Fashion Studies

YUNIYA KAWAMURA

Fashion studies is an area of inquiry that treats fashion as a symbolic cultural object and as an aspect of the larger culture as a whole. It is a new area of research that draws upon many academic disciplines, including cultural studies, sociology, psychology, literature, history, and art history.

A great deal of fashion writing in the mass media often alienates scholars and professionals from the topic because they doubt the legitimacy of the subject, which is - believed to be trivial, ephemeral, and without any intellectual rationale or substance. However, fashion studies deserves a more serious academic consideration, especially in cultural studies and the sociology of culture and the arts.

Conceptions of fashion vary widely. In the classical discourse of fashion, fashion is treated as a form of social regulation or control, a hierarchy, a social custom, a social process, and more. Attempts to understand the dynamics and the mechanism of fashion have been dominated mostly by variants of imitation theory that start from the presumption that fashion is essentially a hierarchical phenomenon prescribed by some identifiable sartorial authority. Sartorial power is most often conceived as residing with some dominant social group or class whose decisions on what is fashionable are then emulated by successive layers of the social hierarchy. Imitation from below induces a pressure on social superiors to display their superiority by further sartorial sophistication and innovation in order to distinguish themselves from their inferiors who have adopted their earlier styles. A potentially unending cycle of imitation and innovation is set up.

If the earlier discourse on fashion can best be analyzed through the concept of imitation, contemporary work is far too diverse to allow any such generalization, largely because contemporary fashion itself is fragmented and diverse. Definitions and meanings of fashion have multiplied. As a result, fashion discourse has spread to various academic disciplines, and has thus become overtly interdisciplinary.

One thing that is certain is that fashion studies encompasses far more than the study of clothing or costumes. Fashion studies

does not focus on the raw materials of clothes, although the terms “fashion” and “clothing” are often used interchangeably. The best approach to understanding fashion and distinguishing it from clothing is the production-of-culture approach, which places fashion within a cultural context in its analysis. While any of the earlier studies on fashion are not empirical, the more recent ones integrate empirical case studies in their research. Viewing fashion from the production-of-culture perspective also allows us to study fashion from a systemic point of view, which provides a different angle to fashion. A set of organizations, individuals, and routine organizational activities that both materially and symbolically produce items of fashion culture can be described. This perspective locates culture in concrete social and cultural institutions.

Therefore, the principal focus of the cultural analysis of fashion is social-organizational and not aesthetic, and assumes that the creation of works of cultural objects involves collective practices that are coordinated by shared conventions or rules and consensual definitions.

FASHION AS A SYMBOLIC CULTURAL PRODUCT

Within the study of culture, fashion can be treated as a manufactured cultural object, and it can be studied by those who examine any cultural forms and content. Fashion is legitimate to study as a symbolic cultural object and as a manufactured thing produced in and by social organizations. Fashion is not visible or tangible and therefore uses clothing as a symbolic manifestation. The production of symbols places emphasis on the dynamic activity of institutions, and cultural institutions support the production of new symbols, such as fashion. Processes of production are themselves

cultural phenomena in that they are combinations of meaningful practices that construct certain ways for individuals to conceive of and to conduct themselves in an organizational context.

Cultural studies researchers and sociologists who study fashion can learn much from those analyzing other symbol-producing cultural institutions, such as art, science, and religion. Cultural objects can be analyzed from the perspectives of both consumption and production. Likewise, fashion can be a matter of personal consumption and identity as well as of collective production and distribution. Like sociologists of culture who focus on the production perspective of culture, such as the production of art culture, literary culture, and gastronomic culture, the production process of fashion culture should also be examined. The fashion system that supports a fashion culture, and to which individuals, organizations, and institutions belong, is another approach that fashion studies takes. What cultural studies scholars and sociologists of fashion can contribute to the project of cultural analysis is a focus on the institutions of fashion and the social relations among fashion professionals, the social differentiation between groups of designers, the status of the designers, their ethnic heritage, and fashion systems worldwide.

FASHION FROM THE PRODUCTION-OF-CULTURE PERSPECTIVE

The sociology of culture represented most prominently by the study of arts organizations and institutions is known as the “production-of-culture approach” and begins from the assumption that the production of cultural objects involves social cooperation, collective activities, and groups. These cultural objects become

a part of and contribute to the making of a culture. This approach is most useful in clarifying the rapid changes in popular culture where production is the primary focus and where the explanation of novelty and change is more pertinent than the explanation of stasis. There is no more apt an idea to study than fashion where novelty is the very key in defining the concept. Furthermore, this theoretical approach includes studies dealing with many different aspects of culture, and applies to studies of the arts, media and popular culture, market structures, and gatekeeping systems on the careers and activities of culture creators.

However, since there are always some weaknesses to any theoretical framework, the production-of-culture perspective has been criticized for failing to pay attention to various features of the art object itself, for tending toward empiricism, and for not locating specific institutions in the wider social context. It is also considered to be ahistorical and to lack explanatory as well as critical sociological power. But its strength is that it often produces very detailed, small-scale studies, and that it helps us to see the processes and institutions of creative production in detail and to shift our attention from the material object of clothing and dress.

FASHION WITHIN CULTURAL STUDIES AND THE SOCIOLOGY OF CULTURE AND THE ARTS

Whether or not fashion is art has been much debated and discussed, but it certainly meets many of the criteria that social scientists have postulated for the arts. Those scholars who start from the premise that art should be contextualized in terms of place and time pay attention to the relation of the artist and artwork to extra-aesthetic considerations. The social construction of aesthetic ideas

and values must be analyzed. They focus on the processes of creation and production and on institutions and organizations. In this perspective, a work of art is a process involving the collaboration of more than one actor and working through certain social institutions. The cultural and social values of the art create the conditions for creative collaboration, which are deliberately invented by formal cultural organizations. Like art, fashion is social in character, has a social base, and exists in a social context. Moreover, it involves large numbers of people. Like other social phenomena, including art, fashion cannot be interpreted apart from its social context, and future fashion studies must attempt to look at the organizational setting in which fashion is produced.

Commonalities found in social, and not aesthetic, factors make the study of fashion just as important as the study of fine art or classical music. Like art, fashion can be assimilated into the sociology of occupations and organization. In either case, the artist, the musician, or the designer is no longer regarded as a genius whose creativity can only be appreciated rather than analyzed, but instead as an ordinary individual whose extraordinary habits can be systematically investigated. In spite of the emphasis on the role of creative individuals, it is social groups that ultimately produce art, music, literature, television news, and fashion as social phenomena. Studies of these phenomena typically cover, for instance, publishers' decision-making criteria in commercial publishing houses, the role of the radio and record industries in relation to changes in the world of country music, or the gatekeeper role of commercial galleries in the New York art world. It is also possible to identify the social hierarchies of art, its decision-making processes, and the aesthetic outcomes of these extra-aesthetic factors.

Furthermore, research on a fashion system has many parallels with that on art

worlds. With the focus on social structure and process, most of the writing on the sociology of culture and the arts deals with the structure and activity of groups and institutions that handle art. We can examine material, social, and symbolic resources for the creation of meaningful cultural objects. Fashion studies scholars are not interested in what the final objects mean but make an attempt to explain what is social about them. The wide array of cooperative links between “creators” and “support personnel” necessary for the production of cultural objects is analyzed and discussed. Critics, dealers, and museum personnel, like everyone else in the art worlds, simply do their jobs.

The stratification of producers of fashion, and of designers in particular, can be included to understand social differences between those who design clothes in the system of fashion. Cultural analysis directs attention toward the stratification functions of cultural systems, that is, to the way social groups are identified by their cultural tastes or their abilities to create cultural institutions suited to members of their social strata. While some are concerned with the differences between the groups who consume cultural symbols, it is important to concentrate on the stratification within the occupational group of designers. Cultural stratification theory assumes that the social attention to cultural differences is important sociologically because they are linked to fundamental patterns of social stratification that are maintained by differences in the cultural attributes of people from different social strata. The designers’ positions within the system of stratification determine the status of the products they produce. At the same time, the designers’ social status reflects on that of their audience.

On the other hand, a cultural studies approach to fashion looks at everyday cultural objects, such as clothing and fashion,

and makes an attempt to uncover what underlies their utilitarian functions and to examine their connotations and meanings. It also looks at cultural artifacts and practices as cultural texts in its analysis. Fashion can be treated and read as a sign with various secondary as well as supplementary meanings. Thus, cultural studies scholars, unlike sociologists, focus on the actual raw materials of clothing and fashion that are tangible.

FASHION DESIGNERS AS IMAGE-MAKING CULTURAL PRODUCERS

Producing a fashion culture does not simply involve making a cultural product, such as fashion. Culture is not simply a product that is created, disseminated, and consumed, but one with an abstract concept as well as a concrete image that is processed by organizational and macro-institutional factors. Today’s designers place the strongest emphasis on recreating and reproducing their image, and the image that is projected through clothing is reflected in the designer’s personal image as an individual. Fashion is an image-making industry. What is most significant in placing fashion and fashion designers within cultural studies and the sociology of culture and the arts is that neither treats the objects as the creation of an individual genius. This is the fundamental principle shared by fashion studies, cultural studies, and the sociology of culture and the arts. In opposition to the idea that cultural artifacts, like fashion, are simply the work of individual artists from whence they are then filtered to the public, fashion studies scholars stress that the symbolic cultural objects are manufactured among certain occupational groups and within a particular social network.

Film Genre

SEAN REDMOND

In film studies genre is used to analyze and classify films according to their shared audiovisual and narrative conventions, ideological structures, identification processes, and industrial or commercial properties. A film genre is understood to be an intertextual, commodity-centered construct, its existence dependent on its imagined relationship with other films of the same type and with interested audiences,

as well as on its ability to be produced, marketed, and promoted on the basis of its aesthetic and pleasure-making unity. A horror film, for example, arranges its discordant nondiegetic music; unsettling play with light and shadow, and night and day; closed and labyrinth-like spaces; and destruction of the (female) human body and/or mind, in ways with which viewers are familiar because they have been repeated in films across time. The horror film is also produced, packaged, and marketed in DVD releases, posters, and trailers through recurring images and sounds that invite viewers to recognize (and be tempted by) the association. These include shots of attics, basements, woods, knives, masks, eyes, cat-and-mouse chase sequences, and accompanying sounds of screams, moans, and sharp piano chords.

In theoretical terms, Rick Altman suggests that in analyzing a film genre one needs to look at their semantic and syntactically based consistencies:

Minimally, all films of a particular genre share certain separate elements that we may call “semantic” components. For example, we recognize a film as a Western when we see some combination of horses, rough-and-tumble characters, illegal acts, semi-settled wilderness, natural earth colors, tracking shots, and a general respect for the actual history of the American West . . . When genres develop from their initial adjective-based breadth to a more focused noun-orientated definition, they develop a certain “syntactic” consistency by regularly deploying similar methods of making the various semantic components cohere: plot patterns, guiding metaphors, aesthetic hierarchies, and the like. (1996: 283)

Film genres, nonetheless, are also considered to be formed on “instances of repetition and difference” (Neale 1980: 48) or marked by shifts and developments in their

conventions so that that they remain textually dynamic, and connected or rooted to historical and cultural events and circumstances. In fact, Thomas Schatz suggests that all genre films go through the following stages “classic–parody–contestation–critique” (1981: 37). Recent developments in the horror film, for example, have led to the term “horror-porn” being applied to those texts heavily reliant on sadomasochistic killing and sexual perversion, such as *Hostel* (dir. E. Roth, 2005). This development in horror – in which body torture is dominant – is read in relation to the post-9/11 trade and traffic in authentic images of killing.

Annette Kuhn argues in relation to genre study generally that “perhaps more interesting, and probably more important, than what a film genre is, is the question of what, in cultural terms, it *does* – its ‘cultural instrumentality’” (1990: 1). Cultural instrumentality refers to the way that genre films speak with and to the dominant social, economic, and political issues in the real world at the time they are made. Genre films, albeit subtextually or allegorically, explore the fears, hopes, panics, and anxieties that circulate in wider society, bringing these issues or themes into the film “undercover” so to speak. A science fiction film, for example, is never really about the future but about some issue that irks the popular imagination in the present, such as ecological disaster (*The Day After Tomorrow*, dir. R. Emmerich, 2004) or the loss of humanness in the face of genetic engineering (*Gattaca*, dir. A. Niccol, 1997).

Genre analysis came relatively late to film studies. As Kuhn (1990) observes, its origins (usually dated to the late 1950s) lay in a populist reaction to the perceived elitism of a film criticism which stressed authorship – the genius or the creativity of one individual, usually male and usually the director – as the key to understanding

how a film created meaning. Genre analysis, by contrast, attends to the shared audiovisual and narrative codes and conventions that could be detected across a body of film work, regardless of who is making the film. However, the move to genre-based analysis is also predicated upon the recognition that the Hollywood cinema machine presells and markets films according to genre-related impulses. Posters, press packs, adverts, and merchandising all speak in the register of genre, and films are often given the green light on the basis of their likely generic appeal. Genre cycles and trends emerge on the basis of their perceived and documented popularity. At the turn of the millennium, a number of historical, sword-and-sandal epics, for example, followed the success of *Gladiator* (dir. R. Scott, 2000). Appeal, pleasure, and subject positioning is also given serious consideration under the umbrella of genre analysis. Viewers are increasingly placed center stage, and their engagement with films that supposedly are repetitive commercial forms critically examined. For the first time in film studies, popular art or mass entertainment came to be examined on its own merits. Genre analysis gives critical weight to film texts that had been previously labeled as “low art” or commercial nonsense, and to audiences who had been viewed as passive dupes.

Through genre studies, viewers came to be seen as active participants, and the pleasure they take from a film is argued to be based on a complex set of cognitive and corporeal identifications. Satisfaction is derived from a game of recognition of rules, identification with events and characters, escapism, hypotheses testing, problem solving, prediction, expectation, fulfillment, and surprise when rules or conventions are broken. It is suggested that the viewer gets a thrill, then, from not only watching a genre film being remapped but in having to use a flexible cartography to chart the revisions

being witnessed (Neale 1980; Abercrombie 1996). Schatz proposes that “the sustained success of any genre depends upon at least two factors: the thematic appeal and significance of the conflicts it repeatedly addresses and its flexibility in adjusting to the audience’s and filmmaker’s changing attitudes toward those conflicts” (2004: 700). However, Rick Altman (1996) also points toward a viewer who experiences genre dissatisfaction if a particular film fails to offer the pleasures normally associated with the type. A number of genres have built-in audiences and corresponding publications and networks that support them, such as magazines, fanzines, fanfic, blogs, websites, events, and conventions, so that the pleasurable experience of the text takes place in secondary or supplementary multimedia environments, often in a spirit of carnival.

One not only derives pleasure from *thinking* with genre films but in *feeling* them deeply, at the level of carnality and bodily affect. The body watching the film undergoes deep physiological and emotional transformations including sweating, palpitations, arousal, and crying. For Linda Williams (1991) this is particularly true of “body genres” such as melodrama, horror, and pornography, which deal in excessive representations of bodily feeling. Using recent developments in neuroscience and cognitive science, in combination with narrative theory and film theory, Torben Grodal (1999) suggests that film genres are mental structures that integrate sensations, emotions, and actions, activating the viewer’s body and mind. If one was to take the example of horror again, the terror that one experiences is both cognitive, the thinking on or of one’s fear, and corporeal, the feeling of oneself as if one is in danger.

Film genre analysis, nonetheless, suffers from a number of inherent problems, the first being what might be referred to as an

“empiricist dilemma” (Kuhn 1990). When one attempts to find the origins of a film genre, to go to the very first instance of a Western film for example, one is faced with the issue of having to use established codes and conventions that had supposedly emerged only after a period of time – in fact, after the very first Western had been made. This creationist paradox posed the unanswerable question: how can a Western (or any film genre) exist before its specific visual and narrative codes and conventions have been isolated and established? This apparent tautology is properly addressed only when questions of difference, multiplicity in form and content, agency on the part of the viewer, and commodification on the part of the entertainment industry are drawn together and analyzed as articulating factors.

The second problem with genre analysis has to do with classification and transformation. Robert Stam suggests that genre classification often suffers from four methodological failings or tensions. First, genres are either greatly extended to catch quite diverse films or so very narrowly defined that their corpuses are highly purist. With such paradoxical elasticity and intransigency, genre classification begins to disintegrate as a workable concept. Second, there is a degree of “normativism” involving a preconceived (highly subjective) positioning with regard to a film’s membership in any one genre. Third, genre definitions tend to be “monolithic” so that questions of polysemy, hybridity, and subcategorization are downplayed or denied. For example, horror film may be best understood as a series of related subgenres including the gothic, supernatural, and slash horror. Finally, genre classification often involves a form of “biologism” in which sets of film are imagined to progress in a linear, progressive, child-to-adult-like development (Stam 2000: 151–2). Such a critique, for example, could be made of Schatz’s

position briefly outlined above, in which genres are seen to form, grow, rebel, and ultimately mature, rather than exist in a circuit or matrix-like dynamic.

When one begins to try to put together criteria for what constitutes the codes, conventions, pleasures, and structures of a particular genre, one immediately finds a great degree of slippage and leakage in terms of consistency in *mise-en-scène*, what are supposedly established narrative patterns, iconography, characterization, and setting. As Christine Gledhill suggests, “genres . . . are not discrete systems, consisting of a fixed number of listable items” (1985: 64). It is difficult to make clear-cut distinctions between one genre and another; genres overlap, and there are “mixed genres” (such as comedy thrillers, sci-horror, and musical Westerns). A film, housed in a particular genre, may have a momentary “lapse” in which another genre’s linchpin signifier appears. For example, the appearance of a flying saucer in *The Man Who Wasn’t There* (dir. J. Cohen, 2001) brings together the iconography of science fiction and the stylistics of film noir (which for some scholars is not a genre at all but a post-World War II movement, or a stylistic subgenre of the thriller). In terms of American cinema, David Bordwell (1985: 3–11) argues that genre is a subordinate category to the overall needs of narrative cinema in which the love-oriented plot is combined with action, suspense, crime, or horror. And in what has been termed New Hollywood cinema, genre hybridity has been identified as the commercial norm, demographically the safest way to ensure box-office success (Collins 1992). Genre hybridity is also often identified as a key characteristic of postmodern film. Film franchises such as the Harry Potter series are a potent mix of fantasy, romance, suspense, investigation, action, and mystery elements, which work to maximize audience share. It is certainly the case

that, in recent years, genre films have become more and more difficult to identify, or pin down – they blur and conjoin – and yet genre is very often the reason a film gets made and a viewer enters the cinema in the first place.

Film Theory

BRIAN HOYLE AND CHRIS MURRAY

Film theory includes any and all theoretical discourse concerned with debating and defining the nature of cinema, including attempts to identify it as a distinct art form, to address its artistic and social functions, to discuss its relationship to reality, and to assess its engagement of the spectator.

Theoretical debates have surrounded film from the outset. Indeed, the process that led to the invention of cinema in the mid-1890s was one not only of great technological experimentation but also of philosophical speculation and, in a sense, film theory predates the medium itself. Writers such as H. G. Wells had anticipated the advent of cinema and began to theorize about what it would and should be used for. Similarly, debates such as those regarding the cinema's designation as a realistic or artistic medium had already concerned theorists and practitioners of photography in the decades preceding the first films. Subsequently, film theorists, whose ranks have included critics, scholars, and practicing filmmakers, have attempted to define this relatively young medium as something unique while also tying it to the ever-changing theoretical debates surrounding older art forms and other disciplines. Indeed, one of the charges leveled against film theory is that it is all too often bound by the predilections of its writers, who often bring with them their training from these other disciplines, most notably psychology and literature.

Upon seeing an early showing of the Lumiere brothers' actuality films (*actualités*) in 1896, Maxim Gorky famously called film "not life but its shadow" (Taylor & Christie 1988: 25). Gorky's reaction to cinema was not, however, disinterested; he was not certain that the new invention was more than a passing fad that would be used as a sideshow attraction to make money. He was not alone in this opinion and it seemed, at least for the first decade of film history, that this may have been the medium's ultimate fate. However, by the beginning of the second decade of the twentieth century the interest paid by certain intellectuals to cinema began to lend the medium credibility as an entertainment and potentially as a serious art form. By 1908 Leo Tolstoy was extolling the virtues of the cinema, favorably comparing its ability to move through time and location with live theater. Shortly afterward, the success of the French *film d'art* movement inspired prominent figures in the German theater to take a serious interest in cinema. German writers set out to create ambitious *Autorenfilme* ("famous authors' films"), cinematic works that had the sophistication and subtlety of great literature. If the resulting works were often rather tightly bound to the conventions of the stage, the *Autenrenfilm*, like the *film d'art*, had the positive effect of greatly elevating the cultural status of cinema from a popular pastime to a legitimate art.

In the early years of film there was much interest in the way cinema related to memory and theories of perception. Some of the first encounters between film and theory were therefore rooted in philosophy and psychology. Philosopher Henri Bergson's theories concerning memory, perhaps best exemplified in *Matter and Memory* (1896), argued for the importance of understanding time and duration without regard to their spatial representation. Film, being in part

a medium of time and duration, came closer than most arts to representing the relationship between reality and memory. While Bergson was never a film theorist himself, specifically arguing in 1906 that it had not been his intention to regard film as the exemplar of his theories, later philosophers of film owed much to Bergson.

Another influential figure of the period who denied a link between his discipline and film was Sigmund Freud. It is a gross oversimplification to suggest that Freud saw the mind as analogous to film (indeed, he later resisted attempts to enlist him in the creation of “psychoanalytic films,” believing the medium to be inadequate to the task of representing his theories). However, the fact that psychoanalysis and film appeared at the same time and were both concerned with the relationship between images, narrative, and memory has insured that they have many points of contact. It should therefore come as little surprise that much film criticism draws a great deal from psychoanalysis.

One of the first psychologists to treat film seriously was Hugo Münsterberg, whose particular concern was with the representation of time and space. In his 1916 work *The Photoplay: A Psychological Study*, he examined cinema in relation to live theater and argued that the new medium’s lack of color and sound and its two-dimensional image placed it at a remove from physical reality. He saw this, however, as a virtue, writing that, “It is as if the outer world were woven into our mind and were shaped not through its own laws but by the acts of our attention” (1916: 91). He argued that film’s power lay in its ability to represent the mental processes of the viewer, and to distort time and space, making it the perfect mode through which to render complex psychological experiences, mimicking the nonlinear operation of memory through techniques such as editing.

The period between 1915 and the end of the silent era, around 1930, was one of great development in the medium, with filmmakers such as D. W. Griffith, Eric von Stroheim, F. W. Murnau, Abel Gance, Dziga Vertov, and Sergei Eisenstein developing the vocabulary of cinema. While the style of these filmmakers ranged from the expressionism of Murnau to the naturalism of von Stroheim, they each experimented and innovated with film narrative and techniques such as camera movement and dramatic lighting, and perfected a variety of editing styles, from the continuity cutting of Griffith to the montage techniques of the great Soviet filmmakers. By the late 1920s the medium became sufficiently sophisticated that Virginia Woolf could write in her article “The cinema” (1928) that film could easily achieve effects that even the most skillful writer could not. Written on the cusp between the silent and sound eras, Woolf’s article also argues that the cinema must avoid the temptation to adapt the great novels and plays if it is to develop as an art in its own right. In this Woolf, like so many other film theorists, makes a case for the *medium specificity* of cinema. Put simply, much film theory often attempts to identify the attributes of cinema that are unique to it and not “borrowed” from other arts. This is perhaps not surprising, given the relatively young nature of film and its perceived indebtedness to older art forms. However, there is little consensus among film theorists as to what is specifically cinematic about cinema, just as there is little consensus as to what film theory itself should consist of. Similarly, in defining the scope of film theory one encounters two opposing impulses, the first seeking to weave film into a wider theoretical debate, often using film to elaborate upon theory itself, the second seeking to differentiate film from other arts, seeking a specific *theory of film*.

MEDIUM SPECIFICITY: FORMALIST AND MIMETIC TRADITIONS

Perhaps the first significant work of film theory proper can be located as far back as 1911, when Ricciotto Canudo, an Italian-born intellectual, published a short manifesto entitled “The birth of the sixth art” (he would later alter it to “the seventh art”). Canudo posited that the cinematograph was “a superb conciliation of the Rhythms of Space (the Plastic Arts) and the Rhythms of Time (Music and Poetry)” (2002[1911]: 19). He also argued that film would become the sixth (later the seventh) art if it transcended its purely mimetic qualities and aspired to become “plastic art in motion” (24).

The tension between those who argue in favor of the mimetic qualities of film and those who see virtue in its plastic qualities has been present from the earliest days of cinema, and in debates about the nature of photography before that, as was lucidly explained by Siegfried Kracauer in his *Theory of Film: The Redemption of Physical Reality* (1960). As his title suggests, Kracauer favored the mimetic qualities of film. He viewed the medium as an extension of photography, and therefore a medium best suited to record and reveal physical reality. Film, however, also had the advantage of capturing and preserving real time as well as space and was therefore an important evolutionary step in photographic technology. He argued that there were two basic tendencies in cinema: the “realistic tendency” (as typified by the first *actualités* of the Lumière brothers) and the “formative tendency” (as typified by the fantastical narratives and trick films of George Méliès). For Kracauer, there was not merely a tension between these two tendencies but a genuine antinomy. However, while he openly preferred the realistic tendency, namely films that captured the flow of everyday

life and renounced the artifice and neatly constructed narrative, he did not reject narrative and artifice entirely. Rather, he argued that filmmakers should find the correct balance between the realistic and formative tendencies and that the latter should serve rather than overwhelm the former.

On the other side of the debate were the formalists, who saw more virtue in exploiting the techniques of the medium – its formal qualities – to create meaning, than in merely exploiting film’s mimetic qualities. Such formalism is not divorced from film’s realistic, mimetic qualities (which many film theorists would argue is impossible except in the most extreme abstract films) but rather seeks to take reality and impose on it a new meaning through the use of cinematic techniques. The finest example of this is perhaps that of montage, which was the principal filmmaking aesthetic of the great Soviet filmmaker-theorists of the silent era.

Although montage is now commonly used simply as a synonym for film editing, for Soviet filmmaker-theorists such as Vsevolod Pudovkin, Sergei Eisenstein, Alexandr Dovzhenko, Lev Kuleshov, and Dziga Vertov, montage was also the governing principal of film form, which had the ability, through the juxtaposition of images, to direct a viewer’s emotional, intellectual, and psychological response to a film. Following the work of Ivan Pavlov in conditioning a subject’s response to stimuli (a dog salivating to the sound of a bell), Russian film theorist and director Vsevolod Pudovkin investigated how film could be used to condition audiences to respond in certain predictable ways to images and gestures through a process of association. At this time Russia was the source of much influential film theory, notably the experiments performed by Lev Kuleshov, who argued that the unique nature of film lay in its radical ability to present the viewer

with a montage of edited shots, a nonrealist mode that engaged the mind rather than just the senses. This forced the viewer to engage their intellect in order to understand the relationship between the shots. The way the viewer understands an edit is not random or subjective but predictable, as they make inferences about the meaning based on the context, resulting in noticeable patterns or tendencies toward certain interpretations. Drawing on Kuleshov's theories Eisenstein developed "Intellectual Montage," arguing that a shot had no meaning until placed in relation to another. Eisenstein rejected the use of continuity editing as a bourgeois affectation, calling instead for discontinuity, using editing to deliberately create conflict between two images, setting in motion a perpetual revolution of consciousness. Film was therefore inherently political.

Due to his wide-ranging approach to film and his sensitive and detailed *mise-en-scène* criticism, Rudolph Arnheim is often viewed as the leading film theorist of the 1920s. Arnheim argued that film was a "unique experiment in the visual arts" (1957 [1928]: 1) and was among the first thinkers to write about it accordingly in his seminal work *Film as Art*. When he revised the book in the late 1950s he refused to alter many of his views or his frame of reference, both of which unashamedly remained rooted in the silent era of filmmaking. He was suspicious of synchronized sound and thought film should remain a visual medium, while also seeing little value in color. He was especially critical of dialogue, which he argued would impede the visual imagination of directors and encourage them to return to filmed theater, as they had before the advent of montage, which, for Arnheim, was perhaps the technique that most distinguished film as a medium and allowed it to be called an art. Like the Soviet theorists, Arnheim thought that montage was a "tangibly creative and formative process," in which

the artist/filmmaker could make his or her presence felt (88). However, Arnheim's view of montage was not restricted to that of the Soviet theorists, whom he thought sometimes overused their technique, and he also praised the breaking up of a single scene into a series of different shots of varying length, in the manner of classical continuity editing, as a "vigorous and stimulating move towards emancipation of the camera" (89).

For Arnheim, art begins where mechanical reproduction leaves off. Indeed, he noted that for him it was "the very properties that make photography and film fall short of perfect reproduction" that enabled them to become art forms (3). His basic assumption was that a good filmmaker used cinematic style and techniques – various shot lengths, camera angles, detailed *mise-en-scène*, montage – to transcend the simple recording of reality and instead "make it vivid and decorative" (57). What Arnheim had in mind was the elegant narrative style and sophistication achieved by directors such as Charles Chaplin, Buster Keaton, and King Vidor as well as Eisenstein, Pudovkin, and the other Soviet directors.

Cultural theorists such as Walter Benjamin also saw cinema as political and viewed montage in particular as distinctly suited to expressing the frantic pace and fractured reality of modern, urban life. However, Benjamin, like fellow Marxists Georg Lukács, Bertolt Brecht, and Theodor Adorno, was primarily interested in using art to attack fascism. In "The work of art in the age of mechanical reproduction" (1935) he theorized that high art was surrounded by an "aura" that made it appear to have a mystical authority, like a religious relic. He celebrated film as an art form that destroyed this aura by using the mechanical reproduction of images to deliver art to the lives of the masses. Film was an art for the people, it could represent them, and it could record their lives, dreams, and goals with a degree

of accuracy not seen in other arts. For Benjamin cinema was a means of liberation from the dehumanizing hierarchies of older forms of representation. However, others were sharply critical of Benjamin's optimism, such as Adorno, who argued that cinema brought new scope for political control. World War II demonstrated the possible power of film as a tool for propaganda, not just in the hands of totalitarian regimes, but also in democratic countries. In Britain, for example, John Grierson, one of the leading exponents and theorists of the documentary film, argued that film was perhaps the most vital weapon in political management and military success.

After the war, further significant advances in film theory were made by groups such as the French "filmology" movement, which represented an attempt to create a more scientific approach to understanding film and combined the psychological study of film's effects on viewers with general questions about the social functions and possible uses of film and other mass media. Around the same time, the Hungarian Bela Balázs's *The Theory of Film* (1945) argued that cinema allowed the language of the human body to be viewed in a unique and detailed way. As a result, he saw the close-up as cinema's great contribution to art, as for him facial expressions were the most expressive and genuine manifestations of human communication. The most influential film theorist of the late 1940s and 1950s was, however, the French critic André Bazin. Bazin never wrote a theoretical treatise: his importance as a film theorist rests on a series of articles and reviews, most notably those written for the influential French film journal, *Cahiers du Cinéma*, which he helped establish. His major contribution to film theory was his masterful criticism of *mise-en-scène*. He openly criticized Soviet montage techniques for fracturing reality and rebuked classical continuity editing in the

mold of D. W. Griffith for breaking reality down into successive, though logically ordered, shots. Instead, Bazin praised a disparate group of films and filmmakers he saw as adopting an "aesthetic of reality" that restored temporal objectivity to the cinema. In this way, Bazin brought together the work of Italian neorealists and directors such as Jean Renoir and Orson Welles, who employed techniques such as long takes and deep focus. These techniques, according to Bazin, refused to fragment reality and compelled the spectator to make their own choice about what to focus on in a scene. *Cahiers du Cinéma* was also notable for bringing about one of the most discussed areas of film theory – the auteur theory, which treated directors as the creators of films, in the mode of the authors of literary works.

Later that decade *auteurism* was combined with trends in structuralism to bring a greater theoretical sophistication to auteurist criticism. Auteur-structuralism seeks to find a series of identifiable structures within a director's films that go beyond a superficial linkage of subject, style, or theme. The most influential work in this mold is undoubtedly Peter Wollen's *Signs and Meaning in the Cinema* (1969), which assesses the works of John Ford and Howard Hawks. Wollen recognizes a series of binary oppositions, most notably East/West and culture/nature (and variations and inversions thereof), running through all of Ford's films. For him it is this deep-rooted consistency and the shifting antinomies in his work that make Ford not only an auteur, but a great artist.

REPRESENTATION: POLITICS, GENDER, AND RACE

Since Bazin, film theory has largely moved away from debates about medium specificity

in favor of more socially and politically motivated theories, which were seen as especially relevant and useful after the crisis of 1968. For example, Marxist critics began to reveal what they saw as the hidden operations of power and the capitalist messages that reside at the heart of many films, which are usually the product of a capitalist system. In the 1970s the British film journal *Screen* became a locus for Marxist film theory, with notable proponents such as Colin McCabe, Stephen Heath, and Laura Mulvey exploring what they called the “cinematic apparatus,” a view of the relationship between the film industry and the viewers that was heavily influenced by Louis Althusser’s concept of ideological state apparatuses. In what came to be known as the “screen theory” cinema was regarded as one such apparatus, mobilizing spectacle in order to create an image of the viewer. In watching a film, the viewer is positioned as a certain kind of subject, conditioned by the often straightforward realism of film to accept certain ideas as “common sense,” thus disguising the potential political power of the medium.

Feminist critics are primarily concerned with how films portray gender and power in support of the patriarchal hierarchy, reducing women to spectacle, the mere receptacle of the male gaze. As Mulvey notes in her seminal essay “Visual pleasure and narrative cinema,” written in 1973 and published in 1975, “In their traditional exhibitionist role women are simultaneously looked at and displayed, with their appearance coded for strong visual and erotic impact so they can be said to connote *to-be-looked-at-ness*” (1989: 19). Mulvey asserts that there are two kinds of looking, the first known as scopophilia, which can be defined as pleasure in looking and so is predominantly sexual, perhaps even predatory, while the second is a development of scopophilia into a form of voyeuristic narcissism, an inward rather than an outward gaze, which she

called an *ego libido*. The overriding concern in her work is that the two forms of looking both do a kind of violence to their subject, with the look taking on masculine attributes. The gaze of the audience and the camera is male, subjecting the female form to sexual scrutiny.

Critics interested in racial representations often seek to expose stereotypes, as well as the processes of exclusion and oppression that operate within the industry and the film’s narrative, demonstrating how racial prejudices are reflected on screen. They would also seek to discuss films from various cultures to promote a wider appreciation of film production. These theorists of politics and identity have been drawn time and again to film, largely because as a dominant cultural form film is well versed in communicating symbols that will be understood by its audience, but it can also be used to project meanings that create clichés and stereotypes, as well as to undermine them.

STRUCTURALISM

Structuralist film theory is concerned with how the formal arrangement of properties on screen establishes a code that is understood by the viewer. Like any language, film has a certain grammar, which generates possibilities and limitations, in other words, rules. The structure of these rules and their relation to one another generates a complex system that determines meaning. Structuralism owes much to the work of Swiss linguist Ferdinand de Saussure, whose analysis of language in the early twentieth century argued that it is determined by signs, which are separate from that which they signify, and which are arranged in a complex system of differences. It is this structure that actually produces meaning. Saussure’s work led to the development of semiology.

Such formalism has proved very seductive to film theorists, especially when applied to the rules of the studio system, and how the technical and aesthetic “rules” governing the production of films relate to the production of their meaning. This is also a powerful idea when applied to genre, which employs rules in a very clear way. However, structuralism has been criticized, especially since the political turmoil of the late 1960s, for being ahistorical and deterministic, favoring a reductionist view of the medium over a celebration of individual creative power and the ability of viewers to come to their own unique understanding of a film. One of the great proponents of structuralist film theory was French critic Christian Metz, whose application of Saussure’s theories to the medium of film resulted in the highly influential *Film Language: A Semiotics of the Cinema* (1990[1974]), in which Metz focuses on narrative structure and coins the term “cinesemiotics” for his mode of analysis. Later works would unite Freudian psychoanalysis and Jacques Lacan’s idea of the mirror stage, establishing a link between structuralist and psychological film theories.

POSTSTRUCTURALISM

By the 1970s many began to see the structuralist argument that meaning derived from form and the way it was expressed in the rules that governed the language of cinema as essentialist and limited. For Gilles Deleuze, who returned to Bergson’s ideas, film was a powerful metaphor for the way individuals create ways of being and systems of representation that define their own existence. Deleuze argued that to exist is to create. Likewise, when Roland Barthes declared “the death of the author” he was also pronouncing the same fate for the auteur. Being a largely collaborative medium film could have been a perfect symbol of

this new relationship to art. Disappointingly, when film theory could have explored new concepts of collaborative creation between audience and filmmakers, the auteurist debate was busy reinscribing old notions of authorship. As a result, the work of poststructuralists such as Jean Baudrillard, Michel Foucault, and Jacques Derrida had an impact on film studies, but nowhere near as great as it might have been. Regardless, for these theorists film was endlessly fascinating precisely because it captured the key tension of the twentieth century – the conflict between material reality and the forces of subjectivity (ideology, psychology, memory, and identity) and the way in which these constructed notions of power.

THE AVANT-GARDE

While no film theory is without its specific problems or its critics, a common limitation of almost all film theory is its tendency to generalize. For example, most film theorists draw on examples from industrial, narrative cinema at the expense of the avant-garde. For example, theories that rely on the unique properties of the film camera often neglect to account for phenomena such as “direct film,” in which images are drawn, painted, or scratched directly onto celluloid, as is often the case in the work of filmmakers such as Len Lye, Norman McLaren, and Stan Brakhage. Similarly, film theory has not yet fully accounted for films such as Chris Marker’s *La Jetée* (1963) and Jean-Luc Godard and Jean-Pierre Gorin’s *Letter to Jane* (1972), which comprise (almost) entirely still images, or “essay” films, such as Marker’s *Sans Soleil* (1983) and Welles’s *F for Fake* (1973), which problematically defy classification as either documentary or fiction. Most film theory deals with such difficult films simply by ignoring them, perhaps because engaging with them would

more often than not provide a counter-example that disproves the rule. However, there has been a significant amount of film theory dedicated to avant-garde, which is in itself a highly contested term. Many notable theoretical works about the nature of experimental cinema have been written by practicing filmmakers such as Brakhage, Maya Deren, Stephen Dwoskin, Malcolm Le Grice, and Peter Gidal as well as scholars such as P. Adams Sitney. These works often define avant-garde film as oppositional to mainstream cinema in terms of its production and distribution as well as its aesthetics and dominant modes of representation. Many of these works also seek to question the assumption that film is predominantly a narrative medium, offering various alternatives such as abstract film, structural film, underground film, and the like.

POST-FILM THEORY?

While the relationship between film and various theories has been enormously productive in many ways, the most contentious issue has been the way in which many scholars, critics, and practitioners have fashioned a distinct “film theory” from the intersections and collisions of the theoretical approaches outlined above. Of course, the singular is misleading, and it is most appropriate to talk not of “film theory,” but of “film theories.” However, many scholars have come to base their work around an ad hoc theory drawn from various writings by Saussure, Lacan, Althusser, Barthes, and others. Opponents of this tendency, such as David Bordwell, Noël Carroll, and Frederick Crewes, have noted that such critics, in their attempts to address “everything,” prefer to bicker over ideological matters rather than discuss films.

Works such as Carroll’s *Mystifying Movies* (1988) and Bordwell’s *Making Meaning*

(1989) have subsequently argued that too much film criticism relies on obscure, elitist rhetoric and has become myopically obsessed with interpreting the meaning of films. Instead, in their coedited volume, *Post-Theory: Reconstructing Film Studies* (1996), Bordwell and Carroll call for more empirical investigation and systematic research in film scholarship. They present an alternative path for film studies along more modest, middle-level lines of research, involving questions of style and narrative as well as the functions and effects of cinema. For Bordwell, this approach could form the basis of a “poetic of cinema” in the tradition of Aristotle, Tzvetan Todorov, and the Russian formalists. The work of Bordwell and Carroll can be aligned with that of a wide group of current film scholars and theorists whose interest in film history, style, and form has placed them somewhat at odds with the Saussure–Lacan–Althusser paradigm that has otherwise dominated film studies since the 1970s. For example, Bordwell along with Kristin Thompson represents “neoformalist” film criticism, which has its roots in the work of figures such as André Bazin and Noël Burch (without the latter’s Marxist agenda). Carroll, along with Edward Branigan and Joseph Anderson, is a key exponent of the cognitive approach to film studies, which attempts to assess the ways in which films work on the human mind. Also, scholars such as Barry Salt, Tom Gunning, and Ian Christie have offered rigorous historical research into film style and re-evaluations of early cinema. However the debate surrounding “film and theory” or “theories of film” progresses, that such tensions exist points to the fact that there is much in the way of healthy debate still to be had in this area, and film theory is arguably enriched by both approaches.

Fiske, John

IRIS SHEPARD

John Fiske has been a pioneering critic of popular culture (especially television) since the 1970s. The focus of his work includes popular culture, mass culture, and television studies. Fiske was born and educated in Britain. After graduation from Cambridge University, he traveled and taught widely in New Zealand, Australia, and the United States. Because of his international experiences, Fiske is referred to as a “peripatetic student of popular culture” (Docker 1994: 158). While teaching in Australia, Fiske helped establish the *Australian Journal of Cultural Studies*. In 2000, after 12 years of teaching there, Fiske was awarded emeritus status as a Professor of Letters and Science/Communication Arts from the University of Wisconsin.

Fiske has authored eight books: *Reading Television* (1978, co-authored with John Hartley), *Introduction to Communication Studies* (1982), *Myths of Oz: Reading Australian Popular Culture* (1987), *Television Culture* (1987), *Reading the Popular* (1989a), *Understanding Popular Culture* (1989b), *Power Plays, Power Works* (1993), and *Media Matters: Race and*

Gender in US Politics (1996). *Reading Television* was the first book-length investigation to take television programming seriously from a textual and cultural perspective. Fiske's works have largely continued to revolve around adapting the methodology of literary theory to television and other modern media. His innovative application of semiotics to media texts has earned him the title "father of television studies" (O'Regan 2000). Fiske's work attempts to legitimize the study of television shows as texts and to explore television's positive impact on society.

In *Television Culture* Fiske highlights a problem of much traditional textual analysis of television; it has tended to produce authoritarian or "correct" readings of a text and to assert that the text itself has the ability to impose this reading on a passive audience. Fiske rejects the notion of a passive television audience mindlessly absorbing the ideology encoded in television shows. He asserts that, instead, viewers are able to participate actively in creating their own meanings from the text. By creating their own meaning from the text, viewers are then able to resist the dominant ideology, referred to as the "incorporation devices" that the television producers and ideology of late capitalist consumerism encode in the text. Additionally, when viewers observe shows that articulate their powerless position under the dominant discourse, they may be able to understand their position and begin taking steps to change it.

Because television is a popular cultural medium, it reaches a mass audience composed of numerous subcultures. The diverse sociocultural experiences of the viewing audiences allow for differences in interpreting the television programs. Fiske states: "The hegemony of a text is never total, but always has to struggle to impose itself against the diversity of meanings that the diversity of viewers will produce" (1987: 93).

He coined the term "semiotic democracy" to describe this capacity of viewers to inscribe their own meanings on the text. Fiske interprets watching television as a "process of negotiation between the text and its variously situated readers" (64). He also asserts that television viewers will find pleasure only from a television show that allows for the articulation of their specific interests.

In *Television Culture*, Fiske introduces the term "excorporation," or the process by which disempowered audiences (he refers to children in his example) borrow elements from the dominant culture and use them to further their own, often oppositional interests. Excorporation is a form of semiotic resistance. Diverse social groups with diverse interests construct meanings from texts in ways that resist homogeneity, often by appropriating or reinterpreting aspects of the dominant culture.

In *Understanding Popular Culture*, Fiske opposes previous approaches to understanding popular culture that either ignored popular culture's involvement with the dominant ideology or overemphasized popular culture's complicity with the dominant ideology. He proposed a third alternative, seeing popular culture as a site of struggle between the dominant ideology and the people. Fiske sees people's participation in popular culture as highly creative and inventive. People, Fiske insists, don't just passively consume a commodity, but they also rework this commodity to construct and express their self-identity and social identities. In a mass-culture text, Fiske asserts, it is possible to separate elements of the dominant ideology from popular resistance elements.

Numerous critics question Fiske's ideas. John Docker in *Postmodernism and Popular Culture* questions Fiske's binary opposition of the interests of the dominant ideology and the people: "What happens in culture, 'high,' radical or popular is too ideologically

'mixed,' too discursively messy, to be easily cast into the binary either/or boxes of domination and resistance" (1994: 163). Jim McGuigan accuses Fiske of retreating from critical thinking and abandoning all understanding of political economy (Barker 2003: 418). John Frow states that Fiske attempts to purify "the popular" by eradicating ambivalence and complexity and, through this, turning the category of the popular into a prescriptive, fantastic category (1995: 61–2).

Understanding Popular Culture also investigates the production of popular culture. Fiske argues that popular culture involves not merely consumption, but instead "the active process of generating and circulating meanings and pleasures within a social system" (1989b: 23). He asserts that the groups commonly considered the consumers are really the producers: "popular culture is made by the people, not produced by the culture industry. All the culture industries can do is produce a repertoire of texts or cultural resources for the various formations of the people to use or reject in the ongoing process of producing their popular culture" (24).

Frow, John

IRIS SHEPARD

John Frow (b. 1948), a highly acclaimed critic of media, communication, and popular culture, is the current chair of English Language and Literature at the University of Melbourne, Australia. He was educated at Wagga High School and the Australian National University. From 1971 to 1975 Frow conducted his graduate studies in the comparative literature program at Cornell University, including a year at the University of Heidelberg. He has worked at numerous universities: from 1975 to 1989 he was at Murdoch University in Western Australia; from 1990 to 1999 he served as a chair at the University of Queensland; from 2000 to 2004 he was the Regius Professor of Rhetoric and English Literature at the University of Edinburgh. He has also held visiting research and teaching positions at the University of Minnesota, the University of Michigan, and the University of Chicago. Currently, as well as being the chair of English Languages and Literature at the University of Melbourne, Frow is the head of the School of Culture and Communication. His current research includes investigations of cultural memory and the city of Port Arthur and of the notion of cultural property as it impacts the character and forms of personhood. In addition to numerous articles, book chapters, and book reviews, Frow has authored six books: *Marxism and Literary History* (1986), *Australian Cultural Studies: A Reader* (1993), *Cultural Studies and Cultural Value* (1995), *Time and Commodity Culture* (1997), *Accounting for Taste: Australian Everyday Cultures* (with Tony Bennett and Michel Emmison; 1999), and *Genre* (2005).

His forthcoming publications include the *Handbook of Cultural Research*, coedited with Bennett.

In *Cultural Studies and Cultural Value*, a critical investigation of the way cultural value is organized in the advanced capitalist world, Frow asserts that the distinction between “high” and “low” culture is currently untenable. Describing the purpose of this book, he writes: “I understand this book as making an indirect contribution to the critique of some of the fundamental categories of cultural studies – culture, class, community, value, the popular, representation” (1995: 7). Frow asserts that the discipline of cultural studies lacks a secure definition and thorough theoretical and methodological reflection. By analyzing some of the central terms in cultural studies, he exposes several problematic assumptions found in cultural studies. Instead of offering practical solutions for these problems, he encourages a rigorous investigation of these areas.

