan University (Middletown, Connecticut). He is the founding editor of *Diaspora: A Journal of Transnational Studies*, and has published on a wide range of topics, ranging from narratology and the American novel to diasporic nationalism and terrorism.

Ben Trott is a doctoral candidate at the Free University of Berlin.

Anastasia Valassopoulos teaches postcolonial fiction and film in the School of Arts, Histories and Culture at the University of Manchester. She has published articles in *Research in African Literatures*, *Popular Music and Society*, and *Critical Survey*, and has contributed to numerous collections on

postcolonial literature and cinema. She has published *Contemporary Arab Women Writers: Cultural Production in Context* (2007).

Paul Wake is a senior lecturer in English literature at Manchester Metropolitan University. He is the author of *Conrad's Marlow* (2007), editor (with Simon Malpas) of *The Routledge Companion to Critical Theory* (2006), and has published articles on narrative theory, postmodernism, and children's literature.

Melanie Waters is a lecturer in English at Northumbria University and has published work on feminist theory, American poetry, and popular culture.

Allison Weiner is a visiting assistant professor in the Department of Comparative Literature at Cornell University. She received a PhD in comparative literature from Yale University in 2008. She specializes in literary theory, focusing particularly on poststructural theory and contemporary continental philosophy in her scholarship and teaching. She is the co-editor (with Simon Morgan Wortham) of *Encountering Derrida: Legacies and Futures of Deconstruction* (2007). Her current work explores intersections of ethics, the body, and disability.

Anne Whitehead is a senior lecturer in the School of English at Newcastle University. She has published *Trauma Fiction* (2004) and *Memory* (2008). She has also co-edited (with J. J. Long) *W. G. Sebald: A Critical Companion* (2004) and (with Michael Rosington) *Theories of Memory: A Reader* (2007).

Ross Wilson is a lecturer in the School of Literature and Creative Writing at the University of East Anglia. He works on literary theory and philosophical aesthetics, and romantic and Victorian poetry. He is the author of *Subjective Universality in Kant's Aesthetics* (2007), *Theodor Adorno* (2007), and is editor of *The Meaning of "Life" in Romantic Poetry and Poetics* (2009). The book on which he is currently working is envisaged as an extended reading of Percy Shelley's statement that "we live on, and in living we lose the apprehension of life."

Min Wild teaches at the University of Plymouth. She specializes in the eighteenth century and her *Christopher Smart and Satire* (2008) engages with the periodical press and the Enlightenment in Britain. She has also published on Wyndham Lewis and on the personification of words, texts, and literary styles from the Bible to the present day.

A

Aesthetic Theory

LISA OTTY

Aesthetic theory examines the relationship between perceptual, sensory experience and value judgments and raises questions about taste, art, value, and truth. While aesthetic theory is often held to be synonymous with the philosophy of art, its importance extends far beyond this realm. Indeed, as reflection on a fundamental part of human experience, aesthetic theory has consequences for many different discourses, impacting on notions of subjectivity, politics, and ethics. Having fallen out of fashion in the mid-twentieth century, the field has been brought back to the fore recently and is currently recognized as an area of critical importance in contemporary philosophical inquiry.

To grasp what is at stake in late twentieth-century aesthetic theory, it is important to understand the field as developing out of and reacting against “high” modernist aesthetics. In the American context, the influence of modernist aesthetics reached its zenith in the 1960s but extended well into the 1970s. Formalist critics such as Clement Greenberg (1966[1961]) argued that art is “disinterested” or autonomous from social systems such as history, politics, and economics. This autonomy is grasped positively as freedom from the utilitarian

concerns and pragmatic considerations of everyday life. Art is situated as the haven of values which transcend individual concerns and the particular, material conditions of production and reception. In this sense, modernism holds aesthetic values to be superior to those inscribed by “interested” judgments which are made according to the subjective needs and desires of the moment. If art concerns itself with such “interests” it is in danger of being reduced to propaganda, or merely reinforcing the values of the dominant social group. The distance between art and life, between aesthetic values and non-aesthetic values, must therefore be constantly reinscribed in order to preserve a space for values uncontaminated by political or economic concerns. “High” modernism thus appears to depend upon the idea of aesthetic values as universal and timeless rather than historical and contingent. In such a framework, taste is held to be the critic’s ability to discern these universal values in the artwork rather than a purely subjective individual judgment.

It has been against the apparent timelessness and universality of aesthetic value and against the authority of critical taste that much “postmodernist” aesthetic theory has been directed. Critics have attacked the narrative of modernism, arguing that aesthetic values, like all other values, are historical and socially constructed (Krauss 1972).

In other words, what has been made to appear as universal is in fact nothing more than the culturally privileged position (Western, bourgeois, white, and masculine) and the idea of good taste is complicit with economic and cultural domination, a means of validating a particular set of norms and of suppressing different kinds of experiences and tastes. One critical project, therefore, has been to give voice to other types of aesthetic theory, articulating, for example, feminist aesthetics (Hein & Korsmeyer 1990) and comparative aesthetic theories, which consider the relation between a specific experience, place, and culture (Van Damme 1996). Another influential argument is the “institutional theory” of art, which argues that aesthetic value does not depend on the quality of the object but rather on the social context (the “art world”) in which we experience the work (Danto 1964; Dickie 1974). Different contexts encourage different kinds of aesthetic attitude toward the work and, therefore, value can be understood as something that is attributed by the specific institution (i.e., the gallery) rather than something inherent in the work. Taken to its logical conclusion, the institutional argument suggests that art and aesthetic experience are not autonomous of wider social systems at all but are in fact a form of illusion generated by a specific set of cultural conditions. Some critics have thus asserted that the very idea of aesthetic value is a kind of mystification that masks the real social conditions of the production and consumption of art (Bourdieu 1984[1979]). Such sociological work is important in that it often reveals the assumptions and biases inherent in the aesthetic theories that it rejects.

The sociological approach to art is not without its problems, however, for to deny the validity of aesthetic judgments and to claim that art is no different from any other object is to reduce art to a nexus of social, political, and economic values. It is thus to

deny art and aesthetics as a site of potential freedom and truth. This is a central concern in the work of German Frankfurt School theorist Theodor Adorno, whose *Aesthetic Theory* (2004[1970]) continues to be influential today. For Adorno, the autonomy of art is not a hard-won freedom but rather an exclusion from society, a consequence and so expression of the domination of human experience by the forces of rationalization. History, as Adorno sees it, is a progressive domination of the natural world by technology, science, and capital. Art, he argues, is an “after image” of a lost human capacity for extracting and positing meaning and truth intuitively (through aesthetic experience) rather than logically or conceptually. It is a reminder that the forces of techno-scientific rationalization obscure and repress other types of knowledge and experience and, by reducing thought to logic and value to a system of exchange, operate to suppress difference. Art is important because it is incommensurable with empirical reality and, as a result, it constitutes a space in which critical reflection on society can be articulated and explored. However, while Adorno argues that art is necessarily autonomous, this is not to say that the aesthetic is understood as a realm beyond history nor is aesthetic value considered to be higher than other values. Indeed it is against universalizing aesthetic theories that Adorno positions his Marxist theory, arguing that art, although it appears as something cast out and so different, is essentially sociohistorical and inseparable from the conditions of its production and reception.

Adorno’s aesthetic theory is famously pessimistic about the future of art and the potential of aesthetics to maintain an alternative to dominant forms of knowledge and experience. If art provides the last bastion of resistance against techno-scientific capitalism, a field in which the truth potential of aesthetic experience hibernates, it is also an

increasingly encroached-upon space and therefore one that is continually under threat of dissolution. Moreover, although it is its distance from society that gives art its power, the exclusion of art means that it is unable to effect any real social change. Thus, as many Marxist critics have argued, while art can be understood as voicing critique of society, that critique is already silenced by the separation of art from other social systems. The autonomy of art is not only its strength but also its weakness.

Such pessimism provoked a sequence of debates about the death or end of art in the 1970s and '80s. For some, late twentieth-century art showed that art and aesthetics were entirely infiltrated by politics and economics (Bürger 1984[1974]). The work of artists like Andy Warhol and Jeff Koons seemed to affirm the logic of late capitalism and to celebrate the artwork as a commodity while the slogans of political artists such as The Guerrilla Girls highlighted the prejudices inherent in aesthetic judgments and art institutions. In this light, it appeared as though the forces of rationalization had encroached so far into the sphere of aesthetics that they had rendered autonomy all but impossible and thus annihilated the critical potential of art. Art's subsumption into the rationality of late capitalism had rendered it nothing more than a commodity, one product among others. If art and aesthetic value were collapsed into life and social values, moreover, not only did it seem to signal the end of a genuinely critical art but also, if it is the case that to have a theory one must have a discrete field, the end of aesthetic theory.

Since the mid-1990s Anglo-American criticism has developed a renewed interest in aesthetics, often referred to as new aestheticism. A key text in this regard is American philosopher Jay Bernstein's *The Fate of Art* (1992) which distinguishes between aesthetics and postaesthetic philosophy:

the former understands art as separated from other spheres of experience, cut off from truth and so effectively silenced, while the latter is the thinking that responds to this silencing at the center of aesthetics, namely the contradiction of art's autonomy. If art is a critique of (but also product of and by no means opposite to) the rationalized, conceptual "scientific" cognition that modernity privileges, then post-aesthetic theory attempts to maximize and highlight this critical potential. It accepts that art relies on some degree of autonomy (thus post-aesthetic philosophy is not institutional critique) but denies that it is severed from truth, from politics, from morality. Instead of bemoaning or celebrating aesthetic alienation, such work attempts to understand art in nonaesthetic terms, and thereby to avoid the distinction between art and truth. In other words, post-aesthetic philosophy attempts to preserve the importance of aesthetics by breaking down the frameworks in which aesthetic theory has conventionally been thought. This process is evident not only in Adorno's work, as Bernstein demonstrates, but also in the "paraesthetic" theories of French poststructuralists like Jacques Derrida and Jean-François Lyotard, who allow aesthetics to pervade their writing as well as their thought (Carroll 1987).

Those writing under the banner of new aestheticism must also be understood as post-aesthetic theorists for they do not seek a return to the framework of "high" modernist aesthetics and reject the universalizing tendencies associated with earlier aesthetic theories (Eagleton 1990). However, they also reject the sociological approach of schools such as new historicism and institutional theory. Instead new aestheticism proposes an understanding of aesthetics that grasps the specificity and particularity of the work, reading art and literature as fully implicated in society

and history yet at the same time as evading or exceeding reduction to mere commodities. Aesthetic value is not the only criteria by which works are judged, but that does not mean that there is no such thing as aesthetic value. For new aestheticism, the importance of aesthetics lies in its intersections with politics and ethics: it is the fact that art and aesthetic experience are different from other types of knowledge and experience that makes them valuable, for they provide a space for an alternative form of truth to that provided by logic or science (Beech & Roberts 2002; Joughin & Malpas 2003). Staking out the potential of this alternative is the task of any future aesthetic theory.

African American Literary Theory

JASON PRICE

African American literary theory since 1966 has responded to both the Black Arts Movement of the 1960s and '70s and the contemporaneous influx of Western literary theory in the academy. Theoretical arguments in this field address questions of the critic's audience and responsibilities, the use of European theory in reading black texts, and representations of gender, race, and sexuality in African American literature. The theoretical responses to these issues reveal a multiplicity of positions from critics as varied as Henry Louis Gates, Jr., Barbara Smith, and Charles I. Nero and a wide range of theoretical approaches too, including structuralism, poststructuralism, and European feminism.

The Black Arts Movement, led by figures like poet and critic Amiri Baraka and Larry Neal, was a corollary to the Black Power Movement. The movement centered on an assumption of an essential "blackness," or an understanding of an authentic black experience. Consequently, texts written by African Americans during this period were

judged by the degree to which they were true to the black experience of everyday life. For example, leaders of the movement championed realistic novels like Richard Wright's *Native Son*, while Ralph Ellison's *Invisible Man* was less highly regarded. While critics like Gates and Houston A. Baker, Jr. voiced their opinion that the Black Arts Movement was limited in its ideological approach to African American literature, several critics acknowledge that it was successful in securing African American studies and literature programs in the academy.

In his critique of the Black Arts Movement, Gates traces the nonliterary treatment of black texts back to some of the earliest works in the African American literary tradition. In *Figures in Black* (1987) for example, discussing the poems of Phillis Wheatley and the autobiographies of Frederick Douglass, Gates reveals how these works weren't read for their literary merit. Rather, these early African American texts were read by white critics, both slaveholders and abolitionists, as proof of black literacy and therefore of the possibility of black culture and humanity. Gates suggests that such a beginning for the criticism of African American art has had a profound effect on the trajectory of how we read black texts. His critique of the Black Arts Movement, then, is its failure to consider the literary complexity of black texts. Gates's critique is informed by formalist, structuralist, and poststructuralist theories. By using these theories, Gates suggests, we can better appreciate the rich layers of black texts by performing close readings, examining form and content, viewing "blackness" as a trope (rather than as a marker of authenticity), and looking for intertextuality, or the way these texts revise, relate, and respond to previous texts and tropes.

In contrast to Gates's adopting of several European theories, early founding black feminist theorists like Barbara Smith and

Barbara Christian condemn the practice of black critics who incorporate European theories in readings of black texts. In "Toward a black feminist criticism" (1977) Smith calls for a black feminist way of reading, explaining that white feminists have largely disregarded the question of racial politics and that black male critics often ignore sexual politics. In defining this way of reading, Smith argues that the reader should consider the intentions of the writer, focus on representations of black and female identity, and assume that black women have a literary tradition. In addition to Smith's stance against using European male theory to read black women's art, her consideration of the writer's intent is also at odds with the formalist and poststructural theories that Gates draws on, where writer's intent is of no concern. Lastly, Smith calls for an analysis of sexuality in African American texts that would also lead to a black lesbian way of reading, pointing out that heterosexuality is often privileged in black texts.

Like Smith's theory of reading, Alice Walker's "In search of our mothers' gardens" (1983[1974]), a precursor to Smith's essay, addresses the shortcomings of white feminist theory for black feminists. Walker takes issue with Virginia Woolf's feminist essays, arguing that black women under slavery produced art even though they were remarkably more oppressed than white women. Under the institution of slavery and racial oppression, the question of "a room of one's own" (the title of one of Woolf's feminist essays) was not a plausible consideration for African American women artists, as Walker reveals. Walker argues that, as black women were denied the opportunities of the fine arts, they expressed themselves in other media like their gardens, as her essay's title suggests. Walker's critique of the blindness of white feminist criticism was essential in founding a black feminist criticism.

Drawing on Smith's essay and discussing Walker's texts, Barbara Christian critiques the use of theory in reading black texts, arguing instead that the goal of criticism should be to recover texts that remain silenced or receive little treatment in critical circles. Like Smith, Christian sees European theory dominating the current critical discourse. She also argues that black writers have always theorized in their art like the theories implicit in Toni Morrison's novels, for example. In addition, she suggests that the language of European theory confuses the position of black feminist critics. Christian further warns against the power of European theory, emphasizing that critics who use these theories largely ignore texts by African American writers. She also suggests that readings informed by theory are proscriptive, offering the Black Arts Movement as an example of theory simplifying the world and limiting the possibilities for interpretations of texts. In her reading of the Black Arts Movement, Christian suggests that the leaders of the movement tried to replace a white center of power with a black center, a problematic and perhaps equally oppressive move that Morrison also critiques in *Playing in the Dark*.

While Christian does not specifically name those critics who practice European theory, it is generally assumed that she targets Gates and Baker. Michael Awkward, a poststructuralist and self-identified black male feminist critic, disagrees with Christian's dismissal of theory. Awkward argues that Christian's portrayal of black critics as natives colonized by white poststructural theory is too simplistic and fails to acknowledge the possibility that black critics choose to use it. In addition, Awkward points out that Barbara Smith's call for a black feminist criticism is theoretical, although Smith doesn't draw on contemporary theory. Awkward also takes issue with Christian for assuming that black

males and whites can't do the kind of work she describes. Dismissing theory, Awkward contends, would also be to dismiss the important work of Gates, Baker, Mary Helen Washington, and Hortense Spillers (who uses Lacanian psychoanalysis) – theoretically informed critics who, Awkward suggests, have greatly enriched our knowledge of African American texts and their production.

Continuing the discussion concerning the appropriation of European theory in the reading of black texts, Joyce A. Joyce also argues against theory. Joyce offers a position similar to Smith, Christian, and theorists of the Black Arts Movement as she sees a connection between black lives or black realities and black literature. Focusing more on the question of the critic's responsibility and audience than on previous theorists, Joyce argues that theoretical critics like Gates no longer write for the black community, but for a small audience. She also posits that poststructural theory isn't useful in discussing black American literary works as the poststructural challenge to the idea of a stable identity, one that is finite and knowable, and the arbitrary relation between sign and signifier seems to ignore black American history. In contrast to Gates who suggests that he is attempting to defamiliarize black texts to help him appreciate their literary value, Joyce argues that black creative art is an "act of love" which brings people together, preventing "estrangement" rather than promoting elitism. Joyce's position is ultimately informed by class and a recognition of the critic's responsibility to black people.