In the first chapter, “The social organization of culture,” Frow examines the binary distinctions between high and low culture, arguing that these distinctions are arbitrary and unsupportable for numerous reasons including the absorption of high culture into commodity production and the erosion of modernist attempts to define high culture in opposition to a degraded mass culture. In the second chapter, “The concept of the popular,” he objects to the concept of “the popular” as a valid descriptive category. Though the concept of the popular can be helpful in breaking down the canon or as a slogan in the struggle against the oligarchy, it is untenable to describe the popular as a category opposing high culture or as an area of our culture that has escaped hegemonic influence. In the third chapter, “Class and cultural capital,” Frow redefines class. He asserts that class is a theoretical construct with discursive effects and proposes that class can no longer be understood simply

in economic terms. Capitalism has transformed knowledge into a productive resource, making a new social class: the knowledge class. Political and ideological structures struggle with economic forces to determine the formation of class. In the final chapter, “Economies of value,” Frow asserts that having a general concept of the economy of value leads to authoritative and entrenched reading practices that serve to repress alternative reading practices. Despite the repressive quality of the authoritative concept of value, discourses of value abound in all facets of society. Frow examines several alternatives to the discourse of value. The first model insists that, instead of engaging in discourses of power, it would be more productive to analyze the value discourses themselves, to investigate how value is formed, transmitted, and regulated. Closely related to this strategy of dispassionate analysis is a relativist acceptance of the world as plural and free from totalization. Frow proposes another alternative way to deal with discourses of power called “the regime of value” (1995: 144). This concept underlines one of the fundamental concepts of cultural studies by asserting that no text or cultural practice has intrinsic meaning or value, but that meaning and value are the effect of specific, ever-changing social relationships.

In *Time and Commodity Culture: Essays in Cultural Theory and Postmodernity*, Frow investigates the concepts of postmodernism, nostalgia, gift exchange, and memory. In the introduction to the essays, he broadly defines the purpose of the book which is to investigate history, memory, and the concept of postmodernism in a way that rejects widespread assumptions about the “epochal coherence” of the world. In the first essay, “What was postmodernism?” he suggests that “postmodernism” can mean nothing more than a genre of theoretical writing, after which he examines the problems inherent in the ways the term is commonly

defined. Postmodernism is frequently defined by being opposed to modernism. Frow insists that this simple binary structure is an “idealist representation of a historical time” (1997: 17). Furthermore, postmodernism is often defined in contradictory ways, leading Frow to insist that “the concept of Postmodernism is logically incoherent” (26). The scope of postmodernism is impossible to limit, and periodizing postmodernism is highly controversial.

In the fourth essay, “*Toute la memoire du monde: Repetition and forgetting*,” Frow distinguishes between two types of memory: true memory and historical perception. True memory consists of deeply embedded experiences, skills, and the body’s inherent self-knowledge. Historical perceptions are memories that have been transmitted and handed down. In historical memory the experiences are constructed, not recalled. These experiences (Frow uses the Holocaust as an example) are constructed collectively through the interests, fears, and fascinations of the present. Memory’s relationship to the past consists not of true recollections of events but of desire. As exemplified by this

essay, Frow’s critical work is focused on rigorously investigating commonly held assumptions about important concepts of cultural studies and postmodernism.

G

Gaze, The

ANNA P. MURTA

The gaze, more notably the male gaze, is one of the central constructs utilized in film, gender, and postcolonial studies or other fields of academic criticism. Put simply, the gaze is the *look* induced by the message producer and followed by the message receiver in the process of creating meaning. It generally refers to the way in which cinema – and, later on, other cultural products, visual or not – leads the spectator to look in a certain direction or to view things in a certain way, revealing at the same time the worldview of the characters in the film and the ideologies behind the camera. In her essay “Visual pleasure and narrative cinema,” written in 1973 and published in 1975, feminist scholar Laura Mulvey (1989b) brought the concept of the “male gaze” to prominence by arguing that mainstream Hollywood cinema makes use of three looks – the look of the camera, the look from the narrative characters, and the accomplice look of the spectator – in order to generate male pleasure through women’s objectification, thus reinforcing a monolithic patriarchal ideology.

Mulvey elaborates on the male gaze, drawing from Sigmund Freud’s scopophilia and Jacques Lacan’s “mirror stage” gaze. According to her, cinema plays with the

ego-constructing pleasure of looking (scopophilia) at another person as an object. Moreover, as Lacan posited, the pleasure of looking takes place in the ego-forming mirror phase, when a child recognizes his likeness with joy and begins to understand the boundaries of his selfhood. Similarly, cinema simulates this extravagant and pleasurable mirror-like identification within the male spectator. Mulvey posits that filmic language, exemplified by deep focus, camera movement, invisible editing, etc., is peculiarly employed to create a fetishist and voyeuristic male pleasure and a female “to-be-looked-at-ness.”

Mulvey’s concept of the male gaze has been repeatedly summoned, revised, and expanded by diverse scholarship over the years. To Todd McGowan (2003), cinema doesn’t necessarily use the gaze as an ideological tool, since movie audiences may also seek and experience, by means of identification with the camera and creation of fantasy, a sense of mastery over the gaze’s female object. He posits that such a cinematic function can be conceived only if criticism extrapolates Mulvey’s male gaze and further expands the Lacanian gaze. Similarly, Clifford Manlove privileges Lacanian theory over Mulvey’s gaze since, according to him, the human subjectivity represented in the gaze surely transcends patriarchy. It also encompasses any other power relation

between groups and respective objects: “Researchers variously point to the following: white and black gazes, the tourist gaze, heterosexual and homosexual gazes and the meta-physical gaze, to name a few” (2007: 84)

Likewise, Corinn Columpar (2002) criticizes Mulvey’s concept of the male gaze for its exclusive dealings with patriarchy, its monolithic premises, and, consequently, its exclusion of other historical/contextual forces, such as national and racial identities. To her, a more nuanced feminist film theory has to include, within cinematic looking, relations and, in addition to the male gaze, the concept of a colonial and ethnographic gaze, in which function the non-white subject is fixed in her/his otherness. If, on the one hand, the male gaze projects masculine fantasies onto the female object, on the other hand the ethnographic and colonial gazes project their fantasies of authenticity, empowering white culture and reducing others.

Moreover, Columpar points out that Mulvey’s gaze is intrinsically sadistic, and therefore ignores masochistic pleasures that are also associated with the cinematic experience. In her analysis of *Fatal Attraction* (1987), *Basic Instinct* (1992), and *Body of Evidence* (1993), Miranda Sherwin (2008) highlights masochistic mechanisms associated with the gaze as an “active position,” deconstructing the male gaze. In those movies, the object of the male gaze controls instead of giving in to dominance: “The joke is against the men, both spectator and protagonist, who falsely assume their own centrality and control. Those identifying with the male protagonist will find in the end that they have been deceived, whereas those identifying with the female protagonist will find that they have been controlling the action all along – which, if they are good readers, they will have suspected anyway, for the signs

are there coded for the female gaze” (2008: 178)

The theoretical shift from the exclusivity and dominance of the male gaze to the inclusion of the female gaze has core implications for Mulvey’s prepositions in “Visual pleasures and narrative cinema.” First, it acknowledges that female spectatorship also derives pleasure from cinema. Second, it recognizes masochistic mechanisms of pleasure as possibly “active,” with the power to face up to patriarchy. Third, it allows the possibility of deconstructing the male gaze, not exclusively in counter-cinema, as proposed by Mulvey, but within mainstream Hollywood cinema itself. Brenda Cooper studies how female gaze in *Thelma and Louise* (1991) deconstructs the male gaze by rejecting and mocking patriarchy, objectifying men, and celebrating women’s friendship, concluding that “the female gazes structured in the movie’s narrative encourage women to take ‘pleasure in feminist power’ and to identify with the spectacle of women depicted in roles that challenge the traditional cinematic association of activity with masculinity” (2000: 301)

As the female gaze comes to prominence in postfeminist films and film theory, it is important to discuss the potential role it may play in masculine identity formation. As Kevin Goddard (2000) points out, though the identities of men are not monolithically formed, they are still irrevocably determined by women’s expectations of them, in other words, by the female gaze. Therefore, the heightening of the female gaze in visual cultural products makes it necessary for cultural scholars to address the question of how spectators will or should cope with the gaze viewed as mutually, and not unidirectionally, empowering.

Geertz, Clifford

MARK PATERSON

Clifford Geertz (1926–2006) was a groundbreaking cultural anthropologist whose techniques for the interpretation of cultural practices have been widely influential, not only in anthropology, but in fields such as literary criticism, where they exercised considerable influence on the development of the New Historicism. Part of the wave of veterans suddenly inducted into college life after World War II, Geertz originally aspired to be a famous novelist in the vein of John Steinbeck or Jack London. Having grown up

in Depression-era California, he applied to Antioch College, a small liberal arts college in southern Ohio where the atmosphere was conducive to both countercultural expression and intellectual exploration. As an aspiring writer, he originally enrolled in English, but soon switched to philosophy. Unable to find work after graduation, he was advised by a philosophy professor to pursue further study in the area of anthropology. Swept up in the spirit of postwar adventure, he joined the social relations program at Harvard, a then unusual blend of anthropology, sociology, and psychology at a time when anthropology was mostly physical anthropology and aligned with the more scientific techniques of archaeology. The Social Relations Department was a gathering of academic fugitives from many disciplines, together aiming for a “common language” in the social sciences. He was aided in this endeavor by being brought up to speed in areas such as anthropology but also in the fields of social psychology, sociology (Talcott Parsons was a contemporary in social relations), and much else besides. Having become an accidental anthropologist, Geertz and his first wife Hildred then found themselves doing their first stint of fieldwork in Indonesia, a place to which he would return to perform innovative fieldwork. After a year at Berkeley Geertz spent 10 years at the University of Chicago (1960–70), whence he also conducted fieldwork in Morocco; he then spent 30 years in the Institute for Advanced Study at Princeton, New Jersey, where he was Emeritus Professor before he died in 2006 at the age of 80.

From his initial encounter with fieldwork in Java from 1952 onward, Geertz became fascinated with the notion of culture, and what constituted it. Drawing on history, psychology, philosophy, and literary criticism, Geertz analyzed and decoded the meanings of rituals, art, belief systems, institutions, and other “symbols,” as he defined

them. During his time at Chicago a loose agglomeration of theoretical terms and methodological approaches developed around him that became known as “symbolic anthropology,” although he himself preferred the term “interpretive anthropology,” whereby anthropologists gain a degree of familiarity with the symbolic contrivances by means of which individuals imagine themselves as persons, as actors, sufferers, knowers, judges, as more generally participants in a form of life. Culture becomes for Geertz “a system of inherited conceptions expressed in symbolic forms by means of which people communicate, perpetuate, and develop their knowledge about and attitudes toward life” (1973: 89). This resolutely nonobjective approach was clearly inspired by his background in the humanities. For, rather than explaining “culture” or “religion” per se, the trick was to approach the multiple ways that significances have been constructed. In other words, the question to ask about cultural phenomena is not what they do, but what they mean. If anthropology is the study of other peoples’ cultures then, as Geertz saw it, the task is to analyze how people gain a working familiarity with the frames of meaning through which they enact their lives. “Believing with Max Weber that man is an animal suspended in webs of significance he himself has spun,” he wrote, “I take culture to be those webs and the analysis of it to be therefore not an experimental science in search of law but an interpretive one in search of meaning” (5).

After Java, Geertz conducted fieldwork in Bali and further applied his hermeneutic, interpretive reading of a number of activities as “texts” to be interpreted, the most famous being in his essay “Deep play: Notes on the Balinese cockfight” (in Geertz 1973). Here he analyzed the kinship and social ties that are constructed, emphasized, and maintained in this form of ritual “deep play” as

if they were “an assemblage of texts.” This essay is a notable example of what he termed “thick description,” a method of applying philosophical insights and literary analysis in the writing of ethnographic experience, explaining not simply what is observed but also fleshing out in vivid detail the background through which activities could be meaningful. Thick description helped to further the turn in the social sciences toward meaning, employing rich language and a degree of expressivity in the interpretation of activities as “texts,” and was therefore a hermeneutic enterprise that had influence beyond the discipline of anthropology, fostering that conversation between the social sciences in general, and bringing new techniques and writing skills into the fold as a result. His evident writing skills and ability to analyze complex symbolic systems while expressing the richness of his experience in the field makes him stand out from other anthropologists, and presumably allowed him to exercise his earlier literary ambitions while retaining his philosophical mode of inquiry into culture. As he himself put it, “I think of myself as a writer who happens to be doing his writing as an anthropologist” (1991). These writing skills enabled him to win a National Book Critics Circle Award for *Works and Lives: The Anthropologist as Author* (1988), which examined the writing of four towering pillars of the discipline of anthropology: Bronisław Malinowski, Ruth Benedict, E. E. Evans-Pritchard, and Claude Lévi-Strauss. In addition to his influential books, Geertz often wrote for the *New York Review of Books* and *New Republic*.

Another key concept for Geertz was “local knowledge.” Arguing that ethnographic reality does not exist apart from anthropologists’ written versions of it, he said that cultures and peoples should speak for themselves, with anthropologists learning to “converse with them” and interpret them.

In *Local Knowledge* (1983), Geertz also addressed the question of whether someone from one culture can objectively understand another. He wished to avoid grand, universal theories, seeking instead to find meaning in small-scale observations of simple human interaction, hence what he called “local knowledge.”

Gender and Cultural Studies

SUSAN WHITLOW

Theoretical approaches that seek to understand the role played by gender in culture and society are an important element of the

field of cultural studies. Gender theory in the modern sense is typically considered to have begun in the late nineteenth century with the arrival of the first wave of feminism. However, to the extent that gender theory involves the study of constructions and representations of gender in Western literature, society, and thought, an exhaustive survey would necessarily reach back at least to Homer and Sappho and include a myriad of iconic writers, philosophers, and leaders from the past several centuries to the present day. Nevertheless, as gender theory is generally agreed to have begun with feminist theory, it is useful to begin chronologically with the rise of modern feminism and to examine how other gender theories then arose to offer new visions and revisions to feminist thought.

FEMINIST THEORY

First-Wave Feminism

The so-called “first wave” of feminism began in the mid-nineteenth century with very clear goals and under the leadership of such revolutionary figures as Sojourner Truth, Susan B. Anthony, Lucy Stone, and Elizabeth Cady Stanton. Stanton in particular provided a forum for the concerns of women and a focal point for the movement by organizing a women’s rights convention in Seneca Falls, New York in 1848, during which women leaders laid out several specific objections to the treatment of women in the United States. For example, women were expected to pay property taxes and to submit to laws without any representation in the levying of taxes or the formation of such laws. In fact, women’s legal rights were virtually nonexistent; married women had no property rights, and their husbands were allowed to imprison them or use corporal punishment as they deemed necessary.

Further, women who chose to divorce their husbands could expect no help from the legal system, which nearly always gave custody of any children to the father. Perhaps such rulings were rationalized by the fact that women had very few options for employment, and any jobs they could obtain paid only a fraction of what men earned doing the same work.

The movement was slow to gain acceptance, and its leaders faced ridicule and sometimes violence in response to their demands for women's rights, but Stanton, Anthony, and others persevered. In 1890, the strong-willed and articulate Stanton became the first president of the National American Woman Suffrage Association, an organization that continued to lead the charge for women's rights, finally securing women in the United States the right to vote in 1920. Similar suffrage movements were active in other Western countries at about the same time. Women had gained the right to vote in the UK in 1918, though women's voting rights there did not fully equal those of men until 1928. Spain followed suit and granted women suffrage in 1931, but France, despite the efforts of indefatigable feminist leaders, did not extend the vote to women until 1944.

Second-Wave Feminism

Feminism and other forms of political activism experienced a lull during World War II; during this time of crisis, women often left their homes to join the workforce. Popular images of Rosie the Riveter represented the female presence in factories and women's determination to support their nation at home while their husbands, fathers, and sons did so in Europe. After World War II, however, women returned to their homes, where many of them felt dissatisfied. Having been a part of a team in the

workforce, many women now found the relative isolation of home frustrating. This widespread discontent, coupled with the civil rights movements of the 1950s and 1960s, led to the women's liberation movement and the second wave of feminism.

While the first-wave feminists strove to obtain some measure of rights under the law, second-wave feminists sought *equality* with men in education, the workplace, and under the law. These scholars and activists worked to change the way people thought about the role of the American woman and to broaden immensely the opportunities open to women. Second-wave feminism was informed, among other things, by an increased attention to the examination of literary and cultural texts. Significantly, second-wave feminism arose at about the same time as cultural studies itself, and the two were informed by a similar desire to move beyond the elitist orientation of conventional literary studies.

The second wave of feminism is sometimes broken down into several distinct categories, indicating that this wave is not, in fact, one unified voice but rather constitutes many different priorities and philosophies. One such category is radical feminism, which focuses on concerns about the violence that often characterizes the relationships between men and women. Liberal feminism is concerned with negative stereotyping of women, the so-called glass ceiling in many workplaces, and discrimination against women in general. Cultural feminism, unlike many feminist theories, argues that men and women are essentially different and occupy different subcultures, positing that the woman's subculture is undervalued. Another category is socialist feminism, an approach that attacks class inequalities whereby men have opportunities that allow them to rise to a higher status than women can achieve except through marriage to such men. One marginalized theory, even within

the marginalized feminist movement, is critical race theory, represented by the work of Kimberle Crenshaw and Angela Harris who argue that women of color are doubly disadvantaged in the United States.

Some have argued that the second wave of feminism failed because of the failure of the Equal Rights Amendment in 1982; on the contrary, second-wave feminists won several legal victories – the Equal Pay Act of 1963 and *Roe v. Wade* in 1973 – and many social victories as well, for example the opening up of many men-only venues like the military and military academies, NASA, and traditionally all-male universities. The National Organization for Women was also founded during the second wave by feminist leaders including Betty Friedan, author of *The Feminine Mystique* (2001[1963]). In 1971, Friedan partnered with Gloria Steinem and other feminist leaders to found the National Women's Political Caucus. By this time, Steinem was well on her way to becoming a feminist icon and was instrumental in forcing the feminist cause into the public sphere and applying feminist ideology to popular culture. Steinem founded *New York* and later *Ms.* magazines and publicly attacked the exploitation of women in *Playboy* publications. By the late 1970s, Steinem was the public face of feminism.

Despite the progress made by the second wave and the many voices contributing to its political and social successes, detractors have rightly pointed out that the movement and theory developed during this time reflected a rather limited view – that of the middle-class white woman. Race theorists like Crenshaw, Harris, and Audre Lorde went largely unappreciated until the third wave of feminism.

Third-Wave Feminism

The third wave of feminism, generally agreed to have begun in the 1990s, responds

to the limitations of the second wave by including voices of various cultures and ethnicities. For example, Patricia Hill Collins, bell hooks, and Carla Trujillo have added African American and Chicana perspectives to feminist theory. bell hooks, whose greatest influence was abolitionist and first-wave feminist Sojourner Truth, has made a particular effort to extend feminist theory to new audiences. One of her most recent books, *Feminism Is for Everybody* (2000), employs informal language rather than academic jargon and explains feminism in a way that a general audience can easily understand. Trujillo, author and editor of numerous publications on identity, sexuality, and Chicana feminism, has contributed to queer theory as well as feminist theory. Also worthy of note is *This Bridge Called My Back* (1988[1981]), a collection of essays, poetry, and artwork edited by Cherríe Moraga and Gloria Anzaldúa. This powerful book amplifies the voices of black and Chicana feminists within the US. As its preface explains, the collection seeks to expand what is typically meant as feminism and to explore the existence of “Third World feminism” in the US.

While the diversity of feminism's third wave is certainly commendable, the multiplicity of concerns and perspectives causes this stage of feminism to be even more fragmented than the second wave. As we have seen, feminism's second wave was a cacophony of voices, but the movement nevertheless was consistent in its goals of equality between the sexes even though equality may have meant something different to different theorists and activists. The third wave, however, is less unified and less interested in activism than it is in individuals. The major concerns of the third wave are the construction of individual identity, including gender and sexuality. In this sense, the third wave can be seen as the inverse of the second: instead of changing society for

the betterment of women, the third wave seeks to change women for the betterment of society.

Third-wave feminists both question and celebrate the term “woman” and embrace, at least in theory, the diversity of female identities, from tomboy to cheerleader, lesbian to housewife. Seeking to correct the second wave’s tendency to view society from only the middle-class white woman’s perspective, third-wave feminists consider the differences inherent in culture and ethnicity. Since the focus of much of the third wave’s theory is on the social construction of gender, these theorists are more apt to consider how various societies construct and perform gender.

One of the most prominent and influential third-wave feminists is Judith Butler, author of *Gender Trouble* (1990) and *Undoing Gender* (2004). Butler argues that while our sex is biologically determined, *gender* is overtly and covertly constructed. As soon as we hear “It’s a girl!” or “It’s a boy!” we begin treating the baby according to its gender, typically decorating in pink for girls and in blue for boys, buying dresses and Barbie dolls for girls and trucks and action figures for boys, and so forth. However, Butler contends that we learn the culturally constructed norm for our gender less through instruction than through observation of adult performances of that gender. The notion of *performativity* is central to Butler’s theory; she asserts that we begin to mimic and practice gender-appropriate behavior at an early age.

Elaine Showalter is another feminist theorist associated with the third wave. In one of her early articles, “Toward a feminist poetics” (1979), Showalter outlined a history of feminist theory which she broke down into three periods. The first of these is the feminine phase, from the mid to the late nineteenth century, in which women first began attempting to compete with men

intellectually. Showalter asserts that at this time, women accepted male judgments concerning art and literature and focused on meeting those expectations. Next is the feminist phase, which extends from the late nineteenth century to 1920, the end of the suffrage movement. This period is characterized by the fight for equal rights, particularly the right to vote. Last is the female phase, which Showalter describes as a period of searching for a female identity separate from the male. Instead of internalizing male values, women develop their values and their own criteria for art and literature.

Though Showalter is now highly regarded as a feminist, literary, and cultural theorist, she was once criticized for her willingness to engage in debates about popular culture. At a time when popular culture was not considered worthy of academic study, Showalter was publishing pieces in *Vogue* and *People* magazines. At least two of her books deal with representations of women in popular culture: *Hystories: Hysterical Epidemics and Modern Media* (1997) and *Faculty Towers: The Academic Novel and Its Discontents* (2005).

Other third-wave feminists grapple with psychoanalytic theory. While some feminists feel Freudian theory has little to offer the cause of feminism, others, like Juliet Mitchell, have argued that Freudian analysis can be adapted to feminist theory. In her book *Psychoanalysis and Feminism: Freud, Reich, Laing and Women* (1974), Mitchell seeks to reconcile Freudian theory and feminism. Likewise, Hélène Cixous employs the psychoanalytic theory of Jacques Lacan when discussing the need for the child to begin to see itself as a separate being from the mother. Cixous asserts that this transition marks the child’s movement into the world of the symbolic, the world of language. Thus, by Cixous’s theory, the mother’s body is not part of the symbolic order; it is unrepresentable by what Cixous refers to as the

phallogocentric symbolic language. Cixous then applies this notion to women in general, not just the bodies of mothers.

French Feminism

Cixous, Luce Irigaray, Julia Kristeva, Simone de Beauvoir, and others form a mode of thought collectively known as French feminism or French feminist theory. Influenced heavily by poststructuralist theory, French feminism, particularly in the work of Cixous and Irigaray, is built around the notion of hierarchical binaries – light/dark, emotion/reason, mind/body – which these feminists see as dominating patriarchal Western thought. Therefore, set in opposition to “man,” “woman” becomes marginalized. As the lesser half of the binary, women’s thought and bodies become repressed and seek expression in ways other than symbolic – phallogocentric – language. In addition to Cixous, Kristeva has contributed significantly to the field of semiotics, which is the study of what is *not* spoken – the pauses, inflections, and body language that color our communication. Like Cixous, Kristeva builds on the psychoanalytic work of Jacques Lacan, whose revision of Freud’s theories have greatly influenced French feminism. Kristeva also focuses on the child’s creation of identity and entrance into the symbolic world as a significant moment of development and as movement away from the maternal. She uses this moment in which the child rejects the mother as an analogy for the way in which patriarchal societies reject and exclude feminine thought. Simone de Beauvoir famously took up the notion of binaries in her groundbreaking work *The Second Sex* (1974[1949]), in which she postulates that men have repressed women by defining them as “other” in relation to men. Thus, men take on the role of the subject, the actor, while women are relegated to the position of

object and are acted upon. Further, de Beauvoir, in agreement with most other French feminists, sees this binary as socially, not naturally, constructed. De Beauvoir’s theory is one on which Judith Butler would later build when composing *Gender Trouble*.

Postfeminism and Postmodern Feminism

The definition of “postfeminism” is ambiguous. Some use the term to mean that the goals of feminism have been achieved and therefore the need for feminist theory has been overcome. For others, postfeminism is a backlash to feminism; they assert that feminism has become as rigid and exclusive as its founders believed the patriarchy to be. These critics claim that feminism prevents women from following traditional roles of femininity and is a divisive force in society.

The term “postmodern feminism” is equally nebulous, incorporating the interrogatory nature of poststructuralist theory with the feminist concern for the representation of women. One example is Donna Haraway’s “Cyborg manifesto” (1991), an essay that responds to one of Butler’s arguments that the source of the patriarchal power structure could theoretically be sought out and changed. Haraway disagrees with the idea that any starting point for societal problems could be located. Her “manifesto” seeks to disrupt such theories and to challenge accepted binaries like animal/human and human/machine.

Feminism’s Contribution to Cultural Theory

Despite postfeminist detractors, feminism remains a powerful force in literary and cultural theory. Since most feminists see gender as a social construct, they naturally analyze the cultural influences that

contribute to the female identity. To employ Butler's theory of performativity, popular media figures create gender performances that are received, likely mimicked, and thus perpetuated by young women. The television series *Ally McBeal* has been a popular text for feminist analysis and debate since the late 1990s. While some find the titular character annoying, immature, and demeaning to professional women, others observe that McBeal is aware of and in control of her own sexuality, displays agency in her own life, and provides a witty, successful model for young women. Similar observations have been made about *Sex and the City*, a more recent television series that frankly depicts the sexual lives of modern, 30-something women.

Perhaps feminism's greatest contribution to cultural theory is the development of feminist film theory, an area of criticism and research introduced by British cultural theorist Laura Mulvey in her essay "Visual pleasure and narrative cinema" (1989 [1975]). In this influential work, Mulvey explains the significance of what she refers to as the "male gaze" in film. Male characters, she posits, tend to be subjects, often looking with intensity at their objects, which tend to be feminine or emasculated. The male gaze then becomes a kind of penetration that serves to subordinate other characters. Mulvey neatly extends this gaze to the realm of science and science fiction, noting that the telescope and microscope are extensions of the male eye, constructing the source of its inquiry as "object" or "other" and thus feminine.

Angela McRobbie, a British feminist and cultural theorist, is also well respected for her analyses of popular culture. McRobbie began in the 1980s by considering the presentation of women in popular magazines and the reception of those magazines by young women. McRobbie argues that while many feminists consider depictions in

young women's magazines to be limiting to young women, the younger generation's priorities simply differ from those of second- and third-wave feminists; therefore, feminists need to understand the younger generation's attraction to these publications in order to carry on the feminist conversation. Since the 1980s, McRobbie has expanded her research to include popular music, dance, and fashion. Her most recent work, *The Aftermath of Feminism: Gender, Culture and Social Change* (2008), examines contemporary film and television and considers questions posed by postfeminists: In an age in which women are encouraged to get an education, seek a career, and practice sexual independence, is feminism no longer necessary? Is the emphasis on the rather limited experience of middle-class white women (in series like *Sex and the City* and films like *Bridget Jones's Diary*, for example) undermining feminism as a whole? McRobbie concludes that feminism has not outlived its usefulness, but that it must continue to evolve to meet our culture's changing dynamics.

QUEER THEORY

Though the terms are clearly related and the concerns overlap, queer theory is not synonymous with gay theory or lesbian theory. While gay and lesbian theories focus on the unique concerns of gay men and women respectively and the various manifestations of sexual desire and intimacy, queer theory is more inclusive, taking into consideration the unique identities of transsexuals and transgendered individuals as well as gay, lesbian, bisexual, and straight identities and sexualities. Queer theory draws much of its foundation from feminism, particularly its interest in the social construction of gender and identity and Butler's theory of performativity. Queer theory argues that

society “norms” certain behaviors and marginalizes others. Theorists often use the word “heteronorming” to describe the way in which cultural artifacts reinforce a given society’s strong preference for heterosexuality. “Queering,” by contrast, has come to mean the act of transgressing “normal” expectations and destabilizing traditional paradigms of sexuality.

Much queer theory is built upon the work of French theorist Michael Foucault. Foucault argues against the notions that a person has an essence, an unchanging center of identity, and that if the best questions are asked and tests performed, the core of that person can be unearthed and we can learn who that person really *is*. Rather, according to Foucault, identity is informed by one’s observations of and discourse with others and is never fixed; identity is fluid and is shaped and reshaped over a person’s lifetime. Similarly, Foucault sees sexuality as the result of discourse. He argues that Western culture’s tendency to repress sexual desire has made the sexual act seem unnatural, prompting a need to confess sexual urges, thereby creating a discourse about sexuality. This discourse, Foucault says, shapes our notions of “normal” sexuality. These ideas have clear implications for queer theory, since Foucault seems to suggest that sexual norms are norms not because they are natural but because society has normalized them. Further, Foucault postulates that power is also fluid: it is not a gift inherent to certain classes, races, or individuals but is instead a behavior. Power is not an attribute according to Foucault; it is an exercise. Such a claim is naturally liberating to traditionally marginalized groups like women and homosexuals.

Two theorists who are indispensable to any discussion of queer theory are Judith Butler and Eve Kosofsky Sedgwick. Butler’s theories of gender constructions, as already discussed, build upon Foucault’s notion of

an unstable, changeable identity. Sedgwick, on the other hand, is less interested in the formation of identity (though that is part of her work) than she is in the dynamics between same-sex individuals. In her *Between Men: English Literature and Male Homosexual Desire* (1985), a seminal work for queer and gay theory, Sedgwick posits that the same male relationships that are essential for society to exist – male business partnerships, cooperation in government, and particularly familial relationships, which are transacted through women – often also conceal latent homoerotic desire. Thus, the homoerotic is ever present, even within conservative patriarchal structures. This theory led Sedgwick to one of her more controversial insights – that a “minoritizing view” of homosexuality and a “universalizing view” coexist in our society. The minoritizing view is the idea that because only a small segment of the population is gay, attitudes and legislation that have an impact on homosexuality affect relatively few people. This view of homosexuality seems to favor a fixed notion of sexuality – those who are straight will always be straight, and those who are gay will always be gay – and conceives of little gray area. The universalizing view, on the other hand, is the idea that sexuality is fluid, or perhaps contagious, and that homosexuality is therefore a threat to the heterosexual norm. This latter view can also be expressed more positively as an understanding that everyone is in some way influenced by same-sex relationships, whether they be homosexual or homosocial.

Queer theory is often applied to pop culture texts as well as literary texts as theorists evaluate the presentation of queer characters or consider the way in which a given text transgresses or queers the heterosexual hegemony. One popular example is Alexander Doty’s book *Making Things Perfectly Queer* (1993), in which Doty examines the presentation and reception of gay

characters and scenes in popular film and television.

Gay theory and lesbian theory have both emerged out of feminism and queer theory in recent years to become separate areas of inquiry. Both theories predictably rely upon Foucault and Butler for their foundations, but the two areas have slightly different concerns. One notable gay male theorist is Guy Hocquenghem who, in his work *Homosexual Desire* (1978), applies Marxist theory to explain the marginalization of homosexuality. In short, he posits that our culture rejects homosexuality because it does not contribute to the reproductive goals of American capitalist society. Hocquenghem believes, as Sedgwick's universalizing theory suggests, that sexual desire is multifaceted and homoeroticism is an ever-present component of human desire; however, since it is not considered productive, it is isolated and minoritized. Another important work in gay male theory is Dennis Altman's *The Homosexualization of America* (1982), which examines the development of the so-called gay community in America.

Lesbian theory, as a separate mode of cultural and literary analysis, is often difficult to separate from feminism. Cixous, for example, proclaims in her essay "The laugh of the Medusa" (1976) that all women are lesbians, by which she means all women should be concerned about the welfare of other women, but naturally lesbian theory is also concerned with the cultural and literary presentations and receptions of same-sex relationships. One of the most powerful voices in lesbian theory is Adrienne Rich, whose essay "Compulsory heterosexuality and lesbian existence" (1980) argues that female relationships, from friendships to sexual partnerships, typically involve some level of lesbian desire, but since society assumes heterosexuality as natural and inevitable, this desire is usually repressed, distorted, or erased entirely. Rich upholds

lesbianism as both a genuine and natural bond between women and a welcome disruption to traditional patriarchy.

MASCULINIST THEORY

Masculinist theory's development is roughly contemporary with that of third-wave feminism and queer theory and owes much to those theories' investigation of the origins and legitimacy of basic terms like "man," "woman," "heterosexual," "sexuality," etc. and of socially constructed notions of normalcy. Increased focus by theorists like Butler on the construction of the female gender naturally led to an analogous focus on male gender. Furthermore, since male authorship and audience identity have been the de facto focus in literature in the West, it was never a separate study until the emergence of feminism and queer theory created a need.

The terms "masculinist," "masculist," "masculinism," and "masculism" are used interchangeably across disciplines, some giving "masculinist" preference as the first of these terms and the most common. One prominent masculinist is Warren Farrell, author of several popular and scholarly texts about male and female societal roles. Once an elected board member of the National Organization for Women, Farrell now writes and speaks about discrimination against men. In his book *The Myth of Male Power* (2001), Farrell provides startling evidence of such discriminatory practices – violence against men, discrimination in child custody cases, a lack of male advocacy in abortion issues, typically higher insurance rates for men, much higher suicide rates for men, the lack of paternal leave in most companies, the abundance of social programs for women and the corresponding dearth of such programs for men, and the societal awareness of breast cancer and support for breast cancer research funding compared to the relative

ignorance about prostate cancer (according to Farrell, breast cancer research receives 660 percent more funding per year than does prostate cancer research). Because of his advocacy for men's welfare, the *Chicago Tribune* labeled Farrell "the Gloria Steinem of men's liberation." On his own website, however, Farrell is quick to point out that the objective of his work is not to create a backlash against feminism or to raise masculinism to the forefront of societal concern; instead, Farrell intends to promote awareness of the need for balance and equality between genders.

R. W. Connell, author of *Masculinities* (1996) and *The Men and the Boys* (2000), is another prominent theorist who envisions gender as a set of attitudes, behaviors, gestures, and appearances that a given society has chosen to code as "male" or "female." Like Farrell, Connell explains that a focus on feminist studies has destabilized masculine identity, but unlike Farrell, Connell is less interested in established equality between the sexes and more interested in the evolution of masculinity. A professor of education at the University of Sydney, Australia, Connell is naturally interested in masculinity beyond the gender controversies in the United States; not only does he consider various nationalities and ethnic groups, but queer theorists have applauded his most recent book because he considers the effects of societal bias and gender constructs on both gay and straight men.

Some feminists are uncomfortable with the growing popularity of masculine theory. As Lynne Segal explains in "Back to the boys: Temptations of the good gender theorist" (2001), many feminists watch warily as feminist studies has become gender studies and the focus widens to include the constructs of the male gender identity as well as female. Other feminists, like Segal, embrace the newest gender theory as an opportunity to continue to investigate gender constructs.

In her article, Segal expectedly discusses archetypal images of women in our culture – the hag, the witch, the mother – but also embraces masculinist theory as just another way of keeping the gender discussion open in an interdisciplinary arena.

Gilroy, Paul

DENNIS DWORKIN

A cultural theorist, critic, and scholar of black popular culture (who is also a musician and has been a DJ), Paul Gilroy has been in the forefront of articulating a cultural understanding of race and racism in the contemporary world. He was born in London in 1956 and is from an English and Guyanese background (his mother being the novelist, children's writer, critic, and teacher Beryl Gilroy). He attended the University of Sussex as an undergraduate and received his PhD from the Centre for Contemporary Cultural Studies (CCCS) at the University of Birmingham. He has held academic positions in both Britain and the United States, including Goldsmiths College, University of London, and Yale University. At Yale he was the Charlotte Marian Saden Professor of Sociology and African American Studies and chair of the Department of African American Studies. He is currently the first holder of the Anthony Giddens Professorship in Social Theory at the London School of Economics.

Gilroy's early work is found in the collectively produced *The Empire Strikes Back: Race and Racism in 70s Britain* (1982) and the single-authored "*There Ain't No Black in the Union Jack*": *The Cultural Politics of Race and Nation* (1991[1987]). These books were produced in the context of the triumph of Thatcherism in 1980s Britain. Pushing

forward the theoretical/political opening found in the collectively authored CCCS text *Policing the Crisis* (Hall et al. 1978), Gilroy argues that the articulation of racial and national discourses has become a central feature of British political culture. In contrast to late nineteenth-century British racism, which was based on biological hierarchy, its late twentieth-century equivalent is founded on cultural differences, which cast blacks as permanent outsiders. For Gilroy, not only had such thinking become a central feature of new right ideology, but it has also shaped left-wing political ideas. When the left seeks to reclaim the signifier “Britishness” from their conservative opponents, they leave its racial and imperial dimension unexamined. Gilroy applies this critique to the cultural studies tradition from which his own thinking emerged. He cites influential thinkers in that tradition, notably E. P. Thompson and Raymond Williams, as founding their work on discourses of English nationalism.

Gilroy has not only critiqued the nationalism and “ethnic absolutism” of English political culture but also, most importantly, black nationalism, insofar as it is based on essentialist and fixed notions of the black historical experience. He views the experience of blacks in terms of “cultural syncretism,” defined by national, diasporic, and transnational traditions. This perspective underpins the second phase of Gilroy’s work, exemplified by *The Black Atlantic* (1993), one of the most influential texts in the humanities in the last 25 years. His approach is rooted in the thought of C. L. R. James and Eric Williams, for whom the black African experience of slavery is as critical to the development of modernity as secularization and the Industrial Revolution. He likewise borrows from W. E. B. Du Bois the idea of “double consciousness” to describe black subjectivity in the modern world. Gilroy analyzes a wide gamut of writers and

musicians who have produced the black Atlantic diasporic experience – from 2 Live Crew to Richard Wright, from Miles Davis to Martin Robison Delany. A critical dimension to the book is that music – not words – is at the center of black self-understanding and political practices.

Much of Gilroy’s most recently published work is the product of years spent living in the United States. *Against Race* (2000) draws parallels between the use of mass communications by the Nazis and by nationalist movements in contemporary multicultural societies. It also critiques contemporary rap for having become a corporate multicultural irrelevance to the experience of most black Americans. *Postcolonial Melancholia* (2005) returns to the critique of contemporary Britain. Speaking from an explicit position of “agonistic, planetary humanism,” Gilroy argues that post-World War II Britain suffers from a “melancholic mood” rooted in the evasion of its colonial past. He advocates a historical analysis of the British Empire, the brutalities and atrocities committed in its name, and the racial hierarchies that are among its legacies. Despite their different focus, these books share the controversial thesis that while racism is, indeed, a historical and material force, and continues to thrive, “race” and “racial hierarchies” are constructs and should be abandoned. His argument is aimed at a host of right-wing thinkers for whom race is a fixed and ahistorical category. He is also critical of anti-racist thinkers and activists, who have been engaged in progressive political struggles, yet have tended to invert rather than to displace racial hierarchies. Gilroy’s planetary humanism is based on a deep commitment to transnationalism and cosmopolitanism.

Gilroy’s attack on essentialist categories then – whether held by progressive or by reactionary thinkers – is a critical component of his thought. He has been criticized for his inattention to the ongoing problem of

poverty among blacks and other minorities; some black scholars in the United States have found his understanding of African American popular culture wanting; he has been accused of an overreliance on European critical theory, and he has been critiqued for his wholesale denunciation of nationalism. Yet it is indisputable that Gilroy has greatly expanded the scope of what counts as black studies, that he has made important contributions to understanding the fluidity and complexity of cultural identities, and that he has helped to inspire the proliferation of diaspora and black Atlantic cultural and historical studies. The proliferation of scholarship on the Atlantic, conceived as a historical, political, and cultural region, is unthinkable without his work.

Globalization

DEREK C. MAUS

Globalization signifies a range of processes that replaces traditionally localized social and cultural structures (e.g., tribes, nation-states, ethnic groups, languages) with more universal ones. Some cultural historians have defined globalization as simply an intensification of fundamental processes originating in the related systems of European colonialism and international mercantilism dating back to the early Renaissance or even the Hellenistic Mediterranean of antiquity. Others locate globalization's roots squarely in the rise of industrialization in Europe and North America during the eighteenth and nineteenth centuries. Although both of these perspectives are useful in understanding the wider historical context of recent trends, the most common contemporary usage, and the one that is pertinent here, refers to the post-World War II period that has been marked by the establishment and expansion of political, economic, and social institutions with a trans- or supranational influence. Such institutions include the United Nations (UN), the International Monetary Fund (IMF), the World Trade Organization (the WTO, established in 1995, 47 years after the General Agreement on Tariffs and Trade [GATT] outlined its guiding principles), and in more recent decades a profusion of private nongovernmental organizations (NGOs) with explicitly international missions.

Drawing upon Ernest Mandel's discussion of "late capitalism" as a new postimperial stage in the historical development of capitalism, Fredric Jameson parallels the rise of globalization and the contemporaneous

cultural phenomenon of postmodernism in the early 1970s by identifying both as far-reaching and intertwined cultural responses to the dominant forces of late capitalism. For Jameson, globalization becomes the means – economic, political, military – by which a universalizing culture based on commodification is spread across existing boundaries, and postmodernism becomes the philosophy that helps justify this spread by undermining the assumptions that set or maintained those boundaries. Fredric Jameson & Masao Miyoshi (1998) argue that globalization is distinctly postmodernist because it conflates the cultural, the economic, and the political.

In many respects, contemporary globalization is an outgrowth of the Cold War, both because internationalist bodies like the UN were designed as a check against the hegemonic rise of individual nations and because both the United States and the Soviet Union created and maintained extensive networks of client states throughout the world, over which they exerted massive economic, political, and cultural influence while demanding ideological allegiance. With the collapse of the Soviet Union and the end of the Cold War, these client states seemingly required continued economic support to avoid political destabilization, but also represented untapped markets for international trade that could presumably flourish in the absence of superpower rivalry. The concurrent transformation of large corporations from national to international entities, especially since the end of the Bretton Woods system of international monetary policy in 1971, resulted in the rapid growth of an international consumer culture in which a host of products – for example Coca-Cola soft drinks, McDonald's hamburgers, Sony televisions – have become commonplaces in the far-flung reaches of the world.

Although the overarching concept and much of the terminology associated with

globalization arise from the conjoined contexts of economics and international relations, decades of scholarly examination of related cultural processes have embedded it within most, if not all, of the discourses of the humanities and social sciences. Jan Aart Scholte (2000) has noted that some confusion arises because of the synonymous use of “globalization” with such terms as “internationalization,” “liberalization,” “universalization,” “Westernization,” “modernization,” and “deterritorialization.” Globalization has also been intertwined – both positively and negatively – with concepts related to social justice and human rights. Given this indeterminacy of usage, it is not surprising that there has been nothing approaching a consensus as to whether or not globalization has been more beneficial or harmful on balance.

Proponents of globalization such as Thomas L. Friedman and Jeffrey Sachs have stressed its potential to bring the prosperity and relative political stability that the United States and Europe have achieved since the 1950s to the rest of the world, although neither discounts the ancillary costs entirely. Almost without exception, the pathways to this prosperity and stability involve modernization, technologization, and bureaucratization. As Phillippe Legrain (2002) and Martin Wolf (2004) have noted, there is substantial evidence to suggest that globalization has resulted in dramatic reductions in poverty and infant mortality, along with increases in life expectancy and literacy worldwide. Other supporters of globalization claim that the increased access to information that transnational media like satellite television, cellular telephones, and the internet provide serve to resist political repression, since these media are not as easily controlled as conventional ones. This same characteristic has also made these media an essential part of the communication structure of transnational

groups like al-Qaeda that actively and violently resist most of, if not all, the forces of globalization.

IS GLOBALIZATION HUMANISTIC OR NOT?

In many cases (especially in decolonized regions of Asia, Africa, and Latin America), the putative means of achieving progress have been imposed with negligible input from indigenous populations, a tendency that helps explain why many of the most vocal critics of globalization are scholars and activists from the erstwhile “Third World” (a concept that globalization seeks to efface). Criticism of globalization entered the mainstream in the wake of the large-scale protests – the so-called Battle for Seattle – at the 1999 WTO summit in Seattle, but scholarly criticisms of the philosophies, practices, and institutions of globalization have existed for decades, intensifying in the 1970s with the rise of cultural anthropology and, later, cultural studies.

Whereas most of the proponents of globalization have focused on quantitative measures of the effects of globalization (e.g., infant mortality rates, per capita income figures), critics have looked in greater depth at the qualitative effects, especially the hidden (or even intentionally ignored) costs of “flattening the earth,” to borrow one of Friedman’s central metaphors. Although the specifics of the debate range widely across academic disciplines and professional specializations, the essential question under consideration is whether or not the kind of universalizing trends that contemporary globalization brings in its wake are on balance a boon or a bane to humanity. Do they privilege the macrocosm over the microcosm, and, if so, does this process actually serve the liberating and progressive goals used to justify globalization?

One of the earliest and most strident questioners of the prevailing logic behind the post-World War II form of globalization was the Canadian media theorist Marshall McLuhan. Building on the social philosophies of such precursors as Henry Adams, Joseph Dewey, Walter Ong, and Norbert Wiener, McLuhan focused most directly on the effects of the rapid spread of information technologies, that is, media. McLuhan coined the phrase “global village” in his book *The Gutenberg Galaxy* (1962) to refer to the ways in which previously isolated individuals and cultures would theoretically be able to interact more directly and openly with one another as electronic communications technologies replaced those based on print. As the internet developed, McLuhan’s theories were recast and simplified as prognostications that heralded the democratizing potential of borderless cyberculture. Largely missing from this canonization – made literal by his status as patron saint of *Wired* magazine, one of the most ardent promoters of the culture of technology during the 1990s – was McLuhan’s insistence that one not lose sight of how changes in media can distort knowledge (and by extension the cultures that use such knowledge), pithily encapsulated by his oft-quoted dictum that “the medium is the message.” McLuhan ultimately stops short of being either a wholesale proponent or detractor of the universalizing tendencies of electronic information culture, but his writings serve as the foundation for contemporary debates about the internet’s humanistic potential (e.g., whether an “open-source” and implicitly globalized knowledge project like Wikipedia is preferable or superior to a more traditionally edited encyclopedia).

Although it did not necessarily intersect directly with globalization, the work of such scholars as Clifford Geertz and Pierre Bourdieu has been influential in delineating how and why particular groups of people are

affected by various universalizing processes. Geertz's notion of symbolic anthropology redefined how cultural identity is constituted by examining it in terms of its dominant symbols. In doing so, he established a new critical perspective from which to study the effects of externally imposed symbols, whether the products and logos of globalized consumer culture or the revised notions of power and authority represented by internationalist structures like the UN. Bourdieu's explicitly, if also iconoclastically, Marxist articulation of how "cultural capital" creates both identity and potential power contributed heavily to studies of how globalization potentially undermines and even devalues localized cultural capital.

THE ADVENT OF "GLOCALISM"

In the early 1990s, a hybrid concept called "glocalization" began to offer a parallel view of how the manifold processes of globalization could be modified in ways that reduced or even negated the threats, real and perceived, to cultural distinctions. Originating in Japanese and German business practices from the 1980s, the phrase was promulgated in cultural studies by British sociologist Roland Robertson in his *Globalization: Social Theory and Global Culture* (1992). A "glocal" (or "globalocal") perspective underlies such practices as the Fair Trade movement, which seeks to retain autonomy and viability for small local producers even as it attempts to make their products available within a global marketplace. Even when not explicitly invoked, glocalism underlies the work of a number of prominent social theorists from the early 1990s onward. These theorists acknowledge, often ruefully, the extent to which globalization has defined the early twenty-first century, while simultaneously arguing for the construction of alternative forms of empowering global

interconnections. Such glocalized structures and discourses would theoretically not only undo damage inflicted upon local cultures and subcultures by the largely economic and political processes of globalization, but also seek to ameliorate social ills (e.g., racial or gender discrimination, labor issues) that receive little or no attention within the existing capitalist and Eurocentric frameworks within which globalization has developed.

The work of three scholars – Arjun Appadurai, Paul Gilroy, and Chandra Talpade Mohanty – is representative of the forms that these glocal counterdiscourses take. Appadurai suggests that the concept of the "social imaginary" – a shared set of values and practices that define the members of any group – provides a means of self-definition for local cultures in the face of globalizing processes that obliterate other distinctions. He contends that globalization has propagated many of the same means that can reinforce local identities, provided those identities retain some shared relevance; for example, the worldwide scope of the internet has created the possibility for diasporic populations to re-establish linkages that are not dependent on physical proximity. Gilroy's theory of "the Black Atlantic" similarly reframes the cultural identity of the descendants of Africans displaced from their home to Europe and the Americas by the slave trade not as one of separation and dispersal, but rather as a parallel globalized (or at least hemispheric) identity with common cultural roots in West Africa. Finally, Mohanty's work seeks to establish transnational bonds among gender and class activists that do not impose Western values on non-Western cultures in the process of improving living conditions for women and the working class.

Grossberg, Lawrence

TRACEY K. PARKER

Lawrence Grossberg is a prominent cultural studies scholar whose research has focused on American popular culture and youth culture in a predominantly Marxist context. Born in Brooklyn, New York in 1947, Grossberg attended the University of Rochester and studied with Stuart Hall and Richard Hoggart at the University of Birmingham, England. He completed his PhD in speech communication at the University of Illinois at Urbana–Champaign in 1976. Grossberg has taught at the University of Illinois and the University of North Carolina, Chapel Hill, where he is currently the Morris Davis Professor of Communication Studies and

Cultural Studies and the director of the university program in cultural studies. Grossberg also serves as senior editor of the journal *Cultural Studies*.

Grossberg's work focuses on popular culture and the rise of conservatism in contemporary American society. In *We Gotta Get Out of This Place* (1992b), Grossberg asserts that postwar, postmodern America is characterized by cynicism and apathy, which conservatives have used to their advantage, creating a politics based on emotion rather than on facts and ideology. Conveniently, popular culture has been used by conservatives to help create mood and emotion in the political arena. He also voices his concerns about the Left's preoccupation with identity politics, which he argues has fragmented the Left and rendered it unable to challenge the conservatives effectively.

A number of Grossberg's early essays on cultural studies are collected in *Bringing It All Back Home* (1997a). Many of them focus on the state of the discipline in America as it has been adapted from the British model. Particular essays important to American cultural studies are "Strategies of Marxist cultural interpretation" (1984), "History, politics, and postmodernism: Stuart Hall and cultural studies" (1986), "The formation(s) of cultural studies: An American in Birmingham" (1989), and "The context of audiences and the politics of differences" (1989). This latter essay represents Grossberg's transition to the project he continues in his next volume, *Dancing in Spite of Myself* (1997b). In a number of the essays collected in this volume, Grossberg elaborates on his vision of the interrelation of popular culture and politics. Many of the essays are foundational to the study of popular culture, such as "Another boring day in paradise: Rock and roll and the empowerment of everyday life" (1984). This essay traces the relationship between rock and roll and postmodern America, explaining

that its role in politics depends on its “particular temporal context” (1997b: 61), and that for youths, rock and roll is no longer a source of opposition. Additionally, in “‘It’s a sin’: Politics, postmodernity, and the popular” (1988), he ties the lifestyle obsession in America to conservatism and shows how popular culture helps create an ideologically empty affective sensibility.

Grossberg has also coedited a number of books, including *New Keywords: A Revised Vocabulary of Culture and Society* (Bennett et al. 2005), an update of Raymond Williams’s important text *Keywords: A Vocabulary of Culture and Society* (1976), which defines central terms in the arena of cultural studies. Other publications for which Grossberg has served as coeditor include *Without Guarantees: In Honour of Stuart Hall* (Gilroy et al. 2000) and *The Audience and Its Landscape* (Hay et al. 1996).

Grossberg’s recent research focuses on American youth culture, globalization, and modernity. His most recent work, *Caught in the Crossfire* (2005), postulates that America has become increasingly hostile to children as a result of the culture wars between the Right and the Left. He asserts that the media are complicit in creating an image of children as violent and uncontrollable, and both conservatives and liberals use this image of young people as tools to further their political agendas. Grossberg ties in economics, politics, and cultural examples to explain, in part, the change in the social construction of children and youth in the United States. He is currently writing *We Know Where We’re Going, But We Don’t Know Where We’re At: Cultural Studies and the Problem of the Contemporary*.

H

Hall, Stuart

DENNIS DWORKIN

Stuart Hall is one of the founding figures of British cultural studies, providing a number of incisive commentaries that have helped to shape the field. Born in Jamaica in 1932, Hall has lived in Britain since 1951, originally studying literature at Oxford University as a Rhodes scholar. He has held several academic positions, including director of the Centre for Contemporary Cultural Studies (CCCS) at the University of Birmingham and chair of the Sociology Department at the Open University. Hall is a major analyst of the black British experience, and an influential political theorist and public intellectual. He played a critical role in founding the British New Left in the late 1950s and was in the forefront of analyzing the New Right in Britain in the 1970s and '80s. Hall is responsible for coining the term "Thatcherism," and he played a prominent role in rethinking left-wing politics in an age of globalization and conservative hegemony.

Hall's intellectual trajectory can be divided into three phases. The first roughly coincides with his role in founding the British New Left (1956–64). Hall was among the founders of *Universities and Left Review*, a journal produced by radical Oxford students impatient with existing political orthodoxies and critical of Britain's role in the 1956 Suez

crisis. He was the first editor of *New Left Review* and played a primary role in mediating between the rising student generation and ex-communists mostly of an older generation, notably the historian E. P. Thompson. The left-wing cultural critics Richard Hoggart and Raymond Williams influenced Hall's intellectual work during this period, especially with their use of insights drawn from literary analysis to critically examine transformations in postwar politics and society. In *The Popular Arts* (1964), written with Paddy Whannel, Hall argues that popular and high culture have different aims and aspirations which are comprehensible only on their own terms. At the same time, within the popular arts, he distinguishes between "mass" and "popular" culture. Popular culture is a genuine expression of the urban and industrial experience; mass art, on the other hand, involves the embellishment of a stock formula known to manipulate the emotions, not the imaginative and probing use of conventions.

Hall's second phase (1964–78) roughly coincides with his years at the CCCS, the first institutional site for this emerging interdisciplinary field. Hall helped define the Birmingham School, which fused structuralism and humanism, drawing on semiology (notably Roland Barthes's work), Western Marxism (particularly Louis Althusser's and Antonio Gramsci's thought), and British

socialist humanism (Williams's cultural theory and Thompson's historical practice). In collectively produced studies – see Hall et al. 1978, 1980; Women's Studies Group 1978; Centre for Contemporary Cultural Studies 1982; Hall & Jefferson 2006 [1975] – the Birmingham School made influential contributions to numerous fields: contemporary media, youth subcultures, working-class life, the modern state, historical theory, the theory of ideology, and the relationship between race, class, and gender.

Among many influential essays written during this phase, Hall's "Encoding/decoding" is perhaps his most original (in Hall et al. 1980). He deploys semiology and Marxism to understand the communication process. His model is founded on Marx's concept of production. He sees communication as a chain of discrete moments, each with its own modality and form. Though "structured in dominance," subject to asymmetrical power relations, the production of media messages or "encoding" and audience reception or "decoding" are two moments subject to their own structural logic. On the one hand, producers strive to gain assent to preferred meanings. Audiences, on the other hand, are capable of interpreting these messages in their own terms, because they do not understand the preferred meaning, are indifferent to it, or because they choose to use a different and sometimes oppositional code. Hall's belief that human beings play an active role in the reception of media messages echoes the original socialist humanist impetus of cultural studies. Yet he stresses that experience is constrained by the dominant hegemonic relations of late capitalist society, registering his debt to Gramsci's notion of hegemony as adapted by Althusser. Hall's attempt to fuse structuralism and humanism, perspectives that are often viewed by their adherents as being antithetical, is a hallmark of his thought. Indeed, throughout his career, he combines theoretical and

political positions often thought to be in opposition.

Since the late 1970s (in what might be construed as a third phase) Hall has been active on multiple fronts. The collectively produced *Policing the Crisis* marked his emergence as a theorist of the race/class nexus, the black British experience, and the New Right. The book's impetus was an attack by a group of black youth on a white working-class man, which provoked apprehensions in the mainstream media of a mugging epidemic. Hall and his colleagues maintain that far from being spontaneous, the mugging scare results from a lengthy and complicated process of ideological preparation, whereby the state and the media exploit fears of race, crime, and youth to create a "moral panic." They regard this ideological mobilization in relationship to the crumbling of the social-democratic consensus that emerged following World War II. And they understand the situation in Gramscian terms, as a crisis in hegemony. It is a situation rife for right-wing "authoritarian populism," an emerging hegemonic bloc founded on the ideologies of the free market, nationalism, racism, and a conservative construction of the family. Hall and his colleagues argue that, while blacks in Britain are mostly treated as immigrants, that is, outside of British history and culture, they, in fact, are a diasporic people shaped by the historical experience of the British Empire and global capitalism, thus placing them at the center – rather than the periphery – of British history. Hall regards the racial dynamic in Britain as embedded in class relations. In an influential formation, he argues that race in Britain is the modality in which class is lived.

If *Policing the Crisis* marked a new phase in Hall's intellectual and political development, it was *The Hard Road to Renewal* (1988), a collection of his articles on the New Right, that established him as a major critic of Thatcherism. Drawing on Gramsci's

thought, he argues that Thatcherism is a hegemonic project that reconfigures the relationship between public and private, the individual and the state. Correlatively, the Left's renewal depends on articulating cultural and political alternatives. Hall began to set out these alternatives in *New Times* (Hall & Jacques 1990), a collection of essays by authors who gravitated around the journal *Marxism Today*, an autonomous organ of the British Communist Party. *New Times* writers argue that just as a mass socialist politics developed in the early twentieth century in response to Fordist imperatives, the present moment calls for its post-Fordist equivalent: a politics acknowledging new conditions, new forms of inequality, new pressure points, and new forms of struggle. The point is not so much to break with its labor and socialist past, but to decenter that past. The old-style universalism of the class struggle is displaced by a "politics of difference" acknowledging a diversity of identities, constituencies, and social movements as well as a widening of what counts as politics itself.

Hall's understanding of identity in *New Times* is grounded in a discursive notion of the subject drawn from postmodern and poststructuralist thought. He supplants the centered, rational, stable, and unified self underpinning Marx's class theory with a conception that is "more fragmented and incomplete, composed of multiple 'selves' or identities in relation to the different social worlds we inhabit, something with a history, 'produced,' in process" (Hall & Jacques 1990: 120). Such a perspective underpins Hall's understanding of black British identity, which he analyzes in essays on contemporary black photography, cinema, and popular culture. It was during this time that Hall became increasingly connected to the developing postcolonial movement in the humanities, ushered in by Edward Said's groundbreaking *Orientalism* (1978), and he was in the forefront of defining black British cultural

studies. He sees the contemporary experience of the black diaspora as having produced hybrid and marginalized identities that are at the same time culturally central, emblematic of how identity is constructed in the contemporary globalized world.

In the essay "What is this 'black' in black popular culture?" (1996), Hall argues that to be black is not to possess an already known essence: "blackness" is produced through representation; and its meaning changes in relationship to "whiteness" and is mediated by shifts in politics and culture. At a time when the West is being decentered, when the binary opposition of high/low culture is dissolving, and when modernist universals are being supplanted by a postmodern insistence on difference, Hall argues that the earlier binary black/white needs to be deconstructed, allowing for more fluid notions of how blacks define themselves. His contention that identity is produced, rather than inherent, is indebted to poststructuralism and postmodernism as well as to Gramsci's understanding of politics in advanced capitalist societies as a "war of position."

Since retiring from the Open University in 1997, Hall has been especially active in the public arena of cultural politics. He was a member of a committee that produced *The Future of Multi-Ethnic Britain* (Commission on the Future of Multi-Ethnic Britain 2000), commissioned by the Runnymede Trust, an independent think tank, and chaired by Bhikhu Parekh, a political philosopher. A its launch, the Blair government publicly backed the venture, but it subsequently distanced itself from its findings when the media and the political Right focused on the report's few pages analyzing the meaning of British identity, claiming that the report equated Britishness with racism. Defending the report, Hall argues that historically the idea of Britishness carries unstated racial implications insofar as being white is a critical dimension of the national imaginary. Yet he insists that the

report never meant to state that this historical tendency could not be undone or is inevitable. Hall has also been a chair of two foundations, the Institute of International Visual Arts (INVA) and Autograph (ABP), which promotes photographers from minority backgrounds. Hall's efforts on behalf of these foundations led to his yeoman work in creating an institutional setting for them, Rivington Place, an £8 million gallery in east London, launched in 2007 and built with private and public money. Its library has been named in Hall's honor.

Over the years Hall has been attacked by critics on multiple fronts. For orthodox Marxists he is not materialist enough, and his work is tainted by its penchant for pursuing academic fashions. For adherents of postmodernism and poststructuralism, on the other hand, he is still too rooted in the Marxist tradition. In the end, Hall has been among the most influential cultural critics of his generation. His influence on the shape of contemporary cultural studies has been monumental and global in its reach. Operating in theoretical terrains that have been highly contentious and divisive, Hall has continually built bridges between theoretical perspectives, intellectual traditions, and disciplinary practices. Few intellectuals of our time have worked as hard – or as successfully – at fusing theory and practice.

Haraway, Donna

JOSEPH SCHNEIDER

Donna Jeanne Haraway (b. 1944) is a scholar whose writings, teachings, and politics have helped to create and shape, across the last decades of the twentieth century, the interdisciplinary fields of feminist science studies and the cultural studies of science. Through several original books, scores of articles and essays, and hundreds of presentations – a body of work recognized by several

prestigious awards – Haraway, in a complex, densely cited, and collegial style rich with both figural and empirical detail, has developed and pursued a series of critical questions about the practices and products of techno-scientific knowing and being that are at the center of Western human studies scholarship. She is currently Professor in the History of Consciousness at the University of California, Santa Cruz.

Born into a white, Irish Catholic, middle-class family in Denver, Colorado, and trained as a biologist at Yale University, Haraway early turned away from a disciplinary career in the laboratory and toward the study of the conditions from which biological knowledge emerged and changed and how it links to, reflects, and serves – or does not serve – particular interests, ideologies, and social-cultural practices that were thought to be “outside” science. Indeed, with her science studies colleagues, she has helped to make that very idea – an “outside” to science – appear both antique and ideological.

Haraway has also championed the critical study and deconstruction of other major dualisms and categories that have defined and held in place much conventional scholarly and intellectual thought, including nature/culture, sex/gender, human/animal, organism/machine, carbon/silicon, fact/fiction, material/semiotic, epistemology/ontology. These and many other such ostensibly distinct pairs of concepts are examples, she insists, of what Alfred North Whitehead called the “fallacy of misplaced concreteness” that has dulled our capacity to see the dynamism, partiality, multiplicity, indeterminacy, and relationality of the worlds in which we live. Like Michel Foucault, whose influence is apparent in her work, she offers no grand or even semi-grand theory to “explain” (or reduce) what she interrogates. Indeed, rather than making topics simpler through abstract

argument – she quips that she is almost allergic to abstraction – her work explodes the often unrecognized “intra-action” (Barad 2007) of/within various “black boxes” into “sticky,” always linked, dynamic particulars. The aim is to examine how things came to be as they are and how they might be changed for the “better,” a word for which she does not apologize.

Haraway’s dissertation, “Crystals, fabrics, and fields: Metaphors of organicism in twentieth century developmental biology” (1976; published as Haraway 2004a), takes up Thomas Kuhn’s notion of the paradigm in order to examine the move from vitalism and mechanism to organicism that took place in late nineteenth- to early twentieth-century biology. Even this early writing shows a figural realism that she would trace to the Catholic sacramentalism of her youth. In that early experience, later seen from the eyes of “a committed atheist and anti-Catholic” (Haraway 2004b: 334), the stories, practices, and figures that define Catholic life were part of what she came to call a “worldly practice” that joins the semiotic and symbolic with the material to make a lively space–time that resists analytic separation. Immersed in the radical politics of the late 1960s and early ’70s – of the anti-Vietnam War actions and the burgeoning black civil rights, women’s, and gay liberation movements – Haraway lived a deepened sense of such symbolic–fleshly connection and process.

This way of seeing things relationally – as multiple, partial, contingent, and dynamic – and as simultaneously material and semiotic, with actual consequences for located living beings in an analysis always inclusive of an accountable knower/observer, is a signature of her contributions to cultural criticism and frames her sense of what might be called a feminist science. From the perspective of early twenty-first-century

cultural theory and politics, in the wake of poststructuralism, in the midst of global, techno-scientific capital; and with an emerging critical appreciation of the importance of matter, one could hardly imagine a more provocative and promising intellectual inheritance. Her interdisciplinary work speaks provocatively and productively to an unusually broad audience.

From 1964, during her first full academic appointment at the elite Johns Hopkins University Department of the History of Science, Haraway began her study of sex/gender, race, nation, nature, and culture in primatology that would later become the celebrated *Primate Visions: Gender, Race, and Nature in the World of Modern Science* (1989b). There she examines the complex relationships between humans and animals in scientific stories about primates and how they shaped the racial and sexual stories humans told themselves about their own connections to and differences from others of all sorts. She argues that dominant notions of Western society, of nature and culture, and of sex and gender were “at stake” in these scientific narratives and analyses.

Challenging the descriptions of neutrality and objectivity typically claimed for them, she reads these scientific stories as powerful moral and ethical tales about who and what could count as human and about the foundations of knowledge. Her argument that such categories were emergent in and through the very practices, the work, of primatology rather than preformed “input” thereto – that the practices *constitute* the categories rather than being determined by them – is an early version of one of Haraway’s most important and recurrent contributions to feminist, antiracist cultural analysis and criticism. Parallel to the work of her science studies colleague Bruno Latour, Haraway has argued that the sources of agency in the worlds we inhabit are diverse

and far exceed those enacted by human – or even living – beings.

In 1980 Haraway joined the newly formed interdisciplinary unit at the University of California, Santa Cruz: the Board in the History of Consciousness. Taking up what she thinks was the first formally defined academic position in feminist theory in the United States, she began a career of writing and speaking that would define her as a startlingly original socialist-feminist cultural studies scholar. No small part of this originality comes from how she positions herself relative to various long-lived debates at the heart of late twentieth-century cultural analysis and philosophy. Refusing various orthodoxies and established disciplinary frames – often in ways that displease assorted intellectual and political compatriots and that sometimes (intentionally) make her work difficult to engage in from within those debates – Haraway insists on keeping her eye on the messy complexity and distributed agency of all the entities studied. She also claims to deconstruct only that which she loves and then often refuses to give up the key term, concept, or practice that has been opened up. Science, technology – even military technology – Enlightenment thought, cyborg, the empirical, truth, objectivity, validity, desire, passion, family, care, commitment, and love are some of such hopelessly “polluted” terms that she insists on reworking toward ends that allow and support more (but not equal) flourishing for all beings involved (who/that are virtually never “equal”).

The work begun at Hopkins blossomed at Santa Cruz, yielding a series of publications for which she has become famous: “Teddy bear patriarchy: Taxidermy in the garden of Eden, New York City, 1908–1936” (1984–5); “Manifesto for cyborgs: Science, technology, and socialist feminism in the 1980s” (1985); “Situated knowledges: The science question in feminism as a site of discourse on the

privilege of partial perspective" (1988); "The biopolitics of postmodern bodies: Determinations of self in immune system discourse" (1989a); the prize-winning 1989 book, *Primate Visions*, and in 1991 her third book, *Simians, Cyborgs, and Women: The Reinvention of Nature*, in which these and other early essays are collected.

Haraway's commitment to forefronting complexity, materiality, multiplicity, democracy, partial and strong objectivity, reflexivity, truth, feminism, antiracism, semiotics, and socialist criticism in techno-science and all knowledge projects is extended in the 1997 *Modest_Witness@Second_Millennium. FemaleMan©_Meets_OncoMouse™: Feminism and Technoscience*. Written ostensibly from an email address located in a virtual, postmodern but very real space-time, this book introduces new major figures to join the famous cyborg as part of Haraway's "queer" family of critical resources. These new figures include the so-called Modest Witness from the scientific revolution of the seventeenth century (to help her imagine a mutated and arguably more truly modest witness to knowledge for the twenty-first century); FemaleMan©, the both/and character from Joanna Russ's 1975 science fiction novel *The Female Man* (to give materiality to mobile and mixed categories of transnational feminism); OncoMouse™, a biomedical and biotechnical laboratory animal created for breast cancer research (a real transgenic organism – but also the first patented living model produced by genetic engineering and one that/who suffers and dies so that her human sisters might live); and the vampire, from central and Eastern European mythology of the late eighteenth century (to help her write against fantasies of the racially and biologically pure). Indeed, for Haraway, notions of purity of blood or breed, among other kinds, have submerged histories of pain and suffering for some at the benefit of others. She seeks to identify

those who are differently benefited and to reshape knowledge work to reduce this mortification.

In *Modest Witness* Haraway considers a mantra-like list of material-semiotic entities that she calls "stem cells of the technoscientific body," which can be seen as "objects into which lives and worlds are built": the "chip, gene, seed, fetus, database, bomb, race, brain, ecosystem" (1997: 11). She writes to open up such nodes that index worlds of techno-science in order to see how they operate as "apparatuses of bodily production" made up of diverse knowledges, mobile practices, and unequal wealth and power. Such openings always make clear that things are virtually never as simple or "clean," politically or analytically, as one may have thought or hoped. In her famous cyborg essay, she insisted this is also true of the categories "identity" and "woman," arguably foreshadowing themes central to postcolonial feminism. There can be no innocent place from which to know, she argues, and fantasies of wholeness and self-certainty – even if they can develop among the subordinated – are poor guides to better worlds for all.

The aim for Haraway always is more than knowing differently. Rather, it is to *do* that knowing in making one's life also different in relentless, located connection with diverse others, in practices of making a difference *in those worlds where one lives in/for* some ways of life and relating rather than *in/for* others. Orthodoxies, rigidities, purities do not fit well here. *Modest_Witness* centers on the optical metaphor of diffraction, which Haraway describes as the recording of difference patterns that result as light is passed through a prism or a screen with angled planes that make the rays change direction or move elsewhere; they are, in short, diffracted. Diffraction is about making, keeping, and attending to this record of change, of passage and, in effect, about doing

a kind of critical scholarship that aims to embody it.

Haraway's most recent book, *When Species Meet* (2008), uses the figure of companion species and significant otherness to carry many of these interrogations forward. Indeed, reading back and forth between the cyborg manifesto and this project makes the consistency of Haraway's arguments and vision apparent. In the most personal and accessible of her writings, she draws on the relationships with her own dogs and their joint participation in the sport of agility training; on her relationship to her father, who was a sports writer; and from many email communications with various others in dogworlds that were part of her research to address bioethics, genomics, laboratory experiments using animals, the "meat industrial complex," and entwined practices of eating and killing and caring.

Insisting that every thing – every idea, practice, connection, gaze/vision, and so on – is located and has an inseparable history that already is full of implication and commitment, she argues that the militarism, Cold War, space race, and command-control-communications-intelligence technology times from which her cyborg emerged have all morphed. To respond to these changes, she requires a figure more appropriate to the fast, condensed, and relentlessly articulated Third Christian Millennium increasingly driven by global capital and techno-biopolitics. Haraway argues that the animal/dog-human pair of companion species and significant otherness, where two is the smallest unit of analysis and where "communication' across irreducible difference," responsibility (the ability to respond), and respect (always looking back at, paying attention to) are the matters at hand, might teach humans to see and live themselves as other than the "stars" of their

own humanist and exceptionalist "movie" (2003: 49). This hope is also why Haraway (1994) has such affection for the game of cat's cradle, which she uses to imagine techno-science practice and life in more collaborative, located ways.

Haraway foregrounds the promise of what Heidegger called the "open" to encourage slowing down critical thought to take account of the concrete, the local, the particular, the contradictory, the actual, and the opportunities they provide for seeing and remolding how we live together with others. Ethical relating and knowing in the face of radical and permanent difference where togetherness is nonnegotiable, "the same" is bankrupt, and the parties are not "equal" (dogs are not honorary humans and this is not about "animal rights") constitute the challenge. A prime target here is human exceptionalism, which Haraway sees as fully present in even her favorite totalities: Marxism and feminism.

Western scholarship, philosophy, and ethics have been, for the most part, so to speak "all about me/us." While "we" have begun to recognize the violence that blinkered vision has produced for so many other human beings with whom we live, Haraway argues that we have hardly a clue of these costs – or of the possibilities – when it comes to our animal fellow beings. Through interrogating our relationships to companion species of all sorts, humans might be able to learn how to build connections to others that allow all to live more fully. In co-constitution, the subject-objects are always entwined and who/what they become is contingent on the actual process of their shared histories as material-semiotic entities in becoming. Being, knowing, and benefit – ontology, epistemology, and ethics – are inseparable here. Accepting this view requires putting one's self and one's knowledge at risk in the face of what one studies.

Hartley, John

ALAN MCKEE

John Hartley is a cultural historian and theorist of modernity. His work is notable for a commitment to cultural democracy (he does not assume that elite culture is better than working-class culture), to comfort (he sees material comfort as an acceptable goal for human struggle), to empirical research (he always provides extensive textual evidence to support his arguments), and to an awareness of the disciplinary positioning of knowledge. His writing is also notable for its pace and density, its colorful neologisms, and its puns: for example, he describes the move from modern to postmodern with the heading “From Arnold to Schwarzenegger” (Hartley 2002b).

Born in England, Hartley studied at Cardiff University before moving to Australia, where he worked and completed his PhD at Murdoch University in Western Australia. Afterward, he became a professor at Edith Cowan University, and Cardiff University. He then moved to Queensland University of Technology, where he was appointed Distinguished Professor and gained a prestigious Australian Federation Fellowship, awarded only to world-class research leaders. As of 2008,

he continues to be a productive scholar whose contributions are still shaping the field of cultural studies.

Hartley's commitment to cultural democracy is rare among theorists. As he has pointed out, cultural theory has traditionally seen "democracy as defeat" (1999). Many cultural theorists portray working-class culture as something imposed upon working people. Cultural democracy – defined as the culture of the people – is thus implicitly seen as inferior to middle-class culture. For example, it is commonly argued that popular culture is not *genuinely* working class but is forced onto the working classes; this culture is thus denigrated in relation to the "higher" middle-class culture (thus arguments for the importance of art, public service broadcasting, "quality" culture, and so on).

By contrast, Hartley has taken a radical turn – he accepts that cultural democracy is as desirable as political democracy. He has no problem with vulgar culture – the enjoyment of gaudy spectacle, an attention to emotions and the lives of individual human beings. His theories can thus view the spread of such elements of vulgar culture as a desirable symptom of democracy, rather than as a problem that must be cured. This has allowed his sustained interest in popular media such as television and magazine journalism, which he sees as serving a "bardic" function (Fiske & Hartley 1978) – creating multiauthored stories by which cultures make sense of themselves and their worlds.

One element of working-class culture that Hartley has taken as emblematic is the desire for comfort. Most cultural theory sees the desire of human beings to seek comfort in their lives in negative terms. It is commonly named as "materialism" or "individualism," and is attacked as an effect of capitalism. By contrast, Hartley (1996) places a desire for comfort alongside the desire for liberty and

fraternity as one of the key drivers of political modernity. He has written about his own childhood poverty (1999); as with theorists such as Richard Hoggart and Raymond Williams, this allows him to see the desire for material comfort as a reasonable one, which in turn allows him to see pleasure and entertainment as being similarly reasonable ends for an ethical cultural politics. Unlike many cultural theorists, he does not reject visual pleasure as suspect, but rather recognizes its importance in popular culture and seeks to understand how pictures become meaningful and function politically (1992a). This can also be related to his important breakthroughs in understanding how community formation works. Whereas many theorists are concerned with how the boundaries of communities are managed through violence and discrimination (hard news), Hartley has been one of the few who pay attention to how groups of people work out what they have in common (soft news). He explores "the smiling professions" (1992a) and the "amelioration of manners" (1999) that allow for the formation of a sense of "wedom" (1996). This allows for such audacious theoretical moves as studying Indigenous representation not through hard news stories, but through lifestyle journalism and women's magazines (Hartley & McKee 2000).

In making these arguments, Hartley takes an unusually empirical approach. His work is theoretically informed, and he demonstrates a strong familiarity with the key cultural theorists. But he also supports his arguments with extensive textual evidence which the reader can access and analyze for themselves. This is atypical in cultural theory, which tends to work at the level of abstraction, and indeed to be quite explicitly suspicious of "empiricism." Hartley's work is generously supported by examples from political documents, newspapers, magazines, television programs, documentaries,

and so on from throughout the history of modernity. This detailed knowledge of history both political and cultural contributes to an understanding of modernity that is nuanced and often surprising. Thus, “The Eighteenth Brumaire of Kylie Minogue” shows his detailed understanding of both Marx and “the singing budgie” (in 1992b).

Hartley also demonstrates a strong awareness of the disciplinary positioning of knowledge. He has refused to accept the limitations on understanding popular culture that are put in place by existing disciplines such as mass communications and philosophy, and has struggled to create more suitable ways of studying it. He was an early proponent of, and remains a key figure in, television studies. He has also focused on finding ways to link the work of humanities scholarship to other domains of knowledge – with a particular interest in addressing the perceived “softness” of humanities research, which has limited its applicability in the management of modern, rational bureaucratic states. To this end he has applied the creative industries paradigm, a humanistic and liberal model of the relationship between economics and culture which offers an alternative to Marxist approaches (Hartley 2005). He has also recently become interested in the possibility of a cultural science that could claim for humanities knowledge a status equal to that of the other sciences.

Hebdige, Dick

KEN GELDER

Dick Hebdige (b. 1951) is a British cultural theorist best known for his influential book, *Subculture: The Meaning of Style* (1979). His earliest essays were published in *Resistance through Rituals* (Hall & Jefferson 2006 [1975]), a collection of work about youth subcultures produced at the Centre for Contemporary Cultural Studies (CCCS) at Birmingham University, where he was a graduate student. In these essays, Hebdige wrote a eulogy for English mods, portraying them as examples of “the first all-British White Negro,” a description he drew from Norman Mailer’s account of the American beat or “hipster.” He also wrote about “Reggae, rastas & rudies” – the only essay in *Resistance through Rituals* to deal directly with racial issues among British youth in the 1970s – where he developed his sense of the subversive possibility of subcultural musical styles and celebrated cross-cultural flows and influences.

Hebdige drew on Mailer again for his account, in *Subculture*, of British punk in the 1970s, arguing that punks – unlike other British youth subcultures – seemed closest in kind to the beat, a “white ‘translation’ of black ‘ethnicity.’” British punk’s engagement with Jamaican reggae in particular is presented positively here in the framework of the troubled race relations of Britain under Margaret Thatcher. But this initial celebration of cross-cultural influence dies away later in the book when Hebdige offers a bleaker view of punk as “curiously petrified,” with a “dumb white face” that leaves it both stranded and segregated in a wider cultural economy. Much of the dynamic of *Subculture* in fact comes from the sheer instability of Hebdige’s view of punk: the problem of whether to celebrate it or to despair over it.

The second part of Hebdige’s book complicates this problem by turning to the topic that has come to define almost all of his work: style. What made punk so special for Hebdige was that its style – its music, its “posture” and attitude, its clothing, and so on – was so obviously nonconformist. Like some other sociologists of the Birmingham School around the same time, he turned to Continental semiotic theory – the work of Roland Barthes, Julia Kristeva, and Umberto Eco – to help him make sense of punk’s various signifiers. He also tied himself to the cultural avant-garde – Dada and the surrealists, the “refusals” of Jean Genet – to understand the extent of punk’s anti-authoritarianism, its “noise” and “chaos.” The anthropologist Claude Lévi-Strauss’s notion of *bricolage* was also important to Hebdige’s analysis, as a way of accounting for a subculture’s apparently improvisational use of commodity form – a notion that also underwrote his later study of Caribbean music, *Cut ’n’ Mix* (1987). But the question of what punk actually signified – the meaning of its “otherness” – finally eluded

Hebdige. “The key to punk style,” he concluded, “remains elusive.”

Part of the problem for Hebdige – and it is something for which he has often been criticized (Cohen 1980; Clarke 2005 [1981]) – was to do with his cultural elitism. Influenced by the earlier cultural sociology of Raymond Williams and the founder of the CCCS, Richard Hoggart, Hebdige likewise understood mass culture and mass media negatively: rather in the manner of the “culture industries” of the Frankfurt School. Williams and Hoggart had channeled their critiques of mass culture through an idealized investment in working-class communities, something from which the later CCCS researchers into youth subcultures had departed. Class itself was a fragile category in *Subculture*; and in fact Hebdige’s interest in style had little to do with class, especially the working class. His affiliations were instead with the avant-garde and the high literary traditions of modernism. At the end of his book, Hebdige acknowledged three writers who had “presided over our study throughout”: Genet, Barthes, and, perhaps surprisingly to some readers, T. S. Eliot. Eliot gives Hebdige his “primary definition of culture,” something akin to Williams’s notion of culture as a “way of life.” But he also gives Hebdige a high modernist sense of a “tradition which he is pledged to defend against the vulgar inroads of mass culture: the trashy films, the comics, the mean emotions and petty lives of all the faithless ‘hollow men.’” This rather bitter remark provides the basis for Hebdige’s investment in punk as a kind of last stand against these things, leading him to draw a sharp but problematic distinction between mass culture and subculture that has since been impossible to sustain. But that punk style remained “elusive” to him meant that, finally, neither mass culture nor subculture could provide him with solace. His otherwise exhilarating study ends with

a melancholic expression of its own alienation from the youth subculture it had tried so hard to understand: “The study of sub-cultural style which seemed at the outset to draw us back towards the real world, to reunite us with ‘the people,’ ends by merely confirming the distance between the reader and the ‘text,’ between everyday life and the ‘mythologist’ whom it surrounds, fascinates, and finally excludes” (1979: 140).

Hebdige’s sense of being excluded by the subculture he was reading made it easy for later commentators to note the limits of semiotic accounts that treated cultural phenomena remotely as if they were symbols or texts (Frith 2004). Indeed, he has been much criticized for ignoring the more mundane, face-to-face methods of cultural analysis such as ethnography in his account of punk (Thornton 1995). But *Subculture* is best understood as a conscious rejection of the mundane, both in terms of method and in terms of the way subcultures were understood. The emphasis on style turned subcultures into a spectacle, a matter of pose and posture, something to see and something that could also stare back: a feature Hebdige took up in a later, more elegiac collection of essays, *Hiding in the Light* (1988). His more recent work continues to be both fascinated by, and excluded from, the meanings and significance of equally spectacular styles in art world production, such as the animations and sculptures of Takashi Murakami (see Hebdige 2008).

Hegemony

PETER IVES

The term “hegemony” (derived from the Greek *hegemón*: leader, ruler, or guide) is generally used in literary and cultural studies to denote how power is used to construct and maintain the consent of those governed. In this sense, it has recently been associated with questions of identity politics and the politics of culture. However, “hegemony” is also used in a number of different and even inconsistent ways. For example, it is commonly used as a synonym of “superpower,” as in the global hegemony of the US. The emphasis is often on the pervasiveness of power, or its “total social authority” (Hebdige 1979: 15–16). Thus when writers such as Noam Chomsky use it in describing the US it is almost synonymous with “cultural

imperialism” without significant emphasis on the choices of those who consent, as with other usages.

Hegemony as a concept concerning international relations goes back to ancient Greece where it described the preponderance and leadership of Athens or Sparta among the other city-states (Fontana 1993: 207). This usage became common again in the nineteenth century, for example, when describing the role of Prussia within the German states (Williams 1983[1976]: 144). Isocrates, Plato, and Aristotle also used hegemony in a more general sense, for example, Isocrates’ statement, “*logos hegemon panton*” (“speech and language are the ruler and guide of all things”). Aristotle used “hegemony” (translated as “leadership”) to describe a ruler whose power, as contrasted to despotism, is used in the interest of those ruled and derived from their consent (Aristotle 1958: 318; Fontana 1993: 206).

Antonio Gramsci’s development of the concept of hegemony has been the most influential within literary and cultural studies as well as political science, sociology, history, philosophy, and education. Because of his focus on the importance of culture to politics, people often refer to Gramsci’s notion of “cultural hegemony” even though he rarely used the phrase in his writings. Gramsci himself never provided a definition of hegemony – indeed, his method did not involve defining terms, rather he used existing terms, developing, altering, and enriching their meanings through his specific political, cultural, and historical analyses (e.g., Sassoon 2000: 42–50). This has led to some confusion over the meaning of his concepts, especially hegemony. For example, Perry Anderson (1976) claimed that Gramsci’s conception of hegemony was severely weakened by inconsistency and confusion. Responses to Anderson’s position have shown how Gramsci used hegemony in different ways when analyzing differing

historical situations, that is, where the hegemonic make-up or forces account for the different relations described rather than conceptual incoherency. Scholars have created broad categories of differing types of Gramsci’s hegemony, for example, Raymond Williams historicizes the concept through his discussion of dominant, residual, and emergent hegemonies (1977: 121–7) and Joseph Femia provides the “ideal types” of “integral,” “decadent,” and “minimal” hegemonies (1987: 46–60).

Gramsci’s use and development of the term “hegemony” has many sources. It was in common usage in Italian socialist circles with which Gramsci would have been familiar, for example in discussing the power relations in the Adriatic after the fall of the Austro-Hungarian Empire (Gramsci 1992: 331–2; Boothman 2008: 202–3). Gramsci was especially attentive to how Lenin and other Russian communists and social democrats used “hegemony” to denote a strategy of the leadership of the proletariat in an alliance with other oppressed groups, especially the peasantry (Anderson 1976: 15–18). Discussions of the “hegemony of the proletariat” extended in the late 1920s to the relationship between the workers’ movements in the metropolitan countries of Europe and those in the colonies (Boothman 2008: 206–7) which is important in understanding Gramsci’s influence on subaltern studies.

Gramsci adopted and elaborated the crucial point that “the hegemony of the proletariat” is based on consent, as opposed to it being the only choice available (i.e., no choice) or being based on coercive domination of one class over another. Hegemony was used to encapsulate Marx’s argument that just as bourgeois revolutions marked a kind of universal progress for all of society (albeit a diminishment of power for the aristocracy), so too would proletarian revolutions be an advance for all of society. This

notion of the “universal” aspect of hegemony is a theme throughout the concept’s history, as noted concerning Aristotle, of how rule or leadership is practiced in a manner favorable to those who follow, that is, those who do not have the power (Gramsci 1971: 161). It is this theme that has become increasingly important in recent discussions of poststructuralism and “universalism” (see below).

Where most of these socialist and Marxist precedents used hegemony to describe a strategy that they advocated, Gramsci also uses it to critique and understand ways in which bourgeois and other regimes attained and maintained power in exploitative rule. He was especially critical of hegemonic formations in which only the passive consent of the masses was garnered. This aspect of Gramsci’s contribution may be rooted in his engagement with three specific sources outside of Marxism and socialism: his critique of Benedetto Croce, the leading Italian philosopher of his age (who was a liberal and an idealist in the Hegelian tradition); his interpretation of Niccolò Machiavelli as the key figure in Italian political thought, especially concerning the relations between coercion and consent; and his university study of linguistics and lifelong concern over language politics in Italy.

Gramsci focused on Croce’s concern with “ethico-political history” but insisted that this history be made more material and concrete than in Croce’s account. Thus, Gramsci combined it with a Marxist analysis of the economy and the institutions of politics, in a manner that enabled him to try to explain, and be critical of, the “passive” nature of many social, economic, and political changes in which the majority of Italians were not engaged. In places, Gramsci connects hegemony with the concept of “passive revolution” that he developed to describe periods when important social, economic, and political changes occurred,

but only by altering the elite alliances or only superficially (Gramsci 1995: 348–50; Boothman 2008: 208–9). Thus, for Gramsci any historical analysis must assess the “historical bloc,” by which he means the relations and alliances among different classes and social groups in a manner that explains how what Marx famously termed the economic base and the superstructures are brought together in concrete historical analysis and not separated in nonhistorical abstractness (e.g., Gramsci 1971: 137, 168, 360, 366, 377).

Gramsci provided a radical interpretation of Machiavelli partly to counteract the image of *The Prince* as an amoral, realist treatise that could be the foundation of the study of politics as an “objective” science (1971: 125–205). Much of Gramsci’s rich discussion of relations of coercion and consent as historical forms of hegemony is found in his discussion of Machiavelli. There are places where Gramsci seems to define “hegemony” as the opposite of “dictatorship,” as in his famous formula of the “integral State” being “dictatorship + hegemony” (239; 2007: 117). But here he is pointing out a common mistake of those who conceive the state in overly narrow terms as just its coercive functions. Similarly, in his famous rendition of Machiavelli’s centaur metaphor, Gramsci equates the half-animal and half-human elements as “levels of force and of consent, authority and hegemony, violence and civilisation, of the individual moment and of the universal moment” (170). And elsewhere, he opposes “domination” to “intellectual and moral leadership” (57). But, as Fontana shows, a more complete reading of Gramsci and Machiavelli reveals a nuanced understanding of how coercion and consent are related to—even inextricable from—one another. As Gramsci notes elsewhere, hegemony is “protected by the armour of coercion” (263; 2007: 75). He makes this point while expanding the concept of the state, which for him includes

“civil society” and “political society” (i.e., what liberals often refer to as the state). Gramsci focuses on the institutions of “civil society” such as schools, churches, community organizations, and clubs as the location of hegemonic power, but he never sees this as totally separable from state power and coercion.

These intricate relations between civil society and the state (what we might call the private and the public realms) are one reason why cultural and literary critics turn to hegemony as a way to connect questions of ideology to issues of institutions and concrete materiality. Cultural studies scholars such as Raymond Williams, Stuart Hall, Paul Gilroy, and many others find in Gramsci an approach to analyzing the political import of cultural phenomena. As Fontana explains, “Hegemony is the formulation and elaboration of a conception of the world that has been transformed into the accepted and ‘normal’ ensemble of ideas and beliefs that interpret and define the world” (1993: 20).

The ideological element of hegemony is also related to the third major source of the term “hegemony” from the linguistic circles in which Gramsci was immersed as a student in Turin. Franco Lo Piparo has argued that he would have been familiar with the terms “hegemony” and “prestige” as linguistic concepts used interchangeably with one another to analyze how certain linguistic forms (including words, phrases, and grammatical constructions) would be chosen over other ones, including in situations of linguistic borrowing (1979: 103–8). Gramsci’s concern with language both as a metaphor for political power relations and as a constituent element of those relations continued throughout his life and occupies considerable attention in the *Prison Notebooks* (see Lo Piparo 1979; Ives 2004; Boothman 2008).

The concept of counterhegemony as a strategy of creating an alternative to

capitalism is often attributed to Gramsci. However, he never used the term and it is arguably inimical to his position. Gramsci insisted that struggling against a dominant hegemony requires engaging its institutions and the “common sense” that it creates rather than mounting an alternative *per se*. British cultural studies scholars such as Stuart Hall and Dick Hebdige astutely emphasize hegemony as a “moving equilibrium” whereby the politics of culture, its institutional components, and the ideological struggles over meaning come into play (Hall & Jefferson 2006[1975]; Hebdige 1979: 16–19). They then analyze “counter-culture” as playing a role within hegemonic relations rather than as “counter-hegemonic.”

Ernesto Laclau & Chantal Mouffe redefined hegemony in their influential version of post-Marxism, or “radical democratic theory” (1985). They argued that Gramsci makes some headway against the economic determinism and class reductionism of orthodox Marxism, but that ultimately he did not break from it completely. Laclau & Mouffe turned to postmodern and post-structuralist theory, especially that of Jacques Derrida and Michel Foucault, to make such a break. Their project redefined hegemony by highlighting its “*potentially* more democratic” possibilities (54) due to their complete “rupture” and following the “deconstructive logic of hegemony.” For them, hegemony is “a space in which bursts forth a whole conception of the social based upon an intelligibility which reduces its distinct moments to the interiority of a closed paradigm” (69, 93). In other words, they argue, there is no “exterior” (where, according to them, Gramsci placed the economy and class determination) and all classes are defined through *articulatory* practices which are often in *antagonistic* relation to how other classes or political identities are formed.

Laclau & Mouffe create a new terminology, drawing heavily from Foucault, Derrida, Lacan, Saussure, and Wittgenstein to describe hegemonic politics as chains of equivalences and differences that are only ever partially “sutured” at nodal points. They argue, though not without critics (see Ives 2005), that this theory of “radical democracy” is more attuned to the politics of the late twentieth century, involving new social movements where the construction of various identities based on gender, sexuality, ethnicity, and other sets of relations have supplanted all recourse to economic considerations of class.

Laclau & Mouffe’s conception of hegemony has been influential for theories of new social movements and accepted by such luminaries in the field of cultural and social theory as Judith Butler and Slavoj Žižek, especially in recent reconsiderations of questions of “universality.” Butler defines hegemony as the notion that “democratic politics are constituted through exclusions that return to haunt the polities predicated upon their absence” and compares it to her own very influential conception of “performativity” (Butler et al. 2000: 11, 14). It remains to be seen whether these uses of hegemony can sustain influence and attention, or whether scholars from many fields will continue to look farther back to Gramsci’s insistence that analyses of hegemony combine institutional and material components along with the ideological, philosophical, and cultural ones.

Hoggart, Richard

MARK GIBSON

Richard Hoggart (b. 1918) was a key figure in the early development of British cultural studies. Together with Raymond Williams and E. P. Thompson, he is widely regarded as one of the founders of the field (Hall 1980a). His book *The Uses of Literacy* (1957) was influential in bringing attention to the relation between culture and class in Britain in the 1950s and 1960s and in opening the possibility of a serious interpretative study of popular culture and everyday life. He was the founder and first director (1962–73) of the Birmingham Centre for Contemporary Cultural Studies, which went on to become one of the most important sites for the development of cultural studies as an academic field of study.

Hoggart's initial training was in literary criticism, but his greatest significance was in adapting the literary-critical method of "close reading" to social observation. This places him as one of the leaders of the "cultural turn" in the humanities and social sciences (Hall 2008). For Hoggart, "culture" is to be found not only in the arts, but also in social manners, forms of speech, dress, food, the organization of the home, and popular entertainment – in short, as Raymond Williams (1965) famously put it, the "whole way of life."

The early motivation for Hoggart's social observation was an interest in class. Like Williams, he was a "scholarship boy" –

one of the first generation from working-class backgrounds to enter British higher education – and negotiated class difference on a daily basis in his own life. But unlike Marxist theorists, Hoggart regarded classes as cultures rather than positions in social relations of power.

Hoggart's extension of the methods of English literary criticism took its lead to some extent from the influential work of F. R. and Q. D. Leavis and the circle around the journal *Scrutiny*, which had already established a bridge from literary texts to popular culture and mass media (Leavis 1932). But there is also in Hoggart a significant shift of emphasis. Where the Leavises wrote of the contemporary life of industrial society distantly and disapprovingly, Hoggart strove for a more sympathetic orientation, especially in relation to the culture and everyday life of the English working class.

The Uses of Literacy, in which this shift in perspective is developed, is a book in two parts. The first is a close description, "from the inside," of the meaning invested by working-class people in home life, family, neighborhood, and religion up to the mid-twentieth century. By capturing the density and subtlety of working-class life, Hoggart sought to correct a tendency either to romanticize or to dwell only on struggle and deprivation. In so doing, he took his distance not only from Leavisism, but also from the "middle class Marxist," who "usually . . . succeeds in part-pitying and part-patronising working-people beyond any semblance of reality" (Hoggart 1957: 16).

The idea that all social groups have distinctive cultures was important for later work in cultural studies on media reception, such as Hall's (1980b) influential "encoding/decoding" model. It suggested that the relationship between media texts and audiences must always be one of active negotiation. Even those with little education

are formed by the cultural context to which they belong, bringing their own dispositions or sense-making practices to anything they receive.