Both Gates and Houston Baker's responses to Joyce challenge her reading of literature and point out what they see as several flaws in her essay. While early on Baker was more aligned with the Black Arts Movement, his and Gates's theoretical stances have become increasingly similar in

their use of poststructural theory. In his response to Joyce, Baker points out that poststructuralist theory performs a powerful critique of Western philosophy, especially its forms of privileging, which has been a major source of oppression for black culture and black people. Gates responds similarly, however, suggesting that the richness of black texts demands that readers work harder to do justice to the writer. Responding to Joyce's critique of the poststructuralist idea of language as play, Gates argues for the usefulness of this concept as he contends that black people have been reading white language as systems of play since 1619. Gates also describes how black literature inhabits spaces of difference, and suggests that it is the critic's responsibility to identify formal difference in black texts as revision through close reading. In addition, Gates argues that black critics must form their own language of criticism, a practice he attempts later in *The Signifying Monkey* (1988). In response, Joyce later points out where Gates and Baker misread her essay and she accuses them of being dismissive and abusive in their treatment of her writing.

Deborah McDowell, a black feminist critic, also weighs in on the theoretical debate between Gates, Baker, Joyce, and Awkward. In reviewing their arguments McDowell comments on the nature of the relationship between theory and practice, challenging their division and arguing that theory is too often privileged in that ostensible binary. She also points out that often in the arguments over theory the concept of theory is synonymous with poststructuralist theory. Thus, critics like Gates and Baker accuse black feminists of being conservative and resistant to theory, whereas McDowell disagrees. McDowell argues for the importance of considering recent historical developments in this debate, especially the recent second renaissance of black women writers being read.

Such a consideration is important for McDowell because it highlights how poststructural assumptions – the death of the author, and the challenging of history, tradition, and authority – were contesting many of the assumptions of black feminist criticism that were developing in response to this new trend of a prevalent reading of black women's texts. For example, black feminist critics called for recovering and describing a literary tradition in the face of the poststructuralist challenge of the very idea of tradition. McDowell explains how, despite the differences, black feminists and poststructuralists have key concerns in common. The focus on analyzing the relationship between the margins and the center in terms of hierarchies is pivotal to both theoretical schools. While both groups have this common focus, they are often viewed as antithetical, and McDowell posits that this view stems largely from the general perception of black feminist criticism as lower class in terms of a theoretical hierarchy in the academy.

Amid critiques of their adoption of European poststructuralist theory, both Gates and Baker attempted theoretical projects with a more African American theoretical basis. Baker's theorization of the blues as a matrix in *Blues, Ideology, and Afro-American Literature* (1984) seeks to develop an approach to most African American and American literature based in the vernacular, or everyday language, and music of black people. Drawing on the poststructuralist and Derridean idea of a decentered subject, Baker views the blues singer as being always at the crossroads, portraying the way in which experience is always multiple and varied. Thus, for Baker the blues singer and his experience serve as codifiers that cannot be pinned down to any final significance or meaning. He also points out that the blues are always on the move to further support this inability to contain them in any

one account. He suggests that a single interpretation can seem to bring order to experience but single readings are always disturbed by “remainders.”

Henry Louis Gates’s project in *The Signifying Monkey* assigns a similar importance to vernacular in identifying a particularly African American tradition of literary theory, as he draws on figures from Yoruban myth to rename current theoretical concepts in the vernacular of African Americans. In this book, Gates attempts to read black texts in terms of their own tradition rather than merely borrowing European theories. Thus, the goal in this book is markedly different from the earlier *Figures in Black*, in which he admittedly reads black texts and their criticism in light of European theories. In a similar way to McDowell, Gates attempts to debunk the idea that theory is only a Western exercise. To accomplish this task, he selects two trickster figures, Esu-Elegbara and the signifying monkey (which he sees as particularly Afro-American), for the basis of his project of identifying a theory of reading existent in the black tradition. Gates posits that Esu is a figure for the nature and function of interpretation, while the signifying monkey serves as a figure of figures.

Discussing the signifying monkey, Gates argues that the monkey’s language of signifyin’ indicates intertextuality or black formal revision and repetition, indicating a black difference. For example, Gates reads the repetition of situations from William Wells Brown’s *Clotel* in Frances E. W. Harper’s *Iola Leroy* as an example of this repetition and revision. Gates defines the task of the African American literary theorist as the responsibility to name the tradition and its antecedents (both black and white), and then to rename and thus revise and signify upon these antecedents. In *The Signifying Monkey*, Gates contends that he uses European theories only as analogies

and points out the differences between them and the theories of the black vernacular. Gates proceeds to define different types of textual relations and explains the two ways in which texts can signify: motivated or unmotivated signifyin’. Motivated signifyin’ is intertextuality that attempts to be corrective or to offer a negative critique of a previous text. In contrast, unmotivated signifyin’ pays homage to a previous text or texts.

The theoretical conversation involving Gates, Baker, Joyce, and others continued to evolve as in “The crisis in black American literary criticism and the postmodern cures of Houston A. Baker, Jr., and Henry Louis Gates, Jr.” (1994) Sandra Adell addresses several problematic theoretical maneuvers in Baker’s *Blues, Ideology, and Afro-American Literature* and Gates’s *The Signifying Monkey*. Adell views Baker’s and Gates’s attempts to identify an authentic African American tradition through blues and signifyin’ as contradictory because the methods they employ render the concept of authenticity dubious. In contrast to previous critiques of the work of Gates and Baker, Adell argues that she finds no fault with their use of poststructuralist and deconstruction theories in their writings, as for Adell the question of theory as it relates to African American literature is one that demands investigation, and using European theories seems to be for her a necessary evil of being a literary critic.

In treating Baker’s text, Adell suggests that his attempt to argue for a non-Eurocentric approach to African American literature is somewhat contradictory seeing how his writing is greatly informed by European theorists. She also comments that the connections he makes between various theoretical concepts and paradigms is often uncritical and misguided. Similarly, she points out contradictions in Gates’s text, like the manner in which he posits

black literature to have a black signifying difference, only to assert later that all texts signify. Another contradiction that she points to is Gates's idea that to signify is to revise in a formal way but signifying is also playful and ambiguous. While critiquing the theoretical underpinnings beneath several of Gates's and Baker's claims, Adell also responds to previous critiques of their work, suggesting that they are as interested in the political and social implications of African American literature as they are in increasing the appreciation of its literary richness. Adell's essay concludes that for all their attempts to be non-Eurocentric, Baker and Gates, ultimately, are perhaps more so in the final analysis.

bell hooks and Cornel West have also communicated their positions on the relevance of postmodernism for African American literary and cultural theory. While hooks advocates the value of postmodernism for black cultural theory, she does so with an acknowledgment that postmodernism has often been exclusionary and the theoretical territory of white males. hooks critiques current postmodern theoretical endeavors, suggesting that postmodernism can be more than merely theoretically attractive or fashionable if it engages its politics of difference with the politics of racism. Of particular relevance for hooks is the postmodern challenge of essentialism as it relates to the critique of an essential or authentic "blackness." Her critique is akin to Gates's in this regard in that she acknowledges that the black experience is multiple and, along with the critique of a fixed identity, postmodernism offers new constructions of self and possibilities of agency. Like Joyce with her concern about elitism, hooks advocates a strong relationship with the black community and encourages black critics to engage in dialogue both within academic arenas and with the poor and undereducated classes. Cornel West, on

the other hand, refutes the relevance of postmodernism, especially as it is expressed in the academy and literary arts, as he sees its current practice as marginalized from black life. This lack of a connection with the black community, in West's view, renders postmodernism's value for black resistance negligible. While hooks asserts that West's view of black life seems essentialist, he argues that black music is ultimately the best arena for black postmodern resistance in popular culture. West deems literary critics to be too easily tempted by material interests to make postmodernism relevant for black life, suggesting that they will instead merely appropriate Eurocentric theory.

Ann duCille also touches on the issue of poststructuralism by making use of it in her critique of the state of relations between black women and men. Citing critiques of black women authors like Morrison, Gayl Jones, and Alice Walker by black male critics, she reveals how these novels are often accused of male bashing and putting the question of gender before that of race by male critics. DuCille objects to the authority of black male critics like Addison Gayle and Ishmael Reed who suggest that the representations of male-female relationships in the novels of black women are inaccurate and misleading. Using poststructuralist theory, duCille challenges their assumptions of an essential black experience, an absolute historical truth, and that art must tell the truth. She posits that these critiques are phallogocentric and just one truth in a plurality of truths. Therefore, the gynocentric truth she sees these authors portraying is also another, equally valid truth. DuCille seeks to challenge the trend where male texts are often regarded as true history and master narratives while women's texts are judged only in relation to them. In addition, she acknowledges that male critics can be gynocentric and that female critics can be phallogocentric in their readings as well.

If for black feminist critics their position of alterity is doubled because they are unprivileged in Western metaphysics in terms of both gender and race, the position black homosexuals occupy is also, in some ways, doubly marginal. Black queer theorists, like Charles I. Nero and Marlon B. Ross, articulate the oppression experienced by gay black males and explore black homosexual ways of reading. Nero reveals the prevalent assumption in the African American community and in literature that homosexuality is a European phenomenon forced on Africans, and challenges this idea with close readings of some early African American texts. Describing the position of black homosexual men, Nero explains how gay culture is thought to be comprised of white males and how early attempts to improve the race and the Black Power movements often excluded gays or positioned homosexuality as antithetical to their movements.

Ross describes the media's representation of the black community's relationship with white gays, suggesting that the media distorts it and pits the one against the other. Ross also points out that black homosexuality was tolerated in black communities because of notions of racial solidarity; white homosexuals didn't receive the same treatment in the black community. Describing the difference in "coming out" for gay men in terms of race, Ross explains that white gay men left their communities to move to urban areas, whereas gay black men remained in their communities. He concludes that Eurocentric notions of gay culture existing autonomously fail to translate to the gay experience in black culture. Thus, while the idea of an autonomous gay culture is liberating for white gay males, for black homosexuals, as Ross argues, the concept caused distancing and intolerance from their communities.

More recent African American theory continues to expand, challenge, and revise

these earlier theories. In addition, the move to cultural studies, a practice of reading cultural phenomena as texts, toward the end of the 1990s by critics like Wahneema Lubiano, Hazel Carby, and Karla Holloway continues to influence the course of African American literary theory. Lubiano's warning that we must prevent oversimplification of Afro-American cultural production during the increased world interest in African American literature is significant for cultural and literary theorists alike. More contemporary works continue theorizing cultural studies like bell hooks's *Homegrown* (2006), while others pick up the study of vernacular like Alfonso W. Hawkins's *The Jazz Trope* (2008). Black feminists continue to theorize about black literature like Cheryl Wall in *Worrying the Line* (2005) and black queer theorists carry on investigations of sexuality as does Marlon Ross in *Manning the Race* (2004).

Agamben, Giorgio

ALEX MURRAY

The work of Giorgio Agamben (b. 1942) has been influential in political philosophy, legal theory, and cultural studies, with his critique of the Western political and juridical traditions gaining him a wide readership in the past 10 years. Yet his work is much broader in scope and his more than 15 book-length projects have explored a di-

verse range of areas. His early education saw the influence of Martin Heidegger, whose understanding of the relationship between language and being profoundly influenced Agamben's early work.

Agamben's reading of Heidegger focuses on the problem of the negative foundation of the human through the question of language. As human beings we are forced to conceptualize ourselves linguistically – language mediates our very consciousness. Yet language is an imposed and abstract system, and Agamben argues that there is something more primary than language – a voice – that we cannot have access to. We are then condemned to living through a negative relation to language in which we experience our linguistic essence as a loss. Agamben's work then proceeds as an investigation of how this irreducible negativity is played out in many different ways.

First, Agamben is interested in the ways languages of power and control are utilized in politics. In particular he is interested in the ways in which legal means are utilized to draw the boundaries of political systems and the privileges they bestow. Political community is usually measured by creating a binary between us and them, citizens and noncitizens. Here the political rights of one group are dependent upon them being excluded from another. Yet Agamben argues that this process works upon an inclusive exclusion. Here he explores the figure of *homo sacer* (sacred or holy man) who in ancient Roman law could be killed without the offender being punished by law. The *homo sacer* was considered to be sacred, in that he had been sacrificed and cast out of the political system, being left without rights. Agamben claims that the sovereign has the same place of being both within and outside of the laws that he is able to control. A sovereign also has the potential to suspend the rule of law, as happens in a "state of exception." For

Agamben the position of the sovereign and *homo sacer* reveal the limit point of politics, namely that any member of a political community has the potential to be excluded from that community and reduced to what he calls “bare life,” which is the product of the distinction between life and politicized life which, following Aristotle, he names *zōē* and *bios*. Agamben then traces a genealogy of the production of bare life in the political and legal systems of the West, drawing a line that connects the foundational principles of those systems with the Holocaust perpetrated by the National Socialists in Germany in World War II.

Yet Agamben’s critique of Western politics is made with an eye toward what he terms the “community that comes.” This community is a rejection of all forms of identity, a community made of “whatever being” which will have no form of commonality except being in common. This community is, importantly, not futural; it is not going to come, but is always coming. The means by which the coming community will emerge are related to the inoperativity that Agamben explores within the political, social, and cultural structures of the present. Inoperativity refers to the ways in which these structures fail to work, that they are characterized by paradoxes and tensions that produce figures such as *homo sacer* in the case of politics. The inoperativity of the system and the sites become the focus for Agamben, and it becomes necessary to force them to breaking point. One of Agamben’s favorite figures who produces greater inoperativity in a system is Melville’s “Bartleby, the Scrivener” who, when asked to perform tasks in the legal office in which he is employed responds, “I would prefer not to.” His preference, which is importantly not a refusal, suspends the logic upon which a series of ideas, such as work, law, action, etc. are

based and becomes instead an instance of potentiality. This is a key idea for Agamben, for whom human potentiality is not strictly a question of passing through into actuality, of a potential to do, but also to not do. The idea of not doing, of rendering inoperative is the driving force behind Agamben’s community.

Agamben’s work extends beyond questions of ontology and politics and enters into other domains, such as literature, art, and religion. Yet in all of these cases they should not be seen as secondary. As with the case of Bartleby Agamben finds philosophy everywhere and seeks to erode the distinction and difference between politics, philosophy, and poetics. Agamben’s idea of poetics is of a general schema of representation which stretches across the arts. Poetics, to summarize, are works that draw attention to their own form: artworks that expose the artist; literature that exposes language; films that expose the mechanics of cinema. An example of this is in poetry in which Agamben explored enjambment as the key feature of poetry, that which distinguishes it from its other, prose. Enjambment is the name for the sentence, or syntactical construction that carries over beyond a rhyme. It is therefore a tension between the meaning (syntax) and form (rhyme), a “hesitation between sound and sense.” Agamben therefore reads poetry as having an anxiety about the end of the poem, the point where poetry must fall back into prose as the tension between meaning and form collapse back into one another. Agamben’s interest is in how this manifests itself, and in particular how certain sorts of poetry seek to push the tensions to the point of disintegration.

Agamben’s work has in recent years moved toward a greater articulation of his own “method,” which he gives the name of an “archaeology,” an exploration of the tensions and structures of the past as they

manifest themselves in the contemporary. Agamben sees the exploration of these structures and their erosion as the “political task of our generation.”

Althusser, Louis

JOE HUGHES

Louis Althusser (1918–90) was a Marxist philosopher whose work exercised an enor-

mous influence on the evolution of French Marxism and on the course of literary theory. Althusser always thought of his work as providing Marxism with a *philosophy*. For this reason, with the exception of his late work on “aleatory materialism,” almost all of Althusser’s theoretical writings take the form of a commentary on Marx.

Althusser’s two central works – *Reading Capital* and *For Marx* – identify, describe, and draw the consequences of an “epistemological break” in Marx’s work. Marx’s “scientific discovery,” according to Althusser, lies in his break with humanism. The “early Marx” was still caught up in the problems of humanism. He still believed, for example, that “only the essence of man makes history, and [that] this essence is freedom and reason” (2005: 224). To understand history and to understand the state one must first understand human nature and its potentials. In an early essay, Marx himself wrote that the ideal state would be the one in which “the individual citizen, when he obeys the State’s laws, is only obeying the natural laws of his own reason, of human reason” (224).

Althusser argues that in 1845, the year of Marx’s *The German Ideology* and the *Theses on Feuerbach*, “Marx broke radically with every theory that based history and politics on an essence of man. . . . This rupture with every *philosophical* anthropology or humanism is no secondary detail; it is Marx’s scientific discovery” (2005: 227). Marxism can no longer be founded on a philosophy of the concrete subject, materialist or idealist, from this point on. The individual subject simply cannot function as its starting point. Rather than finding a middle ground between Locke and Kant, Althusser will argue that Marx staked out an entirely new vantage point with a new set of concepts, a “new way of asking questions about the world, new principles, and a new method” (227).