In the second half of *The Uses of Literacy*, Hoggart turns his attention to the newer forms of mass media that were emerging in Britain in the 1950s. The Leavisite influence is stronger here, showing itself in a pessimism about commercial entertainment and concern at the harmful effects of Americanization. The tendency to condemnation in this has been widely criticized and its contradiction with Hoggart's wider project of sympathetic engagement with popular culture noted. A desire to extend this engagement to postwar youth culture became a significant point of differentiation for a younger generation in cultural studies.

Hoggart has also had a difficult relation with theory. While cultural studies turned in an increasingly theoretical direction in the 1970s, with the adoption of Althusser, Gramsci, and Foucault, this was not a moment in which he himself participated. He has always been uncomfortable with abstractions and has maintained a resolutely empirical orientation in all his published writing. In later work (Hoggart 1995), he has sometimes appeared to side with conservative reactions against relativism and postmodernism, placing him somewhat at odds with the field which he had an important role in developing. However, there has also been a recent, more positive, re-evaluation of Hoggart's work, recognizing its continuing relevance across a range of areas from education, political programs of democratization, media studies, and literary criticism (Owen 2008).

hooks, bell

NAMULUNDAH FLORENCE

Born Gloria Watkins in 1952, the African American cultural critic bell hooks is a prominent public intellectual. In her prolific writing, teaching, film appearances, and public lectures, hooks passionately critiques what she sees as a white supremacist capitalist patriarchy. The work of hooks reflects the influence of critiques of social hierarchies by Sojourner Truth, Paulo Freire, Gustavo Gutierrez, Buddhist monk Thich Nhat Hanh, Martin Luther King, Jr., and Toni Morrison, among others.

hooks draws upon personal experiences, mass media, and the educational system to

critique the interconnected workings of power in relation to race, gender, and class. She demonstrates that these divisive cultural hierarchies reinforce historical inequalities in official knowledge, social power, and access to resources. She also argues that the marginalized often internalize cultural stereotypes, becoming unwittingly complicit with the dominant view.

Highlighting the impact of sensational imagery, hooks views mass media “as the biggest propaganda machine for white supremacy . . . an ideology of difference that says white is always, and every way, superior to that which is black” (1995: 116–17). Further, she argues a continuing color-caste hierarchy in black communities that represents an extension of the historical privileging of house slaves with lighter skin over those with darker skin. For hooks, mutual antagonism between Latinos and blacks over political representation, labor, immigration, education, and cultural rights inadvertently reinforces a white norm. Since cultural identities overlap to reinforce or ameliorate marginality, a European foreign accent is considered chic, while “Hispanic” speech patterns or Ebonics are ridiculed. Meanwhile, society portrays black males as dangerous and threatening.

According to hooks, within schools, the much hyped “academic underachievement gap” ignores historical inequalities in the US. The Eurocentric bias in official knowledge and national heritage alienates minorities. Thus, some black students are ridiculed for being smart while other students “judge themselves” as unintelligent and “eschew academic excellence” as a “white thing.” hooks argues that white teachers prefer “kids they think are beautiful, and that these kids tend to be white and fair or straight-haired” (hooks & Mesa-Bains 2006: 83). The dismissal of minority scholarship as lacking in “depth and quality” reflects a similar bias.

In terms of gender, hooks notes that, through socialization, boys learn to be tough, to mask feelings, to stand their ground, and to fight, while girls acquire habits of obedience, service, and subservience (hooks 1992, 2004b). Meanwhile, family censorship of assertive, radical, or intelligent females devalues the “wisdom, intellect, and leadership of women of color” (hooks & Mesa-Bains 2006: 58). Social space reflects social roles; males dominate the public sphere while society associates women with nature and the domestic sphere. Society’s devaluation of traits and characteristics associated with women reinforces their secondary status, while misogynistic lyrics and sexism in entertainments and religion further the commodification of women as whores or self-sacrificing Aunt Jemimas.

hooks attributes the plight of women as well as men to a patriarchal ideology “that insists that males are inherently dominating, superior to everything and everyone deemed weak, especially females” (2004b: 18). The harsh reality of most men’s lives creates endless insecurity in maintaining a macho ideal of toughness, detachment, and control. Thus, if a man cannot succeed in more conventional economic terms, he must resort to violence to prove his “manhood.” Among females, identity ambivalences reflect their complicity in male domination as well as “suspicious, defensive, competitive behavior” among themselves (hooks 1984: 47). The focus on looks, clothing, and relationships to men reinforces their objectification. Racial/ethnic differences further heighten the power struggle among women (hooks 1984, 2003).

In terms of class, hooks laments the pervasive obsession with success, wealth, and status evident in the media-driven quest for money. Capitalism has turned prisons into factories of readily available cheap labor, while market research translates cultural

diversity into consumer taste. hooks (2000b) decries society's pervasive capitalism, reflected in a shared obsession for immediate satisfaction and undeserved wealth as well as the elitist privileging of middle-class lifestyle and speech patterns, and language to define progress. Wealth is attributed to diligence and poverty to being "unworthy, lazy, and poor by choice" (hooks & Mesa-Bains 2006: 71). Meanwhile, consumerism and addictions to food, drugs, and alcohol offer an illusory sense of relief from the pain and negation of everyday life. Embracing victimization, marginalized people surrender their rage at unjust structures. To counter cultural hierarchies and foster "independence of mind and being," hooks advocates ongoing interrogation of accepted cultural imagery, beliefs, and practices. In this, she continues a critique that has always been evident in "living rooms, kitchens and barbershops" across communities. The process of countering cultural hierarchies begins with cultural literacy through a transgressive education, coupled with acknowledging the contradictions of cultural identities as well as fostering grassroots critical consciousness. Stories that counter the "contemporary ahistorical mood" of injustices are a "catalyst for self-recovery" (hooks 1990: 40).

Horror

DARRYL JONES

Horror is a genre of fiction and film intended to frighten or horrify its audience through the use of images involving monsters, supernatural evil, or abject violence. Because of the often extreme nature of its images and subjects, horror has frequently been dismissed as a peripheral or even harmful diversion from the real business of culture. Yet, as a growing body of theory demonstrates, the study of horror fruitfully combines a number of overlapping intellectual

approaches and discourses – philosophical aesthetics, popular cultural studies and sociology, the theory and history of literature, art and film, debates on the ethics and representation. The gothic, a particular subset of horror revisiting imagined versions of the European past to define and shore up a liberal Enlightenment modernity, began as a historically specific discourse in the mid eighteenth century and was heavily theorized even then (see the collections by Clery & Miles 2000, and by Myrone 2006, for a great deal of this work). As Chris Baldick (1987) argues, “the politics of monstrosity” that animates much of the thinking on the subject was powerfully systematized by Edmund Burke, first in his essay on the sublime (1990[1759]), and then most powerfully in *Reflections on the Revolution in France* (1968[1790]). Written by an Anglo-Irishman and in response to French Jacobinism, *Reflections* implicated the gothic in national ideologies and identity politics from its inception. As Raymond Williams argues in *The Country and the City* (1973) and elsewhere, realism, seemingly positing narrative and epistemological certainties, presupposes (or even constructs) a commensurately stable polity. In extremis, realism has been read as an epistemologically imperializing mode, subsuming and controlling rowdy, seditious, polyphonic, or heterodox voices within its centralizing narrative gaze. Much work has been done on the appeal of gothic and horror to those marginalized, peripheral, subaltern, or colonized identities for whom the ideological stability of realism simply could not obtain. One brief example of this will suffice here, the case of Ireland, which seemingly countered or shadowed the “great tradition” of the realist novel in England with an equally vigorous gothic one (Maturin, Le Fanu, Wilde, Stoker) – a case that has been influentially discussed by Terry Eagleton (1995). This, however, is a complicated issue, as the

most influential practitioners of Irish gothic have invariably been Anglo-Irish colonizers, and thus may well reflect the paranoia of a greatly outnumbered Protestant settler class (see, e.g., Killeen 2005). Baldick & Mighall (1999) have powerfully taken issue with the intellectual orthodoxy of institutionalized “gothic criticism,” which tends inevitably to construct the gothic as a subversive counter to the dominant conservatism of realism. Certainly, *pace* Fredric Jameson’s dismissal of the gothic as “that boring and exhausted paradigm” (1990: 289), this very institutionalizing has led inevitably to a rapid proliferation of critical-theoretical writing on gothic and horror.

Psychoanalysis supplied the dominant paradigm for theorizing horror for much of the twentieth century. Unquestionably the key psychoanalytic text for the study of horror is Sigmund Freud’s 1919 essay on “The ‘uncanny’” (“Das Unheimliche”) (Freud 2001). Freud focuses on the familiar horror tropes of repetition, déjà vu, coincidence, and doubling, and of the animation of lifeless objects or amputated body parts as positing a condition of ontological uncertainty, simultaneously taking us outside of ourselves and providing jarring symbols or reminders of that which we have repressed (as *unheimliche*, Freud reminds us, simultaneously means “unhomely” and “homely”).

Ernest Jones’s *On the Nightmare* (1931) is best described as a fundamentalist Freudian study of horror, taking its impetus from J. H. Fuseli’s celebrated painting of *The Nightmare* (one version of which hung in Freud’s waiting room) to offer brilliantly suggestive readings of vampires, incubi, and other forms of night terror as the symbolic dreamwork of sexual repression and unresolved oedipal conflicts. This Freudian fundamentalism was taken to notorious extremes by Marie Bonaparte (1949) in her psychoanalytic study of Poe, which read Poe’s

stories unproblematically as documents in a pathological case study of the author.

Not all twentieth-century literary critical work on horror was psychoanalytic – see, for example, the important works of Mario Praz (1970) and Devendra P. Varma (1957), which come respectively out of aesthetic history and out of the theological work of Rudolf Otto (1978) on the numinous. But Punter's definitive survey of *The Literature of Terror* (1996) takes what might be described as a soft psychoanalytic approach, one which Punter has developed and refined in a number of subsequent studies. In the 1980s, Day (1985) and Twitchell (1985) also draw on psychoanalysis in their studies of horror, the latter in particular positing a highly persuasive connection between adolescence and horror that is well supported by accounts of the real and implied audience for horror. Elisabeth Bronfen's *Over Her Dead Body* (1992) offers a sophisticated Lacanian-feminist analysis of the recurring horror trope of the beautiful dead woman, also the subject of a brilliant study by the art historian Bram Dijkstra (1986).

Enormously significant in itself as well as for the influence it has had on subsequent work is Julia Kristeva's *The Powers of Horror* (1982). Drawing on psychoanalysis and poststructuralist feminism, and on the structuralist anthropology of Mary Douglas's *Purity and Danger* (1966), Kristeva argues that our selves are defined within the symbolic order by that which we abject from our bodies – blood and menses, excrement, semen, snot, dismembered limbs, corpses – thus creating a binary of subject/abject (that-which-I-am/that-which-I-reject) in order to construct our identities. The concept of abjection has proven enormously important for horror theory, particularly in the work of Barbara Creed (1993). Also drawing on *Purity and Danger* is Noël Carroll's *The Philosophy of Horror; or, Paradoxes of the Heart* (1990), which separates

horror as a pleasurable aesthetic category (“art-horror”) from real-life pain and trauma (“natural horror”). More expansively, Cynthia A. Freeland's *The Naked and the Undead* (2000) attempts a cognitive theory of horror.

Like works of gothic criticism, studies of horror cinema have been coming in thick and fast over the past two decades or so, to such a degree that it's impossible to keep up. Probably the first substantial theoretical analysis of the horror film was also among the most hostile, *From Caligari to Hitler*, by the Frankfurt School sociologist Siegfried Kracauer (1947). With characteristic Frankfurt School suspicion of mass culture, which Kracauer had already theorized in *The Mass Ornament* (1995), *From Caligari to Hitler* examines the repeated tropes of mind control and mass hypnosis to be found in Weimar expressionist cinema, as well as the often overt anti-Semitism found in influential works such as Paul Wegener's *Der Golem* trilogy (1915–20). While Kracauer's argument has been powerfully rejected by S. S. Praver in *Caligari's Children* (1980), it remains a sophisticated precursor of the “media effects” strand of horror criticism, and one whose arguments still carry force. (“Media effects” theory, in the work of, e.g., Barker & Petley 1997, and Kerekes & Slater 2000, engages subtly and profoundly with the simplistic and often downright Pavlovian notions of the “ill effects” so frequently claimed by those hostile to horror, refuting the easy connections made between violent images and violent acts.)

Andrew Tudor's *Monsters and Mad Scientists* (1989) is in essence a structuralist narratology of the horror film. Drawing on an enormous body of data (every horror film released in the UK from the beginning of the sound era to 1984), Tudor identifies a narrative grammar of horror with two basic forms, “security” (narrative closure and resolution) and “paranoia” (openness),

and three fundamental narrative types – knowledge, invasion, and metamorphosis. Armed with a small number of well-defined conceptual tools, Tudor is able to track long-range historical trends in the horror film with great accuracy. The work of David J. Skal, most notably in *The Monster Show* (1994; see also Skal 1990, 1998) combines an ingenious cultural-historical approach with detailed archival research to produce what is the definitive body of work on classic American horror cinema.

Equally widely cited, though very different historically and theoretically, is Carol J. Clover's *Men, Women, and Chain-Saws* (1992), a brilliant feminist reappropriation of the most disreputable of horror's subgenres, the slasher and rape-revenge films. Once again taking issue with crude "media effects" models of audience response, Clover posits the contemporary horror film as a field of slippery and ambiguous gender affiliations, of feminized male killers and masculinized "final girls," far removed from simplistic readings of these films as enacting and fulfilling their audience's fantasies of violence against women. Clover is by no means the only feminist theorist attempting to reread this narrow subgenre: even earlier is Vera Dika's *Games of Terror* (1990), a work that both constructs a narrative grammar of the slasher cycle and, unusually, engages with its actual as opposed to implied audience, an audience that is, Dika discovers, by no means predominantly male. The third great 1990s work of feminist theory on the horror film is Barbara Creed's *The Monstrous-Feminine* (1993), a psychoanalytic reading of horror cinema's monstrous, castrating mothers, femmes fatales, witches, which draws heavily on Kristeva's work on abjection, tracing the source of all horror, as did Freud at the end of "The 'uncanny,'" back to displaced or grotesque versions of the womb or the reproductive female body.

Distinctly British traditions of horror cinema have also been the subject of serious study. A coherent theoretical perspective is offered by David Pirie in his book *A Heritage of Horror* (1973; substantially revised 2008), which was for many years the only book-length study of the British horror film, and was initially written while Pirie was still in his teens. Pirie was a major figure in the intellectual reclaiming of Hammer Studios, in particular, and, greatly influenced by auteur theory, in establishing the critical reputation of Hammer's leading director Terence Fisher (in both these endeavors, Pirie's thinking has been developed, systematized, given a psychoanalytic framework, and possibly superseded by the work of Peter Hutchings: see Hutchings 1993, 2002). In attempting to understand British horror cinema (and Pirie uses the word "English" to mean, at various times, "English," "British," "Scottish," and "Irish"), Pirie properly returns his readers to Enlightenment and Romantic gothic fiction, and uses horror to confront the "tyranny of realism" which he believes, with some justification, to be the dominant or (in his term) "official" British cultural-intellectual aesthetic. Instead, for Pirie, "the English Gothic Cinema" constitutes a major tradition of homegrown surrealism (the more general argument for horror as a local archipelagic variety or precursor of surrealism still surfaces occasionally). Other writers who have followed Pirie in writing major books on the British horror film, such as Jonathan Rigby (2000) and Wayne Kinsey (2002, 2007), have tended to be historians rather than theorists of the form, though their work, often meticulously scholarly, has contributed greatly to our understanding of the material practice and history of the films, their makers, and their studios.

An important recent contribution to horror theory is Matt Hills's *The Pleasures of Horror* (2005). Working from a sociological/media studies background, Hills draws on

his own work on “affective discourses” to analyze the “multiple pleasures of horror,” as constructed both in theory and in practice. In particular, Hills takes issue with those theorists and commentators – philosophers (such as Carroll 1990) and critics (such as Twitchell 1985), fans, hostile journalists in search of moral panics (these last figures have shadowed horror since the Enlightenment) – who attempt, whatever their ideological agenda, to essentialize and pathologize horror’s audience. Hills recognizes, surely correctly, that the pleasures of horror can be plural, overlapping, and contradictory, “as much about recognizing histories and generic lineages as about ‘being scared’” (2005: 7). One to set alongside Hills’s book in terms of its media studies approach is Helen Wheatley’s *Gothic Television* (2006) which, in its identification of a distinct Anglo-American form out of what had previously been considered disparate material (and the objects of Wheatley’s analysis include Jonathan Miller’s 1968 adaptation of M. R. James’s “Oh whistle and I’ll come to you, my lad,” *The Addams Family*, and *Twin Peaks*) potentially points the way to a new area of study.

I

Identity Politics

SATYA P. MOHANTY

Identity politics involves joint political action by individuals who feel themselves united by membership in a marginalized social category (ethnicity, gender, class, religion) that gives them common political interests. However, more than almost any other popular term in contemporary culture, “identity politics” poses a problem of definition. Many academic scholars equate the term with the tendency to treat social identities as both predetermined and unchanging as well as with a simple-minded view of politics shaped by such “essentialist” views of social agents. For many practitioners, however, as well as a growing number of theorists, both academic and otherwise, identity politics and the notions of identity that accompany it are more complex. They point out that identity politics has been the basis of some of the most progressive social movements in history, especially in modern times. Defenders of this more complex view of identity politics thus see it as neither simply good nor simply bad; they focus on identities as multivalent social phenomena, and consider our views about them to be both fallible and corrigible. Students of culture and society would do well, then, to begin by being clear about their own working definition of identity politics

as well as the view of (social) identity it presupposes.

Such clarity would have consequences for our understanding of many contemporary phenomena, both local and global. The “clash of civilizations” idea popularized by both academics and politicians sees the world as divided along the lines of cultural identity, and such a view has consequences that are far-reaching (Huntington 1996). It can justify wars, determine foreign policy, and guide the allocation of economic resources. While casting Islamic cultures (for instance) as prisoners of a naive identity politics, this general view assumes that the West is above identity and hence more rational and democratic. On this view, cultural identity is a straitjacket and “they” have too much of it; “we,” on the other hand, have escaped from it through our practice of reason and our institutions which facilitate the free and open exchange of ideas. Identities are thus things to grow out of, not complex and multivalent phenomena to study and analyze. A similar view of identity is defended by some cultural theorists on the Left, who see identity politics as based on “wounds” to which we remain irrationally “attached” (Brown 1995). In this perspective, identities are opposed to liberatory politics, or at least the kind of politics that is based on fruitful communication across identity positions.

Proponents of identity politics are seen as naive essentialists who perpetuate their victim status, cling to their narrow self-definition and do not pay attention to the complexities of the contemporary world (see among others and in addition to Brown, Butler 1990; Gitlin 1995; Michaels 2006).

The one obvious problem with seeing identity politics as irrational, or at least subrational, is that many social justice movements have been identity-based. The women's movements in various countries over the last two centuries in particular have drawn on a conception of the identity of "women" as socially subordinated beings. Anticolonial movements have depended on a conception of the national identity of the colonized, a conception that was, interestingly enough, denied by the colonizers, who often defended colonial rule as the only guarantor of peace among warring ethnic groups. Movements based on race, sexuality, and disability have all depended on an implicit view of identity as a salient feature of the societies in which the struggles for liberation and justice were being waged. One can even argue, reading works like E. P. Thompson's monumental *The Making of the English Working Class* (1964), that class identities are constructed out of a similar understanding – across lines of profession and trade, and sometimes even the workers' inherited cultures – of commonality of political interests and, ultimately, of objective social positions. It would be very limiting, and in some contexts quite foolish, to consider all these notions of identity to be subrational commitments. Their rational basis is evident in part in the way they have implicitly theorized the links among subjective experiences and objective social locations, between the empirically verifiable (confirmable or falsifiable) claims about what we share with those who are, in any given social formation, "like" us. This

"likeness" is a social-theoretical notion, referring as it does to the distribution of material resources and social opportunities across local differences and over generations. Identity claims that are made in this way are anything but irrational, because they refer not to the mysterious *inner* essences of individuals or groups but rather to verifiable *social* experiences and locations. These claims about identity, whether tacit or explicitly formulated, refer to particular contexts, and ultimately to the social – that is, the cultural, economic, gendered – relations that shape these contexts.

In literary and cultural theory, discussions of identity politics have focused on the link between subjective experience and social identity as the central issue that needs to be analyzed. Deconstructionists have argued that the notion of experience is notoriously vague and our views about our identity cannot be reliably based on subjective experience. That is because the meaning of experience is not self-evident; it is itself a construct – produced in part through social ideologies, theories, and assumptions. Hence, it is argued (see Culler 1982, among many others), identities must also be at best social constructs, "fictions" we live with. Proponents of identity politics, it is claimed, ignore the epistemological difficulties involved in interpreting subjective experience and hence defend an essentialist view of social identity as unchanging, based on a simplistic notion of what is to be learned from the experiences of members of a particular group. This view of identity is defective, the argument goes, because the philosophical notion of experience that underlies it is flawed – it ignores the fact that experiences are never self-evidently meaningful, that they are always interpreted and constructed on the basis of presuppositions and social ideologies.

This general view of the link between experience and identity has held sway in academic circles, in part because the underlying account of experience has seemed convincing. The account is, however, only partial, and an adequate theory of experience and identity needs to explore the ways the account is limited and go beyond those limitations. This work has been done by the “realist” school of experience and identity, which faults the deconstructionist position for having too negative and one-sided a view of experience (see Mohanty 1993). Realists point out that experiences are indeed always mediated by theories and ideologies and that these mediations do influence the way we understand and interpret our experiences, but sometimes they in fact lead to better and more accurate interpretations of experience. Realist thinkers urge us to examine how and why experiences are misinterpreted and to distinguish those instances of misinterpretation from ones when experiences are accurately interpreted by the mediating theories (Mohanty 1997; Moya 2000; Moya & Hames-García 2000; Wilkerson 2000; Mohanty 2008). On this theoretical view, then, experiences, and the social identities based on them, can be reliable sources of knowledge just as they can be the sources of ideological mystification. If interpreted accurately, experiences give us a reliable view of the way identities are intimately tied to social structures of power, oppression, and exploitation, as well as to the ways groups of people organize to resist the dominant structures. On this view, identities can be both “constructed” and “real.” They are “real” because accurately theorized identities track genuine features of society, features that possess *causal* powers, the power to shape the behavior of individuals and groups.

The core realist theses about identity can be summarized very simply: “Social identities can be mired in distorted ideologies, but

they can also be the lenses through which we learn to view our world accurately. Our identities are not just imposed on us by society. Often we create positive and meaningful identities that enable us to better understand and negotiate the social world. They enable us to engage with the social world and in the process discover how it really works. They also make it possible for us to change the world and ourselves in valuable ways” (Alcoff & Mohanty 2006: 6).

This conception of experience and identity retains part of the insight of the deconstructionist position, that experiences and identities are not self-evident but rather are socially constructed (see also Foucault 1977, 1978). But it takes us beyond the blind alleys of the original line of argument by providing a view of experience and identity as epistemologically multidimensional, capable of producing both accurate knowledge and ideological mystification.

One startling implication of this new, “realist,” view of identity and identity politics is that identity-based politics is not opposed to radical universalist projects (such as human-rights struggles). Indeed, identity politics can itself be based on a radical moral universalist ethics and politics. Taking equality and social justice as guiding universal values, the proponent of identity politics can show how certain social arrangements may make some groups of people especially vulnerable, and that the dominant cultural arrangement is often oriented to the perspectives of the strong rather than the weak. In these contexts, an identity-based movement of the weak and vulnerable groups becomes a necessary form of education, one that is simultaneously affective and epistemic. It teaches the weak to value their own experiences and perspectives enough to glean the knowledge they contain. It can also teach those in the dominant groups how the normally obscured perspectives of the weak contain

essential knowledge about society and its workings. It is only through an adequate appreciation of these particular perspectives that we gain a more nuanced universalist view of the needs and vulnerabilities of (all) socially situated human beings. By implication, it is only through such identity-based, particularist lenses that we come to gain a richer view of (universal) human flourishing in many social contexts. The cultural and social particular and the moral universal complement and substantiate each other (Mohanty 1997; for a view of political education that complements the realist view of identity and universalism, see Freire 1970).

We live in times when identity politics is more important than it has ever been. The realist would argue that the dominant conceptions of identity and identity-based politics described above are too one-sided and simplistic, that they do not have the resources to understand identity politics in all its complexity. Similarly, the Enlightenment-inspired “color-blind” approach to race, which shapes public policy in such countries as France, is inadequate. What is needed is a more hard-headed and theoretically supple approach to “race” and other minoritized identities. The “realist theory” – articulated by activists and scholars in various ways – suggests a more adequate way to conceptualize identities and a more precise way to imagine how they may be deployed, for good or for ill (Mohanty 2008). Theoretical precision and clarity are necessary, more than ever before, for sound political practice. The goal of the realist school is to ensure that academic fashions, narrow scholarly preconceptions, and a simplistic view of “us” vs. “them” do not get in the way of doing the intellectual work that needs to be done.

J

James, C. L. R.

KENT WORCESTER

Cyril Lionel Robert James (1901–89) was a writer, editor, public speaker, and political activist whose oeuvre has attracted increased notice across the humanities in recent years. Scholars from a range of disciplines and subfields have shown an interest in James's distinctive approach to cultural and political questions. A profusion of biographical and critical studies has explored various aspects of James's peripatetic life and work as well as his relationship to contemporary debates concerning postcolonialism, cultural studies, and radical democracy. Along with Antonio Gramsci, he may be described as a major twentieth-century Marxist thinker whose relevance remains uncontested in the twenty-first.

C. L. R. James wrote on a disconcerting array of topics, and several of his essays and books have come to be regarded as classics in their fields. He contributed to the study of colonialism, Caribbean history, and the Black Atlantic, as well as to the theory and practice of modern leftist politics. He was the author of literary and social criticism, short stories, a novel, political biography, political philosophy, radical polemics, and histories of cricket, slave rebellion, and Soviet foreign policy. Much of his journalistic and literary output appeared in small

press magazines and newspapers, while his most provocative treatises often turned up in either pamphlet or mimeograph form. The arrival of three volumes of selected writings by Allison and Busby in the 1980s, and the publication of a single-volume reader in the early 1990s, helped bring his measured, sometimes ironic prose to a new generation of readers and book critics. More of his writing is in print currently than at any point during his lifetime.

James's best-known titles include *American Civilization* (1993a[1950]), *Beyond a Boundary* (1993b[1963]), *The Black Jacobins: Toussaint L'Ouverture and the San Domingo Revolution* (2001a[1938]), and *Mariners, Renegades and Castaways* (2001b[1953]). His "socialism from below" approach is sketched out in the essays reprinted in *Marxism for Our Times* (1999). *The C. L. R. James Reader* (Grimshaw 1992) showcases essays, fiction, letters, and journalism, with pieces on Hamlet, Picasso, Walt Whitman, Toni Morrison, and the nature of art intermingled with sorties on the vanguard party, Fidel Castro, Kwame Nkrumah, and the crimes of Stalinism. Many of the chapters were originally prepared for politically engaged audiences – from anticolonial activists in the 1930s, to militant industrial workers in the 1940s, to Black Power advocates in the 1970s. The private

correspondence reproduced in *Special Delivery: The Letters of C. L. R. James to Constance Webb, 1939–1948* (1996) offers a rare window onto James's inner life at a time when he was wrestling with his relationship with conventional Marxist politics. The confident mix of autobiography, cricket journalism, and political theory in *Beyond a Boundary* suggests he had arrived at a more settled or integrated position by the early 1960s.

Born and raised in colonial Trinidad, James moved to England in the early 1930s and then to the United States at the end of the decade, where he lived until his internment and subsequent expulsion as an "undesirable alien" at the height of the McCarthy era. While he initially traveled to the British Isles to pursue a literary career, he embraced leftist and pan-African politics during the Depression and joined the fledgling Trotskyist movement in London in the mid-1930s. He supported himself during this period as a journalist, writing on cricket for the *Manchester Guardian* and other newspapers. At the urging of the Trotskyists he relocated to North America, and stayed with Leon Trotsky in Mexico in 1939, where they discussed dialectics, the Soviet Union, and "the Negro question." James was almost certainly the only founding member of the Fourth International who was at the same time an accomplished novelist (*Minty Alley* [1936]), historian (*The Black Jacobins*), and cricketer.

James gradually broke with Trotskyism in the 1940s, moving toward a looser and more self-consciously democratic and culturally sensitive perspective that in certain respects anticipated the politics of the early New Left. His break was undertaken in his collaboration with comrades in the so-called Johnson–Forest tendency, founded in 1941 by C. L. R. James ("Johnson") and Raya Dunayevskaya ("Forest"). Other leading members of the group included Grace Lee,

James Boggs, and Martin Glaberman. (Dunayevskaya formed her own group in the mid-1950s that continues to publish a "Marxist-Humanist" newspaper out of Detroit.) The circle around James wrote intensively on such topics as US history, Hegel and Marx, political organization, popular culture, youth rebellion, and the future of socialism. They also cultivated ties with Cornelius Castoriadis and the Socialisme ou Barbarie circle in France. What they shared in common with Castoriadis and his group was an interest in the radical potential of already existing informal social networks. Rather than focusing on the trade unions, or mainstream political parties, the Johnson–Forest tendency and the Socialisme ou Barbarie group celebrated the self-organization of workers, women, young people, and African Americans. Both currents found inspiration in the Hungarian revolt of 1956 against Soviet-style communism, and the US Civil Rights Movement, and both rejected the Leninist model of the vanguard party in favor of a more libertarian style of socialism.

After his expulsion from the United States, James returned to England and then, in the late 1950s, to Trinidad, where he and his third wife, Selma James, devoted themselves to the national independence movement via the People's National Movement (PNM), a political party led by Dr. Eric Williams. For nearly two years James and Selma edited the PNM's weekly newspaper, the *Nation*, but their lively populist approach chafed against an increasingly establishmentarian PNM leadership. They left the island in 1962, just days before Trinidad and Tobago achieved full national independence. James returned three years later, and was promptly placed under house arrest. Following his release he helped launch a new political party, the Workers and Farmers Party, as a leftist alternative to the PNM. Party candidates, including

James, polled around 3 percent in the 1966 national elections, and the effort collapsed. This was to be James's sole foray into electoral politics – yet another unexpected turn in a life replete with drama. James was residing in the Brixton section of London when he was awarded the Trinidad Cross, the country's highest national honor, in 1988. The political establishment had finally embraced the country's most notorious public intellectual.

Early studies of James's work tended to foreground his relationship to Marxism, black liberation, and Caribbean politics. The chief problematic of this literature was to locate James vis-à-vis other figures in the socialist and black radical traditions (an exception is Buhle 1986). In recent years the secondary literature has taken a cultural and historical turn. Fewer scholars are talking about his role in developing the idea that the Soviet Union was state capitalist, or his critique of far left practice, while more are looking at his fiction, his pan-Africanism, and his comparative historical studies. There is considerable interest in his complicated relationship with Englishness and the West more generally, and the impact of exile on his West Indian identity – what Nicole King has referred to as “the representation and lived experience of black, male, transnational, hybridized subjects” (2006: 17)

The scholarly field that has paid closest attention to the ambiguities and complexities of James's relationship to race, empire, and exile is, not surprisingly, the field of postcolonialism, for whom James is a pivotal figure. A widely discussed reading of *The Black Jacobins* in the postcolonial vein is provided by David Scott's *Conscripts of Modernity* (2004), which suggests that rather than telling a story of political redemption, the book “urges us to take” a hard look “at the consoling (anti-colonialism) story we have told ourselves about colonialism and

civilization, modernity and enlightenment, and especially the vindicationist narratives of emancipation that have animated our hopes for a world without dissatisfaction, injustice, and unhappiness” (14). This is a very different portrait from those offered by recent biographers, who have sought to emphasize James's unvarnished optimism and fidelity to revolutionary politics (Renton 2007; Rosengarten 2008). Evidence for both positions can be found in James's own speeches and published writings; he could be disarmingly hopeful and deeply skeptical in the same passage. In effect, the secondary literature remains divided on whether a single integrating theme connects James's life and work or whether the different phases and intellectual projects offer a puzzling set of fragments that can never quite add up to a coherent whole.

That said, the posthumous recovery of specific texts, such as *American Civilization*, which was drafted in 1949–50 but finally issued in 1993, and “Preface to criticism” (1955), reprinted in *The C. L. R. James Reader*, has brought James's essayistic ambitions into sharper relief. Rather than moving from literature to politics, the newly available material suggests he retained a literary orientation throughout his life and sought to integrate cultural and political levels of analysis even when his day-to-day activities were geared toward building a new kind of revolutionary organization. As Anna Grimshaw has pointed out (1992: 8), James “was conscious of the struggle” to “bring the separate facets” of his own “human experience” into a single, integrated framework. Inspired in part by the writings of Aristotle on the polis, James believed in the unity of the individual and the society, even if he was not always able to achieve that kind of integration in his own life.

Given that James paid serious attention to film, sport, and popular music, it makes sense that he has been classed as a forerunner

to the academic cultural studies movement, even though, as Neil Larsen has pointed out, there are discernible differences between James's cultural criticism and conventional understandings of cultural studies: "his approach to popular culture at no time abdicates the task of aesthetic judgment *per se*" (1996: 89). His work also speaks to contemporary debates around alternative forms of democracy and the limits of conventional theories of political representation. He remains a category-defying intellectual figure whose life and work will continue to yield unexpected insights.

K

Kittler, Friedrich

GEOFFREY WINTHROP-YOUNG

Considered one of the most important contemporary theorists in his native Germany, Friedrich Kittler (b. 1943) is best known for his concept of “discourse networks,” defined as “the network of technologies and institutions that allow a given culture to select, store and process relevant data” (Kittler 1990 [1985]). Following the translation of *Discourse Networks* (1990[1985]) and *Gramophone, Film, Typewriter* (1999[1986]) and the publication of the collection *Literature, Media, Information Systems* (1997), he has also acquired a considerable following in the English-speaking world, especially among those working on media and the intersection of poststructuralism and technoculture.

Kittler studied at the University of Freiburg, where he worked as a German lecturer from 1976 to 1986. Following an appointment at the University of Bochum (1987–93), he was named chair of Media Aesthetics at the Humboldt University of Berlin. The author of well over a dozen books and scores of papers that range from Plato to Pynchon, Kittler retired from teaching in 2008.

According to Kittler, cultures are large-scale information-processing machineries characterized by historically differing social and material techniques that determine the

input, throughput, and output of data. Obviously, media are central to such an approach, yet it took a while before Kittler began to tackle media-technological issues. Initially, he described discourse networks as discursive rather than as medial regimes, with an emphasis on language, not on sound- and image-recording technologies. In a move highly representative of the difficult German reception of French post-structuralism (Holub 1992; Winthrop-Young & Gane 2007), Kittler merged the discourse analysis of Michel Foucault with Jacques Lacan’s revision of Freudian psychoanalysis. Foucault’s early view of history as a radically discontinuous succession of epistemes, each possessing its very own order of speech, was complemented by Lacan’s insistence that humans, rather than being in command of language, are spoken by it. On this view, even seemingly natural phenomena such as the familial order, or the notion that we are autonomous subjects boasting an ineffable selfhood, are the effect of signifying chains that ensnare and inscribe individuals. As analyzed in the first half of *Discourse Networks*, this is what happened in the so-called Discourse Network 1800, which roughly coincides with the epoch named after its most famous (and typical) representative, the Age of Goethe.

A fundamental change occurred with the arrival of the Edisonian nineteenth-century

communication and storage technologies, which Kittler started to analyze in the early 1980s. Phonography on the one hand and photography and cinematography on the other challenged the supremacy of writing, which itself switched from the continuous flow of ink on paper to the mechanized, discontinuous letter arrangements of the typewriter. The very basis of representation changed. Writing operates by way of a symbolic relationship between words and things, while photos, movies, and sound recordings are (in predigital times, that is) physical effects of the real. Thus, writing lost the natural glamour it had enjoyed in the Discourse Network 1800; as a result, the imaginary edifice of the romantic Discourse Network 1800, with its philosophical menagerie of souls, subjects, truth, and spirit, came to an end and was replaced by the modernist Discourse Network 1900. With the advent of the computer, however, “the formerly distinct media of television, radio and telephone, and mail converge, standardized by transmission frequencies and bit format” (Kittler 1999[1986]). As the medium to end all media, the computer renders the very notion of media questionable. But to Kittler’s dismay, the computer enjoys a reputation similar to that of language: it is viewed as a means, an extravagantly useful tool, but its cunning user-friendliness obscures the fact that we are excluded from its internal operations. We are literally screened off from the fact that we, the alleged makers and masters, are “subjects to gadgets and instruments of mechanical discourse processing” (1997).

Kittler is no stranger to controversy. He has been charged with flagrant anti-humanism and a cynical disregard for any kind of emancipatory social agenda. These objections recall those aimed at the French poststructuralists to whom he is indebted, as well as at Martin Heidegger and Friedrich Nietzsche, the two principal

German influences behind his work. Blanket statements like the notorious opening line of *Gramophone, Film, Typewriter*, “Media determine our situation” (1999[1986]), have provoked charges of technodeterminism similar to those leveled at the Canadian School of Media Theory. Kittler has been accused of fetishizing war by presenting it as the basis of modern media evolution. Feminist critics have argued that for all his analyses of the discursive construction of women as the natural, silent other of men in the Discourse Network 1800, Kittler’s writings tend to perpetuate precisely this image.

Recently, Kittler has begun his most ambitious project, a genealogy of musical and mathematical notation systems ranging from ancient Greece to Alan Turing. So far, only the first half of the first volume of a projected tetralogy has been published (Kittler 2006). Whether this esoteric work will ever be available in English depends in no small degree on how that which has already been translated manages to deal with the numerous reservations about Kittler’s work.

Kracauer, Siegfried

JEFF SOLOMON

Siegfried Kracauer (1889–1966) rose to fame as one of the best-known cultural critics of Weimar Germany before fleeing the Nazi occupation of Europe to re-establish his career in the US. Born to a middle-class German Jewish family in Frankfurt-am-Main, Kracauer was originally trained as an architect, though he also studied sociology and philosophy with Georg Simmel and Max Scheler, informally instructed Theodor Adorno on Kant's *Critique of Pure Reason*, and earned his doctorate in engineering in 1914. In 1921, after a disappointing career as an architect, Kracauer turned to journalism full time, first as a freelance writer in the arts and culture section of the trendsetting liberal newspaper, *Frankfurter Zeitung*, and then as the paper's editor from 1924 to 1933. Kracauer fled Nazi Germany in 1933 for Paris, where he struggled to earn his living publishing essays, fiction, and longer works of cultural criticism. When Paris fell to the Nazis in 1940, Kracauer was again forced to flee. In 1941, with assistance from Adorno and Max Horkheimer, he relocated to the US, taking a position with the Library of the Museum of Modern Art in New York. Vowing never again to write in his native

German, Kracauer taught himself to write in English and then resumed his career, emerging as one of the most celebrated mid-century voices on film criticism and the philosophy of history. Kracauer was appointed research director of the Empirical Social Research Department at Columbia University in 1951. He died in New York in 1966.

The majority of Kracauer's works written in German first appeared in serialized form within the pages of the *Frankfurter Zeitung*, including the 1922 essay, "Sociology as science," in which he articulated the phenomenological approach that he would apply in his later works. His important writings from this period include his literary analysis, *The Detective Novel* (1925); a collection of essays on the surface features of life under modernity, entitled *The Mass Ornament* (1925[1927]); his first autobiographical novel, *Ginster* (1928); and his ethnographic study of the petit bourgeois class in Berlin, *The Salaried Masses* (1928[1930]). While in Paris, Kracauer completed his second autobiographical novel, *Georg* (1934), and published his social biography of nineteenth-century Paris, *Offenbach and the Paris of His Time* (1937[1935]), a groundbreaking work (often compared to Walter Benjamin's *Arcades Project*) in which he recounts the details of Offenbach's life and music to provide a sweeping cultural analysis of Second Empire Paris.

Upon relocating to New York, and with support from the US government's Experimental Division for the Study of War Time Communications, Kracauer produced two studies of Nazi film propaganda, *Propaganda and the Nazi War Film* (1942) and "The conquest of Europe on the screen: The Nazi newsreel, 1939–1940" (1943). He followed these studies with his very well-received (though some have argued, overly deterministic) cultural history of nationalistic German cinema under UFA, *From Caligari to Hitler* (1947).

Kracauer's engagement with cinema reflected a lifelong interest, culminating in his *Theory of Film* (1997[1960]). Though criticized for its emphasis on the transparent nature of film rather than on the formative techniques of cinema (i.e., editing, lighting, montage, etc.), the work represents one of the earliest attempts at a systematic aesthetic analysis of film and it has achieved classic status in film studies programs; in it, Kracauer celebrates film's ability to capture the ephemeral surfaces of reality that often escape our notice. Kracauer's fascination with film is clear even in his final study on the philosophy of history (1969) in which he suggests intriguing epistemological similarities linking the discourses of history and film, explaining that "they share their inherently provisional character with the material they record, explore, and penetrate." From similar natures to similar applications, they "make it much easier for us to incorporate the transient phenomena of the outer world, thereby redeeming them from oblivion" (192).

Whether writing about architecture, literature, biography, culture, social class, film, or history, Kracauer consistently draws attention to the historical and cultural meanings encoded within the visible surfaces of modern life, pointing out the often overlooked details of such mundane constructions as the architectural layout of a hotel lobby or a synchronized chorus line. Where a traditional Marxist critic might dismiss these cultural formations simply as superstructural reflections of the economic base, Kracauer combines a Marxian critique of production with the sociological insights of Max Weber and Georg Simmel, and the psychological insights of Sigmund Freud to invest the mass ornament with a collective cultural meaning pregnant with potential, one that rises out of the chaos of modern life in response to impulses specific to the time and place of their emergence.

Moreover, where his associates in the Frankfurt School are often critical of the products of the culture industry, Kracauer celebrates the constructive potential of "low" culture, arguing that the mass ornament possesses a historical and cultural authenticity lacking in the artistic expressions of "high" culture. In this same spirit, he eschews the often mystifying language common to scholarly analyses of mass culture in his own writing, preferring clarity, specificity, and accessibility to the philosophical abstractions of his Frankfurt School associates.

L

Latour, Bruno

MARK M. FREED

Bruno Latour is a leading figure in the philosophy, sociology, and anthropology of science referred to collectively as “science studies” or “science and technology studies” (STS). He has played an important role in developing the method of sociological analysis called “actor-network theory” (ANT).

Latour was born in Beaune, France in 1947 and received training in philosophy, biblical exegesis, and anthropology, including fieldwork in Cote d’Ivoire. From 1982 to 2006 he was professor at the Centre de sociologie de l’innovation at the Ecole nationale supérieure des mines in Paris, France. In 2006 he became professor and vice-president at SciencePo, Paris, where he is affiliated with the Centre de sociologie des organisations (CSO).

Latour’s early work involved field studies of the natural sciences conducted in the manner of an anthropology of science. In *Laboratory Life* (1979) Latour and Steve Woolgar describe the way daily activities of working scientists at the Salk Institute for Biological Studies in San Diego, California lead to the construction of scientific “facts” through the inscription and manipulation of statements about stabilized objects. In so doing they also draw attention to the processes that obscure the social and

historical circumstances on which the construction of a fact depends, contending that by the time a statement has transformed into a fact it has become freed from the circumstances of its production. This is one example of what Latour terms “black boxing,” a process in which scientific work is made invisible by its own success. In *Science in Action* (1987) Latour describes the ways scientists build claims resistant to refutation by enlisting other claims, scientific instruments, newly stabilized objects, and financial backers of research. One important implication of this work is that scientific facts are supported not by their links to an independent nature but by the size and strength of the network of relations scientists construct around their claims.

Latour’s work in science and technology studies, along with that of Michael Callon and John Law, led to the development of actor-network theory. ANT seeks to describe the complex interaction of *actants* in a system without regard to their status as human or nonhuman, thereby dispensing with the common distinction between subjects and objects, semiotic or materialist entities. One of ANT’s central insights is that human behavior is enmeshed in a network of relations between various kinds of actants such that adequate analysis involves description of the ways the various entities translate, modify, and displace their

properties and interests through interaction with one another.

One important context of Latour's work has been the so-called "science wars" between scientific realism and social constructivism, the former holding that science discovers a real world of independent, nonhuman nature and the latter insisting that scientific facts are human constructions that are contingent upon the social circumstances of their production. The realist versus constructivist debate comes down to the question of whether science can bridge the supposed ontological gap between the human and nonhuman domains: realists answer "yes"; constructivists answer "no." Latour's intervention in the controversy amounts to insisting that there is no ontological divide. His work in science and technology studies attempts to show that supposedly independent bits of nonhuman nature are in actuality connected to humanly constructed facts by chains of *intermediaries* (quasi-objects) that successively translate their properties along a kind of ontological continuum that embraces nature at one end and culture at the other. One example of intermediaries are scientific instruments that translate properties of laboratory samples into data inscribed on viewing screens or paper printouts.

In *We Have Never Been Modern* (1993[1991]), Latour examines the *modern* intellectual constitution that gives rise to the sharp distinction between nature and culture characteristic of the science wars. According to Latour, premodern conceptions of the universe make no sharp distinction between the human and the nonhuman such that a range of interactions take place between them, petitionary prayer and divine intervention, for example. The modern intellectual constitution, by contrast, makes a fundamental ontological distinction between humans and nonhumans, culture and nature, through to two sets of intellec-

tual practices he terms *purification* and *mediation*. Purification carves up the world into smaller and smaller nonhuman entities (e.g., the isolation of atoms, electrons, quarks, and neutrinos). Mediation connects newly purified entities with human concerns, building networks of humans and nonhumans (e.g., antibiotic drugs and disease-resistant crops). Both practices are necessary for the advancement of modern science, for without new purification, mediation slows down or stops because there is a finite number of combinations possible among existing humans and nonhumans. Inversely, without an interest in developing new networks of humans and nonhumans, there is nothing to drive purification. Despite their mutual dependence, however, purification and mediation have to be kept separate in order to remain effective, because concern about the consequences of introducing new nonhumans into the human world puts a halt to purification, as has been the case, for example, with genetically altered agricultural products and human cloning. For this reason, modern science has officially privileged purification while surreptitiously pursuing mediation. Latour argues, however, that we have never really been modern because we have always engaged in mediation through creating networks of humans and nonhumans.

Lefebvre, Henri

BEN HIGHMORE

Henri Lefebvre (1901–91), a French philosopher and sociologist, established the critical analysis of everyday life as the central component for understanding culture and society. While he spent most of his life in Paris he was also engaged in the study of rural society and never severed his ties with his birthplace in the French Pyrenees. He was a communist but was expelled from the party in 1958 for his general recalcitrance to the party line. Throughout his life he was connected to various avant-garde cultural and social movements: Dada and surrealism in the 1920s and 1930s, and the Situationist International in the 1960s – and his love of art and literature comes through in everything he writes. During World War II he fought on behalf of the French Resistance.

For much of the twentieth century Lefebvre's thought was out of step with the modishness of French intellectual fashions. During the decades when Louis Althusser was proclaiming that Marx's work could be divided between a (good)

scientific project in the later work and a (bad) humanist project in the early work, Lefebvre continued to champion the early, humanist work. When the rigorous analysis of structuralism was in the ascendancy, Lefebvre's work focused on the subversive and unstable energies of the festival and the spontaneity of "moments." (He would claim that the word "rigor" always suggested to him "rigor mortis.") When poststructuralism concentrated on the intricacies of texts, Lefebvre paid attention to the interconnections of the sensual world. It is hardly surprising then that Frederic Jameson would describe Lefebvre (in a blurb on the back cover of Merrifield 2006) as the "twentieth century's last great undiscovered philosopher."

It is hard to fit Lefebvre into the intellectual orthodoxies of the last 100 years. In many ways he is closer to dissident thinkers like the Russian theorist Mikhail Bakhtin than he is to his French counterparts. Central to Lefebvre's work is his recognition of the importance of Marx's "Paris Manuscripts." This "lost" work (more properly called the *Economic and Philosophical Manuscripts of 1844* [1988]) was brought to a French readership by Lefebvre and his friend and colleague Norbert Guterman in 1934. In this work Marx proposes that the central analytic concept for a critical understanding of society is "alienation": human beings are alienated from each other, from the things they make, from their natural environment, and from their human potential. But while existentialism would also claim the centrality of alienation, Lefebvre (after Marx) constantly insists that alienation is not an abstraction affecting our human condition but a material element of our daily life.

The analysis of alienation and the fight against alienation are the core motivating force of Lefebvre's work and life. In politics it meant that strong state solutions to the

inequalities of the world were never going to be adequate (the state maintained the alienation of the demos in organizing “their” society) and thus Lefebvre championed more anarchistic solutions of workers’ councils and self-management (*autogestion*). In intellectual life, forms of scholarly specialism and disciplinary protectionism simply maintained and intensified alienated consciousness; thus Lefebvre refused such specialization and wrote across the disciplines of sociology, philosophy, literary criticism, politics, urban planning, aesthetics, and history.

His core ideas and their associated works should also be seen in the light of the analysis of, and the fight against, alienation. His critique of everyday life, a project begun in the 1930s and continued throughout his life, is exemplary in this regard. By insisting that the ordinary circumstances of domestic life witness the colonization of everyday life by commodities and commodification he at once makes alienation material and ubiquitous. The washing powders we use, the cars we desire, the media culture we consume necessarily mean that the private world of domesticity and intimate life is not a solace from alienation but the sphere of its most material presence. Yet, as you might expect from someone dedicated to overthrowing alienation, Lefebvre’s critique is hardly the one-dimensional denunciation of the modern world. While a weekend camping trip might be structurally dependent on the working week, and couched in on all sides by commercial pressures (buy this tent, these walking boots, and so on), it remains a material critique of the paucity of daily life and its alienation from creativity, play, and nature.

In the various books that make up the critique of everyday life – the three volumes that appear under this title, but also his book *Everyday Life in the Modern World* (1971[1969]) and various essays that

contribute to the critique – Lefebvre moves from the minutiae of daily life, through social-theoretical and philosophical reflection, through to a consideration of global structures and back to the materiality of everyday life. He considers everything from women’s magazines to commuting; from the films of Charlie Chaplin to the philosophy of Hegel; from domestic gardens to globalization and the information society. At the same time he recognizes that the actuality of daily life constantly changes and outstrips our attempts to arrest and to analyze it. In this way the critique of everyday life isn’t simply a series of interpretations and opinions, it is itself the performance of its ambition: to recognize the totality of social arrangements as they are articulated in ordinary material life.

His 1974 book *The Production of Space* (1991[1974]) heralded the first enthusiastic reception of his work by the Anglophone academy in the 1980s and 1990s. Cultural and social geographers, frustrated by the often mechanistic deployment of structuralism that characterized much of the work in this field, found in Lefebvre’s work (and particularly in *The Production of Space*) an exhilarating sophistication and complexity of thought that allowed them to be attentive to the physicality of space, as well as to the practices and imagination that animate it. If Anglophone cultural geography has seen a real explosion of inventiveness in the last 25 years it is in no small part due to Lefebvre’s initial intervention.

The Production of Space, though, is not an isolated instance of Lefebvre’s interest in space. In many ways he is a spatial thinker who insists that a concern for space is the grounding requirement of any form of analysis that wants to be alive to the material and imaginative circumstances of our alienated actuality. The city and countryside are the phenomenal forms that articulate the social and cultural processes that characterize our

world. So again spatiality is both a complex perspective (or multiple perspective) that allows us to fight the alienation inherent in single-viewpoint perspective, as well as generating accounts of the world that allow alienation to be mapped, assessed, and challenged. While Lefebvre pioneered work in rural sociology he is best known for his concentration on urban questions and for his demand for spatial justice in the city.

His final work, *Rhythmanalysis: Space, Time and Everyday Life* (2004), partly written with his wife Catherine Régulier and published a year after he died, is a stunning testimony to his life's project. Here, in his late eighties, Lefebvre proposes a whole new form of social and cultural analysis. The book bristles with energy and suggests a form of attention that is capable of registering the orchestration of social, cultural, global, informational, biological, and natural rhythms. Lefebvre's ambition is constant: how to understand the overarching organizing capacities of social power in relation to the capabilities and potential of human creaturely subjects. The methodological practice of working from the concrete singular to the general (and back again to the singular, but now as part of the general), which was first announced in the volumes of the *Critique of Everyday Life*, is given a sharpness of focus by its attention to rhythms. Thus passages in the book can move from the biological rhythms of the body, through the dressage training of social learning (eat like this, walk like that, sit still, behave) to the rhythm of global finance markets. Lefebvre's search is not for neat solutions, but for forms of attention that allow for the most adequate, vivid, and critical view of our actual and complex circumstances. Rhythmanalysis, with its ability to acknowledge syncopations, stasis, arrhythmia, polyrhythmic forms, and so on, is a productive perspective

for recognizing the complexities and contradictions of a living, breathing social and cultural world.

Reading Lefebvre can be a frustrating experience. Much of his work was dictated as he paced his office and it both gains and suffers from this form of production. On the one hand, it has a real liveliness and energy that is contagious for the reader; on the other hand, there are long rambling patches that can be unwieldy and difficult to navigate. Similarly, while the range of references and examples is exhilarating, the reader can feel that a good deal is expected of them as they dart from classical Greek philosophy to specific examples of French culture. Yet, like all great writing, the payoff is worth it. Lefebvre teaches by example, and reading his work is the best way of learning a dialectical approach that is sensitive to the creative potential buried in our most alienated social and cultural forms.

Lifestyles

TANIA LEWIS

In cultural studies and sociology, the term “lifestyle” refers to a distinctive style or mode of living adopted by individuals and groups. Associated in particular with contemporary consumer culture, the concept of lifestyle encompasses a wide range of practices, habits, and values, from people’s diets and fashion choices to their interpersonal relationships and hobbies. It has also become a key term in public health where issues like obesity are often framed today in terms of people’s lifestyle “choices” and behaviors. Another way in which lifestyle is a pivotal concept is in marketing and advertising circles. Since the 1960s marketers have looked for broad lifestyle patterns through which they can categorize consumers into different groups based on their spending power, habits, attitudes, and tastes. In the 1960s and ’70s the term “lifestyles” also took on another set of connotations with the emergence of various hippie or counter-cultural modes of living. Often associated with a degree of freedom from social constraints, today such alternative lifestyles include everything from ecopolitics and communal living to new ageism, with many of these lifestyles having been absorbed into contemporary “mainstream” consumer culture.

SOCIAL AND HISTORICAL CONTEXT

While the notion of lifestyles tends to be associated with the contemporary moment, in sociological thought the concept has had a long life. Here the term has its roots in the rise of modernity and mass consumer culture where it emerges as a marker of social status and identity. In premodern times people’s ways of life and social identities were relatively stable, associated with fixed communities and places. In contrast, processes of modernization such as the shift from agrarian to factory-based forms of production and associated mass migration into cities saw people uprooted from stable existences and thrown into contact with strangers. In a society of strangers, people’s social identity and social status was not known in advance but became something that people displayed via symbolic means, or what today we might think of as lifestyle markers, such as the types of clothes worn and choice of home decor.

The contemporary notion of lifestyle, however, did not start to emerge until the development of mass consumerism and the emergence of a consumer culture, in which people’s lifestyles became increasingly associated with individual consumer choices. Many Western nations in the 1950s experienced a postwar economic boom that saw a rapid expansion of the middle classes and the growth of suburbia, accompanied by the mass production of affordable consumer items – cars, home appliances, and other commodities – along standardized “Fordist” production lines (modeled after Henry Ford’s car factories). In contrast to the frugal war years where people were encouraged “to mend and make do,” the relative economic surfeit of the postwar years saw ordinary people embracing the pleasures of consumption and leisure-based lifestyles.

Compared to today, however, consumption practices in the 1950s were relatively homogeneous, with consumers for the most part offered a rather limited array of lifestyle images oriented toward the suburban family (the “swinging” bachelor lifestyle promoted in *Playboy* being a marked exception). In the 1960s and ’70s, however, there was a growing focus on variety and choice in products and advertising and an increasing emphasis on the individual consumer. In part this reflected the broader social upheavals that were occurring around the time, from the rise of feminism and gay and black identity politics to the emergence of “alternative” hippie lifestyles among a largely middle-class “counterculture.” It also reflected a major shift in the international economy in the early 1970s as many companies moved from the production of standardized Fordist goods for a mass market to producing specialist “post-Fordist” commodities that spoke to the creative individualism and relative anticonformism of the time.

The link between consumption and the notion of lifestyle choice as an expression of individualism came into its own in the 1980s, a period often seen as the peak of postmodern consumer culture and that saw the emergence of a highly sophisticated media and advertising industry around lifestyle concerns alongside the rise of new market segments like the “yuppie,” or young urban professional. Magazines at the time became increasingly lifestyle-oriented, offering readers (highly consumer-oriented) advice on everything from physical fitness and personal relationships to cooking, fashion, and travel. Where shopping and personal style had been seen primarily as a feminine domain, men were increasingly also the targets of the lifestyle media market, with high-end magazines like *The Face* and *GQ* addressing men as informed, style-savvy consumers. Such shifts in consumer culture

can be seen to mirror broader political shifts at the time and in particular the emergence in the UK and US of conservative “neoliberal” governments that sought to deregulate and privatize the economy and to reduce the role of the state in providing social services such as education and health care. Eighties-style neoliberal politics spoke in a language of free-market individualism which in turn dovetailed with postmodern consumer culture and its emphasis on flexible selfhood and the freedom to choose one’s own lifestyle. However, the focus here was less on adopting alternative, oppositional lifestyles (as in the 1960s and 1970s) than on often highly narcissistic forms of style-driven individual consumption, from body sculpting to fashion.

In the 1990s and into the twenty-first century the long-term influence of neoliberal ideology, at least in the West, has seen a broad popular acceptance of the notion of lifestyle as a privatized individual concern rather than as an attribute of social or class position. The present period then is one characterized by a *lifestyle culture* where questions of lifestyle choice and consumer-related practices have become central to everyday life and to people’s identities. The emphasis on lifestyle choice has seen the growth of a huge media industry around lifestyle advice, with lifestyle supplements now constituting a significant section of newspapers and lifestyle television formats playing a prominent role in primetime schedules. As governments have stepped back from the provision of social services, commercial forms of lifestyle media have begun to play an increasingly prominent role in providing people with advice and directing them to manage their own lifestyles. While much of the advice provided by commercial media is concerned with encouraging consumption, increasingly it has been marked by a focus on directing people toward “good” modes of consumption with an

increasing emphasis on the impact that personal lifestyle “choices,” such as diet and home energy consumption, have on the community. Lifestyle in the contemporary moment has thus become a pressing issue imbued with political and moral significance, where public concerns around the obesity “crisis” and global warming are increasingly framed in terms of the behavioral choices of individual consumer-citizens.

CRITICAL APPROACHES

A range of different critical frameworks has been used to understand the concept of lifestyles. Traditionally, within sociological thought the concept has been associated with the styles of life or ways of living of particular status groups (Sobel 1981; Weber 1991[1958]), that is as a marker of social hierarchies based on wealth, status, and power. Within contemporary culture, however, the term has increasingly become associated with an individualistic, choice-based notion of social identity.

A number of scholars have attempted to explain and contextualize this shift. In his influential recent essay titled “From ways of life to lifestyle,” David Chaney (2001) contends that where people’s lives were once shaped by relatively stable “ways of life,” the complexities and uncertainties of modern living have seen lifestyle culture come to fill the gap left by the demise of communal culture. Lifestyle here has come to play both a normative role, offering meaning and stability in uncertain times, and a status role, marking out social identity and difference.

Writing a decade earlier, Mike Featherstone (1991: 81) associates the growing role of lifestyle culture with the emergence of a postmodern consumer culture in which consumer goods are increasingly used as

“cultural signs.” Where once the notion of lifestyle was fixed by one’s membership of a particular social group, the rise of postmodernism sees lifestyle increasingly refigured as an individualized set of consumer-based stylistic choices. As Featherstone puts it: “Rather than unreflexively adopting a lifestyle, through tradition or habit, the new heroes of consumer culture make lifestyle a life project and display their individuality and sense of style in the particularity of the assemblage of goods, clothes, practices, experiences, appearance and bodily dispositions they design together into a lifestyle” (84).

Similarly, writing about the shift to what he terms “post-traditional” (rather than postmodern) society, Anthony Giddens argues that as traditional beliefs and social structures such as religion or class culture have become less dominant, identities are increasingly formed through lifestyle choices. Without the rituals and predictability of traditional societies, Giddens contends that “[r]eflexively organized life-planning . . . becomes a central feature of the structuring of self-identity” (1991: 5). That is, in a post-traditional world, the question of how one lives is not taken for granted but becomes a daily process of decision making about what one eats, what one wears, and how one behaves.

While scholars like Featherstone and Giddens argue that lifestyle has become a site of “reflexive” or self-conscious choice in relation to identity and self-expression, this is not to suggest that people are completely free to adopt whatever lifestyles they desire. As Giddens emphasizes, lifestyle culture is not just about a multiplicity of possibilities but “it is also a medium of power and of stratification” (1994: 76). Featherstone, meanwhile, sees lifestyle culture as continuing to be structured by class hierarchies. While contemporary postmodern society holds itself up as a democratic space freed

of social divisions, the particular kinds of lifestyles and forms of taste promoted today tend to be those of the “new” middle classes or petite bourgeoisie.

The work of the French sociologist Pierre Bourdieu has been crucial to debates around lifestyle, especially his account in *Distinction* (1984[1979]) of the relations between social distinction, taste, and class. Based on a survey of more than 1,200 people in France in the 1960s, *Distinction* maps the rise of a professional class of symbolic workers or “cultural intermediaries” who act as mediators between bourgeois culture and a growing petite bourgeoisie, spurred on by a growing consumer culture. In an analysis that remains surprisingly relevant to contemporary lifestyle culture, Bourdieu describes the emergence around this class of a strongly individualized, aspirational culture of self-expression and continual self-improvement (367), that is an earlier form of the kind of lifestyle culture that dominates today.

Bourdieu’s work is particularly useful for understanding the way in which social class and power inequities continue to be played out within consumer culture. While consumer culture promotes itself as a site of democratization of consumption and taste, Bourdieu’s work demonstrates at the same time that it tends to privilege the taste and lifestyle dispositions of dominant groups, in this case the “new” aspirational middle classes.

Another important critical framework that has been used to analyze the growing dominance of middle-class forms of lifestyle culture and taste concerns the rise of neo-liberal forms of government and their focus on the role of the consumer-citizen. In brief the argument made here is that, as neo-liberal governments have increasingly sought to place responsibility for once public concerns such as health on individual consumer-citizens, middle-class forms of lifestyle culture promoted by commercial

media have come to fill the gap left by government (see Ouellette & Hay 2008).

M

Macdonald, Dwight

FARHAD IDRIS

Dwight Macdonald (1906–82) was a prominent American author, editor, film critic, cultural critic, and political activist. He was a leading figure in the cultural scene from the 1940s through the 1960s and was widely known for his many stances on the issues of the time. He held no consistent political philosophy; rather, he advocated a brand of politics that veered from left to right and to left again. These “positions” led to heated controversies.

Macdonald was born in New York City into an affluent white Protestant family and received his education at Bernard School for Boys, Phillips Exeter Academy, and Yale University. Macdonald’s professional career began as a trainee salesman at Macy’s. Just a year or so later, he joined *Time* magazine and was soon transferred to its sister publication *Fortune*. This was when he openly espoused Marxism in his writing. Because of a critical excoriation of the steel industry, he fell out of favor with the *Fortune* management and joined the editorial board of the prestigious *Partisan Review*, then headed by Philip Rahv and William Phillips.

Macdonald was a card-carrying socialist at the time. He joined the Socialist Workers Party in 1939 and became a vocal champion of the communist cause in his many writ-

ings. His admiration of that cause was short-lived, however. As a Trotskyite, Macdonald vehemently opposed Stalin, but he was quick to attack Trotsky when he felt that both Trotsky and the Socialist Workers Party were somewhat evasive in condemning Nazi German expansionism in Western Europe. Annoyed by Macdonald’s hostile writings, Trotsky commented: “Every man has the right to be stupid on occasion but comrade Macdonald abuses it” (Wreszin 1994: 83). According to Michael Wreszin, Macdonald’s biographer, the remark could have originated with Macdonald himself, though Stephen Whitfield’s well-documented quote from Trotsky’s writing suggests a strong possibility otherwise: “Dwight Macdonald is not a snob, but a bit stupid” (1984: 1).

Macdonald’s split with *Partisan Review* occurred over his strong antiwar stance. His “Ten propositions on the war,” co-authored with Clement Greenburg, angered Rahv and Phillips, who persuaded him to resign from his editorial post; however, he continued to contribute an occasional piece to *Partisan Review*. While Macdonald’s antiwar views were the obvious reason, his dissatisfaction with its editorial policy was the fundamental reason for his departure from the publication (Rodden 2007: 53). He disapproved of the literary direction that Rahv and Phillips were instituting for the journal. Macdonald

wanted a more political journal, so he created one and named it *politics*. The funding came from his wife's legacy and his own savings. *politics* attracted important well-known thinkers and personalities, George Orwell, Albert Camus, Bruno Bettelheim, and Hannah Arendt among them. Though the editorial policy he assumed was openly leftist, his critique of the Soviet Union for its excessive bureaucracy and totalitarianism grew increasingly virulent. Macdonald's break with communism and Marxism was only a matter of time. In 1946, he published in *politics* "The root is man," which expressed his new-found anti-communist beliefs.

Commenting on this radical shift, John Rodden and John Rossi note that Macdonald never found another politics that fired his imagination, that his romance with left politics existed exclusively at an intellectual level, and that he knew little of the American working class (2006: 10). Because of funding problems, *politics* folded as a regular publication in the late 1940s, though Macdonald put out issues at irregular intervals for a number of years afterward. His next steady occupation was that of a staff writer for the *New Yorker*. He also wrote for the British *Encounter*, a staunchly anticommunist publication later revealed to be funded by the CIA; contributed film and political criticism to *Esquire*; and wrote literary articles for the *New York Review of Books*, including its inaugural issue in 1963.

In 1960, Macdonald authored the influential "Masscult and midcult." Originally published in *Partisan Review* and later reprinted in *Against the American Grain* (1962), "Masscult and midcult" deals with a recurring issue in cultural criticism: the public taste and how the arbiters in the cultural industry shape it. Mass culture, or masscult, according to Macdonald, has a loose affinity with traditional folk art. However, in the emerging culture of the US, especially since

1945, it allows none of the sense of community that folk art fostered; rather it shapes individuals into a homogenized public and transforms them into mere consumptive units of cultural products. For Macdonald, television, authors, and artists such as Erle Stanley Gardner, Norman Rockwell, and *Life* magazine illustrate the worst of masscult. Midcult, on the other hand, only *pretends* to be the heir to traditional high art. It is, in fact, a dilution of high culture because it is established by people with suspect tastes. Between masscult and midcult, Macdonald directs his particular ire toward the latter because it has the power to leave long-lasting impacts on people's tastes. In the end, Macdonald is convinced that American culture is on an unstoppable downward spiral, but he sees some constructive elements in British culture.

The last decade of Macdonald's life was fraught with despair and alcoholism. His failure to author a substantial work deeply troubled him, more so because he was going through an unending writer's block. One can claim, however, that this self-condemnation was unfounded. Macdonald's essays occupy quite a few impressive volumes, and his *The Ford Foundation* (1989[1956]) is, according to Francis X. Sutton, "the only book-length account" of the institution (1989: vii). Macdonald developed another liaison with the Left – though it was not the political Left but the cultural Left – in the 1960s when he joined the antiwar movement. Opposition to war was one consistent element in his checkered intellectual career – for a brief period, though, he did support the US side in the Korean War (Rodden 2007: 55). Another would be his championing of the underdog, as when he was one of few to denounce Israel for its treatment of Palestinians. He died of heart failure in 1982.

Because of his wit and antitotalitarian and antiwar views, Macdonald is often

compared to George Orwell. His alleged anti-Semitism – a debatable claim, in some opinions – and concerns for high culture also remind one of T. S. Eliot and Ezra Pound. It is pertinent to note that Macdonald's support for *Pisan Cantos* played a part in Pound's winning the Bollingen Prize for Poetry in 1948 (Rodden 2007: 57). Others who benefited from Macdonald's sanction were James Agee, who won the Pulitzer Prize for *A Death in the Family*, a posthumous recognition; Michael Harrington, whose *The Other America* inspired Macdonald to write a positive review that caught President Kennedy's notice; and Hannah Arendt. When her *Eichmann in Jerusalem: A Report on the Banality of Evil* created a huge controversy, Macdonald defended her vigorously. In the year of his centennial, 2006, many admirers lamented that Macdonald had become a forgotten man. To the student of twentieth-century cultural and literary politics, however, he is a noteworthy presence.

Marcuse, Herbert

TIM LIBRETTI

Herbert Marcuse (1898–1979), a German philosopher and social theorist, was one of the leading figures in Marxist intellectual circles in the twentieth century. His intellectual and political odyssey constitutes an important chapter in the tradition and development of Marxist thought and in intellectual history generally, resulting in a body of work characterized by strikingly original multidisciplinary research that engages philosophy, aesthetics, psychoanalysis, and critical theory. This remarkable odyssey featured an early philosophical apprenticeship to Martin Heidegger, later membership in the Institute for Social Research where he studied and theorized alongside other Frankfurt School theorists such as T. W. Adorno, Max Horkheimer, and Walter Benjamin in the 1930s and 1940s. In 1933, Marcuse left Germany to escape Nazi persecution, eventually settling in the United States, where he pursued a career that included positions in the Office of Secret Services and the State Department (motivated by his desire, as a Jew who fled

Europe, to fight fascism) as well as academic stints at Columbia University, Brandeis University, and the University of California at La Jolla, where in the 1960s and 1970s he became a major influence on and defender of the New Left in both the United States and Europe, achieving a world renown that has since waned. His rise to intellectual and political eminence was due in part to his incisive ability to rethink Marxism and to synthetically engage Marx and Freud in the post-World War II socioeconomic environment, characterized by both abundance and the rise of a technocratic structure that ushered in the viability of imagining an end to poverty at the same as it posed the threat of a repressive society of total control.

In this latter regard, Marcuse's 1955 work *Eros and Civilization* might be considered the centerpiece of his intellectual production, although his earlier work in the Hegelian Marxist tradition, such as *Reason and Revolution* (1941), should not be discounted. In what is subtitled "a philosophical inquiry into Freud," Marcuse emphatically articulates his hallmark utopian Marxist vision and elaborates his comprehension and working through of the concept and problem of alienation that Marx theorized in his early writings and which captivated and arguably began to center Marcuse's philosophical imagination as early as 1933, when he published his first major review of Marx's *Economic and Philosophic Manuscripts of 1844*, which had just been published. *Reason and Revolution* constitutes Marcuse's response to and Marxist synthesis of the entire oeuvre of Freudian thought, even as he is powerfully influenced by Freud, as evidenced by what must be understood as his radical appropriation of psychoanalysis. Marcuse challenges the central thesis of *Civilization and Its Discontents*, in which Freud argues that civilization necessarily entails repression and hence our discontent, as the

maintenance of safety and order requires that we subordinate the pleasure principle, which drives us to recognize and satisfy our desires, to the reality principle, which pushes us to delay gratification and restrain antisocial desires. In particular, Freud argues that work is necessarily repressive and requires subordination of the pleasure principle. Against this analysis, Marcuse highlights the prospects for a non-repressive civilization characterized by libidinally gratifying and disalienated labor, open sexuality, and generally a society and culture committed to achieving freedom and happiness. Moreover, it is within Freud's own thought that Marcuse identifies the theoretical justifications and premises for a nonrepressive society, as he argues that Freud's theory suggested that the unconscious contained evidence of an instinctual drive toward happiness and freedom, which we see evidenced in aesthetic practice, philosophy, daydreams, and other dimensions of culture.

Marcuse effectively presents Freud's theory of normative human psychosexual development as an ideological narrative that accommodates people's alienation from themselves and their libidinal potentials so that their erotic and more generally creative energies can be instrumentalized in the capitalist system of labor exploitation. Reworking Freud, Marcuse argues that the reductive relocation of sexuality to the genital zones, which Freud theorizes as a normal stage in psychosexual development and which Marcuse sees as partializing what was once our more fully erotic bodies characterized by a "polymorphous perversity," achieves from the perspective of capitalist instrumentality "the socially necessary desexualization of the body: the libido becomes concentrated in one part of the body, leaving most of the rest free for use as the instrument of labor" (1955: 48). This condition of polymorphous perversity

becomes for Marcuse evidence of the creative whole self from which we have been alienated and which we need to recover from its repressed state.

This infantile state of polymorphous perversity indexes a state for Marcuse that needs not only to be recovered but also, of crucial importance, to be remembered. As critics such as Fredric Jameson and Martin Jay have highlighted in their studies of Marcuse's thought, the importance and role of memory, or anamnesia, cannot be overstated. While Freud more strenuously focuses on the recovery of repressed traumatic memories so that they can be dealt with responsibly in the present, Marcuse reminds us that the unconscious also contains past moments of gratification and of fulfillment of our potentials that we can recover as figures of the possibilities and promises that we have been taught to repress in civilization but which can be projected as a utopian goal. Importantly, for Marcuse, this state of fulfillment or happiness can be restored or achieved only through its externalization in an organization and set of institutions for the social whole. It is in this sense that memory functions for Marcuse as a primary energy for social revolution, and here we also see the abiding influence of Heidegger on his thinking about alienation, as he always retained Heidegger's sense that something crucial had been forgotten in modernity. For Marcuse, that forgetting is the symptom of our alienation from ourselves, from others, and from our world; and remembrance of these crucial aspects of being and world is key to overcoming alienation.

This latter notion that happiness must be achieved through creating the socioeconomic conditions that make human fulfillment and disalienation possible becomes a central feature of his utopian Marxism in such later works as *One Dimensional Man* (1964). During this time, Marcuse theorized

largely from within the United States' post-war society, characterized increasingly by abundance and affluence. While on an individual basis immediate desires might be more easily satisfied in such a society, the fulfillment of these individual desires did not address the more fundamental source of unhappiness, the abiding condition of alienation that was symptomatic of capitalist social institutions and organizations of labor. For Marcuse, however, the ability to gratify immediate individual desires more readily actually siphoned off revolutionary energies, hindering movements for liberation. Thus, for Marcuse, liberation from affluence became a guiding objective for revolutionary activity aimed at creating a disalienated society.

Mass Culture

FARHAD IDRIS

The term “mass culture” refers to cultural products that are mass produced and intended for commercial success, particularly in the context of the latter half of the twentieth century. It therefore has a strong association with consumer culture and with the commodification of culture under capitalism. Social critics have struggled to develop a sense of “culture” appropriate for a large population ever since the eighteenth century when the Industrial Revolution concentrated people in vast urban centers. In its broad sense, “culture” denotes not only aesthetic expressions but also life’s other aspects. Raymond Williams unravels some of the complexities of the concept in his influential *Culture and Society: 1780–1950* (1960[1958]). He explains the term’s evolution and associations with related concepts, such as industry, democracy, class, and art (xiii–xx). Culture, he argues, is not merely “a state or habit of the mind”; it is “a whole way of life” (xviii). On the other hand, cultural critics in the twentieth century often made a distinction between “high” culture and “low” culture. The latter resembles working-class culture as well as popular culture. “Mass culture,” as distinguished from “popular culture,” tends to have negative connotations and to suggest the cultural manipulation of the masses by the large corporate entities that produce mass culture.

The early growth of mass culture parallels that of working-class culture, and a historical overview of both is useful. It was Matthew Arnold who first pointed out the

nexus of capitalism and working-class culture in his *Culture and Anarchy* in 1869. *Culture and Anarchy* reveals a deep anxiety about the uncertainties of Arnold’s time, about the rise of capitalism and the rage of the working class. Arnold describes the predicament: “our social machine is a little out of order; there are a good many people in our paradisiacal centers of industrialism and individualism taking the bread out of one another’s mouth” (1960[1869]: 80). Arnold believes that capitalist greed, combined with extreme libertarianism, creates a dangerous society.

In the early twentieth century, commentators such as T. S. Eliot and José Ortega y Gasset extended Arnold’s concerns about the massification of Western culture. Clearly motivated by a dread of the working class, Eliot sees the culture of mass society as a threat to the cultural legacies of the West. Ortega is equally horrified by modern mass culture, though for him mass culture is less directly associated with the working class. His mass society, in fact, includes the successful lawyer as well as the bus driver and the homeless. Neither provenance nor profession defines people in this society. What defines them is their sheer number, their all-pervasive sameness, their lack of individualism, their lack of taste, and a whole range of other deficiencies. Massified society signals civilization’s end because the ability to reason, which was instrumental in the growth of Western civilization, is no longer a prized quality. Reason has been replaced by the right not to think, “the Magna Carta of barbarism,” as Ortega puts it (1985 [1929]: 63). The dismal state of affairs has come to pass because Europe has dismantled all traditional authoritative social structures, leading to amorality (174) – morality, in Ortega’s view, means submission to legitimate authority.

If both Eliot and Ortega critique mass culture from fairly conservative

perspectives, a more penetrating condemnation of mass culture appears, in fact, from the Left. Scholars associated with the Institute for Social Research in Frankfurt, Germany, usually referred to as the Frankfurt School, have offered the most systematic and sophisticated study of mass culture in the twentieth century. The Marxist scholars of the Frankfurt School included Max Horkheimer, Herbert Marcuse, Theodor Adorno, Jürgen Habermas, and even Walter Benjamin (who didn't hold an administrative position at the Institute but influenced it and received its patronage in several ways). Horkheimer and Adorno offer the most thorough and meticulous appraisal of mass culture in "The culture industry: Enlightenment as mass deception," which forms a chapter in their *Dialectic of Enlightenment: Philosophical Fragments* (2002[1944]). This decisive work examines many facets of mass culture. As the title of their essay indicates, Horkheimer and Adorno place much emphasis on the corporate nature of mass culture, as when they point out that broadcasting companies and moviemakers depend on electricity industries and banks (96).

Two characteristics of mass culture, however, are the most sinister for Horkheimer and Adorno – its totalizing power and its "[u]nending sameness" (106). Mass culture invades every sphere of life: "The whole world is passed through the filter of the culture industry" (99). As it shapes individuals to think and act in predictable ways, mass culture blurs the distinction between entertainment and work, creating the illusion that the "world outside is a seamless extension of the one which has been revealed in the cinema" (99). "The culture industry" retains strong memories of Nazi Germany, where fascism thrived on repetitious propaganda. In its endless repetitions of various catchphrases, mass culture, to Horkheimer and Adorno, is unmistakably reminiscent of fascism. Mass culture, in

their view, does not allow much variation on the basic. As they say, there is no material difference in "the offerings of Warner Brothers and Metro Goldwyn Mayer" (97). Some other detrimental aspects of mass culture that Horkheimer and Adorno reveal in the chapter are its ability to dish out "something for everyone" (97), its dependence on clichéd motifs (98), its lack of a sense of style (103), its exclusion of the new (106), and so on. Horkheimer and Adorno view mass culture as a unique phenomenon in Western civilization. Since certain formations in corporate industrialization led to its creation, mass culture has no precedents.

The effects of mass culture are profound, one of which is the blurring of boundaries. The subjects fail to classify between what is good and what is bad because "Kantian schematism is denied" to them and nothing is left to classify (98–9). Adorno develops this particular point in another essay, "The schema of mass culture," available in *The Culture Industry* (1991). Over and over again, the Horkheimer–Adorno analysis of the culture industry shows the insidious workings of mass culture, which operate to help establish the approved ideology of capitalism: "Donald Duck in the cartoons and the unfortunate victim in real life receive their beatings so that the spectators can accustom themselves to theirs" (110).

"The culture industry" focuses primarily on films, as well as on other light entertainment products. Comic books, popular among the young in the 1940s through the 1960s, were thought to be harmful, not just by Horkheimer and Adorno but also by others. Fredric Wertham, a German psychiatrist who settled permanently in the US, argued that comic books had an extremely pernicious influence on young minds. In *Seduction of the Innocent* (1954) and many articles, he demonstrates the link between comic books and violence and recommends

strong censorship of these (to him) trashy cultural products of mass culture.

There can be no doubt that, later in the twentieth century, television had a more profound influence on children's socializing experience than comic books. Certainly, television has proved to be the most potent vehicle of mass culture of any medium, and very few adults in the Western world can claim to have been raised in a home without a television. Adorno's "How to look at television" unravels some of the interesting ways television operates in today's culture, for example, its promotion of "false realism" (1991: 158), its dissemination of many-layered cultural codes (164–5), and its manipulation of the audience – what Adorno calls "a technological means of 'handling' the audience" (166). What he and Horkheimer state in "The culture industry" about the radio and film applies to the television as well, but a more thorough study of television, from production of programs to audience reception, appears in Williams's *Television: Technology and Cultural Form* (1974). It is interesting to note that Williams discounts the notion that television contributes to violence in society, arguing, instead, that television is an effect of social processes (126–34).

Williams's *Television* acquaints readers with different production systems of the world (1974: 32–43); however, the bulk of his discussion centers on the systems developed in Britain and the US. He explains that the two are based on somewhat contrasting principles: television as "public service" in Britain and television as a "commercial institution" in the US (36). An important finding in Williams's analysis of television is "the shift from the concept of sequence as *programming* to the concept of sequence as *flow*" (89). The difference between the two lies in the placements of commercial breaks; in the former, one can watch a show – for example, a film – with no interruptions, while in the latter, as American viewers are

well aware, this is not so. Williams recalls the first time he watched American television in Miami and acknowledges that it was quite a confusing experience (91–2). American television, on the other hand, is popular in Britain, as Williams notes, where it is promoted not as commercial (or capitalist) television, rather as "'free' and 'independent'" television (37). The Independent Broadcasting Authority in Britain has emerged, it appears, to fulfill this particular need. Broadcast of American television productions also occurs in other parts of the world, sometimes surreptitiously, with no identification, with the backing of the United States Information Agency (40–1), later renamed the United States Information Service. With improvements in satellite and receiver technology, broadcasts of many Western networks are available to Asian and African viewers 24 hours a day now.

Meanwhile, the proliferation of cable and satellite television networks suggests an increasingly fragmentary viewing experience, and the trend is no doubt a result of intertwining entertainment and consumerism. This seamless fastening of disparate elements, moreover, demands heightened viewing effort. Julian Stallabrass captures the experience well when he says, "Television has a relentless one-way character" (1996: 200). Williams's awareness that this powerful apparatus of mass culture is global in scope emphasizes its status as a vehicle of multinational capitalism. Here it is useful to remember that in *Postmodernism; or, The Cultural Logic of Late Capitalism* (1991), Fredric Jameson, the Marxist literary theoretician and cultural critic, identifies the video or television as a cultural marker of postmodernism – in contrast to the film, which is primarily a product of modernism (69, 76).

Another leading critic of mass culture, Dwight Macdonald, a powerful presence in the American cultural scene in the 1950s and

1960s, articulates ideas similar to those in Horkheimer and Adorno's "The culture industry." A renegade socialist when he wrote "Masscult and midcult" for *Partisan Review* and published it again in *Against the American Grain* (1962), Macdonald quotes Adorno's *On Popular Music* and censures many trends in the emerging popular culture of the US. Masscult unmistakably is the mass culture of "The culture industry." It is to Macdonald's credit that he recognizes another cultural stratum in the US, the midcult, which masquerades as high culture. Macdonald suggests a variety of examples: the Revised Standard Version of the Bible, the Book of the Month Club, Ernest Hemingway's *The Old Man and the Sea*. Midcult dilutes high culture; to Macdonald, this, in fact, is modernist art "because it [midcult] incorporates so much of the avant-garde" (1962: 51). It is curious that when Horkheimer and Adorno take a great deal of care to separate mass culture from high art and popular art, what they call "serious art" and "light art" (2002: 107), they, too, defend modernism.

Is mass culture a regionally and historically specific concept, applicable only to the West in the mid-twentieth century? Or is it a term still useful in understanding contemporary society, a society that, in this day of fast travel and the internet, is global in scope? It certainly behoves one to view mass culture as one of several transitional phenomena leading to postmodernism – with some positive aspects as well. Eliot, Ortega, Horkheimer, Adorno, Macdonald, and other critics of mass culture, thus, were rebelling against early signs of the modernizing process that would eventually lead to postmodernism. One reason for their distaste of mass culture was its conflation of high and low. Cultural elitism, which mass culture resists, on the other hand, has fallen out of favor in establishments such as academic and entertainment institutions. What

defines high art is also a troublesome quest. Culture wars that have revamped the literary canon in American universities beginning in the 1960s have challenged the quality of so-called masterpiece texts. A prime example is *Heart of Darkness*. Readings informed by contemporary literary theories amply demonstrate the text's latent racism and misogyny. Jameson, moreover, shows that the totalizing and hegemonic power of mass culture had its limits. He indicates in "Reification and utopia in mass culture," originally published in *Social Text* and later included in *The Signature of the Visible* (1992), that even in some widely popular mass culture products, such as Hollywood's *The Godfather*, one can detect utopian elements that suggest alternatives to the capitalist status quo. Jameson attributes the film's phenomenal appeal to the Mafia family's ability to protect those who depend on them. Neither the state nor any other entity can offer the same to its people. Mass culture, Jameson further observes, could not penetrate certain "marginal pockets" of cultural production, such as "black literature and blues, British working-class rock, women's literature, gay literature, the *roman québécois*, the literature of the Third World" (1992: 23). Indeed, the increasing multiplicity of ethnic origins that characterize today's Western society certainly undermines the homogenized mass that "mass culture" implies. Our society in the twenty-first century is a lot more complex than the early critics of mass culture could ever have imagined.

Another phenomenon that has had an impact on the concept of mass culture is the rise of cultural studies, first in Britain and then in North American academic institutions. The Centre for Contemporary Cultural Studies, founded in Birmingham, England in 1963 – later shut down in 2002 for political radicalism – became a model that inspired the establishment of similar

entities in North American universities in the 1980s and 1990s. The event led to a huge amount of scholarship and publications and the founding of several prestigious journals dedicated to cultural studies. Scholars associated with Birmingham's CCCS, mostly Marxists, maintained the concept of mass culture, but those in North America watered it down, the reason being they were more interested in issues of race and gender than of class. They like to approach mass culture in a more nuanced light, preferring the term "popular culture" instead because the theory of mass culture is hard to disengage from commercial issues.

Consider, for example, Simon During, who argues in *Cultural Studies: A Critical Introduction* (2005) that the idea of mass culture had currency only "traditionally" and that it "failed to account for nuances, differences and qualities within the domain that it named" (196–7). Still, During believes that "The problem with jettisoning the concept of mass culture once and for all is that not all popular-cultural products are equally popular. Some are much more widely consumed than others" (197). On the other hand, he maintains that the theory of mass culture is helpful only in grasping certain aspects of popular culture. During, however, does not mind jettisoning the commodifying and reifying tendencies of mass culture when he offers the notion that mass culture is "culture that accesses audiences across a variety of cultural sectors and is part of almost everyone's cultural literacy within a particular society" (197). To During, mass culture is a "sub-section of popular culture," which is "all culture that is not regarded as, or does not consider itself, elite culture" (197).

Nevertheless, traditional mass culture continues to draw significant scholarly attention. Two recent works worth considering are Bruce Lenthall's *Radio's America* (2007) and Susan Smulyan's *Popular Ideol-*

ogies (2007). Lenthall's intention is to present the radio, very popular around the mid-twentieth century, in a new light. According to Lenthall, the view that the radio disseminates only impersonal and low-quality cultural products is not accurate. Lenthall's study, which uses letters sent to the radio stations by their listeners and other primary documents, demonstrates that radio listeners formed a community that stretched across the nation. Smulyan, on the other hand, deals with key issues in cultural studies, such as race, class, and gender. The most interesting chapter in the book is the one on the history and use of nylon stockings. First promoted as a cheaper alternative to the silk stocking, the nylon stocking became invested with cultural meanings from its very creation and marketing by DuPont. Smulyan shows how nylon became a commodity with strong cultural resonances: "Nylon had ideas about femininity, and to a lesser degree ideas of race and nation, built into its molecular structure" (2007: 50). The success in marketing this product depended heavily on US national sentiment because it was competing against Japanese silk in the late 1930s. There can be little doubt that studies that treat such interesting aspects of mass culture will keep appearing in the future.

McLuhan, Marshall

CHRISTINE HOFFMANN

Marshall McLuhan (1911–80) was a Canadian cultural theorist, best known for his work on the media and communication,

specifically his theory that all media are extensions of human faculties. For most of his career, he taught English at the University of Toronto, but he was also a magazine editor, a grammarian, and a Catholic convert, in addition to being considered a media guru, prophet, pop philosopher, punster, and patron saint of *Wired* magazine, to name but a few. He is famous for inventing and/or popularizing such well-known phrases as “the global village,” “typographic man,” and, most famously, “the medium is the message.” Due in part to his growing popularity in mainstream culture, McLuhan became a controversial figure in cultural studies; inserting playful puns alongside traditionally academic, erudite discourse, his publications range in tone from the scholarly to the blithe. Alternately dismissed and embraced, McLuhan may claim credit for expanding the debate surrounding media studies and thus ensuring that communication theory became part of a much more general public conversation.

McLuhan arrived at his central argument regarding media as extension relatively early in his academic career; almost all of his publications expand on this initial theory, first introduced in *The Gutenberg Galaxy: The Making of Typographic Man* (1962). McLuhan had published *The Mechanical Bride: The Folklore of Industrial Man* in 1951, which focused, rather censoriously, on the content of various media such as radio, television, and advertisements. By 1962 he had shifted focus from the content of media to the form of the medium itself.

In *The Gutenberg Galaxy* and elsewhere, McLuhan specifically argues that new forms of communication are extensions of human senses. The phonetic alphabet and the printed book, which followed Gutenberg's invention, are extensions of the visual sense, and while such an extension privileges a fixed individual point of view, thus privileging individualism, it also inspires

a paradoxical drive toward homogeneity and closure. With this move from the ear to the eye, McLuhan suggests, words are translated into mass-produced, uniform, repeatable commodities, “things.” The effect, to quote McLuhan himself, is a “visual homogenizing of experience” and an “ingraining of lineal, sequential habits” (1962: 125). McLuhan devotes most of the book to explaining the paradox of the power of print, which empowers the individual reader’s private, subjective experience even as it induces a rigorous definition of rationality as linearity. In the future, McLuhan predicted, the conflict would go the other way, thanks to the development of electronic technology. If print is an extension of the visual sense, electronic technology is an extension of the entire central nervous system. With no one sense privileged, the drive toward universal homogeneity is disrupted. We face instead the pressure toward collectivity and interdependence – retribalization – or, the global village.

McLuhan’s next publication, *Understanding Media* (1964), expands on and looks forward to the impact of this cultural change. With individual chapters dedicated to clothing, housing, money, clocks, photography, radio, television, telephones, cars, games, movies, and weapons – all of which McLuhan identifies as media – *Understanding Media* explains more fully the revolutionary cultural changes ushered in by various media of the electronic age. According to McLuhan, the introduction of any new medium leads to a process of “speeding-up”; before the electronic age, whenever human beings managed to extend themselves via new media, the result was an increase in diversity, fragmentation, and specialization. Borrowing in part from the theories of his Toronto colleague Harold Innis, McLuhan explains how, in an effort to manage this increased diversity, existing centralized power sources would utilize

the new media to resolidify the familiar center/margins organization of society. But the electronic age disrupts the center/margin model, replacing explosion and expansion – a specialized, fragmented society obsessed with linear causality – with implosion and contraction – the more intimate, retribalized global village. The fixed point of view is no longer privileged, altered as it is by a new compulsion toward participation and spontaneous involvement, thanks to the nature of the new, inclusive media.

McLuhan partly explains this disruptive process through an identification of certain media as “hot” or “cool.” A hot medium is one that extends a single sense, is filled with information, and thus demands little participation. According to McLuhan, photographs, radio, movies, and print are hot media. In contrast, a cool medium provides less information up front; its gaps must be filled in by the listener/viewer/participant, rather like the pointillist dots of a Seurat painting must be “filled in” before the picture takes shape. Cool media such as the telephone, the hieroglyphic, and the television require high levels of participation. McLuhan sees Western society as caught between the compulsions of hot and cold, new and old media – we may *live* electrically but still *think* linearly. Thus most initially react to the adoption of new technology with numbness, still hypnotized by a past that favored the extension of a single sense. Though he extends the capability to anyone and everyone, McLuhan isolates the artist as the person uniquely capable of making him- or herself conscious of the formal qualities of media. Among the artists most useful to McLuhan are James Joyce, T. S. Eliot, and William Blake, though he argues that all artists are more likely than nonartists to put themselves in the position to see technologies for what they are – extensions of human faculties – and

then extend their understanding to the masses. McLuhan repeatedly cites the Narcissus myth as an illustration of the social ignorance of media forms: most interpretations of the story argue that Narcissus, in embracing his own image, falls in love with himself, but a more accurate interpretation insists that Narcissus falls in love with an extension of himself, not at all realizing that this extension *is* himself. McLuhan uses this myth to caution against the narcissistic attitude toward media as unattached to and independent of human faculties. The ultimate aspiration proposed in *Understanding Media* is a condition of a harmonious, collective, cosmic consciousness brought about by the recognition of electronic media as the extension of all the senses at once.

Such a recognition of what McLuhan calls the new world of “allatonceness” necessitates the abolishment of traditional notions of time and space as precise and measurable quantities. With graphic designer Quentin Fiore, McLuhan attempted to illustrate this eroding of tradition in *The Medium is the Massage* (1967). Though itself a printed book, which became a bestseller, *The Medium is the Massage* disturbs the conventional organization of its content, which appears slanted, backwards, and upside-down, interrupted by graphics, cartoons, and a variety of allusions to art, literature, and current events. McLuhan explains the pun/typo of the title (“massage” rather than “message”) by claiming that “all media work us over completely” (1967). Essentially the book repeats McLuhan’s basic positions on media extension and the global village outlined in *Understanding Media*, with the added emphasis on the potential of young people, those already exposed to the new and nontraditional technological environment. Indeed, the book “concludes” with a *New Yorker* cartoon in which a young man, seated uncomfortably in his father’s impressive library, enthusiastically explains

McLuhan’s theory of social involvement to his bewildered parent, who clutches a printed book in his hands.

If McLuhan sets forth the possibility of a cosmic consciousness in *Understanding Media* and *The Medium is the Massage*, 20 years later he and colleague Bruce Powers used *The Global Village: Transformations in World Life and Media in the Twenty-First Century* (1989) to explain in more detail how this change in perception might occur. Here McLuhan proposes the concept of the tetrad as a means of predicting the future effects of any medium (“figure”) by simultaneously considering the historical context (“ground”) that initiated the medium’s adoption. The tetrad is a tool made up of four questions: (1) What does any medium enlarge or enhance? (2) What does it erode or obsolesce? (3) What does it retrieve that had been earlier obsolesced? (4) What does it reverse or flip into when pushed to the limits of its potential?

Among many others, McLuhan offers the example of the automobile: cars *enhanced* the ability to traverse long distances quickly, thus *eroding* the pedestrian means of transport as well as transport by horse. The automobile *retrieved* a spirit of individualism and private expression, but when pushed to the limits of its potential through traffic and pollution, the medium *flipped*, leading to a renewed interest in less congested, more convenient, and more environmentally responsible forms of transport – smaller electric cars, plus walking, biking, jogging. By inserting any medium into the same structural formula, one can better understand the resonance of that medium, its simultaneous relation to past, present, and future. What McLuhan celebrates here is his understanding of acoustic, as opposed to visual, space and the opportunities he believes it provides to recognize interchanging patterns, as opposed to linear sequences. Thanks to the interchanging

patterns of electronic media, McLuhan predicts for the future a sudden, sped-up process of decreased individualism, which will lead to a temporary trend of narcissism as those formerly dependent on individual and specialized definition retreat inward, but which will eventually drive new technologic man to involve himself, spiritually and wholly, in the global village.