These new concepts are those of the “mature Marx.” Althusser lists the following: “the concepts of social formation, productive forces, relations of productions, superstructure, ideologies, determination in the last instance by the economy, specific determination of the other levels, etc.” (2005: 227). In other words, Althusser has in mind the entire conceptual apparatus supporting Marx’s theory of “social formation” that we know from *Capital*. In what has become his most well-known work, “Ideology and ideological state apparatuses: Notes toward an investigation,” Althusser goes to the foundation of this new set of nonhumanist concepts by submitting Marx’s theory to the “ultimate condition of production”: “the reproduction of the conditions of production” (2001: 85). Most of Marx’s concepts can be easily reconciled with this ultimate condition. Althusser has relatively little trouble accounting for the reproduction of the “means of production” (the raw materials and tools of production). The reproduction of “forces of production” (the workers who use the tools) is settled through a mix of wages, biological reproduction, and education (spiritual, technical, or otherwise). What Althusser cannot immediately account for is the reproduction of the “relations of production” or those social structures which organize production.

In “classic Marxism” this role was given to the “state apparatus,” the set of institutions which regulate social order: the police, the courts, the army, and so on. Althusser’s innovation was to complicate this notion of the state apparatus by dividing it into two forms (which were already there in practice, he argues): the “State Repressive Apparatus” and the “State Ideological Apparatus.” The repressive state apparatuses (RSAs or SAs) are those which act by force (the police and the army) but also by “mere administrative commands and interdictions” and even by

“tacit censorship.” As the name suggests, their function is primarily repressive. Althusser’s main interest is in the “ideological state apparatuses” (ISAs) of which he provides a long list including the family, churches, radio programs, television shows, literature, trade unions, and, the most influential of them all, the educational system. It is these apparatuses that ultimately secure the reproduction of the relations of production. The only question is how.

This raises the prior question however of ideology – a concept whose meaning is not at all clear and has been the subject of considerable debate. This is in part because what we know about Althusser’s conception of ideology is drawn from diverse sources, several of the most important of which are qualified by the appendage “notes.” “Very schematically,” Althusser writes, “an ideology is a system (with its own logic and rigor) of representations (images, myths, ideas, or concepts, depending on the case) endowed with a historical existence and role within a given society” (2005: 231). This system of representations is not optional. It is not a false consciousness that criticism can break through. It is an essential component of society in general. Human societies “secrete ideology as the very element and atmosphere indispensable to their respiration and life. . . . *historical materialism cannot conceive that even a communist country could ever do without ideology*” (2005: 232; emphasis original). As he puts it somewhat provocatively in *Lenin and Philosophy*, “ideology has no history” (2001: 107).

This system of representations is not floating out there in an imagined heaven of ideas. Nor is it something created and controlled by a “group of individuals (Priests or Despots) who are the authors of the great ideological mystification” (2001: 112). Althusser confronts these two conspiracy theory interpretations of ideol-

ogy with two theses of his own. First, ideology is “material.” By this Althusser means that it lives not in our heads but in the everyday actions of subjects: “the ‘ideas’ of a human subject exist in his actions” (114). Althusser quotes Pascal to make this point rather dramatically: “Kneel down, move your lips in prayer, and you will believe” (114). Second, there is no hidden operator of the system. It works only in and through the “ideological state apparatuses,” those rituals or structured *activities* in which we engage every day at the dinner table, at school, in telephone conversations with our friends. Thus Althusser’s statement that “[t]he subject acts insofar as he is acted” (114) contains both theses in condensed form. Ideology, then, is the set of those institutional structures, or apparatuses, however mundane or serious, which structure or “govern” our everyday actions. As he puts it in *For Marx*, the “representations” that constitute the system of ideology “are usually images and occasionally concepts, but it is above all as *structures* that they impose themselves on the vast majority of men” (2005: 233).

We become incorporated into these structures through a process Althusser calls “interpellation” or “hailing.” He gives a famous example of the police shouting, “Hey! You there!” In this situation “the hailed individual will turn around. By this mere one-hundred-and-eighty-degree physical conversion, he becomes a *subject*” (2001: 118). This example clarifies, first of all, the material nature of ideology. In the *act* of turning around, the individual is immediately incorporated into the structure of a particular ritual or ISA. The very structure of this apparatus instantly defines and even “governs” the subject’s possible actions. What *I* can do is determined by the particular apparatus in which I find myself engaged. Second, it shows in a concrete way how the hailing or interpellation works. Interpella-

tion is an address to individuals which incorporates them into a ritual in which they will take up a determinate subject position. In this case, the act of hailing is particularly flagrant and the subject position is well defined, but there are many other ways to interpellate, from the overly vigorous handshake of a “type-A” business exec to a birthday card from your mother. Each of these acts brings us into a structure in which we occupy a more or less determinate subject position, whether that be “suspect” or “mom’s little boy.” Interpellation, then, is the act that welcomes us into the various “rituals” or ISAs which govern our everyday actions and thus ensures the reproduction of the relations of production.

An examination of the various subject positions created in interpellation gave rise to one of the more interesting applications of Althusser’s thought in the late 1970s and early 1980s. One of the ISAs Althusser listed in his essay was literature. Althusser himself, however, did not develop the way in which literature functioned in the structure of ideology. Several literary critics, such as Catherine Belsey and Colin McCabe, thus developed Althusser’s claims by describing the subject positions created by the “classic realist text” and the modernist text. After this brief Golden Age Althusser’s thought slowly receded from the public eye. Recently, however, there have been several calls for a return to Althusser. These calls are inspired primarily by the recent appearance of an entire corpus of late writings by Althusser in which he outlines the fundamental premises of his philosophy which he now describes as an “aleatory materialism” or a “philosophy of the encounter.” In these writings Althusser emphasizes the role of pure chance in conjunctures and the radically undetermined nature of change.

American Indian Literary Criticism and Theory

ROBERT DALE PARKER

The criticism of American Indian literature began earlier and has a longer history of theoretical engagement than is ordinarily recognized. Before European writing systems reached what are now known as the Americas, the people now known as Indians or Native Americans had their own writing systems of various kinds, from Mayan glyphs to wampum and petroglyphs. Moreover, American Indians, like all peoples, have always had an extensive oral literature and a history of thinking about their own and their neighbors' oral literature. That history continues into contemporary times, both through oral tradition and through the dialogue between oral and written traditions.

Beginning with the European invasion, then, and the introduction of European writing systems, Europeans changed and were changed by Native American literary thinking of many kinds. Euroamericans were slow to recognize the presence as well as the breadth and intricacy of Indian oral literature, but in the nineteenth century Henry Rowe Schoolcraft, Daniel Brinton, and many other Euroamericans began to write about Indian oral literature, usually without much acknowledging the extent of their dependence on the critical thinking of individual American Indians who taught them – or taught their sources – about Indian languages and traditions. These early accounts of Indian literature influenced mainstream literary writing, most famously in Henry Wadsworth Longfellow's *The Song of Hiawatha* (1855), the most popular American poem of its time. With the growth of professional anthropology in the late nineteenth and early twentieth centuries, the massive project of writing down Indian oral literature grew in sophistication and breadth. While the published anthropological studies from that time usually reflect colonialist perspectives and draw on varying degrees of familiarity with the languages and cultures they record, they also vary in the ways they included, relied on, and recognized Indian scholars. Nevertheless, anthropologists gathered a vast archive of primary texts and interpretation of those texts. Working under the assumptions of what has come to be called salvage anthropology, they usually supposed, for the most part inaccurately, that Indian cultures were about to disappear and that anthropologists needed to write down Indian cultures before Indians and their traditions and languages faded away. Still, as a record, however imperfect, of the storytelling and other oral literature of particular times and places, the legacy of such late nineteenth- and early twentieth-century anthropologists as

Washington Matthews and Franz Boas, along with Boas's many students, remains invaluable.

In later years, anthropologists began to reconsider how early Euroamerican anthropologists imposed their own culture's ideas of storytelling onto the stories that they transcribed and recorded. Dennis Tedlock studied how the process of transcribing and translating changed the stories that it recorded, and Tedlock and others sought new ways to make the transcription and translation of stories faithful to oral performances. Barre Toelken and others showed how stories are integrated into the culture, rituals, and beliefs of the people who tell and listen to the stories. Meanwhile, as Native scholars and writers increasingly joined the scholarly discussion of traditional Indian oral narrative, or spoke and wrote back to it, or incorporated it into their own experience of oral traditions and their own literary writing, scholars and writers called attention to the close relation between land, so often central to Indian self-definition, and the stories that grow out of the land and hold the people and the land together.

Growing in part from these emerging discussions as well as from broader changes in American and American Indian culture and education, including the response to the African American Civil Rights Movement, the published body of written Indian literature grew dramatically in the years following N. Scott Momaday's (Kiowa) *House Made of Dawn* (1968). Kenneth Lincoln dubbed the new outpouring of Indian literature the Native American Renaissance. Soon, as the scholarly criticism of American literature expanded beyond its traditional bounds, scholars began to study and theorize about the new Indian writing. They often drew heavily on the long tradition of anthropological scholarship that they found ready and previously relatively unaddressed by literary scholars.

In the early years of this new body of literature and scholarship, many poet-scholars played a leading role, inspired partly by Tedlock's experiments with rendering the orality of storytelling in the form of printed poetry and the experiments of the anthropologist Dell Hymes, who turned to poetry for ways to make the printed page express the patterns and structures of oral storytelling. Led by Jerome Rothenberg and others, an "ethnopoetics" movement emerged. The ethnopoets often searched through anthropological transcripts of Indian stories, songs, and rituals and rewrote them as English-language poetry. While much of the poetry showed great inventiveness and power, it also came under attack as falsifying the oral traditions that it sought to represent by rewriting them and transforming them onto the page. Gradually, the influence of the ethnopoetics movement waned, in part from the criticism it provoked and in part because the desire for non-Indian poets to imagine ways to represent a Native oral poetry diminished in the face of the increasing recognition won by contemporary Indian poets themselves. Nevertheless, the ethnopoetics movement also influenced the writing of Indian fiction in such influential early novels as *House Made of Dawn* and Leslie Marmon Silko's *Ceremony* (1974), which integrated poetic versions of oral prayer and storytelling into their prose narratives. For both fiction writers and critics, an ongoing dialogue with or even dependence on oral storytelling came to seem like a defining feature of the new Indian writing and a way of connecting it to Indian traditions and history.

Another poet, fiction writer, and critic, Paula Gunn Allen (Laguna), called for the emerging literary study of Indian writing to take heed of the defining role of women in Indian cultures and stories and proposed as well that the central role of ceremony in Indian cultures and writing defines the dif-

ference between Indian writing and non-Indian writing. Other critics joined the growing effort to define a distinguishing difference in Indian literature. William Bevis noted that Indian novels take a different approach from the novels previously central to the study of American literature. While such novels as *Moby-Dick*, *The Adventures of Huckleberry Finn*, *The Great Gatsby*, or those of Henry James, tell of characters leaving home, Indian novels, by contrast, such as the acclaimed early works of Momaday, Silko, and James Welch (*Blackfoot and Gros Ventre*), tell of characters who return home. In seeing Indian writers as centered on their homelands, Bevis's argument anticipated many later arguments, even as Indian writing itself diversified after the boom of attention and excitement surrounding the flurry of new Indian writing in the 1970s and 1980s.

As a consensus emerged that Indian writing centered on place, on home, on orality, and on storytelling, that consensus produced competing reactions. On the one hand, some critics, including Allen and the poet Kimberly Blaeser (Anishinaabe), came to see such features as definitional of what makes Indian writing distinctive. They see orality as opposed to what they see as the linear patterns of Euroamerican writing, and they celebrate the distinctiveness of Indian difference from Euroamerican traditions. Such ideas had enormous influence on Indian writers and the theory and criticism of Indian writing, even while many critics came to believe that Allen tended to generalize too broadly and to underestimate the variations and differences within Indian cultures. The novelist and critic Greg Sarris (Pomo and Coast Miwok), for example, characterizes Pomo culture and intellectual life by writing about Pomo oral storytelling, and lets the circuitous wiles of storytelling influence the structure of his critical writing. The novelist and critic/historian LeAnne

Howe (Choctaw) makes the focus on storytelling into a theory of Indian imagination and Indian–white relations, a theory she calls “tribalography.”

The desire to define the distinctiveness of Indian writing made sense in a world where the dominant culture has done and continues to do so much to take away, even to steal, Indian distinctiveness, taking Indian land, making Indian religion illegal, fostering the myth that Indians were supposedly disappearing (the last of the Mohicans), forcing Indian children into colonialist boarding schools that often sought to destroy Indian languages and cultures, and trying desperately to assuage the colonialists' guilt by converting Indianness into the romanticized nostalgia of commercial products, from toy headdresses and tomahawks to toy Indians, to movies, to advertising images and sports mascots. In the same way, and at more or less the same time, some African Americans developed the Black Arts Movement, some Chicanas and Chicanos defined their history through the legend of Aztlán, and some feminists sought to establish a special and distinct difference that defines women's or feminine writing.

Each of those movements in turn provoked counterarguments. In the theorizing of Indian culture and literature, the counterarguments have taken many forms. Perhaps the most prominent counterargument has come from the writer and theorist Gerald Vizenor (Anishinaabe). Vizenor spoofs fixed ideas of Indianness – the clichés of the savage warrior, the stoic wooden Indian, the romantic Indian princess, and the natural Indian ecologist – calling them “terminal creeds.” Instead of valorizing images of Indianness, Vizenor valorizes tribal history and heritage. Through humor and satire, he models his theoretical and literary writings on the irrepressible playfulness of tribal tricksters and trickster stories, and he revalorizes the sometimes

derogatory terms “mixedblood” and “crossblood” as models for the unpredictable combinations of ideas and histories in what he calls “postindian” life and writing. The term “postindian” evokes Vizenor’s engagement with poststructuralist theory and with the flamboyant eclecticism of contemporary postmodernism. In response to Vizenor, some critics have seized on the idea of the trickster as a defining characteristic of Indian writing, though that might seem to go against Vizenor’s skepticism about defining characteristics. Others, notably the novelist and critic Louis Owens (Choctaw and Cherokee), have celebrated Vizenor’s focus on postmodernist multiplicity, taking the metaphor of the mixedblood as a representative signifier for Indian writing. For Owens, the metaphor of the mixedblood resonates in an age of cultural and genetic mixing, and in a context where the racial prejudices of the dominant culture exoticize the routine of mixed Indian heritages. Often, from the perspective of the dominant culture, mixed heritages seem to compromise Indian authenticity, as if only the dominant culture were allowed to change and still remain true to itself, and as if changes in Indian culture signify, once again, the myth of Indian disappearance. On the other hand, some critics have rejected the metaphor of the mixedblood as overly biological and thus reincorporating the myth of biological authenticity that the metaphor sets out to spoof. And some critics fear that the focus on tricksters can oversimplify Indian traditions and go too far to celebrate disruption and disrespect, thus reducing the role of the sacred and the role of respect for history, tradition, and practicality.

Thus while some critics see Vizenor’s ideas as a club to beat up other critics for oversimplifying Indian literature by trying to define it, others respond to Vizenor by seeking new strategies of definition that

might not succumb to the oversimplifications that Vizenor critiques. After all, critics observe, no other American ethnic or racial group has a land base. No other American ethnic or racial group has a literature and culture emerging from distinct nations that have their own governments and sovereignty. Indeed, Indians do not form an ethnic group or a race in the usual sense of those terms in American English. They are instead a wide variety of peoples that have emerged through the cultural heritage of hundreds of different Indian nations, many of them recognized by the federal government, some recognized by state governments, and some not governmentally recognized at all. Elizabeth Cook-Lynn (Crow Creek Lakota) thus asks Indian writing – and theory and criticism about Indian writing – to attend first to what good it can do for the sovereignty, land, and languages of Indian nations. Robert Warrior (Osage) challenges critics to attend to the intellectual sovereignty that he sees as underlying the history of Indian writing, instead of letting Indian specificity dissipate into the assimilating perspectives of non-Indian literary history. Taking up that challenge, Craig Womack (Muskogee Creek and Cherokee) invites critics to reshape questions about the definition of Indian literature by thinking less in terms of Indianness in general and more in terms of the specific histories of particular Indian nations, an invitation that Womack himself takes up in his history of Muskogee literature and that Daniel Heath Justice (Cherokee) takes up in a history of Cherokee literature. With a related focus on the centrality of Native communities, Jace Weaver (Cherokee) proposes what he calls “communitism” as a value that defines the distinctiveness of Indian traditions and Indian literary writing. Robert Dale Parker looks to changing, rather than consistent, cultural patterns and histories to characterize Indian literature. Meanwhile, in a variety

of ways across a long and diverse series of writings, Arnold Krupat stands out among critics who work to integrate the criticism and theory of Indian literary studies into the broader debates across the theory and politics of literary studies in general, while also attending to the specific qualities of Indian literary history.

Some critics, carrying the torch of Vizenor's postindianism, have looked skeptically on the challenges put forth by Cook-Lynn, Warrior, and Womack. In response, Womack, Weaver, and Warrior have argued for the centrality and value of national self-consciousness in Indian literary writing and in critical writing about Indian literature. Their argument coheres with an increasing attention to the historical centrality of sovereignty in American Indian politics and in Indian studies more generally, owing to an increasing recognition of the key role of sovereignty in Indian political and intellectual history and in the current struggles faced by Indian nations, as well as by indigenous peoples across the world. Indeed, in recent years, Indian studies within and beyond literary studies has begun to engage more largely with international indigenous studies, including the call by such scholars as the Maori Linda Tuhiwai Smith for scholars, indigenous and nonindigenous, to make their scholarship serve indigenous communities rather than simply asking what use they can make of the indigenous peoples they study. Drawing on similar dialogues, and calling attention to the frequent confluences of nationalism with masculinity and to the increasing movement of Native people into cities and away from their national homelands, Shari Huhndorf (Yup'ik) calls for a broader, international indigenous dialogue, combined with an attention to feminist questions, to reinfect and supplement the focus on local nationalism.