Critics have much to say against McLuhan's technological materialism, in particular his totalizing vision of the technological sublime, suspicious to some for its uncomfortable likeness to the Christian heaven. Retribalization, for the Catholic McLuhan, is a kind of sinner's redemption. Other critics claim McLuhan's media theories are ahistorical: even the questions of the tetrad, which posit an interest in the past and the present context of an artifact, are fundamentally nonspecific and therefore untenable. In addition, McLuhan's concentration on predicting the effects of media is a generally passive enterprise that fails to take into consideration power imbalances in society and a practical strategy for effecting change. Released from the bias of the eye, McLuhan's technologic man or woman may finally comprehend the effects of new media – may submissively comprehend, in other words, their place in an unremitting flow of information that would progress regardless of their comprehension.

In his life, McLuhan could readily admit to his uncertainty as a scholar if not to his bias as a believer, a man of faith. If his theories are not always immediately practicable, nor all his predictions likely to materialize, much of McLuhan's work is relevant today, given the expansive and accelerating developments in electronic technology that have occurred, and are occurring, in the twenty-first century. In entertainment, education, politics, and political campaigns, in the military and the economy – the effects of these developments are felt almost everywhere, and in every

industry. McLuhan's enthusiastic approach to media study can serve as a model for anyone interested in the immediate social consequences of developing mass media.

McRobbie, Angela

EMILY A. MATTINGLY

Angela McRobbie (b. 1951) is a cultural critic and theorist, influential in both

feminist and cultural studies scholarship. She is best known for her prolific work concerning young women, gender, sexuality, class, race, subcultures, postmodernism, and various popular and consumer cultures. Originally from Glasgow, Scotland, McRobbie now resides in England, where she has been a Professor of Communications at Goldsmiths, University of London since 1998.

Though McRobbie completed her undergraduate degree in English and sociology in 1974 at Glasgow University and her PhD in sociology in 1998 at Loughborough University, she is most often associated with her postgraduate training in the mid-1970s at the Birmingham Centre for Contemporary Cultural Studies. While greatly influenced by other Birmingham School scholars, McRobbie's early work importantly critiqued their exclusion of both girls and women in their analyses of subcultures, class, and media. In particular, McRobbie & Garber (1976) condemned many Birmingham School scholars' male-centered discussions about British youth. Advocating that critical investigations of young women are necessary to cultural studies scholarship, McRobbie's early research often focused on various working-class women's and young girls' complex relationships with femininity and cultural production.

From McRobbie's early body of work exploring these relationships came her groundbreaking research on popular magazines for girls (McRobbie 1982). The first theoretical work to take such girls' magazines seriously, McRobbie's research was a catalyst for various scholars' later theorization of young women and popular culture. In her more recent publications, McRobbie continues to explore young women's magazines and the young women who read such magazines. Indeed, in her recent work, she explores what she argues was a dramatic content shift young women's

magazines underwent in the 1990s and how this shift reflects changes in both feminism and normative models of femininity (McRobbie 1997). In her work on young women's publications she investigates specifically both depictions of sexuality and the relationships between editors, publishers, and young female readers.

As her later work with young women's magazines suggests, McRobbie's recent research projects focus less on women's and girls' relationships with ideology and more on their various practices as consumers and laborers. Her most recent work often examines how young women now operate within more flexible gender norms and how these norms in turn affect young women's consumption and labor practices. Especially important to her recent scholarship concerning consumption, labor, art, and popular culture is postfeminism. In particular, McRobbie's recent work often explores how postfeminist processes forge complex discourses about young women, gender, and sexuality (McRobbie 2004).

Metz, Christian

JACKSON AYRES

Christian Metz (1931–93) is an important and influential figure in the fields of film theory and film language. Metz is known best for pioneering a scientific approach to film theory, applying both semiotic and psychoanalytic models to the study of film. Born in Béziers, France, Metz received the world's first doctorate in semiology, and taught at the Ecole des hautes études en sciences sociales in Paris.

Metz's early work was heavily influenced by Ferdinand de Saussure's research into the process by which a language system – a structure of rules and conventions – allows language to produce meaning. This scientific objectivity and precision appealed to Metz, and his early collections of essays, *Film Language* (1974a[1968]) and *Language and Cinema* (1974b[1971]) were attempts to discover and formalize a cinematic language system. Metz's early attempts to apply Saussure's formula directly to film were frustrated by two problems, which he identifies in *Film Language*. First, film

is a language that lacks phonemes, Saussure's term for the minimum units of language, and, due to its iconic nature, even the smallest unit of film, the shot, contains within it an entire "block of reality" (1974a [1968]: 15). Related to this was the second complication Metz encountered in his application of Saussure to cinema: the seeming lack of arbitrariness (in Saussure's sense) in the signification of the image.

Metz was able to reconcile these obstacles by reconfiguring his language system of the cinema as a structure used primarily for constructing narrative. He argues that the smallest units of cinema and cinematic narrative – the filmic images – are akin to sentences or events, and that these individual images are subordinated in the construction of a larger narrative. From this premise, Metz lays out his core questions to the semiotics of the cinema: "How does the cinema indicate successivity, precession, temporal breaks, causality, adversative relationships, consequence, spatial proximity, or distance, etc.?" (1974a[1968]: 98). Metz proposes the *grande syntagmatique*, a formal catalog of shots and their relations to each other, as his attempt to answer these questions.

The *grande syntagmatique* is composed of eight types of independent segments: the autonomous shot, the parallel syntagma, the bracket syntagma, the descriptive syntagma, the alternative syntagma, the scene, the episodic sequence, and the ordinary sequence (124–33). Additionally, Metz argues that the formal elements of cinema – editing, *mise-en-scène*, lighting, point of view, etc. – all contribute to creating narrative within the filmic image. Metz's eventual concentration on the importance of narrative moves his work into narratology, examining how narrative structures influence the perception of events, culture, and cultural artifacts. Although his *grande syntagmatique* is designed primarily to

understand and describe the mechanisms that produce narrative in realist fiction films, Metz claims the system applies to more experimental, nonrealist types of film as well. Although film's lack of double articulation or an entirely arbitrary terminology prevents Metz's system from operating as an exact cinematic equivalent to Saussure's language system, his concentration on narrative does provide a relatively stable and formal method of film analysis.

Metz's later work expands upon his cinematic semiotic model by exploring the possible contribution "Freudian psychoanalysis make[s] to the study of the cinematic signifier" (1977: 17). Metz's psychoanalytic project for cinema applies Freud's concepts of mirror identification, voyeurism, exhibitionism, and fetishism in order to study the relationship between the film text and the viewer. To substantiate this relationship, Metz finds in film a parallel to Freud's theory of phallic lack. The same psychic process of disavowal used by a child in the denial of its mother's phallic absence is also operating between the viewer and the film image. Film viewers willingly accept the images in a film as real and meaningful while simultaneously, on a different psychic level, recognizing the gap between those images and their real-world referents. In other words, cinema requires the viewer to "deny the signifier" in order to suspend disbelief in the illusion of film and grant legitimacy to those signified images. Metz argues that, since the psychological mechanism of disavowal found in children also allows the film viewer simultaneously to believe and disbelieve film images, other Freudian psychoanalytic concepts (including voyeurism and fetishism) are involved in the film viewer's relationship to cinema.

Christian Metz's work has provided a significant contribution to film theory, film languages, semiotics, and psychoanalytic criticism. His work is not without

its critics, however, especially of his attempt to apply a legitimate linguistic structure to cinema, which has been criticized as being too abstract, incoherent, and having limited applications. Despite such criticisms, Metz's work and research continue to gain considerable traction and influence among critics in the fields of film theory and semiotics. For his important and distinct accomplishments, Metz is generally recognized as one of the leading film theoreticians of the West.

Modleski, Tania

MEGAN HURLEY

Tania Modleski (b. 1949) is a prominent feminist critic of popular culture whose work focuses on popular texts by and about

women or produced for female audiences. She is particularly concerned with examinations of the ways in which these narratives address women's needs in ways that perpetuate patriarchal hegemony and how artists and critics might address women's needs in more radical, liberating ways. Educated at the State University of New York at Albany and Stanford University, Modleski has spent the majority of her career as a Professor of English at the University of Southern California. She has served on numerous panels and editorial boards. She is also the editor of *Studies in Entertainment* (1986).

In her first book, *Loving with a Vengeance* (1982), Modleski draws on feminist, psychoanalytic, Marxist, and semiotic criticism to explore the interactions between female readers' desires and the forms of mass art aimed at them: Harlequin romances, gothic novels, and soap operas. Modleski finds that these forms reflect real conflicts and patterns of trauma in women's lives, training women for the work of motherhood and teaching them to find pleasure in the repetitive logic of an adult woman's life. They also help to neutralize individual women's rage at their own constructed egolessness and unrealizable longing for just outcomes. While Modleski admits that the genres distort women's needs and desires, she argues that they reveal women's healthy fantasies as well, such as a longing for connectedness. She believes feminists should help women to meet their needs in ways that are more "creative, honest, and interesting" than those that popular texts currently provide. Modleski's discussion of the Harlequin romance, in particular, contributed to a feminist reconsideration of mass culture for women as a critical subject.

In her second book, *The Women Who Knew Too Much* (2005[1988]), Modleski addresses the controversy surrounding the treatment of women in Hitchcock's films. She argues that the films' misogyny and

sympathy for women are interrelated. Against other critics' conclusions that the female spectator can experience either a masochistic pleasure as she identifies with the violated woman or a transvestite pleasure as she identifies with the male aggressor, Modleski suggests a third option: anger. She argues that the female spectator may understand the symbolic system in which the narrative takes place, but not receive pleasure from it. Instead, she may use the text to experience the pleasure of analysis or the pleasure of acknowledging and working through the anger she feels within the patriarchy. Thus, *The Women Who Knew Too Much* participates in the re-evaluation of Laura Mulvey's theory of the female spectator. It also contributes to theories of the male spectator by helping to identify dynamics of masochism in male viewers and the ways that Hitchcock's films call into question male characters' claims to authority and mastery, as well as Hitchcock's own.

In *Feminism Without Women* (1991), Modleski critiques the postfeminist movement's complicity with mass culture in prematurely assuming that feminist goals have been attained. She says that, by identifying in traditional philosophy elements of passivity and masochism, and then conflating them with femininity and female experience, gender studies critics have allowed men to coopt femininity while continuing to oppress actual women. Modleski urges readers to distinguish analyses of the diversity among women, which she says feminism must emphasize, from a denial of "woman" as a category around which to organize to resist oppression, which she says robs feminism of its ability to bring about meaningful change. In her analyses of popular texts of the 1980s – including Pee-wee Herman movies, *Big* (1988), *Dead Poets Society* (1989), *Lethal Weapon* (1987), and *Three Men and a Baby* (1987) – Modleski

demonstrates a critical method for identifying and dismantling the strategies of postmodernism, particularly those associated with fragmentation and disruption, so that they do not function to reinstall dominant ideologies, such as patriarchy. She also demonstrates the tendency of reader-response criticism to reinforce readers' investment in fantasies that perpetuate political and cultural domination. Modleski describes the dream of women's liberation as a gift that feminist critics can bring to readers, a gift with the potential to cause radical change.

In *Old Wives' Tales and Other Women's Stories* (1998), Modleski uses her own life and work to argue for the diversity and flexibility of feminist critics who began their work in the 1970s, a group she says is often unfairly maligned as static and essentializing. The collection is generically heterogeneous, mixing traditional literary criticism with memoir. Modleski analyzes texts – among them Jane Campion's film *The Piano* (1993) and Sandra Bernhard's album *Without You I'm Nothing* (1987) – as well as her own experiences reading romance novels and caring for her aging parents. Her analysis continues her exploration of what women's genres hold for women and examines the ways that some stories by and about women uphold and perpetuate the repressive narratives of patriarchy.

Mohanty, Chandra Talpade

TIM LIBRETTI

Chandra Talpade Mohanty (b. 1955) is an important feminist theorist who associates herself most assertively in her writing with feminist struggles and the theory and politics informing those struggles. Nonetheless, it is fair to say that the vital contributions of Mohanty's feminist political thinking result from her writings' engagement with and emergence from the crossroads of many theoretical, political, and activist traditions, where, for example, Western feminist scholarship meets the historical realities of Third World women's lives and Third World anticolonial critiques; where feminist scholarship and the academy more broadly meet feminist political practice and struggles for economic and social justice more generally; and where a feminist politics must of necessity meet, inform, and transform into anticapitalist and antiglobalization struggles to realize its vision. While her work engages issues of economic and social justice on a global scale from what is arguably a profoundly historicized and deeply layered Third World Marxist feminist perspective, she is always clear that a feminist perspective centers her vision and that her work "is based on a deep belief in the power and significance of feminist thinking in struggles for economic and social justice" (2003: 1).

Mohanty's influence and commitment as a feminist theorist were clearly established in her essay "Under Western eyes: Feminist scholarship and colonial discourses" (1991 [1984]), in which she offers an incisive critique of Western feminist scholarship as engaging in a discursive colonization of Third World women in ways complicit with the effectively colonial discourse of the Western humanist tradition. The intent of the essay is not to discard feminism but rather to provide a corrective vision to reconstitute the radical political objective of feminism of empowering all women as historical subjects engaged in directing social transformation. In this objective, Mohanty argues, Western feminist scholarship has fallen short by "sustain[ing] the hegemony of the idea of the superiority of the West" (72) in its ahistorical representation of Third World women as objects of oppression rather than resisting subjects of history living in specific sociohistorical contexts.

Mohanty identifies a tendency of Western feminist scholars to construct a figure of the "average Third World woman" that exists apart from and thus elides the specific circumstances in which actual Third World women face and resist oppression, thus hindering rather than enabling our ability to understand, say, male violence or other modes of oppression as they operate in specific societies and hence also our ability to organize to change conditions. This "average Third World woman" is often represented as "ignorant, poor, uneducated, tradition-bound, domestic, family oriented, victimized, etc." (56), while Western feminist scholars tend to present themselves as secular, enlightened, liberated, and in control of their lives. This difference between the self-presentation of Western feminists and their representation of Third World women Mohanty terms the "Third World difference," the difference Western

feminism tends to add to its analyses of sexual difference when theorizing Third World women, which "includes a paternalistic attitude toward women in the Third World" (72). One major thrust of this essay is to challenge Western feminist scholarship – and all feminist scholarship – to situate and examine its practice in the context of a global economic and political framework and, in particular, to interrogate how its construction of Third World women enables its self-presentation and participates in colonizing practice by reinscribing imperialist figurations of First and Third World dynamics.

With the publication in 2003 of *Feminism Without Borders*, Mohanty powerfully extends, elaborates, and updates the analysis presented in "Under Western eyes," in part in response to changing political and social conditions. While she describes writing "Under Western eyes" in the context of a visible and activist women's movement in the mid-1980s, she diagnoses this radical movement as effectively exhausted as she writes in the early years of the new millennium. The inspiring context she identifies for this work is "a more distant, but significant, antiglobalization movement in the United States and around the world" (2003: 236). While in "Under Western eyes" Mohanty explored the colonizing effects of Western feminism and certainly moved to inform feminism with the politics and project of decolonization, in *Feminism Without Borders* she intensifies the focus on a redefined and recrafted decolonization movement responsive to developments in global capitalism. Acknowledging that the antiglobalization movement has not been substantially gender-focused, she stresses that "women of the Two-Thirds World" have always spoken for humanity as a whole by organizing against the predations of global capital and organizing anticolonial and antiracist movements. Thus, while in

“Under Western eyes” she wanted to decolonize Western feminism by refocusing its vision on the realities of Third World women’s lives and colonial relations more broadly, in *Feminism Without Borders* Mohanty wants to redirect political practice and organizing efforts more concretely and materially. While feminists have always been involved in antiglobalization movements, she wants this movement to be “a major organizing locus for women’s movements nationally in the West/North” (237), which historically it has not been as it has been, of necessity, for women in the Third World.

In *Feminism Without Borders* Mohanty continues to situate academic scholarship in a global political framework, making clear the political effects and ideological interventions involved in producing knowledge. She follows the first section of the book, “Decolonizing feminism,” with a second entitled “Demystifying capitalism.” This section features three chapters: the first focuses on women workers around the globe and ways of practicing solidarity with them; the second focuses on the corporatization of the university and its significance as a productive context for feminist scholarship and a site for feminist resistance; and the third explores how race and multiculturalism are mobilized in educational contexts in ways that enable or constrain dissent, and how we might develop pedagogical strategies that encourage and are themselves acts of dissent. Again, her insistence on creating a crossroads where academic theory and political practice of necessity collide is apparent, as is her insistence on a feminism that imagines freedom by grappling with the specificities of oppression globally so that we can better understand them and better organize against them. Indeed, the final section of the work, “Reorienting feminism,” makes clear that the politics of anticapitalism and

decolonization are for her necessarily involved in a genuine and effective feminist politics.

Morris, Meaghan

TANIA LEWIS

Meaghan Morris is a leading intellectual in the field of cultural studies and one of a handful of Australian cultural theorists whose work has gained a considerable audience in the Anglo-American academy. Her work spans a wide range of fields from cultural geography to feminism and

is strongly informed by French theory, in particular theories of the everyday.

Morris's intellectual career has been characterized by a considerable degree of mobility, both institutional and geographic. She has worked as a film critic for the *Sydney Morning Herald* (1979–81) and the *Australian Financial Review* (1981–5) and has held numerous research positions and taught in universities in Australia and in the US, only relatively recently taking up her first full-time academic position at Hong Kong's Lingnan University.

Born in Australia in 1950, Morris was raised in a small town on the outskirts of the industrial city of Newcastle in New South Wales and grew up in an atmosphere dominated by class issues and communist party politics. In 1969, she moved to Sydney to study French and English at the University of Sydney. Strongly influenced by the structuralist teachings of French studies academics such as Anne Freadman, it was in Sydney in the early 1970s that Morris was also first exposed to the work of French thinkers such as Louis Althusser and Michel Foucault via reading groups associated with various political movements such as the gay liberation movement. A pivotal period in Morris's intellectual development was her time based at the University of Paris 8, Vincennes, from 1976 to 1978 where she attended lectures by figures like Gilles Deleuze, Jacques Lacan, Foucault, and Roland Barthes. On returning from Paris, Morris became involved in the late 1970s in translating and publishing work by various French thinkers through small alternative presses, her work at the time subsequently playing an important role in disseminating French theory throughout Australia.

The 1980s saw growing academic recognition of Morris's work both locally and internationally, particularly in the US, with the publication of *The Pirate's Fiancée: Feminism, Reading, Postmodernism* in 1988

positioning her as a major cultural critic. In the late 1980s and early 1990s, Morris spent much of her time away from Australia on visiting scholar programs to the US. Ironically, it was during this period overseas that she wrote some of her now classic articles on specifically Australian sites and events. The 1990s saw Morris consolidate her status as a leading cultural critic, with the collection *Too Soon, Too Late* (1998) bringing together a number of her pivotal essays from the time.

Over the past decade Morris has become increasingly involved in developments in cultural studies in Asia. At the end of 2000, she moved to Hong Kong to take up a professorial chair in the Department of Cultural Studies at Lingnan University. Since then, from her base in Hong Kong, Morris has been playing a significant role in cultural studies research in the Asia Pacific through the *Inter-Asia Cultural Studies* project and as senior editor of *Traces*, a multilingual series in cultural theory. Since 2006, she has held a shared professorial position between Lingnan University and the Centre for Cultural Research at the University of Western Sydney.

Morris is known primarily as a highly gifted essayist rather than as a writer of single-themed, discipline-bound academic monographs. Her major contributions have been to the fields of feminism, cultural studies, media studies, film criticism, and cultural geography, with her essays being widely translated into a range of languages including German, Chinese, Japanese, and Persian. One strand of Morris's writings that has had a major influence on cultural studies (as well as on the fields of urban studies and cultural geography) has been her work on "the everyday." Morris has played an important role in introducing audiences to a specifically French genealogy of theories of the everyday as represented by the work of figures like Michel de Certeau, Henri Lefebvre, and Roland Barthes. At the same

time, through her local studies of Australian sites such as suburban shopping malls and the Sydney Tower, Morris has also foregrounded the limitations of applying French “high” theory, with its universalizing assumptions, to ordinary everyday culture (see Morris 1988a, 1988c, 1990a, 1990b).

Another important and influential dimension of Morris’s work and career has been her concern with highlighting questions of intellectual location. Much of her work is marked by an acute awareness of the way in which Australian and other “non-metropolitan” intellectuals, especially those writing about Australian culture, continue to be marked by nationality and specificity in a way that American or British cultural theorists are not. In “Afterthoughts on ‘Australianism’” (1992: 472), for instance, Morris interrogates the universalist assumptions underpinning certain types of “metropolitan internationalism,” emphasizing the “uneven distribution of labour” that marks the process of translation between metropolitan and nonmetropolitan theory. While a concern with the geopolitics of academic writing recurs throughout her work, questions of cultural exchange and translation have become especially central to her more recent work, focused as it is on popular culture and cultural studies in Asia.

Multiculturalism

TIM LIBRETTI

Multiculturalism, which might be defined as a careful attention to and respect for a diversity of cultural perspectives, has been a crucial part of cultural studies throughout the history of the discipline. Cultural studies and multiculturalism at some fundamental level share the common mission of destabilizing the entrenched bodies of knowledge, ideological perspectives, and most particularly the representational and interpretive practices through which the dominant culture shapes and regulates the production and consumption of

knowledge. Both academic discourses, in their original forms, fundamentally challenge traditional literary and cultural canons, what counts as “literature” and “culture,” as well as what are considered appropriate tools or modes of interpretation for assessing and analyzing literature and culture. In their most progressive forms, they are effectively allied and mutually supportive juggernaut theoretical movements and discursive fields that powerfully infiltrated and influenced reconfigurations of academic institutions in the 1980s and ’90s, reshaping – or attempting to reshape – the contours and contents of traditional disciplines and their modes and methods of inquiry.

While cultural studies has multiple intellectual and political sources, its emergence and development can certainly be traced to the mid-twentieth-century writings of Raymond Williams and others when intellectual Marxism was still linked to the English working classes and when the waning of the British Empire motivated a reconfiguration of the centers of knowledge production in the British university system. In its earliest formulations, cultural studies asserted the value and significance of popular and particularly working-class literary and cultural productions against the recently established system of production, consumption, and distribution of literary works known as “English literature,” which it questioned; that is, cultural studies unsettled the notion of a singular or homogeneous English national culture, exposing its elite class basis and ratifying the legitimacy of working-class modes of being, expression, writing, and overall ways of life as, in fact, culture. While initially cultural studies focused on the representations – and misrepresentations – of the working classes and highlighted the multicultural nature of British society in terms of class cultures, in successive generations following the

pioneering work of Williams and others, cultural studies expanded its focus and participation to include a range of diverse populations who challenged and complicated British identity from many sectors of the faltering empire, a development perhaps exemplified by Paul Gilroy’s 1987 work “*There Ain’t No Black in the Union Jack*”: *The Cultural Politics of Race and Nation*, which in part challenged the ethnocentric bias of earlier cultural studies practice and, again, underscored the heterogeneous populations of the English nation and their cultural practices with the aim of exposing the illusory ethnically absolutist construction of English national identity which elite class culture tried to represent as homogeneous.

Likewise, multiculturalism in the United States putatively and in principle, in its progressive forms, also entered the academy as a controversial challenge to the monocultural basis of knowledge production that tended to establish disciplinary foundations rather exclusively on the historical experiences and cultural productions of white males of Western Europe or the United States. Evolving out of the Third World student movements of the 1960s and early ’70s, which were stridently anti-imperialist and allied themselves with the many decolonization movements in Southeast Asia and around the globe, multicultural theory led to the development of ethnic studies programs on many American college and university campuses. It often sought to demonstrate the role of literary and cultural studies, particularly the construction of literary traditions and canons, in underwriting and ratifying the colonizing and otherwise racist practices of the United States and Europe in maintaining domination over the rest of the world. Edward Said’s 1978 work *Orientalism* was a key forerunner of multicultural criticism in its progressive manifestation as it uncovered the relays

between the racist production of knowledge about the non-European other and Western imperialist expansion and colonial brutality. Perhaps the most critically compelling and demystifying aspect of Said's work is his identification of racist ideology and thinking as produced not simply in overt political discourses but more thoroughly and pervasively by those presumed to strive for objectivity and truth, namely scholars and intellectuals whose social function is to produce knowledge about the world in such academic disciplines as anthropology and ethnography and also the sciences and social sciences. Thus, Said's work effectively interrogates the objectivity, even the integrity, of academic knowledge production by highlighting the cultural specificity of such practice, demonstrating that the production of knowledge always takes place in the context of and is filtered through a set of cultural values or cultural worldview.

Another key thrust of multicultural theory that complements its critique of the culture-bound and even deeply racist or stereotypical premises of much academic practice is its focus on developing culture-specific methodologies. The most progressive multicultural theory eschews assertions of allegedly universal methods as effectively coded articulations of unacknowledged domination and insists upon the need for culture-specific methodologies. Henry Louis Gates's collection of essays *Figures in Black* (1989) stands as an early exemplar of this particular project of multicultural theory, offering a bold challenge to conventional formalist or New Critical literary theory. Consistent with the understanding that multiculturalism in the academy is an evolutionary consequence of the Third World nationalist movements in the United States during the late 1960s and early '70s, the antecedents or predicates of Gates's analysis can

be traced to the history of black nationalist scholarship in the United States, rooted in the thinking of nineteenth-century figures such as Martin Delaney and starkly represented in W. E. B. Du Bois's now canonical work *The Souls of Black Folk* (1903). As black nationalist politics developed into the twentieth century, the literary and cultural counterparts were established in major artistic movements such as the Harlem Renaissance of the 1920s and perhaps most notably in the Black Arts Movement of the 1960s, which was quite explicit in injecting the "discourse of colonialism" into the literary analysis of the cultures of people of color in the United States. Certainly, literary scholars from other groups of people of color, such as Paula Gunn Allen and Arnold Krupaut in Native American literary study, Chicana/o scholars Ramon Saldivar and Maria Herrera-Sobek, and Asian American literary critics E. San Juan, Jr. and Sau-Ling Wong, share this general orientation in their work, likewise challenging the illusory universalism of the entrenched methods of literary and cultural analysis which underwrite and ratify colonizing practices.

In line with the premises of and perhaps influenced by early cultural studies theory and practice, this school of multicultural theory, in challenging the putative universalism complicit with colonial domination, tends to hold in common the view that culture is based in shared historical and life experiences and in common practices and beliefs such as religion or folklore and therefore, to be adequately understood, must be analyzed in the context of the specific lived experiences of a people. Thus, diverse cultures cannot effectively be studied or understood in terms of the models and categories derived from a national literary canon that is representative of the dominant culture alone and that excludes texts from "subcultures" precisely because they do not share the same features

as the dominant cultural exemplars of cultural achievement. Thus, like cultural studies, multiculturalism interrogates the notion of cultural unity, that there is a homogeneous national culture, and emphatically underscores that attempts to assert a methodological unity in terms of aesthetic value and theoretical lexicon only reinforce relations of domination and subordination and lead to grossly distorted apprehensions of complex social formations comprising many subcultures, each of which might be internally divided by race, class, or gender stratifications. As Gates argues, these dominant models actually reflect selective European patriarchal values, masking their specificity in the disguise of “universal, transcendent normative values” (Gates 1986: xx). Thus, because the standards used to measure literary value and the methods for classifying literature derive from and hence ratify select Eurocentric or dominant cultural practices, so the means to study and understand cultures of people of color and other subcultures must be derived from the extensive study of the cultural products of these cultures.

In their most progressive practice, then, cultural studies and multiculturalism emerged as trenchant critiques of the very foundations of the production of knowledge and culture and revealed the complicity of such production with social power dynamics and the material relationships of exploitation and domination in racial patriarchal capitalist society. As both discourses have evolved, however, each has been institutionalized in the academy in ways that over time have opened these discourses to charges that, far from challenging or critiquing racial and class hierarchies and neocolonial modes of exploitation and domination, they function as the attendant ideologies of the new finance capitalism. Rosaura Sanchez, for example, has argued that multicultural-

ism has largely been institutionalized as a liberal pluralism that simply celebrates cultural difference and in doing so ignores the material realities of racial difference and the very real socioeconomic inequality racism – and racial exploitation – enables. As she traces the deradicalization of multiculturalism into a “new orientalism” and liberal pluralism that “threatens to become a new myth of equality” (1995: 156), her position is representative of a prominent understanding that multiculturalism is in fact the discursive outcome, along with postcolonial theory, of the disarming incursion of contemporary cultural studies on the foundational stridently anti-imperialist discourses of racial and ethnic studies as they developed out of Third World student movements with the aim of decolonizing the academy. In *Racism and Cultural Studies* (2002), E. San Juan, Jr., for example, argues that “contextualized in the history of transnational capitalism . . . multiculturalism tends to occlude, if not cancel out, the material conditions of racist practices and institutions,” conceals “the problematic of domination and subordination,” and fundamentally in its neoliberal version “idealizes individualist pluralism as the ideology of the ‘free market’ and its competitive utilitarian ethos” (9–10). In this development, multiculturalism is really the consequence of the British invasion of cultural studies and its efforts to coopt and neutralize the radically decolonizing discourses of racial and ethnic studies.

Thus, infused with a neoliberal multiculturalism, racial and ethnic studies came to reproduce the very racial, gender, and class hierarchies their critical discourses formerly challenged, as they became dominated by a narrow focus on representational practices that divorced “race” from its material conditions of articulation and largely ignored the economic inequalities and exploitation racism sustains.

Evolutions in cultural studies practice can be understood as prominently redirecting racial and ethnic studies away from its origins in nationalist politics, as evidenced below by the anxieties expressed and debated about cultural studies by Chicana/o and African American scholars such as Mae Henderson, Wahneema Lubiano, and Angie Chabram-Dernersesian, who are tied to the Third World nationalist models discussed above.

Because of the complexity of these developments and the varying and competing traditions and influences on racial and ethnic studies, multiculturalism is itself a contested discursive field. Even as discussed so far, multiculturalism has been represented as a discourse that radically reconfigured academic knowledge production and as a disarming and neutralizing discourse that accommodates racial exploitation. Indeed, it is such contradictory and contested articulations of multiculturalism that enable Avery Gordon & Christopher Newfield to make statements such as “Multiculturalism rejected racial subordination but seemed sometimes to support it” (1997: 3) or “Multiculturalism sponsored contacts among people of color that avoided white mediation and oversight by white opinion. And yet, it became a popular term in managerial circles for controlling a multi-racial and gendered workplace” (5). Obviously, many factors can be identified as influencing and informing the discursive contestation that is multiculturalism. The more detailed discussion below of the evolution of cultural studies will provide, however, a meaningful backdrop for understanding the development of the ascendance of the discourse of multiculturalism, against Third World nationalist thought, as “the official policy designed to solve racism and ethnic conflicts in the North” (San Juan 2002: 9).

DERADICALIZING EVOLUTIONS IN CULTURAL STUDIES AND MULTICULTURALISM

The development of the field of cultural studies has a clear origin that can be traced back to post-World War II Britain when pioneering practitioners Richard Hoggart, Raymond Williams, and E. P. Thompson initially outlined a critical approach to the elitist and antidemocratic traditions and methodologies characterizing the study of cultural expression. They challenged the definition of culture as arts and letters, or customs and manners, and overhauled such foundational assumptions of the humanities that the study of art and literature is separate from the study of society and that the object of study in the humanities is a canon of timeless classic works that provide universal reflections and insights on the human. Williams, for example, stressed understanding culture as a whole way of life that therefore included the forces and relations of production, family structure, governing institutions, and forms of communication. These initial formulations shifted focus to study how culture is made and practiced with the objective of grasping and exposing how social classes and groups struggle for cultural domination.

Understanding cultural struggle as a fight for legitimacy and cultural status and asserting that the ruling classes established and upheld power by legitimizing their cultural forms and practices as *culture itself*, working-class intellectuals like Hoggart, Williams, and Thompson endorsed working-class culture against the “high culture” of the bourgeoisie and upper classes as well as against the onslaught of mass culture. Thompson’s *The Making of the English Working Class* (1963) altered conventional understandings of British history in his focus on the concerns and experiences of the working classes, their differing

comprehensions of British culture, and their own cultural formulations of class consciousness. He highlighted, for example, how different class cultures might in fact share sources, such as John Bunyan's *Pilgrim's Progress*, yet make radically opposed meanings of those works in arriving at a consciousness of one's relational position in society. Influenced by the literary studies of F. R. Leavis, both Hoggart and Williams adopted similar perspectives on working-class agency in the cultural production of meaning and forms that exist independently of the dominant culture. In his inaugural cultural studies text, which describes changes in working-class life in postwar Britain in a deeply autobiographical way, Hoggart (1957) centered culture as an important category to emphasize that a life-practice such as reading, among others, cannot be understood independently from the context of other practices, from the "whole way of life," such as work, family life, sexuality. While agreeing with Leavis's view that the value of culture lay in its ability to widen and deepen experience and that, in the face of mass culture's onslaught, reading the works of the "great tradition" in British literature was important not just as entertainment but to mature individuals into fully rounded citizens, both Williams and Hoggart also understood that Leavisism, in its exclusive focus on the "great tradition," ignored the rich working-class communal forms in which they were socialized. Williams in particular worried over and argued that such conceptions of aesthetic or literary value underwrite the ideological structures of the dominant culture and foster contempt for and dismissal of both the common efforts and cultural productions of the working classes, the ordinary people. Thus, the work of these three intellectuals articulates the basic approach of cultural studies, which is always to study culture as a set of practices in relation to power, to

expose power relationships, to explore how cultural practices influence and are influenced by power relationships. Exactly how "power" is understood, however – and exactly how cultural studies differs from the ideological analysis of Marxism – becomes a matter of controversy in cultural studies' evolution and, by extension, in the development of multiculturalism, as it is precisely the relationship of competing multicultural discourses to Third World Marxist thought which, arguably, accounts for the diametrically opposed articulations and political meanings of multiculturalism which Gordon & Newfield (1997) are able to chart in *Mapping Multiculturalism*.

The work of key practitioners at the Birmingham Centre for Contemporary Cultural Studies (CCCS; founded by Hoggart in 1963), such as Stuart Hall, the CCCS's first director, reflects the evolution in methodological focus and in the conceptualization of culture itself, proceeding, in San Juan's analysis, from "the empiricism of its initiators to a structuralist phase, then to an Althusserian/Lacanian one, followed by a Gramscian moment, up to its dissolution in the deconstructive poststructuralism of Ernesto Laclau and Chantal Mouffe" (2002: 207). Operating on the premise that working-class communal forms were becoming increasingly fragmented, cultural studies practice underwent a shift in focus from experiential, locally produced cultures to larger cultural structures that produced consciousness from afar, what Max Horkheimer & Theodor Adorno (2002 [1947]) termed "the culture industry." As the study of the relationship between consciousness and society, between subject and object, evolved in cultural studies, an Althusserian structuralism that asserted ideology as the cultural mediation whereby subjects are produced, or individuals interpellated, into subject positions, paved the way for the displacement of experience as a

key category – as it was for Williams, Hoggart, and Thompson – in favor of centering discursive practice, textuality, and representation through ideological state apparatuses, mass media, and other information technologies as the site of subject formation.

Thus, from its theorization as a “whole way of life” by Williams, culture came to be understood within cultural studies practice as a set of discursive and representational practices where subjects and meanings are produced. Political struggles, then, were conceived primarily as struggles over representation. Certainly, the influence of the thought of the Italian communist Antonio Gramsci, particularly his crucial concept of hegemony, to describe relations of domination as secured through the consent of the dominated, led cultural studies to a more nuanced conceptualization of the subject as an actively experiencing subject. Nonetheless, the narrow focus on discourse and representation left cultural studies vulnerable to the critique that it had abandoned any sense of political struggle understood in terms of transformation of the material structures of the socioeconomic system of capitalism. Evident here is the influence on the development of neoliberal multiculturalism which came to replace analytical terms such as “contradiction” and “exploitation” with an emphasis on the concepts of “heterogeneity” and “diversity,” just as it replaced a focus on “race” with a focus on “culture.” A focus on materially lived experience in concrete historical and socioeconomic formations was superseded by a focus on representational practices, often dematerialized and divorced from concrete historical contexts. Indeed, Gordon & Newfield note that “multiculturalism often avoided race. It designated cultures. It didn’t talk up racism. It didn’t seem very anti-racist, and often left the impression that any discussion of cultural diversity would render racism insignificant. It was

ambiguous about the inheritance and the ongoing presence of histories of oppression” (1997: 3).

Thus, the emergence and even popular ascendancy of something called cultural studies in contemporary academic practice, institutionally legitimated by the support of university budgets, has a more ambiguous history in terms of its relationship to the Marxist Left and to the original cultural studies project developed by Williams, Hoggart, and Thompson; and it is the ascendancy of this academic brand of cultural studies that largely shaped the deradicalizing transformation of multiculturalism from its radical Third Worldist origins. While Cary Nelson, Paula Treichler, and Lawrence Grossberg celebrate cultural studies as holding “special intellectual promise” for “the fragmented institutional configuration of the academic left” because it cuts across “diverse social and political interests and address[es] many of the struggles within the current scene” (Grossberg et al. 1992: 1), Michael Denning observes that “the suspicion of cultural studies is widely shared on the left these days” (2004: 147). These dual and opposed assessments of the “left’s” attitude toward and political alignment with cultural studies reflect conflicting positions on Marxism’s utility to the original cultural studies project and its survival in and relevance to contemporary cultural studies practice. Some critics, such as Fredric Jameson, stress that the cultural studies or “cultural materialism” of Williams constituted not just a fervently committed political project but a deeply Marxist one that contemporary cultural studies practice often overlooks in its gross caricatures of Marxist theory. Williams’s landmark essay “Marxism and culture,” for example, from his foundational and classic cultural studies text *Culture and Society* (1958), rigorously addresses the classic Marxist problematic of the relation

between the economic base and superstructure, not to dismiss Marxism but to refine it. Certainly, Williams and Thompson reacted to a rigidly economistic and determinist Marxism that posited thought and action as the direct effect of economic forces, but their project refocused Marxist inquiry on everyday life experiences as crucial actions of social groups in making history.

Other tendencies of cultural studies, however, either reject Marxism outright or else engage it tactically as one possible methodology among many to be drawn on strategically but not wholly endorsed. Often, the roots of cultural studies in its deep engagement with and indebtedness to Marxism are forgotten as Marxism is uncritically equated with a vulgar economism and hence demonized. In some of the dominant tendencies of cultural studies, "economism" or "Marxism" has been established as the new theoretical taboo. Proclaiming that he generally works within "shouting distance of Marxism," Stuart Hall, who has alternated in his sympathy with and distancing from Marxism, has condemned Marxism for "a certain reductionism and economism, which . . . is not extrinsic but intrinsic to Marxism" and for a "profound Eurocentrism." He sees Marxism as outdated, writing, "The radical character of Gramsci's 'displacement' of Marxism has not yet been understood and probably won't ever be reckoned with, now we are entering the era of post-Marxism." While in "The problem of ideology: Marxism without guarantees" (1996) Hall takes a more subtle and sympathetic approach to Marxism in the spirit of Williams's "Marxism and culture," the statements here echo a typical caricature of Marxism as economistic and deterministic found in contemporary cultural studies practice. Moreover, in such statements, Hall also ignores both the rich tradition of Marxist humanism and also that of Third World

Marxists such as Amilcar Cabral, Frantz Fanon, and C. L. R. James who all theorized Third World cultural resistance from a non-Eurocentric Marxist perspective. If cultural studies initially was energized by a profound critical engagement with Marxism, contemporary cultural studies practice seems to sidestep any serious confrontation with Marxism, as typified by Angela McRobbie proudly announcing cultural studies' evasion of Marxism: "The debate about the future of Marxism in cultural studies has not yet taken place. Instead, the great debate around modernity and postmodernity has quite conveniently leapt in and filled that space" (1992: 719).

It is precisely this critical amnesia in contemporary cultural studies practice, its tendency to displace and dismiss earlier critical models and then coopt them and represent itself as new that seems to inform neoliberal multicultural discourse, and it is precisely this amnesia that creates anxiety from multicultural practitioners rooted in Third World Marxist nationalist models. Mae Henderson, for example, in reflecting on the relationship between black studies and black cultural studies, asks, "How can the paradigm of 'internal colonialism' postulated by the black theoreticians of the 1960s serve as a model for studying dominant structures of power?" (1996: 59), thus giving voice to an anxiety about the liberalizing and colonizing potential of cultural studies on multicultural or race and ethnicity studies: "Here I am less concerned about the displacement of African American hegemony in black diasporic studies than I am by the erasure of a historical genealogy for black cultural studies that extends back at least a century to the African American critique of politics and culture formally inaugurated by W. E. B. Du Bois in his landmark *Souls of Black Folk* (1903)" (59). Similarly, when Wahneema Lubiano reminds us that "Afro-American/Black Studies . . . has already engaged itself in

the struggle that some cultural studies critics are at pains to suggest it undertake” (1996: 71), the reminder functions not to stake a claim of theoretical primogeniture to the methodological territory of cultural studies but to point out the extent to which earlier traditions have been forgotten. The loss of historical perspective has meant also the loss of the radical political perspectives for understanding oppression, exploitation, and resistance to those conditions developed by the Left and Third World movements of the 1960s. Many of the essays in Angie Chabram-Dernersesian’s volume *The Chicana/o Cultural Studies Reader* (2006) express anxiety and excitement about molding some models from cultural studies into Chicano studies, but what one sees here, importantly, is that Chicano studies preceded cultural studies and was part of an originary multicultural movement rooted in nationalist thought and tentative about its engagement with substitute radicalisms not rooted in its historical and cultural tradition.

Indeed, while critics such as Denning see cultural studies as a potential replacement for Marxism and others, such as McRobbie and at times Hall, see it as a transcendence of Marxism, often these gestures of substitution and transcendence are premised on an amnesia of many elements of the Marxist tradition of literary and cultural analysis. For example, when Lawrence Grossberg attributes the rise of cultural studies to the emergence of the New Left, which responded in part “to the failure of the traditional marxist left to confront, in both theoretical and political terms, the beginnings of late capitalism, the new forms of economic and political colonialism and imperialism, the existence of racism within the so-called democratic world, the place of culture and ideology in relations of power, and the effects of consumer capitalism on the working classes and their cultures”

(1993: 25), he (like Hall) ignores Third World non-Eurocentric Marxists, many elements of the Marxist intellectual tradition that cannot be characterized as economicist. Indeed, in terms of the study of culture and its relation to economic development, Williams’s classic study *The Country and the City* (1973), in which he analyzes English pastoral poetry in relation to the growth of a highly developed agrarian capitalism as it evolved into the Industrial Revolution, stands as an excellent example. It is such blindness to the nonvulgar Marxist tradition that prompts San Juan to write, “All commentators agree that a version of Marxist reductionism, otherwise known as *economism*, triggered the revolt against the left.” But, he asks, “What happened in reaction to a caricatured ‘actually existing’ Marxism?” (San Juan 2002: 221).

For San Juan, what happened was cultural studies developed into a method focused so narrowly on formalist analysis of textuality that it ceased to be a meaningful agent for emancipation from the material structures of capital exploitation and oppression. Nonetheless, the very nature of cultural studies raises difficulties for assessing its politics in any unified way. Denning (2004), for example, characterizes cultural studies as not so much a discipline in itself but as a critique of disciplinarity. Patrick Brantlinger similarly suggests that cultural studies emerged “not as a tightly coherent, unified movement with a fixed agenda, but as a loosely coherent group of tendencies, issues, and questions” that does not espouse or constitute a methodology in itself but makes use of a range of methods (1990: ix). Frequently, cultural studies practice encompasses thematics and theory of both Third Worldist anticolonial theory and postcolonial theory, of Marxism and post-Marxism, which seems to take us beyond defining cultural studies as a left dialogue but rather as a kind of liberal pluralism

that doesn't attempt to resolve or work through these political and methodological contradictions as much as to celebrate their plurality.

Again, here precisely the lesson in understanding the varieties of multiculturalism and even of cultural studies discourses is that each needs to be historicized. David Palumbo-Liu (1995) elaborates a historical materialist approach to understanding the discourse of multiculturalism and its deradicalizing ascendance. Because regressive deployments of multiculturalism dissociate categories of race, culture, and difference from their material conditions of articulation, Palumbo-Liu insists that addressing the contemporary crisis requires understanding the social, political, and economic forces conditioning the instrumentality of multiculturalism at this historical juncture. While multiculturalism's rise is in part an attempt to neutralize the "race question" brought center stage by the aforementioned Third World movements and to obscure the material inequalities racial ideologies sustain, Palumbo-Liu sees this explanation as insufficient to account for "the accelerated and much more widely spread development and institutionalization of multiculturalism in the late 1980s and 1990s" (1995: 7). Rather, Palumbo-Liu sees the reritualization of multiculturalism as motivated by economic developments that make requisite the recruitment of women and minorities into the skilled labor force in order to sustain corporate profitability.

Likewise, Kobena Mercer (1992) has argued from a cultural studies perspective for understanding deployments of multiculturalism in their concrete contexts, highlighting how in Thatcher's Britain multiculturalism was deployed to manage and suppress racial conflict while in the United States it posed the possibility of useful cross-racial political alliances. The lesson is perhaps that articulated by Ray-

mond Williams when he attempted to stem the tide of cultural studies as it flowed away from working-class politics and concerns and to correct the elitist tendencies he saw developing. In this work, he reminds those involved in and committed to cultural studies that a central theoretical tenet of the cultural studies project has always been that "you cannot understand an intellectual or artistic movement without also understanding its formation," and he continues, stressing, "The importance of this is that if we are serious, we have to apply it to our own project, including the project of Cultural Studies" (1987: 152). It is in such historicizing that the relation between multiculturalism and cultural studies needs to be charted and understood.

Mulvey, Laura

ANNA P. MURTA

Laura Mulvey is a prominent cultural critic and filmmaker, known especially well for her readings of the gendering of film. Born in Oxford, England in 1941, Mulvey studied history at St Hilda's College, Oxford University. She is currently Professor of Film and Media Studies at Birkbeck, University of London, and was for a number of years associated with the British Film Institute. It was her essay "Visual pleasure and narrative cinema," first published in *Screen* in 1975, that brought Mulvey to prominence in the women's movement and in the field of cultural studies. Later, the essay would become one of the most frequently cited and reproduced works of scholarly film criticism and would establish Mulvey as a pioneer of multidisciplinary approaches to film. The essay, along with several others, was later published in her collection *Visual and Other Pleasures* (1989).

As argued by Mandy Merck, Mulvey's essay "has been applied, elaborated, interrogated, revised, refuted and endlessly reiterated in the years since its publication" and has had the merit of instilling worldwide reactions against all sorts of cultural practices somehow diminishing to women (2007: 1). Mulvey utilizes psychoanalytic theories to describe how traditional Hollywood cinema is built upon a patriarchal model of pleasure and enjoyment, according to which the male unconscious desire is satisfied by means of three looks: the look of the male characters within the narrative, the look of the camera, and the look of the spectator in the audience. However, she argues that the first two are subordinate to the third in order to comply with the illusionist and normative conventions of Hollywood film. According to Mulvey, camera movement, angle, framing, and invisible editing provide both pleasure and self-actualization to the male spectator by exploring a woman's "to-be-looked-atness": "The presence of a woman is an indispensable element of spectacle in normal narrative film, yet her presence tends to work against the development of a story line, to freeze the flow of action in moments of erotic contemplation" (1989: 137).

Drawing from Jacques Lacan and Sigmund Freud, Mulvey posits that spectators promptly identify themselves with the scopophilic mechanisms (pleasure of looking at the body of another) employed by the camera and the male characters in Hollywood movies. Moreover, the spectator utilizes glamorized images of Hollywood stars to escape the fear of castration imbued in the male unconsciousness by means of demystifying, punishing, or saving (reinforcement of ego) the object of his fear. Watching "illusionist" movies is, thus, a voyeuristic and fetishist activity accomplished by means of the "male gaze." Mulvey's objective in the article is to point out the necessity of

changing film form and normative ways of enjoying film and to call for new modes of filmmaking in order to subvert the dominant patriarchal order.

In her book *Fetishism and Curiosity* (1996), a collection of essays written over a five-year period, Mulvey reiterates the premises of "Visual pleasure," integrating Marxist theories of estrangement and Freudian processes of disavowal. According to her, the changes in the economic world relations that took place at the end of the twentieth century returned a Marxist theoretical framework to the agenda of cultural criticism "with renewed, and significantly altered, force" (xiii). Essays in the book range from the analysis of the myth of Pandora's box to a critique of such films as Orson Welles's *Citizen Kane* (1941), Ousmane Sembène's *Xala* (1975), and David Lynch's *Blue Velvet* (1986). Throughout these essays, Mulvey interprets cinema through concepts such as "the social unconscious" and the symptoms it reveals on screen, including society's sexuality. "Sexuality molds these symptoms in two ways. On the one level, twentieth-century commodity culture has flaunted sex. On the other level, such erotic images disavow those aspects of society's sexuality that are hidden and disturbing. In this sense, the obvious discourse of sexuality appears as a symptom, literally in the case of cinema, screening its repressions" (xiv).

The two main preoccupations of the book circle around the concepts of fetishism versus curiosity, the first being "the most semiotic of perversions," a concept connected with simulacra and a diversion from the second, which, in turn, is seen by Mulvey as synonymous with "inquiry" that "might be transformed into a political process of deciphering images" (xiv). In this context, the author asserts, all spectatorship becomes, at least to some extent, a decoding of meaning. Andrew Quicke (1997) asserts that in *Fetishism and*

Curiosity little is changed or clarified of the theses of “Visual pleasure,” but the book at least expands on Mulvey’s earlier essay. More than that, it perpetuates the original essay’s benchmark aura.

However acclaimed and yet to be demystified, “Visual pleasure and narrative cinema” has attracted much criticism over the years. The first contra-argument came from feminists themselves as they pointed out that, by presupposing the audience to be heterosexual males, Mulvey reflects the very patriarchal order she means to attack. She addressed this critique in a sequel essay entitled “Afterthoughts on visual pleasure and narrative cinema” (also published in *Visual and Other Pleasures*) by explaining that what she meant by the use of the “male third person” was a “masculinized” audience, regardless of each spectator’s actual sex. Additionally, she elaborates on a more malleable concept of the female spectator, arguing that such an audience member would commonly shift between a female and a male identity throughout movies. However, according to Will Brooker & Deborah Jermy (2003), Mulvey’s rebuttal essay only aggravates the case against the first one because, in it, she connects action with the masculine identity and, consequently, passivity with the feminine identity, bringing up a much more pessimistic connotation.

Critiques of “Visual pleasure and narrative cinema” vary widely in nature. For example, according to Merck (2007), David Bordwell disputes Mulvey’s rhetoric altogether, finding her text lacking in critical precision and her emotional arguments inadequate to the comprehension of film’s complexities. Meanwhile, for Merck, Noel Carroll argues that, contrary to the premises of Mulvey’s analysis, in genres such as comedy or biopics, leading ladies were not eroticized and that, moreover, even in movies in which they are eroticized, the common presence of glamorized males,

such as Valentino, indicates that the audience experience the male erotic as well. In other words, he defends the source of visual pleasure in Hollywood cinema as being nongendered. For Bill Nichols, “Visual pleasure and narrative cinema” ignores the fact that women interpret film differently depending on ethnicity, nationality, class, and sexuality. Eric Naiman (1998) complains that Mulvey’s essay conspicuously ignores certain films akin to the ones it criticized, such as Hitchcock’s *Psycho* (1960). Merck (2007) argues that much of the criticism against “Visual pleasure and narrative cinema” could be alleviated and the understanding of the essay’s canonical character enhanced by viewing it as a manifesto rather than a formal scholarly piece.

Context is indeed imperative to the understanding of Mulvey’s ideas and cultural criticism. As argued by Merck, “the most influential publication in contemporary film studies is not an academic essay. It was written by a feminist activist, part-time filmmaker, occasional bookshop worker, housewife, and mother who had never attended graduate school or held a teaching post” (2007: 2). It is clear that Mulvey’s history as a critic is strongly connected with the history of feminism. If, on the one hand, her canonical articles helped to institute feminist criticism as a legitimate field of studies, on the other hand it was the women’s movement that enabled Mulvey to write in the first place.

The women’s movement in Britain in the early 1970s was fostered by educated middle-classwomen very few of whom were employed in academia. In this historical context, feminist theories and texts came out of reading groups and conferences and were divulged in leftist and feminist publications. Back then, Mulvey wrote for periodicals such as *Spare Rib* and *Seven Days*. In her anthology *Visual and Other Pleasures*, she asserts: “Suddenly a perspective on the

world had unfolded that gave women a position to speak from and things that had to be said not from choice but from political necessity" (1989: viii).

Reflecting on feminism, cinema, and her critical work over the years, Mulvey explains that the 1980s presented a clear fissure or historical divide between the 1970s and now. In the 1970s, feminist film theory and practices were strongly associated with the tradition of cinephilia and were informed by a hope of change to be brought up in and by cinema, reflecting the political optimism typical of that period. "For feminism this was particularly the case: the cinema doubled as a major means of women's oppression through image and as a means of liberation through transformation and reinvention of its forms and conventions" (2004: 1287). However, the 1980s – characterized by postmodernist aesthetics and a neoliberalist economy – parted with utopian notions of cinema. In Britain, suggests Mulvey, Margaret Thatcher's policies, along with fundamental changes in the mass media, led to the dilution of feminist filmmaking "as a movement." Although it was far from the women's movement ideal, the presence of women in the cultural industry and marketplace in general grew considerably during the 1980s: "During this period, not only was it impossible to maintain the progressive optimism of the 1970s, it was also hard to privilege the problems of women (especially those of developed economies) and the priorities of film feminism while left politics failed in postcolonial and third world countries" (1288).

Since the concepts of spectatorship about which she wrote in the 1970s were, as Mulvey states, products of their context, considerable technological changes in contemporary filmmaking have given way to a different type of spectator, one more aligned with Raymond Bellour's (1987)

pensive spectator. "Just as the early theorists of film celebrated the way that the camera could reveal more of the world than perceptible to the naked eye, now the pensive spectator can discover more in the celluloid image than could be seen at twenty-four frames per second" (Mulvey 2004: 1289); thus, according to Mulvey, a new relationship between audience and history emerges from technological advances in cinema.

As a filmmaker, Mulvey has applied her ideas on spectatorship in the films she has codirected with her husband Peter Wollen. She found in filmmaking a space in which to confront and respond to the questions of feminist theory, psychoanalysis, and leftist politics that she posed in her own writings in the 1970s. In *Penthesilea: Queen of the Amazons* (1974), Mulvey and Wollen explore male castration anxiety, projected onto a female image that creates a fascination with phallic femininity. In *Riddles of the Sphinx* (1977), the filmmakers address the problems explored in "Visual pleasure and narrative cinema" by challenging the male gaze and presenting an avant-garde filmic space in which female experience and feelings are depicted in counter-position. *Amy!* (1980), a tribute to Amy Johnson, is influenced by Mulvey's "Afterthoughts on visual pleasure" and deals with the position of a female protagonist that "adopts an active relation to narrative space and resists the intimidating look of the camera in its role as sculptor of passive femininity" (Mulvey 1989: ix).

Contrary to these earlier films, which are imbued with the utopian optimism of the 1970s and in which a necessity of a counter-cinema is presupposed as a rite of passage, Mulvey's subsequent movies were responses to the new context of feminist history brought by the 1980s. *Crystal Gazing* (1982) is a less formalist and more spontaneous film in direct reaction to the onset of Thatcherism and related aesthetic/political problems. In films such as *Frida Kahlo and*

Tina Modotti (1982) and *The Bad Sister* (1982) Mulvey revisits earlier feminist film issues. In her documentary *Disgraced Monuments* (1996), she explores pressing issues in postcommunist societies, such as the necessity of replacing the symbolism of communism and reconstructing national identities.

N

Nandy, Ashis

FARHAD IDRIS

Ashis Nandy is an Indian cultural critic whose work covers such topics as nationalism, modernity, history, religion, literature, film, psychology, science, development, and the future. These issues are of fundamental importance in the developing world. Nandy has explored them primarily in the Indian context, in more than a dozen books in the last three decades and, in the process, he has formulated a unique theoretical system of his own.

Born to Bengali Christian parents in 1937, Nandy studied clinical psychology in college, but changed to sociology in which discipline he earned a graduate degree; in his doctoral studies he took up psychology again. The two subjects, understandably, shape his vision and ideas. He is, appropriately, often described as a political psychologist. Nandy joined the Centre for the Study of Developing Societies in New Delhi in the 1970s. The center's loose academic affiliation and interdisciplinary character suited his intellectual temper, and he remained there for the next 30 years or so, becoming director in the 1990s.

The Intimate Enemy (1983), Nandy's third book on politics and culture in India, continues to be his most enduring work. It attempts to rewrite India's colonial history

and reconstruct the nation's political consciousness. While the book dilutes opposites and bedevils established categories – the sahib and the native, the West and the East, history and myth – Nandy's purpose is not deconstructionist. His purpose is to write an alternative account of colonial and of modern times. *The Intimate Enemy* demonstrates that the colonial enterprise was primarily a male endeavor, that the “civilizing mission” adopted by British colonialism sought to morph the “childlike Indian” into a “masculine” adult “through Westernization, modernization or Christianization,” and that this Indian subject was expected to enter “the liberal utilitarian or radical utopia . . . [in a] fully homogenized, cultural, political and economic world” (16). Derisive of femininity, modern Europe, Nandy indicates, also despised old age. The valorization of masculinity that Europe inculcated in Indians had far-reaching consequences: it became a pursuit of many of India's colonial thinkers, writers, and spiritual leaders. Nandy studies several of them, such as Michael Madhusudan Dutt, Bankimchandra Chatterjee, Swami Vivekananda, Dayanand, Vinayak Savarkar, and Subhas Bose, all of whom sought to recast Hinduism in a linear mold, with a definite origin and eventual end, as in Christianity. Mahatma Gandhi, in contrast, fares much better in Nandy's estimation. Gandhi

did not disavow his bisexuality; curiously, his belief in nonviolence – not a masculine attribute, obviously – owed much to the Sermon on the Mount (51).

Many of Nandy's ideas resemble those of Edward Said in *Orientalism*, though Said's exact influence on Nandy in the book is not easy to gauge because Nandy's theoretical concepts derive primarily from psychology. Like Said, Nandy takes to task key principles of the Enlightenment, especially the Western idea of progress. The six essays in *Traditions, Tyranny and Utopias: Essays in the Politics of Awareness* (1987) and his introduction to *Science, Hegemony, and Violence: A Requiem for Modernity* (1988), an edited collection of essays on science, drive home the point that progress or "development" do not always lead to peace and well-being for the polity. Nandy argues that science and development have become synonymous in India, though the "science" that is practiced there leans more toward technology than basic science, especially toward immoral and destructive technologies such as nuclear capability. Nandy attributes such an aspiration to India's desire to emulate France and the United States; like them, India "is perfectly willing to make security anxieties a central plank of its political identity" (1988: 10). Such is the sense of India's national unease that its government has committed a huge amount of national wealth to science, with the wholehearted approval of the Indian middle class, who voted the government into office.

Not surprisingly, nationalism, history, and secularism – the last is often perceived as a vital tool for maintaining amity between religious groups in India – win no endorsement from Nandy. In *The Illegitimacy of Nationalism* (1994), he offers an insightful study of Rabindranath Tagore and Gandhi and points toward their antinationalist stance on issues relating to India's culture, politics, and future. Such an assessment is

likely to seem strange to some, because Tagore was the author of India's national anthem as well as of many patriotic poems, while Gandhi, at least in popular perception, remains the greatest nationalist leader of India. Nandy's analysis of both men, nevertheless, appears well founded. In regard to history, Nandy, like Gandhi, favors the unofficial. In an interview with Jose Ramos he says, "myths, epics . . . often construct the past . . . and do so better than history because they are in better touch with human emotions, tacit knowledge, and our less socialized imagination" (2005: 433–4). For him history is an account of aggressive nation-building and violence, as it was for Gandhi. Nandy also believes that violence in modern India is often a product of secularism. He presents a trenchant scrutiny of the issue in *Creating a Nationality* (Nandy et al. 1995) and *Time Warps* (2002), where he argues that the ideology of secularism suppresses India's traditional religious roots. This evasion, a part of the modernizing and globalizing agenda, makes it possible for militant Hindu fundamentalism to thrive in Indian society.

With similar acuity, Nandy attributes the ills of urbanization in postindependence India to its effort to be modern and Western. The mega-cities in the developing world feed on those displaced from the villages. Nandy studies the phenomenon in *An Ambiguous Journey to the City* (2001). Largely film criticism, the book deals with accounts of violence following the partition of the Indian subcontinent in the wake of independence, which led to ethnic cleansing, life-threatening cross-border treks, and genocidal brutalities. The dispossessed villager is also the focus in his edited volume *The Secret Politics of Our Desires* (1998), another work of film criticism. Nandy's oppositional views seem to reflect strong postmodern tendencies; his scholarly writings, on the other hand, reject such

categorization. To someone like Nandy aspects of postmodernism that question the values of Western civilization would seem to be an approved resistance sanctioned by the West itself. He firmly believes that the so-called subversive elements of the Western culture industry operate very much within certain agreed parameters, never challenging the fundamentals.

Newspapers and Magazines

PETER HUGHES JACHIMIAK

Newspapers and magazines, as periodical publications that sometimes reach quite large audiences, are crucial media in modern society. They not only distribute information, but also construct identities, foster a shared sense of community, and provide outlets for advertising and the dissemination of opinions. An examination of newspapers and magazines in cultural studies not only provides an invaluable insight into class-based reading habits, but makes explicit the simultaneous social and cultural construction of identity. Newspapers and magazines in cultural studies – in line with the interdisciplinary, inclusive nature of cultural studies – can be considered from a range of perspectives: from qualitative “impressions,” through quantitative “mapping,” onto gendered “readings.”

In *The Making of the English Working Class* (1963) E. P. Thompson highlights the centrality of newsrooms and reading rooms at booksellers, coffeehouses, and inns during the Industrial Revolution, where newspapers would be read out aloud in order not only to increase the literacy of the population but also to help solidify a working-class consciousness. The newspapers read would be

examples of the radical press such as the *Register* or the *Poor Man's Guardian*. Perhaps the characteristic of the consideration of newspapers and magazines in cultural studies is such an approach: the study of "history from below" (see Turner 1996: 217). Raymond Williams (1973: 195–236) chronicles the development of newspapers and magazines, focusing on key moments such as the abolition, in the mid-1800s, of the taxing of newspapers, and the "Northcliffe Revolution" of the early 1900s, whereby newspaper publishing began to be dominated by the conglomerate. Crucially, Williams insists that any examination of the early years of the English press is, essentially, an examination of middle-class reading habits.

George Orwell, in "Boys' weeklies" (reprinted in Orwell 1968), commenting upon the proliferation of small newsagents' shops within the poor quarters of all large towns and cities, makes a direct correlation between the squalor of such newsagents' interiors and the (to him) dismal contents of the huge variety of newspapers and magazines that they sold. For Orwell, the interior of these newsagents and the contents of these newspapers and magazines provided the most accurate measure of what the majority of English people felt and thought prior to World War II. "Boys' weeklies" focuses upon "twopenny weeklies," such as the *Gem* and the *Magnet* (originating from the late 1800s), which contained stories concerned with public-school life. Read by many working-class children who had no first-hand experience of the public school, they were founded upon the principle of reader-character association, normally chosen from a number of available characters, all of the same age as the young reader. On the other hand, the readers of newer titles that started to appear during the mid-1930s, such as the *Hotspur*, the *Skipper*, and the *Wizard*, were encouraged to identify with a

single dominant character only. Revolving around the principle of "leader-worship" – which was absolutely central to the perpetuation of the British Empire – Orwell's major criticism of such "Boys' weeklies" was that there seemed no place for left-wing thought amid such popular imaginative literature.

In his classic critique of the reading masses, *The Uses of Literacy* (1990[1957]), Richard Hoggart insists that, in place of traditional values and culture, a newer, depthless "candy-floss world" founded upon crass, mass art, was coming into being. Acknowledging that both working-class and middle-class readers were being increasingly subjected to identical social and cultural trends, Hoggart argues that they tended to consume the same publications. Yet, Hoggart found the newspapers aimed at middle-class readers the most offensive, as they exuded a certain snobbery – what he termed "a cocktail-party polish." He is also scathing in his critique of weekly "family magazines" and weekly (what he termed) "spicy magazines," better known, especially in the US, as "pulp magazines." While the content of the former focused upon the home, fashion and film, radio and TV gossip, they were aimed at all the family, and at young women and mothers in particular. The latter, comprising three subgenres (crime, science fiction, and sex novelettes), shared an identical format: substandard printing on poor-quality paper, encased within a bold glossy cover. Promoted under sensationalist titles as "astounding," "startling," and "weird," and with a proliferation of titillating semi-nudity throughout, they were accused of exploiting the female form. As such, according to Hoggart, they appealed, in the main, to ill-educated adolescents and "inadequate" working-class and lower-middle-class young males.

Thompson's, Williams's, Orwell's, and Hoggart's concern with the telling of a

working-class culture was founded upon qualitative “impressions.” Such an approach was increasingly perceived as inherently nostalgic, at a time when cultural studies increasingly pursued an analysis of society and culture that has shunned a unilateral, Marxist-derived ideology, for a more postmodern multiplicity of pluralized identities that both gender and racial politics offer. So, while both Orwell and Hoggart wrote scathingly about the rise of the weekly magazine – and, in doing so, simultaneously critiqued Americanization and the associated debasing of traditional indigenous cultures – many have since celebrated such aspects of popular culture, championing cheap mass-market periodicals as the epitome of postwar, working-class popular culture. Reed (1997) provides a highly detailed content analysis, or quantitative “mapping exercise,” of both British and American popular magazines, whereby – following a meticulous method of calculating page space given to certain “topics” (such as “personal problems”) – percentiles are tabulated in extensive appendices. Haining (2000) asserts that “pulp” were a medium that often contained outstanding, and sometimes groundbreaking, literature and art. In stark contrast to the “slicks” (far more expensive – but far more mundane – publications printed on glossy paper), “pulp,” from the 1920s to the 1940s, provided escapism during an austere period of American history that saw prohibition, organized crime, and depression. Come World War II and after, though, the circulation of the “pulp” was in sharp decline. During the conflict, paper and metal (for the staples) became increasingly scarce, while throughout the prosperous 1950s, and into the television-fixated early 1960s, the public’s tastes became far more discerning as they now demanded the new, all-color comics and the more challenging cover-to-cover paperback fiction.

Osgerby (2001), charting the rise of a hegemonic – or dominant – form of white middle-class masculinity in an affluent post-1945 America, notes the centrality of such “sophisticated” magazines as *Esquire* and *Playboy*. These magazines – the latter, in particular – promoted a “swinging bachelorhood” that revolved around such hedonistic, leisure-fixated pursuits as penthouse living, surfing, and easy-listening jazz. By the late 1960s, *Playboy* came to epitomize a form of male liberation through compulsive consumption. However, it was the more sexually explicit, “tasteless” *Penthouse* and *Hustler* – magazines that not only stole *Playboy*’s formula, but robbed it of its circulation – that managed to capture the late-1970s grim mood of inner-city decay and oil-crisis recession.

More recently, a number of related texts have appeared that are preoccupied with examining – via gendered readings – the intertwined nature of masculinity and men’s lifestyle magazines in the twenty-first century (see Jackson et al. 2001; Benwell 2003; Crewe 2004). While many of these texts include striking reproductions of covers (which underlined their relevance as archival sources in their own right), they stress that men’s lifestyle magazines do more than merely reflect masculinity, in that they collectively shape and manipulate masculine practices. These texts also maintain that multiple forms of masculinity are not to be encountered in neat chronological order, as hegemonic forms of masculinity (for example, the “new man” of the 1980s and the “new lad” of the 1990s) tend to overlap.

Of particular focus in the study of newspapers and magazines within cultural studies has been the ways in which advertisements have been included and read in relation to lifestyle and identity formation. For example, Williamson (1978) considered, in meticulous detail, the messages

contained in advertisements to be found within glossy magazines of the 1970s. Owing to its inclusion of iconic images of 1970s advertising, the current reprint of Williamson's book, illustrated throughout, has become a much sought-after "retro"-themed publication.

In answer to the male-orientated, street-level work that typified much of the output of the Birmingham School for Contemporary Cultural Studies during the 1970s, Angela McRobbie was at pains to make explicit the ways in which teenage girls (as opposed to teenage boys) made sense of their lives via their bedroom reading habits. To this end McRobbie's *Jackie: An Ideology of Adolescent Femininity* (1978) looked closely at highly popular, romance-orientated weekly magazines. Gough-Yates, like McRobbie before her, sensing that there was a danger of men "taking over" the study of magazines, published *Understanding Women's Magazines* (2002).

Not all considerations of newspapers were preoccupied with the class-based habits of readers; many focused on how newspapers, rather than merely reflecting society, actually created the news. Stanley Cohen, in his famous study of the mods and rockers disturbances on the south coast of England during the mid-1960s (1973), insists that both national and local newspapers – such as the *Daily Express* and Brighton's *Evening Argus* – while reporting on very real, yet small-scale disturbances, not only exaggerated and distorted events (by means of "amplification"), but went so far as to predict events that were never to happen (resulting in such "non-events" still providing newsworthy headlines).

Many felt that the quality – and reputation – of British newspapers went into steep decline from the early 1970s onward. Chibnall insisted that – in their irresponsible reporting of crimes such as mugging – an inflammatory "cocktail of dangerous

illegitimacy" (1977: 141) was created, which was no longer the reporting of news, but the deliberate stoking of public fears. Williams (1998), with regard to the demise of Fleet Street, pointed the finger of blame at one tabloid newspaper – the *Sun*. Responsible for the spread of "junk journalism," the *Sun* eschewed quality journalism for a "bright and breezy," picture-driven format of sensationalism and sex.

One emerging facet of newspapers and magazines in cultural studies to be examined of late is "DIY" publications such as fanzines, the origins of which lay in the underground hippie press of the late 1960s. During the punk era and after, fanzines became the most credible means of communication between the members of music- and fashion-orientated subcultures of the 1980s. Duncombe's *Notes from Underground* (2001[1997]) not only provides the history of fanzines, but predicted their future as e-zines in cyberspace.

With the current trend for publishing magazines aimed at an increasingly nostalgia-obsessed public – for example, as with the relaunch of the children's educational magazine *Look and Learn* (UK, bimonthly) and men's periodicals such as the *Chap* (UK, bimonthly) and *Classic Style* (US, quarterly), both aimed at a suave, gentlemanly masculinity – the continued centrality of newspapers and magazines in cultural studies may involve an investigation into the increasing desire of readers to look back.

Novel, The

TIMOTHY SPURGIN

The novel as a genre has a special historical relationship with the field of cultural studies. One might, for example, see cultural studies as an offshoot of what is sometimes called novel studies. Following this approach, one might view scholarship on the emergence and development of the novel as paving the way for later examinations of other narrative forms, including everything from slasher films to music videos. It is also possible to view cultural studies as an extension of themes and techniques associated with the novel itself. If it is true, as many have said, that cultural studies is concerned with “all the relations between all the elements in a whole way of life” (see Grossberg et al. 1992: 14), then it does make sense to align works of cultural studies with novels like *Emma* or *Middlemarch*.

Crucial to an understanding of the relationship between cultural studies and the novel is a definition of the novel as a modern, middle-class form. Other definitions have been advanced, especially in recent years, and some very broad definitions (including those identifying all long works of prose fiction as novels) seem to lie behind the work of scholars like Margaret Anne Doody and Franco Moretti. Writing as the editor of a massive two-volume anthology of scholarship on the novel, Moretti (2006) describes the novel as “the first truly planetary form,” with a history dating back 2,000 years.

The conceptual problems associated with defining the novel are nowhere more evident than in the work of Mikhail Bakhtin. Bakhtin identifies the novel with

multivoicedness, an ongoing, unresolved dialogue between competing voices or discourses, which he calls “polyphony” or “heteroglossia.” In his earliest writings, Bakhtin boldly identifies Fyodor Dostoevsky as the creator of the polyphonic novel. In later works, however, he lays out an extremely complex history of the novel, one that takes in works dating back to ancient Greece. At some points (1981: 374), he goes so far as to suggest that there are “probably very few words” in all of world literature that are not in some sense polyphonic.

Despite the considerable influence of Bakhtin and Moretti, it seems fair to say that narrower, more precise definitions of the novel remain dominant among critics and scholars in the US. According to these definitions, the novel is to be distinguished from other kinds of prose fiction by its commitment to psychological realism. On this view, the novel is also to be seen as emerging in Europe in the first half of the eighteenth century and as affirming the values of individualism and self-sufficiency. Rounding out this definition is a vision of the novel as a commercial literary product – perhaps the first – to be marketed to a mass audience of newly literate, upwardly mobile readers.

With this definition in mind, it is not hard to see how novel studies might pave the way for cultural studies. Scholars writing on the relationship between, say, Dickens and the Victorian reading public might inspire later generations to investigate the relationship between later popular artists and their most passionate fans. Similarly, scholars tracing the slow process by which the novel came to be seen as a “legitimate” art form might encourage current scholars to consider the complex relationships between media (feature film vs. downmarket network television vs. boutique cable television vs. webcasting) in the contemporary cultural universe.

The best way to support an argument for novel studies as a precursor to cultural studies is by exploring the work of Raymond Williams. Williams is regularly cited as one of the founders of cultural studies in Britain, and in works like *Culture and Society* (1958) he advances influential definitions of key-words such as “class,” “art,” and “culture.” In the same volume, it might be noted, he also devotes considerable attention to the work of Victorian novelists such as Elizabeth Gaskell, Charles Dickens, and Benjamin Disraeli. In Williams, then, it can be difficult to tell where novel studies ends and cultural studies begins. Williams’s enduring commitment to the form of the novel may be most evident in his own work as a writer of fiction. His most famous works of fiction are the three books – *Border Country* (1961), *Second Generation* (1964), and *The Fight for Manod* (1979) – now grouped together as the “Border trilogy.”

Of course, the connection between novel studies and cultural studies need not be made exclusively through Williams. Indeed, Williams’s work on the novels of Dickens and Hardy might strike many of his admirers in the field of cultural studies as somewhat old-fashioned. Instead of looking at sales figures or patterns of reception, Williams dives right into the novels themselves, focusing his attention on long quotations from *Dombey and Son* (1847–8) or *Tess of the d’Urbervilles* (1891). For a discussion of issues such as consumption and commodification – issues usually associated with cultural studies – the best sources might include some of Williams’s contemporaries and perhaps even a few of his predecessors in the field of novel studies. In *Fiction and the Reading Public* (1939), for example, Q. D. Leavis developed an early approach to the subject of reading practices and popular taste. Kathleen Tillotson (1954), George H. Ford (1955), and

Richard Altick (1957) also worked to shift attention from the author to the audience and to describe the cultural assumptions underlying the marketing and consumption of Victorian fiction.

No list of such scholars would be complete, however, without the name of Ian Watt, whose *The Rise of the Novel* (1957) remains the most important single work in the history of Anglo-American novel studies. Watt advances what might be described as an origin story for the modern novel, linking the realism of eighteenth-century fiction to the philosophical tradition of Descartes and Locke. In his opening chapter, he says relatively little about the sort of writing – popular ballads, pamphlets, conduct books – now seen as precursors of the early novel. In the very next chapter, however, he turns to periodical literature, noting the increasingly secular interests of readers in the period. Through this very influential chapter, he deals with sales figures, literacy rates, the average incomes of various groups of potential novel readers, and the scarcity of both privacy and light among readers in the working class. For students and scholars interested in cultural studies, and its complex connections to novel studies, it is this chapter that seems most prescient. For all of these reasons, then, it makes sense to identify cultural studies as – at least in part – an offshoot or outgrowth of novel studies.

In recent years, lines of influence have also run in the opposite direction, with cultural studies affecting novel studies in several ways. There has been, for example, a general shift from formalist and thematic approaches to historicist or materialist ones. In the 1960s or '70s, critics such as Sandra Gilbert & Susan Gubar (1979) read Charlotte Brontë's *Jane Eyre* (1847) as a confrontation with issues of rebellion and powerlessness. In the late 1980s, Mary Poovey (1988) situated the same novel in a contemporary debate over the figure of the

governess, drawing not only on Brontë's work but also on reviews of reports by the Governesses' Benevolent Institution, memoirs by former governesses, and responses to the 1857 Married Women's Property Bill. By 2006, Elaine Freedgood, a critic who openly identifies her work with cultural studies, considered the presence of mahogany furniture in several passages as a sign of the novel's interest in issues of colonialism and deforestation. Through this sort of progression, we see the increasing influence of cultural studies on novel studies – as themes give way to texts, which in turn give way to material objects.

The influence of cultural studies on novel studies is also evident in the work of many other scholars. To cite only a few examples, William Warner identifies the publication of *Pamela* in 1740 as a "media event" with "long-term consequences" for the practice of novel-reading in Britain (1998: 177). Nancy Armstrong (1999) considers the effect of new technologies (particularly photography) on the descriptions of characters in novels like *Oliver Twist* (1837–9) and *Bleak House* (1852–3). And, working in a later period, Loren Glass (2004) explores the deep and seemingly irreconcilable contradictions surrounding the figure of the American celebrity author, ranging from Mark Twain in the 1880s to Norman Mailer in the 1960s and '70s.

A further sign of the impact of cultural studies on novel studies is the growing tendency to explore the experiences of novel readers. The most important work in this tradition is *Reading the Romance* (1984), by Janice Radway. In this work, Radway gives serious attention to the reading habits of middle-class women, a group often dismissed by her colleagues in the academy. What's more, she succeeds in combining anthropological and sociological methods (interviews, surveys) with more conventional approaches to literary criticism. The influence of scholars

like Radway, and of cultural studies more generally, can be felt in recent studies of the relationship between amateur readers of Jane Austen (often known as “Janeites”) and academic scholars working in the field of novel studies. According to Claudia Johnson (2000), the revaluation of Austen in the decades of the 1950s and ’60s and the simultaneous rise of novel studies itself depended in many ways on the devaluation of the Janeites as both frivolous and effete.

For those familiar with the work of writers like Austen, there is a deeper and more complex connection between cultural studies and the novel. Indeed, these readers may conclude that cultural studies is not only anticipated but also shaped or formed by the novel itself. Like the novel, cultural studies has been characterized by a deep suspicion of universals and a passionate interest in the local and the particular. Moreover, cultural studies shares with the novel an interest in the formation of identities and subjectivities, not to mention a concern with the relationship between individuals and larger historical or political forces. In a letter to her niece, who was beginning a novel of her own, Austen asserted the importance of limiting the focus of a narrative: “3 or 4 Families in a Country Village is the very thing to work on” (2004: 176). Scholars working in the field of cultural studies might not go quite that far – but they should understand the impulse behind Austen’s famous remark and applaud her general principles.

Ohmann, Richard

PATRICIA HARKIN

Richard M. Ohmann (b. 1931) was a pioneer in exploring the political implications of the study of literary texts, and in particular in analyzing the institutions that construct and sustain conditions of labor in part as a response to the Cold War, the military conflict in Vietnam, and the social conflicts of the 1960s and 1970s. He was educated at Harvard (MA 1954; PhD 1960), studied at Oxford with the speech act theorist J. L. Austin, and taught at Wesleyan University from 1962 until his retirement in 1997. The salient analytic gesture in Ohmann's work is denaturalizing; his characteristic tactic is the juxtaposition of events and discourses that cultural institutions usually keep separate. His purposes are to reveal the contradictions to which capitalism gives rise and ponder "how consciousness and culture interact with material life" (1987: 116). His first book, *Shaw: The Style and the Man*, invoked speech act theory and transformational grammar to define the patterns of that playwright's "epistemic stances" (1962: xii).

Soon afterward, Ohmann turned from explaining the form of literary texts toward an exploration of the social and political context of humanistic study. In his work since the 1970s, he refers often to Marxist thought, but does not engage in the

arguments about terms (e.g., hegemony) that occupy and divide contemporary Marxists. In *English in America* (1976), he describes how first-year writing courses and their textbooks, the MLA Job Information List, and advanced placement courses create students and teachers, outside of history, who follow directions rather than analyze circumstances. His position is that the corporate and disciplinary models on which English studies bases itself are "inappropriate" and "untenable" (10). In *Politics of Letters* (1987) he argues that the university system (and the place of English studies within it) is a product of capitalism, noting that literary critiques of writers like Updike and Vonnegut (for example) are unlikely to "lead us out of the bourgeois reality that both writers powerfully render" (106). In "A case study of canon formation: Reviewers, critics, and *The Catcher in the Rye*" (with Carol Ohmann; in 1987: 45–67), he reads early newspaper reviews of that novel against front-page accounts of the Korean conflict – his denaturalizing tactic – noting that the reviewers read Salinger's novel only within the literary tradition, comparing it to *Bildungsroman* but failing to notice that the novel emerges from and reflects class conflicts even as it ignores the Cold War. His influential "The shaping of a canon: US fiction, 1960–75" (1987: 68–91) juxtaposes advertising and publishing

practices with reviews in the *New York Times Review of Books* to demonstrate that the “canon” is constructed from best-sellers through processes that have profit rather than “value” as their objective. In “English and the Cold War” (2003: 1–27) he decries the ways in which the new critical “insistence on the autonomy of the literary work” made it the “norm” for literary theorists and critics to ignore the text’s relation to its world, thus denaturalizing this norm. For Ohmann such tactics facilitate seeing ideology as “the bridge between fictional texts and the historical process” (1987: 122).

Ohmann’s inquiries are not confined by traditional university disciplines. *Politics of Letters* (1987), *Selling Culture* (1996b), *Politics of Knowledge* (2003), and his edited volume *Making and Selling Culture* (1996a) weave together history, sociology, and economic analysis with literary “criticism.” In *Selling Culture* he extends traditional Marxian thought to show how a class is formed through cultural practices. He connects the rise of magazines in the 1890s, a period that marked the rapid emergence of “mass culture,” with the rise of the professional managerial class, thereby demonstrating that mass culture and advanced capitalism evolved together. By positing a fictional family, the Johnsons of Cleveland, who learn how to desire the commodities that the monopoly capitalism has invented and depends upon, he provides a cogent illustration of how hegemony works.

If *Politics of Letters* and *Selling Culture* describe the rise of the professional managerial class, *Politics of Knowledge* chronicles its likely demise. “Social classes,” he writes, “are specific to social formations: they never survive into a new epoch without significant change and may gain or lose much in coherence and power” (2003: 86). The professional managerial class, especially university faculty in the humanities, serves

as his example of the ways in which classes can “weaken, fracture, or dissolve” (86).

Ohmann puts his political beliefs into practice both inside and outside the academy, as in his work as a founding member of the Radical Teachers’ Collective. In “The personal as history” (2003: 202–24) he describes protesting the conflict in Vietnam as well as working to change institutional conditions governing tenure and curriculum at Wesleyan University. He was among the small but powerful group of academics who challenged and helped to change the governance of the Modern Language Association. Ohmann also served the National Council of Teachers of English (NCTE). As the editor (1966–78) of *College English*, one of the NCTE’s flagship journals, he was the first to devote an issue to what was then called “The homosexual imagination” (November 1974). He was also among the first editors to call into question the “literacy crisis” by asking his readers whether in fact they experienced such a crisis and, if so, how they explained it. With W. B. Coley, he published a collection of essays from *College English* entitled *Ideas for English 101*. With Harold C. Martin, he published two textbooks for first-year writing: *The Logic and Rhetoric of Exposition* (1964[1962]) and *Inquiry and Expression: A College Reader* (1959).

Oral History and Oral Culture

ROBERT COCHRAN

Oral culture is culture based on the spoken rather than the written word; oral history is a record of the past based on spoken accounts. The enabling insights leading to wide-ranging and spectacularly fruitful new developments in the study of oral cultures originated, paradoxically enough, in classics, that most venerable of humanities disciplines. The American Milman Parry centered his collecting in the 1930s on Serbo-Croatian *guslari*, but his influential “oral formulaic theory,” presented in papers published in French in the 1920s, was developed first of all to describe the compositional methods deployed in the creation of Homeric epics (1987[1971]). For Parry, the key to the art of these epics lay in neither memorization nor

improvisation, though it featured elements of both; what was crucial was the performance, each iteration unique in its enactment for a particular audience and situation, of a traditional repertoire of lines and parts of lines, scenes, and tales.

Parry’s insights, especially as developed and transmitted by Albert Lord (1960), inspired a great flowering of research in a wide range of literary, folkloric, and anthropological disciplines, including oral formulaic analyses of, among other topics, Anglo-Saxon poetry and medieval English literature, Asian and African epics, Anglo-American ballads, and African American blues and pulpit oratory. Meanwhile, studies by Mikhail Bakhtin (1968[1965]), of popular marketplace vernaculars and carnival traditions as used by Rabelais, and by Walter Benjamin (1969[1955]), of oral storytelling traditions in the writing of Nikolai Leskov, have enjoyed a durable influence.

Ruth Finnegan (1977) and John Miles Foley (1988) presented early attempts at summarizing developments in the field, with Foley, who in 1986 founded the field’s leading journal, *Oral Tradition*, stressing the importance of culture-specific generic and prosodic contexts. The same author’s *Immanent Art* (1991) and *The Singer of Tales in Performance* (1995) explored the “traditional referentiality” of oral tradition, the capacity of its specialized language (its “dedicated register”) to carry meanings for fluent audiences beyond those denoted in specific performances.

If uncritical applications of Parry’s oral formulaic theory to materials distant in time, genre, and cultural context are by now a thing of the past, investigation of persistent oral traditional practice within varying written traditions is an ongoing enterprise. Recent studies have examined the continuing literary deployment of oral narrative techniques in authors as modern

and postmodern as James Joyce and Samuel Beckett.

Researchers soon branched out from the epics and ballads themselves to study the larger performance venues, led by Richard Bauman (1984[1977]), Dell Hymes (1981), and Dennis Tedlock (1983). The fundamental insight behind this work recognizes the constitutive role of performance – that oral art has its full existence *only* in performance. Everything else, even the most painstaking textual reproduction, is an abstract, a fossil. Performance studies, like the earlier attempts to utilize oral formulaic analysis, have been applied to everything from Anglo-Saxon charms and Chaucer to oratory on early commercial recordings. *Alcheringa*, a journal established in 1970 and edited by Tedlock and Jerome Rothenburg, devoted itself to what it called ethnopoetics. The journal folded in 1980 but the label stuck and is currently used to describe the study of poetic systems of (mostly) non-Western cultures. A special issue of *Oral Tradition* (volume 20/1) was devoted to “Performance Literature” in 2005.

Appearing somewhat later but no less influential were the analyses of oral traditions from the perspective of communication theory, psychology, and media studies. Marshall McLuhan in particular was celebrated for *The Gutenberg Galaxy* (1962), though Walter Ong’s *Orality and Literacy* (1992[1982]), especially its third chapter, “Some psychodynamics of orality,” had an even greater influence on students of oral culture.

These interests reach beyond the verbal arts themselves to focus upon sociopolitical and cognitive consequences of new communication technologies. The aural world of oral cultures is said to be undermined by the privileging of vision that accompanies the arrival of print technology, and political and economic developments generally labeled “modern” – democracy, capitalism,

nation-states with their burgeoning bureaucracies, individualism – are understood as rooted in and nurtured by this altered cognitive environment.

Electronic media, in their turn, restore the aural–oral world on a vastly larger scale. (The “global village,” understood pejoratively – and presciently – as a tribal world of “panic terrors,” is a McLuhan coinage.) David Rubin (1995) brought a similar interest in cognitive processes to the pre-Gutenberg world of oral performance, describing how traditional “systems of multiple constraints” operate to cue neural associative networks (“schemas”).

The origins of oral history as an academic discipline are very different. The first writers of history – Herodotus, Su-ma Ch’ien, Bede – were explicit in their respect for and utilization of oral sources, and their successors into the nineteenth century – Michelet in France, Macaulay in England, Bancroft in the United States – followed their lead. The emergence of history as an academic discipline founded upon postgraduate university training, however, led to increased emphasis upon archival research centered on written documents. Led by Leopold von Ranke, German universities took the lead in developing a “documentary method.”

Other disciplines, however, continued to make profitable use of oral interviews. In sociology, cultural anthropology, and folklore studies, important works with orally obtained data at their center appeared steadily in the first decades of the twentieth century. Prominent among these would be the works of Chicago School sociologists, though a similar use of interview-based “life history” research informs Ruth Landes’s *The Ojibwa Woman* (1938) and other anthropological studies. Even more significant were the massive collections undertaken in the 1930s under the auspices of New Deal initiatives by the Federal Writers’ Project and the Works Progress Administration. Benjamin

Botkin's *Lay My Burden Down* (1945) was a landmark publication centered on these collections. Folklorists, for their part, undertook studies establishing the comparable veracity of oral accounts and academic histories. One study, for example, compared descriptions of nineteenth-century British military campaigns in Afghanistan in British histories and Afghan oral traditions, concluding that both were short on objectivity and long on ethnocentrism (Dupree 1967).

The return of oral history to a respected niche in academic history is often credited to the 1948 opening of the Oral History Research Office at Columbia by Allan Nevins. Landmark works in the UK and Ireland include the East Anglian studies of George Ewart Evans, especially *Where Beards Wag All* (1970) and Henry Glassie's work in Fermanagh (1982). The Oral History Association in the US (established in 1967) and the English Oral History Society (established in 1973) gave oral historians their own professional associations. The American group publishes (since 1973) the *Oral History Review*. Surveys of the field include Paul Thompson's *The Voice of the Past: Oral History* (2000[1978]), a broad historical account, and Ronald J. Grele's *Envelopes of Sound: The Art of Oral History* (1985[1975]), a wide-ranging collection of essays and panel discussions. Both have been updated in second (and in Thompson's case third) editions.

Students of oral culture generally and oral historians in particular have been much interested in matters of professional ethics – significant power differentials, after all, very often exist between interviewers and interviewees, and it is the former who characteristically publish and benefit professionally and financially from their collaboration. The website of the Oral History Association features substantial sections on “Principles and Standards” and “Ethical/Legal Guidelines.” Like other

scholars, oral historians and students of oral culture accomplish their work in complex political environments – oral epics and national folklore archives have routinely been utilized in the elaboration of nationalist ideologies (twentieth-century Finnish celebrations of the *Kalevala*, for example, have more than occasional echoes in the twentieth- and twenty-first-century promotions of the *Manas* epic in post-Soviet Kyrgyzstan). Jokes in particular have been much investigated for their political dimensions (Cochran 1989; Stokker 1997). Oral historians have often understood their work as possessing an inherent element of social activism. “Oral history,” notes the front page of the Oral History Society's website, “enables people who have been hidden from history to be heard.”

P

Performativity and Cultural Studies

MATTHEW WAGNER

Construed most broadly, performativity refers to the theory that speech or action is constitutive, rather than merely representative, of reality. This is especially germane to questions of identity and identity politics. In other words, statements (speech) or behavior (action) cannot be limited to describing or outwardly manifesting what is real; they should be understood as actually making up what is real. This notion has its most direct roots in the work of speech theorist J. L. Austin, whose key lectures were published posthumously in the 1960s and 1970s; it is perhaps more commonly associated, however, with the writings of Judith Butler, who from the 1980s onward has applied the theory specifically to the discourse of gender identity.

To understand performativity, it is initially useful to keep in mind two key connotations of its root word, “perform.” “To perform” connotes in equal measure “to do” and “to act”; that is, one performs a task, or one performs for an audience. The concept of performativity keeps both of these senses of “performance” firmly in view. Daily speech or behavior *performs*, in the first sense, in that it actively accomplishes something, even if that accomplishment is

unintended or unconscious. In the second sense, the theory of performativity posits that one’s speech or actions are inescapably “performed” for an audience, even if that audience is imagined. Taken together, these two senses of “perform” suggest that one’s words and behavior are always *productive* (they accomplish something), and that the “product” (the accomplished task) is determined in large part by the innate sense of audience that accompanies every instance of speech and action.

MAJOR DIMENSIONS OF PERFORMATIVITY: AUSTIN AND BUTLER

Austin, in his landmark lectures at Harvard in 1955, suggested that Western philosophy has long been dominated by the assumption that any utterance can be only descriptive, and that such description must be either true or false. The easiest and most common example of the inadequacy of such an assumption is the act of a minister or celebrant uttering the words “I pronounce you man and wife” – or, equally, the act of a groom or bride stating “I do.” The performing of such utterances neither truly nor falsely *describes* a state of affairs (or a “reality”); instead, it actively *creates* a reality: that of a married couple.

As such, Austin's work is concerned with the relationship between speech and act, and with the proposition that the former (speech) carries the authority and efficacy of the latter (act). He termed this particular type of speech – a statement which *does* something – “illocutionary” speech. The title of his lectures, “How to do things with words,” effectively captures his sense that speech is “performative”: it *does* things.

Judith Butler expanded this idea beyond the realm of speech. For Butler, behavior itself is like illocutionary speech: “acts” are performative, in the sense that they accomplish something, and that accomplishment is often connected to the construction of identity. To paraphrase her work, wearing a suit and tie is not a reflection of maleness, but the creation of maleness: the clothes literally make the “man.” Butler's work is at once an expansion of Austin's and a narrowing of his focus. Her primary interest is in shifting the concern from the relationship of speech and act to the connection between speech act and identity. In particular, her focus is on gender identity, and the ways in which social behavior is constitutive, rather than reflective, of that identity. Like Austin's proposition that statements are more than descriptions of a state of affairs, Butler posits that the outward markers of gender identity (such as clothing, social roles, and sexuality) do not simply reflect or “describe” an individual's gender; rather these markers construct gender. She also argues that these markers are the results of behavioral patterns (acts, gestures, desires) and that such patterns are themselves inherently performative; her specific definition of performance in this context is a behavior that *seems* to express an essence (or a core reality), but instead manufactures and maintains that essence. In other words, the signs that appear “on” a body (clothes, hairstyles, postures, and so on) that we conventionally read as expressing a true or

essential identity, at the core of an individual, are in fact the very building blocks of that identity. These signs reflect no “true essence,” but rather create the false impression of such an essence. One's identity, then, and especially one's gender identity, does not determine one's behavior, but is instead determined *by* that behavior. And that behavior itself is, in turn, “performative” – it is enacted for a (social) audience, and it accomplishes a particular task.

A key consequence of such an argument is the disappearance or “loss” of reality itself. “That the gendered body is performative,” Butler acknowledges, “suggests that it has no ontological status apart from the various acts which constitute its reality” (1999: 173). In this sense, reality itself is not fixed, or essential – it has no ontological status. Reality, and in particular the reality of identity, is a social construct – it is repeatedly *created* by the members of a given society. A crucial element of the theory of performativity arises here: that of *repetition*. For the “acts, gestures, enactments” of Butler – or the speech acts of Austin, for that matter – to effectively constitute a reality, they must be performed repeatedly. This does not mean that a minister must pronounce a betrothed couple to be “husband and wife” more than once, for example; but it does mean that the society in which that pronouncement is made must recognize the performative power of the utterance. Such recognition demands a social repetition: we must have witnessed this utterance and its effect previously, in order for it to have any efficacy now. Or, to return to Butler's arena, one does not establish one's “male” or “female” identity in a single day, but through repeated behavioral acts, and through the juxtaposition of those acts with the norms of the society in which they occur.