Recent scholars have also called attention to the way that contemporary writing dominates the study and teaching of Native American literature. Increasingly, scholars are turning to the literary detective project of recovering forgotten Indian writing from before the Native American Renaissance. Such scholarship has brought readers to Jane Johnston Schoolcraft (Anishinaabe), William Apes (or Apess, Pequot), Sarah Winnemucca (Paiute), Alex Posey (Muskogee Creek), Zitkala-Sa (Gertrude Bonnin, Yankton Sioux), John Joseph Mathews (Osage), D'Arcy McNickle (Confederated Salish and Kootenai, Cree), and a growing number of other once forgotten writers from the nineteenth and early twentieth centuries. Scholars have thus begun the task of testing, corroborating, and revising their models and theories against a longer history of Indian literature as well as against the continually evolving experiments of new generations of contemporary Indian writers.

Appiah, Kwame Anthony

ANASTASIA VALASSOPOULOS

Kwame Anthony Appiah's work is popular and influential across many genres including philosophy, African American studies, and more recently, postcolonial studies. He was born in London in 1954 and lived in Ghana and England. He was educated at Cambridge, where he studied semantics and philosophy. Currently he is Laurance S. Rockefeller University Professor of Philosophy at the University Center for Human Values at Princeton. Appiah is also a crime fiction writer and has written three novels, among which are *Another Death in Venice* and *Nobody Likes Letitia*.

Appiah's ability to move *beyond* seemingly opposing ideas of modernity and tradition in his discussions of contemporary culture has been very prominent. As Rooney has noted, “Appiah avoids falling into the polemical trap of an either/or: *either* modern philosophy of a Western universalist formation *or* traditional thought” (2000: 13). This is a key concept in Appiah's work, elaborated and reformulated in some of his major writings.

In *In My Father's House* (1992), Appiah argues for the necessity of remembering that when “writing about culture . . . one is bound to be formed, morally, aesthetically, politically, religiously – by the range of lives one has known” (xi). Appiah points to how varying philosophies of the world's cultures are interconnected and how this connectedness can help teach us all about what it means to be part of the human race. For Appiah, any indicator of “race” (apart from the human *race*) is a poor one that tells us nothing about our cultural tendencies. “The truth is that there are no races” (72). The concept of *race* is a barrier to understanding and accommodating cultural difference – it erases the humanity

shared by all. Appiah argues for turning “to our advantage the mutual interdependencies history has thrust upon us” and to understand that this interdependence need not be a sign of weakness (115).

In *Color Conscious: The Political Morality of Race* (1996; with Amy Gutman), Appiah eloquently argues that restrictive ideas of race only serve to further restrict ideas on what it means to be human. The concept of race can only provide generic connections between groups of people and cannot hope to explain “social or psychological life” (74). We cannot assume that subcultures share a common culture – for example, that all Asian American or African American subcultures form a specific kind of culture because they arguably share a common history or have been interpolated similarly. In arguing for a move away from labels that accentuate difference, Appiah is aware of the problems this heralds. How do we separate ourselves and construct distinct cultural identities, while at the same time making claims for multicultural sympathies?

Appiah rejects claims for “authentic” cultures of any kind, untouched by other communities or sociopolitical forces (1996: 95). Nevertheless, while Appiah presents reasons for why differences between groups matter, he maintains that groups must understand that relationships exist which *unite* them. He proposes that we “live with fractured identities; engage in identity play; find solidarity, yes, but recognize contingency, and, above all, practice irony” (104).

Thinking It Through: An Introduction to Contemporary Philosophy (2003a) reveals the extent to which philosophical debates around issues such as morality, justice, and the law all influence and are influenced by ideas used to differentiate ourselves from others. Here, Appiah notes how “it is important, in thinking about how we should behave, to bear in mind that each of us has one life to live and that living that life well –

making a success of one’s life – is important. And the fact that it is important to make a success of one’s life provides a connection between self-regarding and other-regarding considerations” (217). Mutual interdependency is a key factor in Appiah’s assessment of contemporary philosophy.

In his influential work *Cosmopolitanism: Ethics in a World of Strangers* (2006), Appiah addresses how considerations of the self and the other may be brought into dialogue. Rejecting globalization and multiculturalism as useful terms, he instead invests in the idea of the cosmopolitan. Putting the idea of cultural imperialism under scrutiny, Appiah asks us why in a post-9/11 world we are witnessing a discourse of the West and the rest. He promotes a conversational model, “in particular, conversation between people from different ways of life” (xxi). To learn, to know, to investigate – not to persuade, win over or force – is what Appiah promotes. “I am arguing that we should learn about people in other places, take an interest in their civilisations, their arguments, their errors, their achievements, not because that will bring us to an agreement, but because it will help us get used to one another” (78). Appiah’s arguments overall remind us that we are living in a world where cultural exchange is inevitable. The question is, will this exchange be adversarial or will it be accommodating? (2003a: 341–2).

Asian American Literary Theory

ANITA MANNUR

The term “Asian American literary theory” describes collective concerns about, on the one hand, aesthetics, literature, and the construction of “Asian American” identity, and on the other, the racial and ethnic politics of Asian American cultural formation. Since its inception, it has systematically problematized the dominant way in which race is understood, especially in the US, by questioning the binary opposition of black and white.

The playwright Frank Chin was an early theoretician in this field, and his work was rooted in 1960s “Yellow Power” cultural nationalism. In addition to his dramatic work, he was the coeditor of the pioneering Asian American literary anthology *Aiiieeeee!* He argued that it was the materiality of race that defined Asian American literature and he showed how anti-Asian racism was embodied in stereotyped characters in popular culture like Charlie Chan and Fu Manchu. Chin became well known in Asian American literary studies for extending this critique to the representation of Asian American men in the work of writers such as David Henry

Hwang, Amy Tan, and Maxine Hong Kingston, which he argued were emasculating. His “cultural nationalism” often emerged at the expense of feminist concerns and his stance on gender and race has been very controversial, but his continued analysis of Asian American subjectivity grants him an important place early place within Asian American studies.

Following from, and developing in response, to Chin’s critique, the next generation of Asian American literary theorists – including Amy Ling, Elaine Kim, King-Kok Cheung, and Sau-Ling Wong – laid further groundwork. Not only responding to debates over gender in Asian American literature, these theorists underscored the primary features of the Asian American literary tradition, initiating a critical conversation about neglected works by Asian American authors. For Kim, establishing the social context of Asian American literature was a necessary first step in orienting critics to Asian American texts. Ling’s work recovered the “lost” writings of early Chinese American authors. Cheung argued that the intersecting forces of nationalism and feminism were mutually constitutive Asian American critics. Sau-Ling Wong’s work furthers these scholars’ work by reading Asian American literature alongside frameworks of race, food, psychoanalysis, and gender. Collectively, the early theorists integrated gender into the extant narrative about Asian America, paving the way for several feminist analyses to emerge.

However, as a greater awareness of newer immigrant groups in the US arose in literary criticism, cultural nationalism as a critical paradigm gave way to a focus on diasporic connections with Asia. This turn to diasporic and postcolonial studies in the early 1990s broadened the scope of Asian American theory, which now turned to consider the role of immigration, neocolonial expansion into Asia, and the movement of capital,

labor, and commodities between Asia and the United States. Sau-Ling Wong's "Denationalization reconsidered" (1995) prompted an important inquiry into where Asia fits into conceptualizations of Asian America. Wong argued for a definition of Asian American studies as distinct from Asian studies. Works by Lisa Lowe and David Palumbo-Liu have been instrumental in providing critical tools for negotiating the connection between Asia and America in sociopolitical and economic terms. Lowe's landmark *Immigrant Acts* (1996) ushered in a new phase in Asian American literary theory. Rather than considering theory as a Western construction, Lowe embraced a theoretical foundation for Asian American literary studies. For her, "history and historical necessity" (41) fuel articulations of citizenship in American culture. Central to Lowe's work is a critique of the myths of American citizenship, its inherent contradictions and implications for understanding the increased economic and political dominance of the US in Asia. Lowe offers greater nuance to conceptualizing Asian American difference; through the vectors of heterogeneity, hybridity, and multiplicity, one can negotiate historically and politically inflected forms of difference in Asian American cultural production that more systematically engage with the forms of US imperialism. Palumbo-Liu (1999) maintains that the development of the American nation was tied to an expansion across the Pacific in tandem with the movement of Asians into the borders of the US nation-state. This duality foments a tension between "Asian" and "American," disallowing a complete fusing of the two. This explains the logic of inclusions and exclusions that have kept Asians in the United States from being viewed as fully American. The use of the slash in his title *Asian/American* addresses the tenuous sep-

aration of Asian and American while acknowledging their undeniable connections.

In the early 2000s, the field of Asian American theory had come to recognize its broad multiplicities and heterogeneities (to borrow Lowe's phrase). It has given rise to new and exciting work that considers changes in global economic structures, the effects of post-1965 immigration, while engaging marginalized forms of analysis sensitive to sexuality, gender, and class.

Often considered to be blind to inequities of race and ethnicity, psychoanalysis provided rich, fertile ground for theoretical work: Anne Cheng's *Melancholy of Race* (2002) and David L. Eng's *Racial Castration* (2001) are texts that attend to the possibility of understanding racial formation, sexuality, and gendered performance in terms of affect and psychoanalysis. Both suggest that literary analyses of the psychic lives of immigrants and populations of color can propel conversations about race, psychoanalysis, gender, and sexuality. One of the foremost theoretician of psychoanalysis in Asian American literary studies, Eng is also a pioneer in theorizing sexuality. Focusing on masculinities and Asian American queerness, Eng locates gay Asian men in Asian American studies. Gayatri Gopinath's (2005) articulation of queer diasporas in transnational frame brings focus to alternate forms of sexuality and same-sex desire in South Asian public cultures. Key to Asian American queer theory in general is an understanding of sexuality and queerness as central to the project of defining race and ethnicity. Even as Asian American studies occasionally considers queerness to be structured by a kind of impossibility, queer theory revisits the archive of Asian American literature to attend to the complexities of sexuality. Susan Koshy's *Sexual Naturalization* explores the imbrications of sex and race in the US imagination. Anti-miscegenation legislation, Koshy argues,

reproduced America as a white nation while the expansion of the US into Asia allowed white American men to have sexual liaisons with women in Asia.

Because it developed in tandem with ethnic studies, Asian American literary studies has long engaged comparative ethnic/racial perspectives. James Lee (2004) situates Asian American racial formation alongside other US ethnic and racial minorities; Allan Isaac's (2007) concept of "American Tropics" and critical empire studies reads 1898, the year of the Spanish-American war and the official inauguration of US imperialism in the Philippines, the Pacific, and Puerto Rico as a culturally significant moment requiring a comparative reading of Filipino American, Puerto Rican, and Hawaiian literatures; Crystal Parikh (2009) theorizes the connections between Asian American and Chicano/a literatures; Bill Mullen (2004) theorizes Afro-Orientalism; Daniel Kim (2005) considers black-Asian connections while Song (2005) examines the racial politics of the LA riots. Comparative analyses of Jewish Americans (Schlund-Vials, in press) and Arab Americans figures into comparative ethnic literary studies.

If the debate set in motion by Frank Chin's polemics is any indication, Asian American studies has negotiated the thorny terrain of recognizing the "proper" objects of study since its earliest days. As Viet Nguyen (2002) argues, the idea of Asian America is one in which Asian American intellectuals remain invested, both materially and intellectually. Extending this line of inquiry, Kandice Chuh's *Imagine Otherwise* (2003) engages the question of epistemology in Asian American studies. Chuh proposes replacing identity politics with what she calls Asian Americanist critique. This shift away from the question of objects and subjects of Asian American inquiry and toward a "subjectless discourse" allows for strategic attention to be placed on the critiques rather

than on subjectivities. As Lowe's work ushered in a new era of theoretical work in the late 1990s, Chuh's work stands poised to inspire the next generation of theorists. Chuh's call for a new form of Asian Americanist critique paves the way for closer attention to literary aesthetics. A renewed emphasis on literary form and poetics informs new work (R. Lee 1999; Lye 2005; Park 2008; Yu 2009) which strategically reads Asian American literature alongside canonical works of American literature. Park's *Apparitions of Asia*, for instance, provides a literary genealogy for Asian American avant-garde poetry, tracing its origins to American Orientalisms in modernist poetics.

While many consider Asian American cultural formation in pan-ethnic or comparative racial terms, several important developments have taken place in single ethnic studies. South Asian and Filipino American studies contends with being a part of, yet apart from, Asian America. Srikanth (2004) maps the centrality of the diasporic imagination to South Asian American literary studies. Analogously, Filipino empire studies has oriented the field to US imperialism in Asia while also, as in the work of Campomanes (1995), examined the discrepancies between the Filipino American literature of exile and the prevailing ethos of Asian American literature, thus expanding the field's theoretical scope.

At the close of the first decade of the twenty-first century, Asian American literary theory continues to think through history, politics, and relations of power extending the scope of Asian American critique. Intersectional analysis and cultural studies has led to new work, with vital connections being fomented to environmental studies (Hayashi 2007); food studies (Xu 2008; Mannur 2010); disability studies (Wu 2008). The field has moved beyond negoti-

ating inclusions/exclusions, recognizing that to transform the varied logics of inequities requires systematic engagement with forms of power and domination that structure Asian America and America's global reaches in Asia.

Authorial Intention

KAYE MITCHELL

Arguments over authorial intention – and the relevance of this to the interpretation of a text – go back many centuries, having a notable force and currency in the discussion of religious texts. However, contemporary debates about authorial intention in the literary sphere can be quite precisely dated to the publication of a seminal article, entitled “The intentional fallacy,” by W. K. Wimsatt and Monroe Beardsley, which first appeared in 1946 in the *Sewanee Review*. In that article, Wimsatt and Beardsley, who are generally associated with the school of literary criticism known as new criticism, argue that “the design or intention of the author is neither available nor desirable as a standard for judging the success of a literary work of art” (1962[1946]: 92). Although they are, as the quotation reveals, primarily concerned with questions of value, this article served to initiate a discussion about the relationship between authorial intention and textual meaning that has continued, in different forms, to this day. The debates around intention touch on many of the most fundamental questions in literary criticism: the

determinacy and determinability (or not) of textual meaning; the proper object of literary criticism; the author’s authority (and the level of control he/she can wield over the meanings of his/her own work); the functions and methods of criticism; the resolution of interpretative disagreements; the role of the reader; and the nature of literary value. Such debates also, of course, spill over into the contiguous realms of art criticism and art history, aesthetics, philosophy, theology, film and theater studies, translation studies, and any discipline in which interpretation is key.

Wimsatt and Beardsley are keen, above all, to distinguish the task of the literary critic from that of the biographer, historian, or psychoanalyst. The primary object of criticism, according to their argument, should be “the text itself” – divorced from the conditions of its creation and the intentions and desires of its creator. In a separate article – “The affective fallacy” – they proceed to argue that the text should also be divorced from the conditions of its reception, that is, from any emotional effect that it produces in the reader. In identifying both fallacies, they aim to render the discipline of literary criticism more rigorous, focused, and objective, by endorsing “the way of poetic analysis and exegesis” – close reading – rather than “the way of biographical or genetic enquiry” (1962[1946]: 104).

“Intention,” on Wimsatt and Beardsley’s understanding of it, is “the design or plan in the author’s mind” at the time at which he/she is writing the literary work and the premise of their argument is that this prior plan or blueprint is not accessible to the critic (how are we to know what is going on in the mind of the author?), whereas the text itself gives us all the information that we could hope to have (1962[1946]: 92). They therefore seek to specify the direction of inference in criticism: arguing that authorial intentions should be inferred (if at all) from

the meanings of the text, rather than the other way around. There is no point, they say, in “consulting the oracle” (104).

Crucially, Wimsatt & Beardsley distinguish between what they class as “internal” and “external” evidence in the interpretation of a literary text. The contents of the author’s mind are “external” to the text itself; the poem’s use of language and syntax are “internal” features of the text that are easily available to the critic. However, they do complicate this somewhat by introducing the category of “intermediate” evidence, which can include “the use of biographical information” and which concerns “the character of the author” and/or “private or semiprivate meanings attached to words or topics by the author or by a coterie of which he is a member” (1962[1946]: 98).

Wimsatt and Beardsley are the first “anti-intentionalists” and in many ways they set the terms of the debate that has followed, in describing intention as something private and inaccessible (a mental state) and in seeking to shift the focus of criticism from the author to the work. Indeed, they might more accurately be viewed as “anti-authorialists” rather than anti-intentionalists, and it is worth comparing their thesis to the arguments of C. S. Lewis and E. M. W. Tillyard concerning the literary work’s relationship to the poet’s personality in *The Personal Heresy* (1939). In addition to arguing that intention is neither relevant nor available to the literary critic, the anti-intentionalist generally argues: that the author is not always the best reader of their own work (authors don’t always know what they mean or mean what they say); that the author is not the best judge of the work’s value; that it is better to analyze and evaluate the finished work rather than the work that the author had in mind during the creative process; that the text is a public object which has a life beyond the intentions that the author may have had for it; and that the text may contain meanings

and produce effects above and beyond those intended by the author (and that this abundance of meaning partly accounts for the cultural value of literary works).

Both Wimsatt and Beardsley returned to the question of intention in their later work – Beardsley in *The Possibility of Criticism* (1970) and in “Intentions and interpretations: A fallacy revived” (1982), and Wimsatt in “Genesis: An argument resumed” (1968), which is included in his *Day of the Leopards* (1976). In this article, Wimsatt reinforces the original thesis with the expanded claim that “the intention of a literary artist *qua* intention is neither a valid ground for arguing the presence of a quality or a meaning in a given instance of his literary work nor a valid criterion for judging the value of that work” (1968: 12).

The anti-intentionalist line of reasoning has been strengthened by a more general “linguistic” turn in late twentieth-century critical theory, which has tended to favor formalist and structuralist analyses of texts, and by an anti-subjective turn which has tended to compound the undermining of the author, perceived as the stable source and determiner of meaning. Thus Roland Barthes lambasts “the image of literature to be found in ordinary culture [which] is tyrannically centred on the author, his person, his life, his tastes, his passions” and argues that writing signals the “birth” of the reader and the “death” of the author (1977: 143). Michel Foucault asserts that “today’s writing has freed itself from the domain of expression,” it is no longer tied to “the exalted emotions related to the act of composition or the insertion of a subject into language” but is, on the contrary, “a game that inevitably moves beyond its own rules” (1977: 116).

If the tendency within literary criticism and theory in the second half of the twentieth and early twenty-first centuries has been to decry references to authorial inten-

tion, this has not been a universal tendency. In fact, there have been notable arguments put forward in favor of intentionalism. The most sustained and decisive rebuttal of the intentional fallacy argument comes from E. D. Hirsch, Jr., in *Validity in Interpretation* (1967) and the later *Aims of Interpretation* (1976). Hirsch defends what he sees as “the sensible belief that a text means what its author meant,” and his argument has both ethical and methodological motivations (1967: 1). On the ethical front, he claims that “[w]hen we fail to conjoin a man’s intentions to his words we lose the soul of speech, which is to convey meaning and to understand what is intended to be conveyed” (1976: 90). For methodological reasons, he argues that it is necessary to take authorial intention as our interpretative criterion, in order to achieve “validity” in criticism. We should “re-cognize” the author’s meaning because such “re-cognitive interpretation” is “the only kind of interpretation with a determinate object, and thus the only kind that can lay claim to validity in any straightforward and practicable sense of that term” (1967: 27). This validity is necessary, in Hirsch’s view, if literary criticism is to become a “cognitive,” “scientific,” serious discipline.

These are, or have become, the main arguments for intentionalism: that the readers have a kind of ethical responsibility to abide by the author’s intention in their reading of a literary text, and that authorial intention can offer us an objective criterion for determining the meaning of a literary work (and thus for resolving interpretative disagreements, for example). Intentionalists tend to assert, more generally, that the author has, of necessity, a privileged relationship with the work; in the words of F. E. Sparshott, the author is more than “a bystander at his own performance” (1976: 107). This is part of a way of thinking which views literary works as the unique expres-

sion of some unique human subject and which asserts that works of art acquire their value in part because they are deliberately made by human beings (they are artifacts). So Frank Cioffi argues that “there is an implicit biographical reference in our response to literature. It is . . . part of our concept of literature” and “the suspicion that a poetic effect is accidental is fatal to the enjoyment which literature characteristically offers” (1976: 66, 68).

In response to the arguments originally offered by Wimsatt and Beardsley, intentionalist critics have claimed that authors generally *do* say what they mean and mean what they say (they are in the business of communication, rather than deliberate obfuscation), and that the mental states of others *are* readable, to some extent, so intention is not absolutely private and inaccessible. Even if we cannot “consult the oracle,” we can look at contextual information (such as diaries, letters, or other works by the author) which will tell us something about the author’s intentions at the time of writing. (And in fact, as I have suggested, Wimsatt and Beardsley do not rule out such “intermediate,” contextual evidence.)

In recent years intentionalist critics such as Gary Iseminger and William Irwin have sought to develop and expand upon Hirsch’s arguments. Iseminger actually describes his approach as “Hirschian,” as he claims that “if exactly one of two interpretive statements about a poem, each of which is compatible with its text, is true, then the true one is the one that applies to the meaning intended by the author” (1992: 78, 77). Irwin, meanwhile, develops a notion of “urinterpretation” that “seeks to capture the intention of the author, although not necessarily his understanding,” and that involves an interrogation and reworking of Foucault’s “author-function” (1999: 11).

Much anti-intentionalism has worked from the premise that intentionalism and

formalism are incompatible, that an attention to the text's formal qualities precludes an acknowledgment of intention. Yet it is possible (as I have argued at some length in *Intention and Text*) to conceive of other variants of intention which do not attribute it to some extratextual author figure, but rather concentrate on the ways in which the text itself is "intentional"; so intentionalism doesn't have to be authorial intentionalism. In *Art and Intention*, Paisley Livingston (who describes himself as a "partial intentionalist") concludes that he hopes to keep intention "on the research agenda in aesthetics" (2005: ix, 211); arguably, within the fields of literary criticism and theory, it has never really gone away.

B

Badiou, Alain

ALEX MURRAY

The work of Alain Badiou (b. 1937) has emerged as one of the most innovative and comprehensive philosophical projects in postwar France. Badiou's work is characterized by a desire to bring about the "return of philosophy itself." By this Badiou means to introduce an understanding of both subjectivity and ontology, which seeks its foundation in a return to the basic question of philosophy: What is being? Yet this is not done in the name of some sort of analytic formalism, but for largely political ends. Badiou's Maoist heritage and his commitment to a radical collective politics are never far from the surface. He is not simply an academic philosopher and he routinely engages in French and world politics in an accessible and polemical manner, including an introductory book on *Ethics* (2000 [1993]) and *The Meaning of Sarkozy* (2008b) in which he provides a historicization and anatomization of the Sarkozy phenomenon.

Badiou's research is, to a large extent, driven by the twin problems of ontology and subjectivity. If his work is underpinned by the exploration of mathematics as ontology, it has been in order to explore the problem of the subject of politics. In

Badiou's magnum opus, *Being and Event* (2005[1988]), and the second volume *Logics of Worlds* (2008a[2006]), he outlines how, through an articulation of a set theoretical understanding of mathematics, there is within the structure of the universe an underlying potential for transformation which becomes his theory of the subject. Badiou in doing this is neither an analytic philosopher, nor a poststructuralist thinker, but instead attempts to outline a new way of suturing what he sees as the erroneous divisions between the two. He argues that a way to truth can be seen in the four generic conditions of truth that have been severed in twentieth-century thought: love (in particular, the work of Lacan), science (in particular, the mathematics of set theory), art (in particular, modern poetry from Hölderlin and Mallarmé to Celan), and politics (in particular the events of May '68).

Badiou's claim is that philosophy needs to think these four conditions together, and that the way to do this is through the equation mathematics = ontology. Set theory is one of the most important branches of contemporary mathematics, providing something like a metalanguage for mathematics, with any mathematical question being subsumed in set theory. It is not possible to go into Badiou's use of it here, but suffice it to say that Badiou utilizes set

theory as it provides him with an innovative means of formalizing ontological questions: he can present ontological questions as set-theoretical equations. This means that he can take features of set theory – namely inconsistent multiplicity and the void – and import them into ontological discussions. This allows him to posit two important claims: that there is something within a given situation that is not limited to the situation, and that there is always a nothing that is both included in the situation yet does not participate in the situation.

While the theoretical apparatus that underpins Badiou's thought is complex, its outcomes are somewhat easier to grasp. The "situation" is the basic name Badiou gives to experience in its broadest sense, or to utilize the mathematical expression they are "indifferent multiplicities." Each situation is a presentation of these multiplicities but that does not mean that it is anything more – there can never be any truth that emerges from a situation. Just because one situation (capitalism and "parliamentarism") is dominant doesn't mean that it is "right" or that it is universal. That there is a void that underpins and escapes the situation means that there is always something within the situation that has the potential to rupture it. Badiou gives this truth the name "event." The event means that philosophy is not to be found in the exploration of structures, as so much of twentieth-century thought has been, but in "emergence," which is incalculable.

So for Badiou the emergence of the event is the basis of subjectivity: a subject must have "fidelity" to the event. So subjectivity is not limited to the conditions of the situation, but must emerge as a militant to the truth of the event. These "militants" can exist not just in politics, but also in any of the generic truth procedures – love, science, art, and politics. It may be useful here to look at some examples to ground our dis-

ussion. St. Paul often stands as Badiou's epitome of the political militant. Badiou locates St. Paul in the legal, racial, and religious conditions of his own situation. Paul begins life as a Roman citizen, a Pharisaic Jew, and an active persecutor of Christians, firmly entrenched in his particular cultural, social, ethnic, and religious hegemony. Then in the year 34 or 35 BC, while traveling on the road to Damascus, he sees a divine apparition and is converted to Christianity. From that moment on Paul pledges his life to becoming a missionary for the nascent religion. For Badiou, the event of Christ's resurrection is a truth-event, and Paul, in experiencing that event and maintaining fidelity to it, undergoes a process of subjectivization, the becoming of the subject.

Another model for Badiou's understanding of fidelity is that of Samuel Beckett. Beckett's work has long been understood to epitomize a modern nihilism, a lack of faith in any possible structure. Yet Badiou refuses to accept that there is despair in Beckett; instead he sees in his work the struggle to maintain fidelity to the event of nothingness. Badiou argues that Beckett's work is about courage, resistance, and action in an indifferent world and that Beckett's poetic fidelity to the event of nothing is a serious and deeply political gesture. Here we see how Badiou is able to transform a writer/artist through an incorporation into his own critical framework, and his *Handbook of Inaesthetics* (2004) offers several examples of his radical rereadings beyond the strictly philosophical.

Badiou's work offers one of the most comprehensive attempts to rethink philosophy since Heidegger and a series of interventions in debates from science to poetics that has as its ultimate goal an awakening of the transformative potential of the present through an understanding of the truth of the event.

Bakhtinian Criticism

KEN HIRSCHKOP

Mikhail Bakhtin (1895–1975) was a twentieth-century Russian philosopher turned literary critic and theorist. After the devastation of World War I and the drama of the Russian Revolution – he was 22 at the time of the latter – Bakhtin embarked on a search for a new basis for moral and ethical life. At first he believed that the key to making ethical life more compelling and central was philosophy. Only through a new ethical philosophy

could one demonstrate that sympathy and ethical action revolved around an ineradicable distance between ourselves and others, a distance that, once acknowledged, would lead us to appreciate our need for others and their need for us. But although Bakhtin would continue to write philosophically throughout his life, from the mid-1920s onward he began to rework this argument as a theory of language and literature, in which “novelistic discourse,” rather than philosophy, became the means by which Europe would regain its moral and political bearings. In the course of writing three books, drafts for several essays, and many, many notebooks – only a few of his works were finished during his lifetime – Bakhtin argued for the power of three elements of this novelistic discourse: its dialogical language, its carnivalesque imagery, and its chronotopic narrative. Each of these, in its own way, contributed to a deep-seated transformation in our sense of the world and our relations, ethical and political, with others.

Dialogical language acknowledged in its style that feelings, ideologies, and attitudes were never expressed directly, but always at a distance, by the reuse and orchestration of existing ways of speaking and writing, with all the contextual flavor and ideological baggage they carried with them. Carnivalesque imagery destroyed the sphere of sacred spaces and objects, bringing people and things into a “zone of familiar contact,” in which the pressure of social roles was suspended, hierarchies turned topsy-turvy, and all was submitted to cycles of perpetual transformation. Chronotopic narratives presented the world not as a neutral backdrop – a society, an environment, a situation, a sequence of historical events – within which a heroic protagonist must act, but as something itself in the process of “becoming” at the point of possible transformation.

Together these novelistic techniques transformed a world that had overvalued the past, stood in awe of the sacred, and found itself dominated by the declamatory and bombastic style of “official seriousness.” Novelistic discourse, drawing on energies and genres nurtured in popular culture, would make a world fit for those willing to embrace its historical, transitory nature. Bakhtin couched this argument in language that was alternately literary-critical, religious, and political. There were secular forces – variously called the epic, monologism, the poetic – that clearly stood in the way of the novel’s project; but his language also touched on problems that were the fate of frail and mortal creatures as such. As a consequence, there has been constant and vigorous dispute over the meaning of Bakhtin’s work, which itself seems plagued by ambiguity.

In ordinary circumstances, one could look at the history of a writer’s life and at his or her own testimony to resolve such ambiguities. Unfortunately, ordinary circumstances are thin on the ground in the case of Bakhtin. Because his life spans some of the most dramatic and violent events of the twentieth century he found himself, both personally and intellectually, constantly reacting to the sudden and pressing changes of circumstance. Hardly any of his work, therefore, was written or published without an element of calculation and censorship, and research has shown that even Bakhtin himself was not above playing fast and loose with facts when he thought it useful to do so. If the brutal history of the twentieth century left its scars on his work, these remain unhealed even to the present day.

A COMPLICATED LIFE, A COMPLICATED LEGACY

Bakhtin was born in 1895 to a middle-class Russian family. He moved away from his

family in 1914, going to Petrograd, probably to be with his older brother Nikolai (who would later become an academic linguist and classicist in England and a noted friend of Wittgenstein’s). After the Russian Revolution, Bakhtin followed the lead of many in search of a more secure existence, moving to the provincial cities of Nevel and Vitebsk, respectively. There he became part of a circle of intellectuals interested in literature and philosophy, which included the pianist Mariia Iudina, the philosophers Lev Pumpianskii and Matvei Kagan, the critic Pavel Medvedev, the then musicologist Valentin Voloshinov, and I. I. Sollertinsky, later director of the Leningrad Philharmonic. Returning to Leningrad in 1924, Bakhtin inevitably became embroiled in the intense debates then taking place over what the culture and literature of a revolutionizing society should look like. His first attempt to contribute in print to this discussion was, however, ominously unsuccessful: a detailed philosophical critique of Russian formalism was accepted by an important journal that was forcibly closed by the Communist Party before the issue with Bakhtin’s article appeared (the article was finally published 50 years later). In 1929, Bakhtin published the book, *Problems in Dostoevsky’s Art*; but he had been arrested in December of 1928 on the charge of belonging to a counter-revolutionary religious organization. A campaign waged on his behalf (which included support from prominent authors like Maxim Gorky), a favorable review of his book by Anatoly Lunacharsky, then head of the powerful Commissariat of Enlightenment, and Bakhtin’s severe osteomyelitis, ensured that his sentence was reduced from time in a labor camp to a period of exile in a rural town.

After serving his six-year term of exile, Bakhtin took up a post at a teaching institute in Saransk, Mordovia, only to have to leave it in 1937 to escape the wrath of the Stalinist

purges that were sweeping through the institutions of Soviet society. He spent the war years in and around Moscow, all the while managing to write and defend a dissertation on Rabelais. He returned to Saransk in 1946 and led a relatively peaceful existence as a relatively obscure university professor until 1961, when his work was rediscovered by postgraduate students in Moscow. They vigorously promoted his rehabilitation and revival as a public figure, and in 1963 a revised version of his book on Dostoevsky was published, to be followed by a revised version of the Rabelais dissertation in 1965. In the years that followed, Bakhtin became a venerated figure, whose past and work remained, nevertheless, somewhat mysterious. Many of his unpublished essays and notebooks, including substantial fragments of an unfinished work of philosophy from the 1920s, finally made it into print.

There were also more controversial additions to the Bakhtin canon. Beginning in 1970 a campaign was waged to have Bakhtin recognized as the author of a series of works published under the names of his friends, I. I. Kanaev (a short article on vitalism), V. N. Voloshinov (the books *Freudianism* and *Marxism and the Philosophy of Language*, and an article) and P. N. Medvedev (*The Formal Method in Literary Scholarship* and the articles that preceded it). The campaign was officially successful in the then Soviet Union, although the evidence for Bakhtin's authorship was limited to reports of conversations with Bakhtin, in which he was said to have admitted writing the so-called "disputed texts." These claims were treated skeptically outside the Soviet Union (and eventually by many inside as well) and research revealed a number of occasions on which Bakhtin denied authorship or refused to assert it in writing, as well as plans and drafts for the works written by Voloshinov and Medvedev themselves.

With Bakhtin's death in 1975 (Voloshinov died in 1936 of tuberculosis and Medvedev was murdered in the purges in 1938), final resolution was doomed, but even those originally committed to Bakhtin's authorship have now hedged their bets considerably.

The dispute over these texts, however, is actually no more than a skirmish in the larger struggle to define the meaning of Bakhtin's legacy. Generally speaking, those who assert Bakhtin's authorship claim he was a religiously inspired philosopher who, at some point after his failure to publish in 1924, decided to translate his concerns into an idiom (Marxist linguistics and literary theory) acceptable to the Soviet authorities. According to this interpretation, Bakhtin's works from 1926 onward should be read as coded discussions of religious and philosophical themes. On the other hand, those suspicious of Bakhtin's claim to authorship tend to see the transformation of his work as inspired by a genuine interest in the literary and linguistic work of his friends and those around him, and they regard the shift of interest and emphasis as ultimately productive. This dispute has, unfortunately, bled into the editorial preparation and publication of Bakhtin's texts, many of which are unreliable, either because references to religion have been deleted owing to Soviet censorship, because references that appear overtly communist have been deleted by those who see them as concessions to the Stalinist dogma of the time, or because reference to foreign scholars have been deleted owing to the Russian chauvinism of editors (such as the deletion of footnotes to German Jewish scholars in the famous essay "Discourse in the novel"). That, excepting the three books published in his lifetime, all of Bakhtin's works are either fragments of uncompleted works, notebooks, or drafts for essays, means that editors have an even greater role than usual

in putting together printed, final versions of Bakhtin's work.

THE PROJECT FOR AN ETHICAL PHILOSOPHY (1918–1926)

Of Bakhtin's original project for a grand ethical philosophy several long fragments remain: an introduction titled (by the editors, not Bakhtin himself) "Towards a philosophy of the act," a draft of a long chapter devoted to aesthetics titled "Author and hero in aesthetic activity," notes to two lectures from a series with nearly the same title and a lecture on religion, all delivered in 1924. In these texts, Bakhtin argues that our experience of human life is inevitably and irrevocably split. On the one hand, we perceive our own ideas and feelings as necessarily unfinished and aimed forward, with no possible end in sight; on the other, we experience the ideas and feelings of others as bounded by a context or a background, as part of a physical, creaturely world. When we understand or sympathize with others, therefore, we do not translate their feelings or thought into the categories of our own experience: we understand them by responding in a distanced, sympathetic fashion. If, for instance, another is in pain, understanding means not re-experiencing the pain, but comforting or helping the other who is suffering.

Acknowledging this division was the basis for all genuine responsibility and moral action. We would realize that from within our own resources no sort of satisfaction or conclusion was possible: for that we relied on others, who, in their turn, depended on the charity we extended them by virtue of our "outsidedness" in relation to them. Within this schema, the artwork occupied a privileged position, for there the author achieved a kind of synthesis or balancing between the inner energies of the hero and

the author's ability to represent them as part of a creaturely "external" world.

TURN TO THE NOVEL AND THE DIALOGICAL THEORY OF LANGUAGE (1927–1936)

When composing the book *Problems of Dostoevsky's Art*, Bakhtin reframed the problem. To be precise, he reframed it twice. In the first half of the book, the ethical relationship between *I* and *other* is described as the relationship Dostoevsky crafts between the author and the hero. In his prose writings, Bakhtin claims, Dostoevsky found the formal means to represent the hero not as an object or function of the plot, but as a voice with rights equal to those of the author. In the second half of the book, this formal achievement was described as a matter of style: Dostoevsky's discourse was not monological, putting heroes and situations in their place, but dialogical or doubly directed. It had a dual, ambivalent meaning, depending on both the frame of the work as a whole (the author) and the resistant and independent intentions of the hero.

Although this was portrayed as an artistic innovation of Dostoevsky's, Bakhtin anchored dialogism in a philosophy of language he was to develop extensively over the next 45 years. Its fundamental claim was that phenomena like parody, irony, stylization, and the strategic use of language types drawn from other written genres or distinct social groups were all instances of a dialogical orientation toward language. This dialogical orientation understood language not as a tool for the expression of an ego's feelings or intentions, but as an ocean full of the expressions of *others*, at once creaturely – in the sense that they often had distinctive external forms (manifested in spelling, accent, syntax, and so on) – and spiritual, in the sense that each embodied a

distinctive point or view or ideology (in the neutral sense of that term). The writer or speaker whose expressions exploited this dialogism created utterances that were “double-voiced,” in which one could sense both the original source language and the new – perhaps critical, perhaps not – inflection given to it by the speaker.

Bakhtin’s next step was to broaden his argument in dramatic fashion. In what may be his most important essay, “Discourse in the novel” (1934–5) and in a series of shorter essays on the novel written between 1940 and 1945, Bakhtin made dialogism a central feature of novelistic discourse as such, and made novelistic discourse the representative of both modernity itself and its democratic aspirations. From here until the end of his life he associated the denial of dialogism with “official seriousness” and the representatives of repressive institutions and structures. By contrast, the source of dialogical energy was said to be a “heteroglossia,” a world of double-voiced, skeptical, and distanced language, that flourished in everyday life and was concentrated in the lower, popular genres of writing and speech.

CHRONOTOPE AND CARNIVAL (1937–1951)

Having identified dialogism with not just Dostoevsky in particular, but with the novel as a radically new kind of writing, Bakhtin went on to elaborate on the novel’s other distinctive features and talents. In the mid-1930s he began work on a study of the *Bildungsroman* (the novel of education or maturation) and of Goethe as its culmination. His argument was that one can witness, from the advent of the ancient Greek novel onward, a gradual change in the way prose represented the intersection of time and space. Whereas in older forms space was rendered as a neutral background

for the adventures and exploits of the hero, and time seemed to have no developmental aspect, artistic prose gradually wove time and space together in an intricate “chronotope,” such that each began to exert a kind of forward pressure or movement on the action represented. Space became localized and concrete, and began to carry with it the marks of time; time acquired a irreversible momentum orientated first and foremost to moments of transition and transformation.

In the drafts that have been collected and published as “The *Bildungsroman* and its significance for the history of realism” Bakhtin described how the hero of artistic prose evolved from a static model, to a collection of traits gradually revealed, and finally to a protagonist that found itself transformed under the pressure of experience; after which, the developing force of the hero itself spread outward into the world beyond it, which became a place never settled in its ways, always poised on the brink of possible change. But Bakhtin cleverly switched horses when it was time to flesh out this idea of a world constantly at the point of transition, exchanging Goethe for the extravagant world of Rabelais.

Initially content to describe Rabelais, too, as a master of the chronotope, Bakhtin quickly ditched this useful concept in favor of the idea of the carnivalesque. In a dissertation first completed in 1940, then revised several times until it was published as *François Rabelais and the Popular Culture and the Middle Ages and Renaissance* in 1965 (the English translation sports the shorter title *Rabelais and His World* [1984b]), Bakhtin presented Rabelais’s grotesque, public square imagery as a sophistication of cultural forms derived from the popular culture of medieval and Renaissance Europe. Bakhtin argued that the form and style of Rabelais’s imagery was drawn from what he called “festive-popular

culture,” the apogee of which was the celebration of carnival in the Christian calendar. This festive-popular culture, Bakhtin claimed, had been persistently misunderstood as no more than an opportunity for respite from the everyday toil and piety of medieval Europe, a carefree moment for letting off steam. What had been missed was what Bakhtin called the deep “philosophical” content of carnival and its associated culture, for carnival was not merely a time to relax but a complete alternative model of the world, inhabited by the popular classes on a regular basis.

This alternative world was permeated by a “culture of laughter,” through which the individual gained distance not only from his or her individual fate, but from fatedness as such, from the conviction that the rules, roles, and hierarchies that structured medieval social life were permanent and enduring. During carnival, the high was made low, the spiritual was rendered in earthly form, and all rank and hierarchy was either suspended or explicitly reversed. The cycles of human and natural transformation and renewal, embodied in the seasons and the patterns of human birth and death, were applied to the matter of human society and history. Rabelais would take this imagery and spin it in a democratizing and progressive direction, making the emphasis on permanent transformation a weapon of sharp satire and of utopian vision.

THINKING OF THE HUMAN SCIENCES (1952–1975)

During the last 25 years of his life Bakhtin did not pursue an intensive study of literature. Instead, he developed the implications of his dialogical philosophy of language and considered its implications for the work of the human sciences in general. In the 1950s his principal works were two

articles, “The problem of speech genres” (1953) and “The problem of the text” (1959–60). The first of these suggested that we think of genre not only as a literary category, but as a category pertaining to all speech; the second carefully distinguished between a theory of language and a theory of discourse or utterance, in which the dialogical aspect of language, its status as a response, would be the paramount consideration. In these works and the texts that followed until his death, the combative and militant tone typical of his writing on the novel seemed to recede.

If drama receded from the works, though, it intervened in the life. While Bakhtin was living a quiet life in Saransk, three postgraduate students in Moscow had discovered his work in the library. They went to visit him and from then on two of them, Sergei Bocharov and Vadim Kozhinov, devoted themselves to the dissemination of Bakhtin’s work and to his rehabilitation in Soviet life. In these last years Bakhtin became well known not just within the Soviet Union, but also internationally.

His writings in these last years consists of notes and jottings, most of a general and philosophical character, devoted to further describing dialogical relations, the role of the dialogical author, and the nature of human responsibility. Some of these were selected by Bocharov and Kozhinov and published as “Notes from 1970–1971” (a misleading title, as it turned out) and “Towards a methodology of the human sciences.”

After Bakhtin’s death in 1975, previously unpublished texts finally made it into print and information about his life began to be made public, although much of it, as noted above, turned out to be false or dubious. In the 1990s work began on a properly edited, comprehensive *Collected Works*. At the time of writing, five volumes of the expected seven have been published.

LEGACY AND APPLICATIONS

The concepts of dialogism, chronotope, carnival, and outsidedness translate large philosophical concerns into the language of literary analysis. As a consequence, they have a certain grandeur and an enviable range of application. The wide variety of scholars who adopted Bakhtin as their own testifies to just how fluidly these concepts could be applied. Concepts like dialogism and the chronotope have been used to analyze not only literary texts from the Bible to postmodern fiction, but also historical texts, classical and popular music, visual art, digital media, and a number of popular traditions. Bakhtin's vivid account of the philosophy of carnival itself led to a broad and deep reconsideration of the meaning of carnival practices around the world, past and present.

But perhaps even more striking has been the multiplicity of approaches which have seen Bakhtin as an ally or as theoretical ballast for their method. Originally described as formalist or structuralist, Bakhtin soon found himself taken on by critics who saw him as a humanist alternative to structuralism, by proponents of psychoanalytic and poststructuralist approaches like Kristeva, by postcolonial critics, feminists, and Marxist writers.

Bal, Mieke

JOE HUGHES

Mieke Bal (b. 1946) is a European scholar of literature and culture who specializes in narrative theory. Her writing is thoroughly interdisciplinary and ranges from literature to visual culture to theology and biblical studies. She has been particularly influential in defining the fields of narratology and cultural analysis. Her early work in narrative informed much of her later work in

visual culture, cultural analysis, and what she “somewhat halfheartedly” called “post-modern theology” (2006: xix). It was largely through the conceptual structures developed in *Narratology* (1985[1980]) that Bal began to study non-literary objects.

Like the French literary theorist Gérard Genette, Bal took a rigorously systematic approach to narratology. The system is organized around a distinction, originally Genette’s, but here more fully developed and more systematically followed, between three narrative levels: fabula, story, and text. A fabula consists of the basic elements of a narrative text – for example, objects, events, actors, and the chronological and logical relations between them. “Story” refers to the specific ways in which these things and people are viewed. Events may be placed in a non-chronological or illogical sequence, for example. Actors become characters, or specific, human-like individuals. All things, people, and events become “focalized” or seen through a certain character’s mode of perception. The last level, that of the text, is the level of the words themselves, the set of “linguistic signs” through which the story is told. Here objects are described in specific ways and, most importantly, the story is narrated.

In addition to simplifying and systematizing Genette’s narratology, Bal influentially revised the notion of focalization. Genette distinguished between two types of focalization – internal and external – according to the “knowledge” a focalizer has of its objects (1980: 189). Bal argued that the “functional difference” between internal focalization and external focalization is not a matter of knowledge and its degrees of restriction, but is grounded, rather, in a subject–object distinction. In internal focalization we see the particular, imperceptible opinions of the subject; in external focalization we see a perceptible field of objects (2006: 19).

In *Narratology*, Bal had used a *bas-relief* to explain the concept of focalization – ostensibly to demonstrate that focalization, unlike narration, is nonlinguistic and thus does not belong to the level of the text (1985 [1980]: 103). But this formula is easily reversed: if a drawing could exemplify focalization, focalization and other narratological concepts could equally explain visual phenomena. All those concepts which were not tied to the level of the “text” were capable of “traveling” to other fields of inquiry. As Kaja Silverman (2008) has pointed out, the concept of focalization informed Bal’s earliest engagements with visual culture, and in works like *Reading Rembrandt* (1991) and *Quoting Caravaggio* (1999c), Bal both extended narratological concepts to visual art and began developing a repertoire of new, interdisciplinary concepts. One of the more important of these is the notion of a “preposterous history,” a concept which extends narratological concepts (anachronism and frame) to historical problems. A preposterous history emphasizes the ways in which the present rediscovers or reinterprets the past, but in doing so allows the past to reshape the present.

Bal was a founding director of one of the major institutional homes of cultural studies: the Amsterdam School of Cultural Analysis. This attention to the complex interaction between past and present – the ways in which the present reshapes the past and the ways in which the past shapes the present – is one of the distinctive features of her conception of cultural analysis. Cultural analysis is not simply the study of everything in our world that is not “high” culture. In her introduction to *The Practice of Cultural Analysis*, she explains:

Cultural analysis as a critical practice is different from what is commonly understood as “history.” It is based on a keen awareness of the critic’s situatedness in the present, the

social and cultural present from which we look and look back, at the objects that are always already of the past, objects that we take to define our present culture. . . . Far from being indifferent to history, cultural analysis problematizes history’s silent assumptions in order to come to an understanding of the past that is different. This understanding is not based on an attempt to isolate and enshrine the past in an objectivist “reconstruction” nor on an effort to project it on an evolutionist line. . . . Instead, cultural analysis seeks to understand the past as *part of* the present, as what we have around us, and without which no culture would be able to exist. (1999a: 1; emphasis original)

We study culture, Bal argues, because we want to understand our world (2006: 391). This particular conception of a preposterous history allows us to understand the role of the past in the present. In order to come to terms with the present, however, we need to reach beyond disciplinary boundaries. Throughout Bal’s work, there is a constant and careful attention to interdisciplinary methodology, and in her retrospective introduction to *A Mieke Bal Reader*, she identified as the unifying thread throughout her work the concept of the concept.

As early as *Narratology* Bal described a theory as a “systematic set of generalized statements about a particular segment of reality” (1985[1980]: 3). These “generalized statements,” concepts, help us describe certain phenomena by providing a common or social (and therefore both political and pedagogical) framework for discussion. They organize phenomena. They determine what questions we ask of phenomena. They structure our observations about them. They do all this, further, without pretending to exhaust or represent the thing they help describe. For all these reasons, it is imperative that we are absolutely clear and rigorous about the nature and extension of our concepts. Later, Bal

refined this picture, placing less emphasis on the requirement of systematicity (concepts are “miniature theories” [2006: xxii]) and by arguing that the relationship between concept and object is, at root, metaphorical. A metaphor asks us to compare two terms according to a ground, and this has several consequences: it brings out something both new and specific in the objects compared and it places them in new frames of references. In the same way, theoretical concepts are not meant to coincide with the object they help describe. They pull out new aspects of the object and introduce it into a new frame of reference (Bal 1994). By insisting on the generality of concepts and their heuristic rather than representative function, Bal is able to treat concepts as specific but at the same time nomadic, capable of “traveling” from one discipline to another (2002).

Bhabha, Homi

ANKHI MUKHERJEE

Homi K. Bhabha is a foundational figure for postcolonial theory. He was born in Bombay, India, in 1949, educated at the University of Bombay and Christ Church, Oxford, and is at present Professor of the Humanities in the Department of English and American Literature at Harvard University.

Bhabha's most significant book, arguably, is *The Location of Culture*, a collection of writings published in 1994, which includes definitive versions of his influential essays “The other question,” “Of mimicry and man,” “Signs taken for wonders,” and “DissemiNation.” *Nation and Narration*, edited by Bhabha, is another central text in his oeuvre, containing a variety of contributions on national narratives. “Foreword: Remembering Fanon: Self, psyche, and the colonial condition,” Bhabha's 1986 introduction to the Pluto edition of Frantz Fanon's *Black Skin, White Masks*, played a key role in the 1980s revival of Fanon's work and in the resurgence of critical appropriations of Fanon in the academy, which Henry Louis Gates, Jr., (1991) has termed “critical Fanonism.” Bhabha is also the author of several influential critical articles, such as “At the Limits” (1989), a commentary on the aftermath of Salman Rushdie's *Satanic Verses*, “Queen's English” (1997), a study of

hybridized speech, "Cosmopolitanisms" (2000), on the pluralistic nature of cosmopolitanism, and "Adagio" (2005), a reflection on the legacy of Edward Said.

Bhabha's work has provided many valuable conceptual leads and catchphrases to postcolonial theory: nation and narration, anticolonial agency, third space or the place of hybridity, ambivalence and uncanny doubles, mimicry, pedagogic and performative nationality. Bhabha formulates a postcolonial method that draws on high European theory – Sigmund Freud and Jacques Lacan, Hannah Arendt, M. M. Bakhtin, Jacques Derrida, Michel Foucault, to name the major influences – and teases and tests it in reappraisals of the phenomenon of colonialism and the quandaries of the postcolonial condition. Bhabha's theoretical formulations engage with literary texts (by Joseph Conrad, Henry James, V. S. Naipaul, Salman Rushdie, Toni Morrison, for example) as well as nonfiction writings by J. S. Mill, Frantz Fanon, and Charles Taylor. Bhabha writes in an eloquent and sometimes difficult style, and famously won the runner-up award in the 1998 "Bad Writing Competition" (from the journal *Philosophy and Literature*) for a line from *The Location of Culture*.

In "Signs taken for wonders," Bhabha examines the role of the English book in the perpetuation of English cultural rule. Bhabha argues that the fetishized English book – the sign taken for wonders, whether it is the Bible or a canonical text – is a site of colonial ambivalence. Bhabha provides two distinct and seemingly contradictory accounts of this ambivalence or "splitting" of the voice of authority. He argues that it is a constitutional undecidability in the very edicts of Englishness that makes possible anticolonial and postcolonial intervention and subversion: the colonized disarticulate the voice of the colonizer at the very point of its splitting. He also suggests, however, that

colonial ambivalence is invented when master texts are subjected to acts of repetition in the "dark unruly spaces of the earth." In "Of mimicry and man: The ambivalence of colonial discourse," Bhabha outlines his view of colonial mimicry as a discursive operation in which the excess produced by the *ambivalence* of mimicry – "almost the same, but *not quite*" – serves to undermine and make uncertain the totalizing discourses of the colonial system. Mimicry, Bhabha says, works like camouflage, not a repression of difference, but a form of resemblance that defers presence by displaying it partially and metonymically. Through his conceptualization of mimicry, Bhabha problematizes the old colonial relationship between a monolithic power and its faceless victims. Bhabha suggests instead that the colonial presence is always ambivalent, split between its appearance as deliberative and its articulation as repetition and difference. Bhabha illustrates this process by first noting the fetishistic marks of European cultural and disciplinary presence in the space of the colony – cricket fields, European clubs, colonial courts, theaters, mock Etons, the English book. The function of these "transparencies of authority," as Bhabha terms them, is not to satisfy the demands of European nostalgia but to exert a normalizing influence over the native, to re-form the African or Indian as a copy of the displaced European "original." This double exercise of power, which acts to authorize the European and civilize the native, gives rise to mimicry. The colonial disciplinary regime fails to produce allegories of Englishness and produces instability and hybridity instead, and colonial subjects "who are almost the same, but not quite, not white," "less than one and double." The colonist's identity is jeopardized by the emergence of the supplement and the counterfeit. The identity of the colonized, in turn, is not simply a mimesis of the European original, but a

mask of mimicry that is more menace than resemblance.

Bhabha's terms of exegesis in *The Location of Culture* are "the arbitrariness of the sign, the indeterminacy of writing, [and] the splitting of the subject of enunciation" (1994a: 175–6). His concepts of mimicry and hybridity are a version of Derridean *différance*, the difference within binary terms that supersedes them: it is in the uncanny space between dominant cultural formations that Bhabha finds "the location of culture." Bhabha's organizing principle is a deconstruction of the "sign" and his particular emphasis is on the indeterminacy in cultural and political judgment. He seeks to move from what he calls the "pedagogical" aspect of cultural identifications (fixed, exclusive, discriminatory) to the "performative" aspect of the articulation of identities, or what he calls "the disruptive temporality of enunciation." Enunciation (meaning both speaking and performance) is the scene of creative heterogeneity, of differing and deferring: It is through the vicissitudes of enunciation that the borders between objects or subjects or practices are reconstituted. Bhabha identifies his critical task as postcolonial translation, which seizes upon the contradictory and ambivalent space of cultural statements. Postcolonial agency thus emerges as a politics of relocation and reinscription that rejoices in "representational undecidability."

Bhabha draws heavily on Jacques Lacan's ideas on mimicry in *The Four Fundamental Concepts of Psychoanalysis* (Lacan 1981) to conceptualize a colonial subject who is the same as the colonizer but different. The mimic man, not quite, not white, is a partial representation of the colonizer. Far from being reassured, the colonizer sees a grotesquely displaced image of himself: the familiar, transported to distant parts, becomes uncannily transformed. Bhabha undermines the model of mimicry

that locates the other as a fixed phenomenological entity, opposed to the self. The subject of desire, according to Bhabha is never simply a "Myself," just as the Other is never simply an "It-self." In the foreword to Fanon's *Black Skin, White Masks* (Bhabha 1986), Bhabha turns Fanon's idea of the dualistic nature – black skin, white masks – of colonial pathology into an altogether philosophical meditation on the idea of Man as his alienated image, not self and other, but the alienated and othered self as inscribed in the complex of colonial identities. Bhabha lauds Fanon for putting the psychoanalytic question of the desire of the subject to the historical condition of colonial man, though he concedes that this insight into the ambivalences of identification in Fanon's early work is eventually sacrificed to the insurgent political need to name and frame the other in the language of colonial racism. Bhabha's psychoanalytic "remembering" – as distinct from a translation – of Fanon has been criticized as obscuring Fanon's paradigm of colonial condition as one of unmitigated antagonism between native and invader (Benita Parry) and repressing the Manichaeon history of colonialism in favor of colonial ambivalence (Abdul Jan Mohamed). Bhabha's "misreading" of Fanon has been used by other commentators as a critical instance to highlight the gap between academic and political anticolonialism, and also between the expatriate postcolonial intellectual floating in global space, and the class- and ethnicity-bound, immobilized postcolonial with no access to interstitial or neutral ground.

Nation and Narration is a source book for postcolonial theory's ongoing interrogation of the idea of nation. Bhabha's unique contribution to the question of nation formation is to link nations with narratives of nations. In sharp contrast with ideas of the nation as a self-identical and consistent

community that is untouched by the deprivations of history, Bhabha proposes a “double narrative movement.” He sees the nation as an object of a nationalist pedagogy, vested with the continuity and accumulated authority of its past, but also as subjects of a process of signification which denies that past history in live performances of a heterogeneous and processual identity. The pedagogic narratives of nationality are revised and rewritten by migrant and marginalized narratives. Bhabha documents how political solidarity is bestowed upon cultural difference and heterogeneous histories by the self-contained idea of nations: he also celebrates the “marks of difference” shored by destabilizing iterations of that idea.

Bhabha sees the distinction between theory and political practice dismantled in a liminal “third space.” Theory, he argues in *The Location of Culture*, is not necessarily elitist and Eurocentric. Theory and politics are not disparate entities and are mobilized in the productive matrix of writing, which defines the social and makes it available for action. In an interview titled “The Third Space,” Bhabha extends the idea of the third space to imply the opening up of a hybridized space – that allows new positions to emerge – in postcolonial revisions of colonial discourse. He locates the diasporic subject in the borderline place and disjunctive temporality of the third space. In the context of the clash of cultures brought about by the publication of *The Satanic Verses*, Bhabha reinforces Rushdie’s vision of emergent social identities that do not respond to either “Islamic fundamentalists” or “Western literary modernists.” These subjectivities do not draw upon a pure past or a holistic and unicultural present for authentication, but live in doubt, questioning, and a rich confusion of cultural imperatives. The boundary becomes the place where the terms of cultural engage-

ment, whether antagonistic or collaborative, are continually negotiated and cultural hybridities that emerge in moments of historical transformation are authorized.

Bhabha’s current work is around ideas of global citizenship and global discourse, and how aesthetic and ethical experiences influence cultural citizenship. It issues a call to “de-realize” or defamiliarize democracy, so that its occlusions and injustices can come to light, and the democratic ideal can be applied to “other” contexts. In the essay “Democracy de-realized,” Bhabha also anticipates a cosmopolitanism “outside the box of European intellectual history,” one that privileges circumferences as well as centers, and gives rise to global citizenship. The territorial location of global citizenship, Bhabha says, is “postnational, denational or transnational,” and such a community is best constituted through feelings of fragmentedness (“partiality”) and through a shared historical sense of transitional time.

Bloom, Harold

CLAIRE FEEHILY

Harold Bloom (b. 1930) is an American academic and one of the most prominent postwar literary critics. Since 1959, in many books, articles, and reviews, he has written about an extensive range of individual writers and genres; more recently his concerns have included religious themes, mysticism, the Bible, and Jewish culture. Bloom's works on Romanticism, poetic influence, and Aestheticism were of significant academic influence. But his international success is also derived from bestselling work for a wider

readership. In particular, Bloom is associated with a spirited and polemical defense of Western canonical literature against the "School of Resentment," his term for the theoretical criticism within English Studies in higher education. Bloom was born in New York City in 1930, the son of working-class Yiddish-speaking parents. After winning a scholarship from the State Department of Education, he graduated from Cornell University in 1951. He gained his PhD from Yale University in 1955 and has continued to work at Yale, holding the title of Sterling Professor of Humanities since 1983. Between 1988 and 2004 Bloom was also Berg Professor of English at New York University. He is a MacArthur Prize Fellow, a member of the American Academy, and a past Charles Eliot Norton Professor at Harvard University.

Bloom's earliest work, in the 1950s and '60s, arose from his doctoral study of Shelley. Bloom has emphasized the influence of two critics upon his work: M. H. Abrams, a prominent scholar of Romanticism at Cornell; and the Canadian literary critic Northrop Frye. Bloom's published studies of both Shelley and Blake, *Shelley's Mythmaking* (1959) and *Blake's Apocalypse* (1963), as well as more general studies, defend the critical profile and reputation of Romantic poetry, which, Bloom argues, had suffered through the influence of T. S. Eliot, neo-Christian formalist criticism, and the new critics. Bloom's revisionism lay in his view that Romanticism's influence had been an enduring one, which could be identified in the work of twentieth-century poets, notably W. B. Yeats.

In the 1970s, notably in *The Anxiety of Influence* (1973), Bloom developed his highly influential analysis of poetic influence and the "intra-poetic" relationships between poets and the work of earlier writers. In work that showed a deepening interest in Freud, Bloom presented the history of Western

poetry since the Renaissance as a competitive Oedipal struggle between poets and their precursors. Bloom argues that all poetry is intertextual, and that modern poetry needs to be understood in terms of its relationship to past work. Since Milton, poetry has suffered from an anxiety of influence, “a mode of melancholy,” in which there is a fear that the writing of poetry is no longer possible. This anxiety is something far greater than a sense of intellectual awe at the achievement of one’s literary predecessors; rather, it is a force that makes poetry happen. Bloom maintains that it is necessary for poets to clear imaginative space if their own work is not to be overwhelmed by earlier poetry, and that “strong” poets arrive at their own vocation and original voice by strongly misreading the work of their precursors.

Bloom is also well known for his emphasis on the cultural primacy of canonical texts and writers, particularly Shakespeare. In *The Western Canon* (1994), Bloom defended traditional reading and pedagogy against what he maintained were those intellectual forces grouped against the cultural authority of canonical literature. The context, in the early 1990s in America, was one of cultural, educational, and political controversy about the nature of university literary curricula. Debate ran high as to which texts should be taught in universities and schools and by what pedagogical methods.

Bloom maintains that literary canons are inevitable; his canonical authors shared a status as exemplars of the sublime that “unifies poetic and religious pathos,” a group that included the authors of the Bible, the classics and Dante, and the English literary canon. Greatness in literature, Bloom maintains, arises from such spiritual sublimity and aesthetic intensity. He develops the concept of “canonical strangeness” as a criterion for an individual work’s merit. Bloom’s own literary canon emerges from various works, but includes the authors of

Genesis, Jeremiah, and Job, Homer, Dante, Shakespeare, Milton, Blake, Wordsworth, Freud, Kafka, and Beckett.

Bloom has written extensively about the nature of reading, maintaining that its purpose is for solitary pleasure and self-knowledge. His emphasis on aesthetic value, literary hierarchy, and canonicity has put him at odds with increasingly influential developments in literary and cultural theory. Bloom was particularly critical of what he saw as the humanities’ retreat into politics in higher education in the 1980s and 1990s, and strongly resisted postcolonialist, feminist, and multiculturalist scholarship that encouraged a social reading of literature. His advocacy of literature’s autonomy and timelessness has led him to challenge much contemporary Shakespeare scholarship, notably the readings by new historicist critics.

Bloom has not only made a series of important interventions in academic scholarship, he has achieved great popular success with his publications. He has a highly readable, polemical style that demands attention and courts controversy, and his own opinions about literary merit are unambiguous. In *Genius* (2002) Bloom selected 100 writers of what he called particular writerly genius. In 2003 he selected four contemporary American writers for writing the “Style of the Age”: De Lillo, McCarthy, Pynchon, and Roth. There has been great interest in publications that, for example, advise people *How to Read and Why* (2000), and interventions in controversial and popular areas, including that of the literary merit of J. K. Rowling’s *Harry Potter* series. Bloom expressed “discomfort” at the “mania” over the Potter literary phenomenon, concluding that, yes, 35 million book buyers can be wrong.

Body, The

GERALD MOORE

As evidenced in the twisted, inhuman bodies of Francis Bacon, the preserved and plastinated bodies of Damian Hirst and Günther von Hagens, and the prosthetically enhanced performance art of Stelarc, the embodiedness and materiality of identity is one of the principal fascinations of twentieth-century and contemporary artistic discourse. In philosophy and theory, too, emphases on lived experience, mortality, and desire represent a substantial break from the Christian legacy of European modernity.

In his *Meditations on First Philosophy* (1997[1641]), frequently cited as the founding text of modernity, the French philosopher René Descartes argued that the ability of purely rational thought to conceive a conscious subject without a body served as proof of mind–body dualism, the separability of the mind from the physical body. Reasoning logical certainty and the structures of thought to be inexplicable in terms of the experience of a material body all too prone to error, Descartes ultimately reasserted the Christian doctrine of the transcendence of the spirit over the flesh. It was moreover this transcendence that was essential to the free will of human beings. Taken alone, Descartes argued, our bodies are just mechanical objects governed by cause and effect, simple animal automata driven by material needs. Only a transcendent, noncorporeal mind could escape subordination to the base impulses of desire.

Only much more recently have academics begun to emphasize the body as positive, to be celebrated as the site of singularity, difference, and precisely what enables us to think, rather than condemned as negative. Following this, increasing attention has also been paid to the ways that bodies can be both manipulated and liberated to change our thinking, with feminists and other thinkers associated with post-structuralism taking a particular interest.

One of the earliest to embark on this new line of thought, the German philosopher Friedrich Nietzsche speculated in *On the Genealogy of Morality* (1994[1887]) that our entire capacity for abstract rationality originally resulted from the confinement of the body, the enclosure of humans in societies where unavoidable mutual proximity served to make instinct-led behavior prohibitively dangerous. Elaborating an unashamedly speculative history of social relations, Nietzsche imagined a prehistory of

humanity in which the numerous scars on the bodies of the weak had the effect of leaving the victims of violence endowed with memory, unable to forget their suffering. Too frail to live instinctively, they instead used their newfound memory to begin to think in terms of time, to imagine the existence of an immortal soul that lives on beyond the death of the body. Unable to inflict physical suffering on the strong, these “slaves” resorted to mental violence, inventing concepts like sin and morality as ways of denigrating the body and outlawing or regulating the benefits of physical prowess. What we experience as guilt or moral conscience, according to Nietzsche, is nothing other than violent animal instincts turned back against themselves, punishing the body as a site of shame and immorality. A strikingly similar claim comes from Sigmund Freud, whose *Civilisation and Its Discontents* (2001[1930]) argues that such an “introjection of the instincts” is at the origin of the superego, the feeling of shame and moral prohibition Freud describes as the internalized law of father.

This focus on the body by the early critics of modernity was to continue in the work of Martin Heidegger, before taking a decisively French turn and emerging as a defining feature of poststructuralist materialism. Despite containing comparatively little analysis of bodies as such, the principal thrust of Heideggerian philosophy was modernity’s refusal to acknowledge mortality, the simple fact that human being is Being-in-the-world, a being that dies and lives in overwhelming fear of death’s inevitability. Less than the ability to use reason to escape mortality, Heidegger argued that what defines us is primarily the attempt and desire to escape it.

Following Heidegger and with the additional influence of anthropologists like Marcel Mauss, who wrote of the “techniques” of the body, the antinihilistic affirmation of the mortal body would prove crucial to

subsequent generations of writers, including philosopher-novelists like Georges Bataille and Simone de Beauvoir and the philosophers, Maurice Merleau-Ponty and Michel Foucault.

Drawing on fieldwork of the emerging discipline of anthropology to historicize the speculations of Nietzsche, Bataille used theoretical works like *The Accursed Share* (1989, 1991 [3 vols., 1948–57]) to develop an account of “base materialism” already embraced by his novels, most notably the heavily pornographic *Story of the Eye* (1987 [1928]). In a reversal of modern interpretations of the Fall, Bataille locates an experience of the sacred in the bodily experience of sexual transgression and sacrifice that defy the moral taboos and fetishizing of hygiene erected as apparently self-evident ideals by modernity.

In major works like *Phenomenology of Perception* (2002[1945]), Maurice Merleau-Ponty presents the body as the origin and ground all knowledge, an inescapable horizon that cannot be extracted from thought. Along with those of Bataille, this idea influenced one of the founders of modern feminism, Simone de Beauvoir. Writing in *The Second Sex* (1997[1949]), de Beauvoir argues that women are subjected to domination because of their bodies’ greater proximity to nature. Frailer, subject to more visible processes of aging, not to mention the radical and mysterious, incomprehensible changes of pregnancy, the female body constitutes our primary point of contact with mortality.

The history of the domination of woman, for de Beauvoir, is thus intimately bound to man’s attempts to overcome the predicament of his mortality. Reconstructed through myth and fantasy, makeup and dress, and deprived from participating in the privileged arenas symbolic of transcendence – the worlds of work and thought, art and politics, for example – women are

reduced to tools through which nature and death are kept at bay. The male fantasy of feminine mystery, famously illustrated by the medieval rituals of courtly love and the wry but secretive smile of da Vinci's *Mona Lisa*, becomes a self-fulfilling prophecy. Women are culturally alienated from their own physiology, unaware of their ability to transcend the nature to which they are stigmatized as belonging.

The Paris-based Bulgarian feminist philosopher and psychoanalyst Julia Kristeva extends this account into a theory of "abjection," identifying "woman" as one of the classical literary figurations of degradation and impurity. Outlined in *Powers of Horror* (1982[1980]), the abject refers to the unsettling sensation of death infecting life, of corporeality – including feces, sperm, sweat, and menstrual blood – whose stigmatization leaves us unnecessarily alienated from our bodies. Kristeva's reminder that bodily relations are prior to the more abstract exchanges of language is also in agreement with the work of other poststructuralist theoretical feminists, including Luce Irigaray and Hélène Cixous. Irigaray explores the female anatomy and writes of the bodily encounter with the mother prior to all language. Cixous's "The laugh of the Medusa" (1991[1975]) calls for the creation of an *écriture féminine*, a feminine writing not subject to – and which moreover makes explicit – the suppression of the body found in the abstract linguistic exchanges historically privileged by men.

The control exercised over women's bodies has also been linked to the fate of another body, namely the social body or body politic. Against classical (Platonic) and modern (physiocratic, Hegelian) conceptions of the potentially intrinsic harmony of the body politic, other recent theorists have emphasized the artificiality and constructedness of bodies. In *Anti-Oedipus*:

Capitalism and Schizophrenia (1984 [1972]), Gilles Deleuze and Félix Guattari invoke the idea of a "Body without Organs (BwO)" to describe a state prior to and unencumbered by any kind of hierarchical identity. Their argument is that what we regard as the corporeal basis of identity has changed over time, and even once we reject the notion of a metaphysically distinct mind or soul, what we count as a body is still determined by a thinking of transcendence, of metaphysically – as opposed to merely physically – distinct parts. Once again drawing on anthropology to lend weight to the speculative history of Nietzsche, Deleuze and Guattari argue that archaic societies are not defined by aggregations of the individual, privatized, bodies so typical of Western liberal culture. Prior to the onset of monetary and capitalist economies, which are organized first and foremost around the bodies of rulers and the abstract bodies of capital, respectively, what takes precedence is the "body of the earth," the collective body of the tribe, whose members – their tattooed, pierced and painted flesh engraved with the marks of collective identity – have none of the sense of individual self-ownership that comes with capitalism. This is later developed further by Michel Foucault, who argues in works such as the first volume of his *History of Sexuality* (1992[1977]) that our fascination with the body can be traced to the birth of capitalism and the recognition of the profitability of healthy, productive bodies. At the origin of a social body composed of responsible, self-owning individuals, we find (medical) strategies to increase the body's ability to survive and reproduce, thus boosting economic growth, and "governmental" strategies for organizing bodies efficiently in space and time. Wary that bodies be thought passively constructed in this way, Judith

Butler (b. 1956) has examined the multiplicity of transgender and sexual identities to highlight the ways we performatively enact our sexuality by making decisions about what defines us.

These notions of organized and inscribed (social or individual) bodies, bodies that are effectively written into existence, have met with criticism from another French philosopher, Jean-Luc Nancy, who, most notably in *Corpus* (1992), rejects the claim that bodies can be “aestheticized,” subjected to unifying narratives of individual or collective identity. Returning to Heidegger’s emphasis on finitude and death-bound subjectivity, Nancy denies the implication that the collective identity of a national body politic could ever take precedence over the “singular” experience of one’s mortal human body. The finite body is what is constantly expressed in the desire for immortality of writing, but is not what is written and consequently cannot be rewritten. On the contrary, death reverses every attempt to recreate the body as something else. In saying this, he is no doubt influenced by his own experience of undergoing a heart transplant, discussed in *L’Intrus* (*The Intruder*), which has also inspired a film of the same name by the French director Claire Denis.

Braidotti, Rosi

ROBIN STOATE

Rosi Braidotti is a feminist philosopher and theorist, most widely known for her work on the notion of “nomadic” subjectivity, which responds to and builds upon the theories of Continental philosophers in order to theorize an account of both a politically viable female subject, and a more general notion of positive difference.

Born in Italy in 1954, but growing up in Australia, Braidotti holds dual citizenship. She achieved undergraduate degrees in English literature and philosophy in 1976 and 1977, respectively, at the Australian National University and in 1981 completed her doctorate in philosophy at the University of Paris I (Panthéon-Sorbonne). She holds the post of Distinguished Professor in the Humanities at Utrecht University in the Netherlands, and is founding director of its Center for Humanities. She was foundation chair of Utrecht’s Department of Women’s Studies (1988–2005), and the Director of the Netherlands Research School of Women’s Studies (1995–2005), and has been recognized for her contributions to scholarship and women’s studies, receiving an honorary philosophy degree from the University of Helsinki (2007) and being named a Knight in the Order of Nederlandse Leeuw in 2005.

Although Braidotti’s work is influenced by several thinkers, including feminist philosopher Luce Irigaray, philosopher and social theorist Michel Foucault, philosopher Gilles Deleuze, and feminist philosopher of science Donna Haraway, she is

concerned nevertheless with not tying her approach to one system, and indeed actively interrogating theories even as she uses them.

What Braidotti shares with these thinkers is an understanding that the ways in which we traditionally understand the self (or “subject”) are unsustainable. There has long been a basic belief within Western thought that each person is a rational, conscious being, capable of pure thought and in control of its own thoughts and actions; an idea widely associated with the seventeenth-century philosopher René Descartes and the movement of liberal humanism. However, theoretical shifts brought about by things such as psychoanalysis and poststructuralism have suggested that it may be impossible to continue thinking of the subject in this way. The traditional version of the subject has been shown not only to undo itself logically, but to exclude people from its boundaries – anybody who is not white, male, heterosexual, able-bodied, wealthy, and so on – while claiming to be a “universal” human condition.

While Braidotti agrees with this unsustainability in the universal or “unitary” subject, her approach to rethinking it does not subscribe to any one particular model. She believes that theories of the subject should not begin with any concrete set of totalizing rules, or claim to provide a universal structure or set of criteria by which valid subjectivity can be judged. Doing so would only move the boundaries of subjectivity, not erase them. Braidotti’s approach to reconciling this problem is to propound a relationship with theories of the subject that remains “nomadic” – negotiating between many different theoretical approaches, but, importantly, ensuring that this process is carried out with intelligence, rigor, and a sense of political responsibility.

The common threads of Braidotti's approach can be observed in four monographs, all available in English. First, *Patterns of Dissonance* (1991) examines a complex relationship between Continental philosophy and women and feminism. Braidotti argues that the "crisis" of the unitary subject is not inherently negative. She believes that the "void" left by the disassembling of that subject – lamented by some critics opposing what they see as an "attack" on rationality – actually represents a space in which alternative philosophies can now be conceived. Braidotti outlines the possibility of creating a positive understanding of a *female* subject within this new space, whose difference from the masculine subject is not predicated on negativity (i.e., being "not-male"). She also argues that what she terms the "question of the feminine" has, in fact, always played a part in thought, disassembling the unitary subject, with the "crisis" taking place alongside the birth of a multitude of feminist theories and practices, even though this relationship is never explicitly enunciated.

Second, *Nomadic Subjects* (1997) is a response to the specific challenges presented by postmodernism to the construction of a feminine subject. The book propounds a strategy of engagement with existing theories to conceive of a version of the subject that is not rooted in any one particular discourse. This "nomadic" approach would provide ways for women and other traditionally marginalized people to be conceived of as viable, and is demonstrated in the book through interconnected readings of theories, cultural practices, and moments of Braidotti's own "nomadic" – literally and figuratively – life history, such as her geographical shifts during her life and career, and her speaking and writing in several languages.

Third, *Metamorphoses* (2002) expands Braidotti's work on nomadic subjects and

shows a development in her nonlinear writing style. Like *Nomadic Subjects*, *Metamorphoses* espouses a philosophy that, unlike traditional views of the subject, does not aim to escape the body, but takes it fully into account, in all of its shifting forms. Braidotti concentrates on producing radical accounts not only of gender difference, but of an alternative subject that emerges through contemporary crises of the notions of "human" and "life," such as those brought about by shifting relationships with new technologies, like the Internet or genetic engineering.

Finally, *Transpositions: On Nomadic Ethics* (2006) turns its attention to theorizing an ethics of nomadic subjectivity – that is, on propounding ways in which Braidotti's approach can be sustainable as a way of living a positive life with others. Working on the reconfiguration of the concept of "life" that she begins in *Metamorphoses*, Braidotti uses this model both to defend against criticisms of poststructuralist ethical projects as "relativist" – ethically bankrupt with no stable standard against which to judge ethical behavior – and to critique other attempts to build a poststructuralist ethical model, which she believes to be unsuccessful.

Butler, Judith

KAYE MITCHELL

BIOGRAPHY AND INFLUENCES

Judith Butler (b. 1956) is one of the leading theorists working in the field of the humanities in the late twentieth and early twenty-first centuries. Having established her international reputation with the publication of *Gender Trouble* in 1990, she is best known for her work in gender and sexuality studies and is often cited as one of the “founders” of queer theory, but her work extends far beyond these fields, and its influence can be felt within philosophy, literary criticism and critical theory, cultural studies, sociology, art theory and criticism, media and communication studies. After completing her PhD at Yale in 1984, Butler taught at Wesleyan University and at Johns Hopkins University; she is currently Maxine Elliot Professor in the Departments of Rhetoric and Comparative Literature at the University of California, Berkeley.

Butler’s work is strongly influenced by Continental philosophy, feminism, and psychoanalysis; she has spoken in particular of the influence of Hegel upon her thinking, noting that: “In a sense, all of my work remains within the orbit of a certain set of Hegelian questions: What is the relation between desire and recognition, and how is it that the constitution of the subject entails a radical and constitutive relation to alterity?” (1999b[1987]: xiv). It is notable how these questions (of desire, recognition, subjectivity and subjectivation, and alterity) have informed both

Butler’s treatment of gender and sexuality, and her recent discussions of terrorism and mourning after 9/11: in the first instance, she has noted how the heterosexual paradigm relies upon an abjection of illicit homosexual desire and how gender is constructed via processes of exclusion (e.g., of those whose bodies and desires are unorthodox or unintelligible); more recently, questions of “alterity” and of the refusal of “recognition” to certain individuals have been central to her consideration of what constitutes both a “livable” life and a “grievable” death.

Hegel’s influence is perhaps evident also in Butler’s style of questioning, which is influenced by Hegelian dialectics, although it builds to no synthesis. Butler’s writing typically proceeds via series of open-ended and interrogative questions, which lends her argument a rhetorical force, but has arguably contributed to negative reviews of her allegedly “difficult” style; along with Homi Bhabha, she was a recipient of *Philosophy and Literature’s* annual “bad writing” prize in 1998. Butler, however, in response to these charges, has drawn attention to the politics of style, asking, in the preface to a new edition of *Gender Trouble* in 1999, “What travels under the sign of ‘clarity,’ and what would be the price of failing to deploy a certain critical suspicion when the arrival of lucidity is announced? Who devises the protocols of ‘clarity’ and whose interests do they serve?” (1999[1990]: xx).

This troubling of the workings of language and, in particular, of the ideological underpinnings of logic and clarity, reveals in turn the influence of poststructuralism (especially the work of Derrida and Foucault) upon Butler’s thinking, and she is frequently identified as a poststructuralist feminist theorist. Her engagements with the feminist canon have produced illuminating readings of Simone de Beauvoir, Monique Wittig, and Luce Irigaray, among others. Again, her

identification with poststructuralism and postmodernism has not always brought her admiration – as she is sometimes held responsible, by her critics, for the “cultural turn” in leftist politics, and for the perceived disadvantages, for feminism, of the social constructivism with which she is associated.

Butler’s early interest in psychoanalysis is evident in her provocative rereadings of Lacan and Freud in *Gender Trouble and Bodies that Matter* (1993). More recently, in *Giving an Account of Oneself* (2005), she has returned to psychoanalysis – particularly the work of Jean Laplanche – as part of what many have seen as a turn to questions of ethics and politics in her work (arguably, such questions were always motivating factors in her writing), and philosophers such as Levinas and Hannah Arendt have also become central to her thinking.

SUBJECTIVITY

Butler’s work is centrally concerned with the ways in which we become subjects (including, but not limited to, the ways in which we become sexed and gendered subjects). This is evident in her first book, *Subjects of Desire* (1999b[1987]), which was first submitted as her PhD thesis in 1984 and later revised as a book. In *Subjects of Desire*, Butler tracks the mutation of Hegel’s conception of desire in *Phenomenology of Spirit* within post-Hegelian Western philosophy (specifically, in the work of Alexandre Kojève, Jean Hypolite, Sartre, Lacan, Deleuze, and Foucault) noting how, for Hegel, desire is “the incessant human effort to overcome external differences,” part of the “project to become a self-sufficient subject”; yet by the time of the poststructuralists, desire has increasingly come “to signify the impossibility of the coherent subject itself” (1999b [1987]: 6) And she asks: “How is it that desire, once conceived as the human

instance of dialectical reason, becomes that which endangers dialectics, fractures the metaphysically integrated self, and disrupts the internal harmony of the subject and its ontological intimacy with the world?” (7).

Becoming a subject is, then, for Butler, a necessarily incomplete and fraught process, and much of her work is focused upon the forms of coercion involved in subjectivation (particularly in the imposition of gender and of heterosexuality), the “melancholy” effects of the kinds of abjection and exclusion that subjectivation involves, and the myriad possible “disruptions” to the stability of the subject. In this way, Butler introduces both gender-political questions and psychoanalytic insights into Hegel’s account of subjectivity, and thus can be seen as working across (without ever simply synthesizing) quite disparate intellectual traditions.

This is particularly evident in her 1997 work, *The Psychic Life of Power*, which addresses the relationship between the psychic and the social, and is indebted both to Foucault and to psychoanalysis (primarily Freud here), as well as Hegel, Nietzsche, and Althusser. In considering the operations of power in the process of subjectivation, Butler deconstructs any facile opposition between “internal” and “external” forces and influences and explores the extent to which becoming a subject necessarily involves subordination and dependency. She suggests that the subject is formed by power, that power provides “the very condition of its existence,” and thus that “power is not simply what we oppose but also, in a strong sense, what we depend on for existence” (1997b: 2). She makes links between childhood dependency (as explored in psychoanalysis) and adult political subjection and uncovers troubling forms of complicity and desires for subordination as central to the experience of being a subject. Unsurprisingly,

such an account raises the question of how much power and agency the subject itself possesses; this is a question that haunts much of her work, and her critics have taken her to task for her apparent denial of subjective agency. Here, she asks whether there is “a way to affirm complicity as the basis of political agency, yet insist that political agency may do more than reiterate the conditions of subordination?” so it’s clear that whatever agency the subject possesses, it will not amount to transcending or stepping outside these “conditions of subordination” and achieving full autonomy (1997b: 29–30).

In *Excitable Speech: A Politics of the Performative* (1997a), Butler approaches the question of subjectivity in a different way, via an analysis of the relationship between language, speech, and the subject. She discusses performative utterances (i.e., utterances that “do” something, such as “I promise”), which are central to speech act theory but reads speech act theory through the lens of poststructuralism, and politicizes her discussion by considering what words can “do” in the cases of hate speech and pornography/obscenity. Again, agency proves to be a fraught issue here, as Butler asserts that “speech is always in some ways out of our control” and, like Derrida in his reading of J. L. Austin, she stresses the ways in which performative utterances might go awry, failing to enact what they say (1997a: 15).

GENDER AND SEXUALITY

Butler is primarily regarded as a theorist of gender and sexuality and her best-known book, the one with which she is most strongly identified, is *Gender Trouble* (1999a[1990]). *Gender Trouble* introduced her influential but contentious theory of gender performativity and also helped to

inaugurate the new discipline of queer theory. If queer theory emerges out of activism (by the likes of Queer Nation in the early 1990s) and the mutations of poststructuralist theory, then it is Butler’s theories (along with those of Michel Foucault and Eve Kosofsky Sedgwick) that have been most influential in its development.