This raises another crucial, and related, element of performativity: that such performance must abide by, or at least respond to,

the norms and expectations of society. In no way, for instance, does the theory of performativity suggest that one can easily alter one's reality (or identity) by simply selecting one set of actions or behaviors over another. It is on this front that the theory, and Butler's work in particular, engages most powerfully with Foucauldian notions of power and hegemony. Butler asks that we "consider gender, for instance, as *a corporeal style*, an 'act,' as it were, which is both intentional and performative, where 'performative' suggests a dramatic and contingent construction of meaning" (1999: 177). The construction of meaning is contingent upon precisely the hegemonic norms of society. Even the transgression of such norms – the practice of cross-dressing, or drag, for example – necessarily constitutes a recognition of and response to social rules. One can see clearly here the influence of Michel Foucault's work on Butler, and on the theory of performativity at large: identity (or reality) may be constituted through behavior or speech, but such behavior or speech is in turn limited by the confines of the very reality it constructs. Performativity, in this respect, becomes integrated with the self-regulation of social behavior that forms a major part of Foucauldian thought.

PERFORMANCE AND PERFORMATIVITY

As might seem obvious, there exists a clear kinship between the theory of performativity and the study of theater, film, and other performance arts. Butler's work, for example, might be said to be rooted in the discipline of sociology or cultural studies, but it has become widely used as a cornerstone in the study of film, theater, and dance. Indeed, her initial work on the subject appeared in an issue of *Theatre Journal* in 1988, and her essay "Burning acts – injurious speech"

closes one of the key books connecting the two fields, *Performativity and Performance* (Parker & Sedgwick 1995). One major thread that weaves performance and performativity together is the sense of an inevitable audience. To suggest, for instance, as Butler does, that one performs one's gender (and that such a performance is in fact the "reality" of one's gender) is to imply that the performance is *for* someone. In some respects, this turns us all into actors, a proposition which furthers the loss of the real that accompanies the theory of performativity, as described above.

Seen from the other end of the thread, the notion of a constantly produced – rather than fixed – identity has, in the field of theater studies in particular, considerably decentered the role of text and author, and foregrounded the role of actor or "performer." This is to say that the theory of performativity has contributed to the emergent postmodern sense that a character on stage is not a reflection or representation of a sovereign reality, as held within a text or in the figure of an author; rather, the "reality" of the character is continually shaped and reshaped by the outward signs of performance. As with Butler's account of gender, this does not indicate a completely free and open malleability of character identity; rather, such identity must be performed within the context of certain rules of society. This is true, of course, in greater or lesser degree dependent on the character. Hamlet, for example, as a character might be said to be more "bound" to social norms than a protagonist in a new play by an unknown playwright. In both cases, however, the dictates of performativity suggest that, in theory at least, no character is a "fixed" entity, just as no gender identity has a fixed essential core.

The theory of performativity has also contributed to the broadening of the scope of theater and performing arts studies.

Indeed, performativity has added to a greater interdisciplinarity in critical theory, and an attendant expansion of the conventional boundaries of many of those disciplines that are now seen as intersecting. This was the goal of numerous writers through the last few decades of the twentieth century, but it is perhaps best encapsulated by Joseph Roach's "Culture and performance" (1995). Here, Roach suggests that the category of literature itself be expanded beyond its traditional sense of a collection of texts, and should instead encompass a wide range of cultural activities, including oral storytelling, song, mime, rite and rituals, and other such enterprises. Roach's expansive inclusiveness – and especially the fact that he begins from a literary starting point – captures the sense that the notion of performativity has significantly expanded social (and academic) definitions of theater, drama, and performance. The notion that what one says and what one does has both effect and affect – a sense, in other words, of performativity – has become part and parcel of a variety of critical theories, stretching well beyond its roots in linguistics, gender, and performance.

Popular Music

ROY SHUKER

The term “popular music” is generally used to indicate the diverse range of music genres produced in commodity form for a mass, predominantly youth, market. In cultural terms, popular music is of enormous importance in daily life, and for some it is central to their social identities. In economic terms the products of the music industry make it a leading cultural industry, with income including not just the sales of recorded music, but also revenue from copyright, live music (concerts, tours), and merchandising; along with sales of the music press, musical instruments, sound systems, and sheet music.

The extended term “popular music culture” locates the musical text in the wider social field. It refers to the ways of making, disseminating, and consuming music; the economic and technological practices associated with these processes; and the sounds, images, and discourse (thinking, debating, and writing) created by these practices. At the heart of the majority of the various forms of popular music is a fundamental tension between the essential creativity of the act of “making music,” the audience reception of its texts, and the commercial nature of the bulk of its production and dissemination.

POPULAR MUSIC STUDIES

Popular music studies is not a discipline, in the coherent sense that such a term implies, but a field of study. It includes a number of contributing approaches, which are historically situated and frequently in tension with each other. An indication of the scope of these is given in volume 1 of the *Continuum Encyclopedia of Popular Music* (Shepherd et al. 2003), which devotes 100 pages to 30 entries on the approaches to the field. At issue have been questions of the nature and status of the musical text, and how we relate to and “know” music. Analysis has addressed the interrelationships between the music (its authorship, production, and mediation), the nature of the listening experience, and the social conditions under which these occur. The bulk of the associated writing has come out of musicology, sociology, and cultural and media studies, often exhibiting a tension around just where to primarily situate analysis. Depending on their theoretical and methodological allegiances, contributors privilege the musical text, its production and mediation, or its consumption. Two broad approaches, musicology and sociology, though still distinct, have increasingly converged. Popular musicology remains primarily an aesthetic discourse, focused on the music, but increasingly includes reference to the interaction of social factors; conversely, sociologically grounded studies, while emphasizing production and consumption, situate these processes in relation to the nature and authorship of specific musical texts and genres.

With some exceptions, including the work of Simon Frith, Philip Tagg, and John Shepherd, academic analysis of popular music and its associated culture was initially slow to develop. During the 1970s and '80s, the related field of media studies concentrated its attention on the visual media, particularly television, and neglected

popular music. An emergent cultural studies included some significant work on popular music, notably on the construction of social identity and the operation of affect (Grossberg 1992). The field was given a clearer focus during the 1980s, with the founding of the International Association for the Study of Popular Music (IASPM) and the launch of the journals *Popular Music* (UK; from 1981) and *Popular Music and Society* (US; as a quarterly from 1986). In the 1990s, there was a proliferation of research and publications, including new journals (*Perfect Beat*), and a marked increase in the number of university courses either directly focusing on popular music, or studying it as an aspect of popular culture within media and cultural studies. The new prominence of the field reflected increased recognition of popular music as a global cultural phenomenon, associated with a multibillion-dollar industry, and a multifaceted youth culture reaching out into every aspect of style.

The construction of meaning in popular music can be seen as embracing a number of factors: the music industry and its associated technologies, those who create the music, the nature of musical texts, the constitution of audiences and their modes of consumption, and institutions which influence and regulate all of these. The following discussion indicates the main topics addressed in popular music studies, along with some of the main contributors to each.

THE MUSIC INDUSTRY

A body of research has focused on the music industry as an example of the cultural industries, in its drive to commodify performers (especially stars) and genres, and maintain market control (Negus 1999; Hull 2004). A recent focus has been on the previously largely neglected experiences of

women in the industry (Leonard 2007). The increased concentration of the culture industries is a feature of late capitalism, and includes the steady consolidation of the major sound recording companies, and their integration into multimedia international conglomerates. The impact of digital music on musical production and distribution has emerged as a topic of key interest, along with associated issues of intellectual property rights and copyright (Frith & Marshall 2004).

There is considerable debate over the economic and cultural implications of the market dominance of the major companies, especially the strength of local music industries in relation to the globalization of the culture industries, and the relationship between diversity and innovation in the market. A crucial question is how such concentration affects both the range of opportunities available to musicians and others involved in the production of popular music, and the nature and range of products available to the consumers of popular music (Toynbee 2000).

TECHNOLOGY

New recording formats and modes of transmission and dissemination, most recently digital, alter the nature of musical production and consumption, and raise questions about authorship, the legal status of music as property, and the operation of copyright (Théberge 1997). Innovation in musical instrumentation has also historically facilitated the emergence of “new” sounds. A central issue has been the question of market control: are artists and the recording companies being disempowered, and consumers (end-users) being empowered by the increasing availability of online music? Also addressed has been the engagement of consumers with music through online practices: what

happens to traditional notions of the “distance” between consumer and product, and its technological mediation, in the age of the download?

AUTHORSHIP

Studies of authorship and the “auteur” in popular music consider the process of music making, including its sites of production, the nature of “creativity,” and various conceptions of the term “musician.” Individual career biographies, along with the status hierarchy accorded to various categories of performer, illustrate the interaction of musical authorship with genres, audiences, and history. The concept of “auteur” underpins critical analyses of popular music, emphasizing the intentions of the creator of the music (usually musicians), and attempts to provide authoritative meanings of texts. This means distinguishing (some) popular music from mass or popular culture, with their connotations of mass taste and escapist entertainment, and instead relating the field to notions of individual sensibility and enrichment. Central to the work of some musicologists, and professional “rock critics” (Marcus 1991), this approach has largely been reserved for figures seen as outstanding creative talents. It identifies popular music auteurs as producers of “art,” extending the cultural form and, in the process, challenging their listeners. Conversely, there has recently been greater attention paid to performers operating at other levels of the music industry, such as tribute bands (Homan 2006).

TEXTS AND GENRES

Popular music texts include songs and recording in its various formats, but also music videos and graphic texts, such as

album covers. Musical performances, especially concerts, and DJ discourse, have also been analyzed as forms of musical text. These various forms are frequently interconnected and mutually reinforcing, with much attention paid to their intertextuality: the way a text communicates its meaning in relation to other texts.

There are debates around the application of musicology to popular song, and the questions of lyric analysis, authenticity, and the cultural and the musical value of constructs such as the musical canon. Traditional musicology privileges the text by placing the emphasis firmly on its formal properties. The past decade has produced a substantial body of what can be termed “popular” musicology, which has engaged further with the more affective domains of the relationship between the text and its listeners, moving into the generic and historical locations of texts and performers (Hawkins 2002).

While texts are usually analyzed independently, they can also be considered collectively, as with content analysis of chart share in terms of genres, or record labels (majors compared to independents). A similar approach has been applied to radio and MTV airplay, especially in relation to relative shares of local content and imported repertoire. Genre criticism has been the main approach to considering musical texts collectively. Critical analysis of popular music genres has concentrated on the tension between their standardized codes and conventions and their fluidity as these are elaborated on, challenged, and displaced by new configurations. While musical genres continue to function as marketing categories and reference points for musicians, critics, and fans, particular examples clearly demonstrate that genre divisions are often highly fluid (Borthwick & Moy 2004).

MEDIATION

In addition to the sound recording companies, other institutional mediators of popular music culture are music retail, radio, film (both feature and documentary), television, and MTV, the music press, and the internet. The concepts of “taste makers,” “gatekeepers,” and “cultural intermediaries” have all been used to analyze the way in which these music media select, reject, and reformulate material for broadcast or publication, and influence consumption. Each medium has been the subject of extensive study, although this has fluctuated in relation to shifts in their perceived relative importance as determinants of cultural meaning. For example, music video and MTV received considerable attention in the late 1980s through the 1990s, but are now relatively neglected (Vernallis 2004), whereas there is a proliferation of studies of the nature and impact of digital music. There remains a lack of fuller critical analyses of music radio and the music press (Jones 2002).

CONSUMPTION

The consumption of music has been related to music as a form of cultural capital, and as a source of pleasure and empowerment. Studies of the audience(s) and consumer(s) of popular music have drawn on the sociology of youth, leisure, and cultural consumption to explore the role of music in the lives of “youth” as a general social category, and as a central component of the “style” of youth subcultures and the social identity of fans. This research has used both qualitative (ethnography, participant observation, interviews, focus groups) and quantitative (surveys) methodologies to examine various modes of consumption, for example, acquiring recordings, concert going, radio

listening, and viewing music videos and MTV. Studies reveal a complex set of influences upon the construction of both group and individual popular-music consumption, with these related to location, age, gender, and ethnicity. Dance and record collecting have recently received greater attention as examples of music consumption as a social practice.

SUBCULTURES

The relationship between popular music and youth subcultures was comprehensively explored in a number of influential studies during the 1970s and early 1980s, primarily associated with writers linked to the influential Birmingham Centre for Contemporary Cultural Studies in the UK. Collectively, these argued that youth subcultures appropriate and innovate musical forms and styles as a basis for their identity, and, in so doing, assert a countercultural politics. Subsequent theoretical discussions and case studies (Bennett & Kahn-Harris 2004) suggest that the degree of homology between subcultures and music had been overstated, with tastes determined by a more complex pattern of considerations; for example, the constituencies for alternative/indie music (Fonarow 2006). Interest has turned more to the majority of youth (those who do not join or identify with subcultures), as well as to the nature of fandom and the study of local musical scenes.

MUSICAL SOUNDS AND SCENES

The intersection of music and its physical location has been a developing field of inquiry. There have been a number of distinct and original contributions to the critical examination of space and scale as significant aspects in the production and consumption

of sound recordings. Traditionally, the geographical analysis of music emphasizes the dynamics and consequences of the geographical distribution of recorded music around the world, and how particular musical sounds are associated with particular places. This work was characterized largely by the use of a narrow range of methods and theories, and focused on only a few musical styles, notably blues, folk, and country. Studies of rock and pop music, and their various genres, were notably absent from the majority of this work. Since the 1990s, these musical forms, and their locales, have come to be seen as worthy of serious study and been accorded greater attention by cultural geographers and popular music scholars (Cohen 2007).

“Scene” can be understood as the formal and informal arrangement of industries, institutions, audiences, and infrastructures. The concept has become a central one in popular music studies, a key part of the “spatial turn” evident in urban and cultural studies generally. Researchers have engaged with, refined, and applied the concept of scene to a wide range of settings and locales (Whiteley et al. 2004). To an extent, scene, as an analytical concept of greater explanatory power, is regarded as having displaced popular music studies’ earlier emphasis on youth subcultures.

POLITICS

In the general sense of the word, “politics” permeates popular music studies. Practically every aspect of the production and consumption of popular music involves theoretical debates about the dynamics of economic, cultural, and political power and influence, and the reproduction of social structures and individual subjectivity.

A number of commentators have placed popular music, especially styles such as rock,

punk, folk, and rap, and many of their performers, at the center of oppositional ideology. This is primarily to equate the “popular” with a sense of “by and for the people,” in which industry domination is balanced and challenged by practices of resistance, dissent, and contestation. Examples of such practices are the political activism and music of artists such as Bruce Springsteen, and the gender politics of musical movements such as Riot Grrrl (see Shuker 2008). Drawing on Gramscian cultural studies, this approach emphasizes the place of individuals in the construction of cultural meaning, in tension with the political economy of popular music. For example, Middleton’s early survey of the field situated popular music in an area of contestation and contradiction, between the “imposed” and the “authentic” popular (1990: ch. 10). Subsequent culturalist perspectives include studies by Grossberg (1992), Frith (1996), and Leonard (2007).

In addition to ongoing debates over the perceived negative effects and influence of popular music, there have always been attempts to harness the music to social and political ends and arguments around the validity of notions of music as an empowering and political force. Various studies have addressed the role of popular music in creating social change, its mobilization within social movements, and direct political interventions (Cloonan & Garofalo 2003).

POLICY

There was an early emphasis on the validity of the “cultural imperialism” thesis, and its displacement by the concept of globalization, linked by the question of what constitutes the “national” in cultural forms. More recently, popular music scholars have paid greater attention to music policy, and its

development at the local, the national, and the global level. This reflects increased governmental (state) interest internationally in the economic possibilities inherent in the social and economic value of the arts and creative industries, and popular music has been a significant part of this discourse. State and local governments have increasingly recognized the economic and social potential of popular music and demonstrated concern at the dominance of the international music repertoire, along with a desire to gain a larger share in both local and global markets.

HISTORY

The history of popular music has been subject to internal critiques and debates in a similar manner to other forms of historical writing. At issue are the boundaries of the field, including its tendency to privilege Western developments, the treatment of various genres within it, and the emphases that should be accorded to the context within which popular music is produced (Brackett 2005).

Posthumanism

NEIL BADMINGTON

Posthumanism considers the possibility that historical phenomena (such as advances in technology or discoveries about animals) are leading to fundamental changes in the human species and its relationship with the world. It thus involves radically rethinking the dominant, familiar humanist account of who “we” are as human beings. According to the humanist model (a clear and influential example of which can be found in the seventeenth-century writings of René Descartes), the figure of the human has a natural and eternal place at the very center of things, where it is clearly distinguished from machines and animals, where it shares with all other human beings a unique and universal essence, where it is the origin of meaning and the sovereign subject of history, and where it acts according to something

called “human nature.” For humanists, “Man,” to use the problematic gendered term often employed in accounts of “the human condition,” enjoys a position of automatic and unquestionable hegemony. “Man” is the measure of all things.

Posthumanism, by way of contrast, begins with the recognition that “Man” is not the privileged and protected center, because humans are no longer – and perhaps never were – utterly distinct from animals and machines, are the products of historical and cultural differences that make any appeal to universal human essence impossible, are constituted as subjects by a linguistic order that pre-exists and transcends them, and are unable to direct the course of world history toward a supreme, uniquely human goal. In short, posthumanism emerges from the theoretical and practical inadequacy – or even impossibility – of humanism.

Posthumanist criticism has certain things in common with the “antihumanism” commonly associated with the work of theorists such as Louis Althusser, Michel Foucault, and Jacques Lacan, but it tends to depart from antihumanist discourse when it comes to the matter of approaching the troublesome figure of “Man”: while antihumanism regularly set out actively to shatter the hegemony of humanism by making a radical, sometimes scientific, break from the legacy of “Man,” posthumanism often takes as its starting point the inherent instability of humanism. “Man” does not necessarily need to be toppled or left behind with a giant leap, in other words, because “he” is already a fallen or falling figure.

Many books and essays have explicitly and extensively addressed different aspects of posthumanism in the last couple of decades, and in a wide variety of academic disciplines (literary studies, cultural studies, philosophy, film studies, theology, geography, animal studies, architecture, politics, sociology, anthropology, science and

technology studies, education, gender studies, and psychoanalysis, for example). Recent popular culture, too, has explored the implications of posthumanist existence, often in the realm of science fiction, where cyberpunk novels by writers such as William Gibson and Bruce Sterling, along with films such as David Cronenberg’s *eXistenZ*, television series such as *Star Trek: The Next Generation*, and manga/anime such as *Ghost in the Shell*, depict humans and machines interfacing with each other in new, complex, and provocative ways.

The term “posthuman” might, then, feel like a fairly recent invention, as if it were perhaps something coined with the rise of online existence or artificial intelligence. But “post-Human” can actually be found as far back as the 1880s, when it was used in the work of the theosophist H. P. Blavatsky. (In the name of historical accuracy, it should be noted that Oliver Krueger (2005: 78) is completely wrong to claim that the term in question is present even earlier in Thomas Blount’s *Glossographia* dictionary of 1656; Blount refers there only to “posthumian,” a now obsolete word which is taken simply to mean “following,” “to come,” or “that shall be.”) Blavatsky did not develop a detailed theory of the posthuman, however, and neither did the handful of writers (Jack Kerouac among them) who used the term in passing at various points in the first half of the twentieth century.

It was not until the publication in 1985 of Donna J. Haraway’s “A manifesto for cyborgs,” in fact, that posthumanism began truly to catch on and take shape. Although she did not actually use the terms “posthumanism,” “posthumanist,” or “posthuman” in her manifesto, Haraway proposed that a series of three interrelated “boundary breakdowns” (68) had transformed the long-established and long-untroubled figure of the human into a shimmering, hybrid cyborg. (Although

cyborgs are often associated with the realm of science fiction, the term was actually coined in 1960 by two scientists, Manfred E. Clynes and Nathan S. Kline, to describe the technologically enhanced human being that they imagined safely exploring the dangerous depths of outer space. The word “cyborg” itself is a contraction of “cybernetic organism.”) Humanism, Haraway noted, had always relied upon clear distinctions between human and animal, organism and machine, and physical and nonphysical, but a host of dramatic modern developments in science, technology, capitalism, race and ethnicity studies, militarism, animal studies, and feminism, for example – as well as the fantastic visions made possible by science fiction – had made such rigid, absolutist thinking unsustainable and politically dubious. “By the late twentieth century,” she wrote, “our time, a mythic time, we are all chimeras, theorized and fabricated hybrids of machine and organism; in short, we are cyborgs. The cyborg is our ontology; it gives us our politics” (66). The human had become obsolete; the figure of “Man” had been replaced by the cyborg.

In the wake of Haraway’s widely reproduced manifesto, many accounts of posthumanism have examined how modern technoscientific culture has irreparably undermined the hegemony of humanism. In books by N. Katherine Hayles (1999), Chris Hables Gray (2001), Elaine L. Graham (2002), and Thomas Foster (2005), for instance, the posthumanist implications of cybernetics and cyberspace, informatics, artificial intelligence, genetics, and medicine have been examined in detail. When computers can beat humans at chess, when life is understood as a code and when death can be deferred or redefined by medical intervention, when the Genome Project has revealed that humans share 98 percent of their genetic composition with chimpanzees, when artificial limbs outperform and blend seamlessly

with their organic counterparts, and when some experts in the field of artificial intelligence believe that it will soon be possible for humans to achieve immortality by transferring themselves into a computer, the old humanist model seems desperately incapable of speaking to the present order of things. Only a radically revised account – a *post-humanist* account – could make sense of such a scenario.

Posthumanism is not purely a question of high technology, however, and not merely because, as Hayles points out in *How We Became Posthuman* (1999), technological rapture can all too easily preserve some of the most fundamental assumptions of humanist discourse. While it is true that a great deal of criticism and fiction has imagined the posthuman as a technological figure, other strands of scholarship have examined posthumanism in terms of architecture and space, gender, mathematics, geography, education, paleoanthropology, cognition, rights, fetishism, extraterrestrials, botany, postcolonialism, and theology. Meanwhile, Cary Wolfe’s *Animal Rites* (2003) has led the way in arguing for a posthumanism that arises not from technological developments, but from a sustained reconsideration of the “speciesist” humanist binary opposition between “Man” and animal. (In a curious oversight, many of the technology-obsessed critics who were quick to embrace Donna Haraway’s “Manifesto for cyborgs” were just as quick to ignore or marginalize the crucial collapse of the traditional human/animal divide mapped by her essay.) Although it claims with some force not to be interested in the terms “posthuman,” “posthumanism,” and “posthumanist” (perhaps because of some of the ways in which “A manifesto for cyborgs” has been appropriated by simplistic technophiles), Haraway’s *When Species Meet* (2008) covers ground closely related to that examined by Wolfe in *Animal Rites*. In attending to the phenomenon of

“companion species,” Haraway traces how absolutely ordinary, everyday encounters between humans and animals baffle the assumptions of humanist discourse and dramatically disturb the reign of “Man.” In the light of the work of Wolfe and Haraway, as well as related scholarship by Julie Ann Smith (2003) on how humans can live experimentally in posthumanist arrangements with animals, it seems most likely that posthumanism – a field so often wrongly associated only with the latest technological development – will continue to address animals and what Wolfe’s book calls “the discourse of species” as it unfolds toward future configurations.

While a great deal of scholarship devoted to posthumanism takes issue with humanism and subsequently celebrates its waning – Haraway famously ends her manifesto by declaring that she would rather be a cyborg than a goddess – it would be a mistake to conclude that everyone who writes about the subject is in favor of posthumanist existence. In 2002, for instance, the political theorist Francis Fukuyama published a widely discussed book entitled *Our Posthuman Future*, in which he proposed that the contemporary drift away from the principles of humanism was a dangerous societal development in need of urgent correction. Contemporary biotechnology, for Fukuyama, is a “threat” because it will possibly “alter human nature and thereby move us into a ‘posthuman’ stage of history. This is important . . . because human nature exists, is a meaningful concept, and has provided a stable continuity to our experience as a species” (7). While writers such as Haraway and Wolfe have stressed the new and exciting possibilities that open up with the shift from humanism to posthumanism, Fukuyama sees only fear and terrible loss in the fading of “Man.” For him, that is to say, posthumanism is something to be strongly opposed and countered by the trusty principles of humanism.

There is, then, no convenient consensus when it comes to questions of posthumanism; different critics have approached the term in very different ways and have drawn very different conclusions. One thing, however, would appear to be certain: posthumanism has become a major point of debate in recent years because humanism is no longer an adequate or convincing account of the way of the world.

Postmodernism

MICHAEL RYAN

Postmodernism refers both to a historical moment and to an intellectual and artistic movement that can be seen either as uniquely contemporary or as a continuation of a dissonant tradition within Western culture that originates with the sophists and the pre-Socratic philosophers in ancient Greece and that is evident in bohemian, countercultural, and avant-garde intellectual and cultural movements throughout Western history down to the present, from the Albigensians and the aesthetes to the anarchists and the punks.

As the artistic and intellectual movement that comes “after modernism,” postmodernism can be said to begin in the 1960s when modernism in architecture, painting, and especially literature began to wane. Modernist literature was technically innovative; it sought new means of representation, such as the stream-of-consciousness technique of narration and journalistic reporting, which aimed at a brutal honesty of expression. Modernist painting sought to depict reality in its simplest constitutive abstract elements, while modernist architecture privileged the most efficient and rationally functional design.

With the emergence of postmodernism in the 1960s, clarity of line, efficiency of function, and technical innovation gave way to a more self-reflexive style that foregrounded the conventions of construction that constitute buildings or works of art. Postmodernists began to question the very concept of “art” and to examine the conventions that made it different from other forms of cultural representation. Already in

the aftermath of World War II, painters such as Jackson Pollock exploded what constituted “art” by creating wildly nonrepresentational paintings that drew attention to the potential for disorder in the world and focused the viewer’s attention on the artistic medium. His work broke with traditional principles of composition and challenged the idea that art should depict reality at all. Following upon Pollock, postmodern painting in the late 1950s and early 1960s ceased to be about abstract forms and became reflections on the distinction between “art” and other forms of culture, such as comic books and advertisements. The work of Andy Warhol and Roy Lichtenstein, which dissolved the conventional division between art and everyday life, eroded the status value of art in bourgeois culture. The organizers of “happenings” departed from the classic bourgeois notion of art as a “work” that existed to be appreciated in museums. By the end of the 1960s, art aspired to get closer to the flow and flux of life itself. Everything was art.

Central to the postmodernist impulse as it evolved in the 1960s was the idea that by making visible the hidden conventions or rules that make literature literary and art artistic, postmodern practitioners could rupture the pretenses that sustained bourgeois culture – the pretense, for example, that what that culture called reality was acceptable and reasonable rather than constructed and fabricated or irrational and self-deluded. Bourgeois culture is founded on the idea that disciplined work for the sake of accumulating wealth is the most important way to organize human life. Postmodernists largely thought otherwise. For them, more playful life and artistic options were possible, but those were suppressed by bourgeois ideals of self-control and discipline linked to a capitalist economic form that fostered social inequality, the destruction of nature, and the reduction of human

relations to mutual exploitation. The exposure of the conventions that made art art and the troubling of the distinctions that separated art from life were thus not merely aesthetic gestures. They challenged the basic assumptions of the surrounding culture to the extent that that culture depends on the suppression of a critical examination of its founding assumptions and its constitutive conventions. In the eyes of believers in that culture, these conventions are not conventions at all; they are “reality.” The postmodern challenge to the very idea of “reality” should thus be understood as a political gesture aimed at the founding belief system of an irrational bourgeois society which survives by getting people to believe assumptions that do not withstand the challenge of critical reflection and analysis. They are lies presented as truths to a duped population to lull them into compliance and conformity. Postmodernism aimed to remove the blinds and to show the world for what it really was – a construction, a representation, an ideological mirage with, oftentimes, horrifying consequences – as postmodern writers like Kurt Vonnegut suggested in novels such as *Slaughterhouse 5* (1969).

In the literary postmodernism of the 1960s and '70s, novels were no longer about a “reality” that is supposedly represented “realistically,” but were instead about the way representational forms and literary techniques construct our sense of what is “real.” John Barth’s novels such as *Giles Goat-Boy* (1966) exposed and subverted the usual conventions of fictional realism, often playing out to exhaustion some of the most familiar novelist techniques (epistolary form, frame narratives, and the like). Other writers explored the irrational dimensions of human life and the repressive apparatuses of bourgeois culture that held good natural impulses in check. Joseph Heller depicted the irrationality of

supposedly rational modern organizations in *Catch-22* (1961), while Ken Kesey depicted madness as bureaucratic reason in *One Flew Over the Cuckoo’s Nest* (1962). Other postmodern writers, such as Robert Coover, developed new modes of writing altogether in *Pricksongs and Descants* (1969). And Thomas Pynchon, in *The Crying of Lot 49* (1966), portrayed America as a failed project that depletes human empathy and removes meaning from life for the sake of a meaningless pursuit of wealth. For postmodern writers of the 1960s, the bourgeois ideals of realism and rationality, which had gained prominence in the conservative culture of America after World War II especially, no longer counted as virtue in a world in which the most rational and realistic political leaders were fomenting unjust wars in places like Vietnam and moving the world toward mass self-destruction in a nuclear holocaust. The rationality of supposedly “modern” bourgeois culture seemed increasingly to the postmodernists to be itself a form of madness that had to be resisted, often through the development of artistic forms that subverted the classic assumption that art should represent the real or the true. The productions of the Living Theater (founded in 1947 but rising to prominence in the 1960s) made no attempt to “represent” anything; the spectacle of squirming interlaced bodies was designed to incite the audience to critical reflection by breaking both social and aesthetic conventions. For Andy Warhol, what was real and true was not a landscape or a seated figure or even an abstract image as in modernism; it was rather the banal but mesmerizing dazzle and color of such pop culture icons as a Campbell’s Soup can and Marilyn Monroe’s face. Later artists in the postmodern tradition such as Cindy Sherman blurred the line between real and representation by inserting herself into her photographic works in playful pantomimes. And architects such as

Robert Venturi deliberately overthrew modernist ideals of purity in architectural forms by merging different styles in new, eclectic, and ironic ways. Buildings such as the Pompidou Centre in Paris (which opened in 1977) turned architecture inside out so that how buildings were made became visible. It was as if people took to wearing underwear outside their business suits rather than underneath, and the purpose was to shock and awaken.

This questioning of the relationship between art and the life it supposedly represented or between the social ideal of capitalist development and the efficient modernist buildings that embodied its principles was connected with the numerous radical movements of the 1960s era that carried out a similar questioning of the ideals and policies of the ruling elites of the major capitalist countries such as the United States. From feminism to the antiwar movement, from rebelliousness of dress and personal style to new forms of nonrationalist thinking, these movements were also “postmodern.” They took issue with the “reality” of the ideals of “imperialist patriarchal capitalism” and noted that those ideals were products and constructs maintained by cultural representation owned and controlled by those with social and economic power. To draw attention to the conventions that constructed a society’s sense of what counted as “real” was therefore to take issue with the way power was configured in that society. Art and literature became privileged arenas for such explorations, as did entire new fields of scholarly inquiry such as cultural studies that took as their starting point the idea that what we take for reality in our lived experience of the world is constructed for us by media representations.

As a result of these cultural and social upheavals, modernism was no longer seen as the realization of a good dream of social utopia predicated on a benign rational use of

technology. Instead it came to be seen as part of a capitalist culture that was responsible for the repression of good creative energies at odds with the bourgeois ideal of self-restraint and social control. The postmodernists asked the following questions: what if such controls were negative and repressive, and what if what was repressed was in fact good and worthy of liberation? What if the conventions or rules that made modernist art possible were linked to social conventions that limited and restricted people’s lives by making people be, like modernist architecture itself, more efficient and functional parts of an irrational society? They were working parts of a society that postmodernists increasingly came to view negatively because it was dominated by irrational ideals of material progress. In consequence, postmodernists rejected the tone of high seriousness in modernism and turned instead to play, irony, mock citation, pastiche. By being deliberately unoriginal, postmodern writers and artists drew attention to the way we are all immersed in cultural imagery that shapes our lives. We inherit without realizing it a legacy of assumptions, prejudices, beliefs, and identities that become visible to us only when we reflect on how the world we live in is constructed. The exposure of the conventions of culture thus had both an aesthetic and a political purpose.

While postmodernism names a clearly demarcated period “after modernism,” it should also be seen as part of a counter-tradition in Western thought and culture, from the sophists down to the aesthetes of the late nineteenth century and the Dadaists and surrealists of the early twentieth, which posed a sustained and continuous challenge to the conservatism that suppressed wayward natural energies for the sake of creating disciplined, conformist, and unequal societies and imposed dull, leaden-headed modes of knowledge and belief that assured the power of the powerful. These societies

were sustained by ideological systems, from Platonic idealism to Roman Catholicism, from fascism to modern conservatism, that made social and economic inequality and hierarchical authority seem unchangeable and indelibly “real.” The sophists challenged the Platonic system of absolute truth by arguing that people can be made to believe certain things through the astute use of language. They disagreed with the Platonic claim that truth consisted of universal forms that existed outside history and possessed an unquestionable authority, believing instead that truth was more complex, and that it was embedded in discourse and in historical life itself: it could not be separated from the position of the knower anchored in the historical world and living in discourse. The sophist position was more democratic than the authoritarian Platonic one, and that difference – between a democratic epistemology and an authoritarian one – continues down to the present to define the difference between the conservative attempt to shore up political authority and economic inequality and the radical attempt to question those institutions and to promote equality by developing an epistemology and an ontology founded on world-embedded complexity.

It is in relation to this long struggle between philosophical conservatism working in the service of political authoritarianism and social inequality on the one hand and its numerous critical opponents on the other that one must understand the intellectual movement known first as poststructuralism and subsequently as postmodernism which emerged in France in the 1960s. Not surprisingly, the early work of such postmodern French theorists as Jacques Derrida and Julia Kristeva was on late nineteenth-century avant-garde writers such as the Comte de Lautreamont and Stéphane Mallarmé. The affinities were real because they all participated in the same antithetical tradition

in Western culture. Theorists such as Derrida and Kristeva linked those historical examples of aesthetic and linguistic revolt to the work being done in France in the 1960s on structuralist linguistics. Language itself, with its enormous potential for semantic polyvalence and syntactic playfulness, became a privileged lever in the “deconstruction” of what was seen to be a conservative and repressive “Western metaphysics.”

Intellectual postmodernism of the kind that had the greatest influence on literary and cultural theory took the form of major statements by writers such as Derrida, Kristeva, Jacques Lacan, Michel Foucault, Jean Baudrillard, Gilles Deleuze, Hélène Cixous, and Luce Irigaray in the years from 1966 to 1975. A major source of ideas for these thinkers was structuralist linguistics. Philosophy had continued to seek authoritative models of truth in the mind’s powers of ideation down through early twentieth-century phenomenology, the German philosophic school promoted by Edmund Husserl. But developments in linguistics in the mid twentieth century undermined that quest by drawing attention to the way the human mind’s operations were anchored in and made possible by language, a system of sounds that was practical and nonideational. How could truth, which was supposedly absolute, authoritative, and purely mental, rely on a system of merely practical marks or sonic differences that were inherently polyvalent and polysemantic? The great project of philosophic conservatism – the search for truth in some absolute ground that would make hierarchical, inequalitarian, and authoritarian social institutions appear beyond contest or criticism – was scuppered once and for all. The conservative ideal of the “Great Writer,” which paralleled the conservative ideal of the Great Leader, was replaced by a model of how all individual writing is part of a discourse that

is in turn locatable in larger social, historical, cultural fields.

The major linguistic influence on postmodern thinkers was Ferdinand de Saussure, whose *Course in General Linguistics* (1959[1916]) shaped the thinking of a generation of French intellectuals. Two of Saussure's ideas were especially influential. One was that language is a self-contained system. Words are able to function as the names of things or actions because they are part of that system. The relation between words and things is entirely arbitrary. The word "cat" could name a flower if we wanted it to, but our linguistic and cultural conventions make the sound evoke the idea of an animal instead. Language, in other words, is entirely agreement-based. And it works because it is a self-contained system, not because there is any real connection between words and things. A sound image like "cat" evokes an image in our minds and allows us to think of a real cat, but that occurs within a linguistic system that has no direct contact with the world of things. Words are not names; they are arbitrary and conventional directional signals that orient our thinking in the world. One important "postmodern" conclusion derived from this idea is that we can never get direct, unmediated access to reality, to a real world of objects or things; we always know the world through language.

Another influential idea of Saussure's is that language is a sign-system made up of interrelated terms none of which has substance or identity outside the system of relations. Saussure called such relations "differences," and as a result "difference" becomes an important term in postmodernist thinking. Saussure broke the basic component of language (what he called the "sign") into two parts – the signifier, or phonic image, and the signified, or the mental image the signifier referred to. A signifier has an identity only by virtue of its difference from all other signifiers. It has no substance

in its own right. "Cat" can name a cat because it sounds different from "hat," which as a result of that difference can name something else. Individual words have no reality or identity on their own apart from their place in the whole language system of differential relations between terms.

This simple idea had shocking consequences. When applied to the world we know, it suggested that what makes anything what it is is largely invisible and "not there." The presence of the thing before our eyes – a traditional gold standard for accuracy and truthfulness – no longer counted if the automobile you love, for example, has meaning or being or "ontology" only in so much as it is part of a mesh of relations to other things which exceed the grasp of a consciousness that thinks only in terms of the presence of the thing, like the car, before our eyes. The car really *is* the links to the factory that make it, which links to the corporation that built the factory, which has meaning only in a complex interrelational economic system, and so on. For postmodernist philosophy, there is no *there* there. *There* – the presence of any thing before us – is always elsewhere. Thinking in terms of objects that are present to the mind loses all validity as a way of determining what is true. We have instead to take into account the complex relational field in which the object is located and that gives it its meaning.

If structuralists noticed that human culture and society work in similar ways to language so that meaning is generated by relations between terms and so that to know a "fact" is to know a relation, the poststructuralists took that idea one step further by noting that the relations never end. What Derrida called "textuality" was the endless proliferation of connections and relations, the deep network that made the presence of the thing before our eyes and mind possible; knowledge, therefore, is always incomplete.

There is no such thing as absolute certainty or complete knowledge of anything. But just as compellingly, there is no stable and sure identity of anything in human culture and society. Our selves are relational as much as our cultural products. Knowledge and life are complex rather than simple. All the certainties of bourgeois culture – from the “individual” to “facts” to the “truth” that sustained the culture’s moral platitudes – were thrown in doubt. In postmodernist eyes, moral and cognitive simplicity gives way to a norm-disturbing complexity.

The years 1966 and 1967 witnessed the publication of some of the major works of what would come to be called postmodernism. Lacan’s *Écrits* (1966) articulated a new version of psychoanalysis that drew on Saussure’s theories. The mind, according to Lacan, is such a system of interrelated parts, and because the unconscious manifests itself in the form of symptoms that are in fact signs, one could say the mind is itself a language system. Moreover, because the mind resembles language in that it is a self-contained system of relations that does not connect in any way with the world of objects, our conscious life and all of our conscious feelings, desires, and ideas are a kind of bubble through which we see the world and even ourselves. But we can never get access, direct and tangible, to that world. We can never know ourselves fully or know the world accurately and in a purely objective way. Our languages always mediate our knowledge.

Foucault made a similar point in *The Order of Things* (1973[1966]), a history of knowledge that demonstrated that our ways of knowing the world have changed over time and are characterized by different regimes of knowledge and signification. Some knowledge regimes (or *epistemes*) aspired to organize knowledge through hierarchical discourses (like the Renaissance “chain of being”) that reflected relations

of social and political power; others have worked taxonomically to arrange the world in an orderly fashion, as if the world obeyed rules similar to those of the concepts used to understand it. Other regimes of knowledge aspire to be more scientific and to append absolutely accurate names to clearly defined things. The important point Foucault made was that we know the world always through language or what he called “discourse.”

Jacques Derrida published three remarkably influential books in a single year: *Writing and Difference* (1978[1967]), *Speech and Phenomena*, 1973[1967], and *Of Grammatology* (1974[1967]). In an early essay called “Différance,” Derrida explores the ramifications for philosophy of Saussure’s idea that identities in language are in fact made up of differences between terms. According to Derrida, there is in the world a similar relationality or differentiability that operates in both time and space. “Presence” is the usual criterion of truth in philosophy, according to Derrida, either in the form of the presence of the “thing itself” to consciousness or in the form of the idea grasped clearly by the mind as a presence. Phenomenology argued that we see something present in our minds, a “true idea,” and we know it is true because our mind can grasp it clearly. But, according to Derrida, that presence is hollowed out by the fact that it is in time. It is as much what it just was as what it is just about to become. The presence of an object in consciousness is like a “ghost effect,” the image created by a series of cards whose fast flipping gives the impression of something real. That same flickering repetition in time makes the “present” present for us in our minds. Derrida’s conclusion is that if we pin our hopes for truth on something as unstable as that, we are foolish indeed. In a similar vein, he argues that all objects that appear present to our mind are different in space from other objects. All are field-dependent, to use another term.

One always knows the field, not the thing-in-itself.

Because things in the world are like Saussure's words, when we try to know things clearly and accurately, we are always led on to other things to which the first things relate, just as signs in language lead only to other signs because any sign is made up of differences from other signs. Knowledge, in other words, is always complex rather than simple, always a matter of relations or differences that have no substance as "things." When we try to determine what a literary text is about, we usually move from words to things – be they ideas in the author's mind or real things in the world like a historical event. But if those things are themselves differential relations, points in a network, then what really happens when one moves from literary text to author's idea or to historical event is a move from signs to a field of differential relation. If by "text" we mean "differential relations without identity," then the "referent" of a text, be it an idea or an event, is itself a text, which is to say, a network of relations in which any one term has identity through its relations of difference to other terms. To move from Nathaniel Hawthorne's novel *The Scarlet Letter* to the world it is about is to move from literary devices such as symbols and themes such as moral government to a world of real people and ideologies, but it is also to move to fields of differential relations that are themselves like signs in that they refer to other things in order to be what they are. If one attempted to fully account for all the references the text generates, one would never come to a point that was not itself differential and relational, not itself a "text."

Derrida is also known as a critic of the strand of philosophy known as "metaphysics." Metaphysics means "beyond or outside physicality," and it is usually associated with idealism, the belief that ideas exist in a spirit realm apart from the physical

one. But it also names the belief that truth can be determined as an idea that is true because it is present to consciousness in a way that transcends or is above and separate from signification. Derrida argued that metaphysics ignores the way temporal and spatial difference constitutes presence. The presence of the idea in consciousness is made possible by difference in time and space. The presence of the idea in consciousness is thus actually a sign of other things; to be what it is "in itself," it must refer to them – to versions of itself that are past and about to come and to other things from which it is different in space. Its identity is therefore made possible by "others" of various kinds. The word "alterity" ("alter" means "other") is often used to name this state of affairs. Metaphysics associates the voice of consciousness, the way we all speak to ourselves in our minds, with this gold standard of truth. The voice of the mind is supposedly aloof from writing, that exterior graphic practical script that embodies our ideas but not as a living thing like the voice of the mind. Instead, writing is a dead letter, something empty and artificial and purely representational. If the voice of the mind is a guarantor of living presence (one's presence to oneself) that is akin to the living presence of ideas in consciousness, then writing is like death because it connotes the absence of the speaker. Moreover, all writing is a sign of a sign. It works only by referring to the vocal signs of the voice in the mind. It is representation rather than presence, an empty sign rather than the real thing to which the sign refers. But this is not true, Derrida contends. In fact, even presence in the mind is representation. It is a form of writing if we understand by that something that is a "sign of a sign" rather than being a real living presence. If presence in the mind is, like all things, relational, then that presence also refers to other things in order to be what it is. Presence is thus not

distinguishable from writing; both are signs of signs, both are relational and differential. There is no transcendental point, therefore, that stands outside relations of difference. Such an imaginary point of transcendence had been used down through the philosophic ages to create an illusion of a truth so removed from worldly differences of time and space that it was absolutely true, from Plato's Ideas to Hegel's Spirit to Husserl's transcendental logic. Derrida proved that logically such points of authority are unsustainable. They always have to be different from the differences they say they are not, which means, of course, that they are made possible by difference.

This argument has wider repercussions for ethical, economic, and political philosophy. According to Derrida, many metaphysical value systems arrange their values in a way similar to how the transcendental idea of truth-as-presence is conceived in metaphysical thinking. In conservative ideologies especially, something akin to the metaphysical ideal of truth grasped as an authentic, natural, real, living presence in the mind is elevated into an axiomatic position of value. All else is declared to be derivative, merely artificial, and a decline away from the origin or axiom, much as writing is seen in metaphysics as a loss or depletion of presence, vividness, truthfulness, etc., in relation to the presence of ideas in the silent speech of the voice of the mind. In politics, norms and ideals such as "family values" or "proper morals" or "national interest" are assumed to be norms with a natural, unquestioned value. They transcend the field of rhetorical debate about values. Their authority is assured by an unquestionable sense of axiomatic naturalness that is beyond contestation. It is taken for granted.

The task of deconstruction is to reveal just how constructed and differential such transcendental norms are. They are not natural

truths that can go unquestioned because they bear in them a supreme form of authority. They are rather as contingent and constructed as any other possible statement about the world, even those that are made to appear "permissive," "unpatriotic," or "immoral" by those supposedly authoritative values. Each statement has to justify itself using rhetorical argument, and that places it in relation to and different from other possible statements about norms. Norms cannot simply declare themselves to be true because they are more "authentic," or "natural," or "present" as an idea in the mind of the holder of the belief. Each norm is made possible by a field of differences. Each frames the world so that certain forms of thought and action are excluded while others are declared acceptable and included. Every normative system, therefore, is made possible by differentiations. No such system can claim as a result to be founded on a moment of nature, truth, or presence that is aloof from difference and that transcends worldly contingency. All norms express interests and perform operations of differentiation. None is simply "true" in a way that goes "beyond saying." All norms must be spoken, and once they are, they enter into the very world of rhetorical difference they claim to transcend.

Deconstruction thus upsets assumptions about what counts as true and about how we determine what is true in a socially normative sense. It puts pressure especially on traditional conservative assumptions about how authenticity is better than artifice, presence better than representation, nature better than technology, truth better than rhetoric, and the "real" better than the semiotic. By showing the first term in each instance to be infected in its very constitution by the second, deconstruction destroys old ways of thinking and makes possible new ones that are less easy, more complex, and far more risky. One can no longer declare

a norm or value to be beyond question because it is more natural than other norms that are merely artificial. All norms are caught in the same field of differences and relations; none stands above the others; all must justify themselves. This egalitarianism is sometimes mistaken for an abandonment of all values, but what it really abandons is the conservative tendency to win value arguments simply by declaring a particular kind of moral norm to be so natural or good or real that it stands above all others, which are characterized using terms connoting artifice, representation, a loosening of authority, a loss of truth, etc. – all terms that in the metaphysical tradition had been associated with writing.

The new vision of language postmodern thinkers offered emphasized its rhetorical power to create realities, to convince others that certain propositions were true or real. This model of an active creative power of language drew on the work of proto-post-moderns such as Friedrich Nietzsche, Martin Heidegger, and Ludwig Wittgenstein; it inverted the conservative intellectual model of truth understood as something inherent in reality – be it a particular vision of moral laws or of ideal universal truths – that then got represented in languages that had no power of their own apart from representing pre-existing laws or truths. Postmodernists such as Jean-François Lyotard inverted this model and claimed words had the power to create truth and that in fact truth could not be said to exist apart from that discursive and rhetorical power of words. Things are true because we convince one another that they are true, but those truths do not exist apart from those discursive processes and acts. The American philosopher Richard Rorty became associated with this position and argued for it in the Anglo-American intellectual context.

These postmodern thinkers sought to create a new, more complex way of knowing

the world that emphasized relations over things and that heeded how language mediates our knowledge of the world. Like post-modern artists, some of them drew attention to the irrationality of the kinds of rationality that passed for wisdom in bourgeois culture, and argued that that culture represses material energies that are inherently beneficial and creative. This intellectual postmodernism clearly was in the tradition of dissent in Western culture dating back to the sophists. It challenged irrational claims to authority by questioning the ideas regarding meaning that have dominated philosophy and literary study. In cultural studies, it questioned the idea that the reality we know exists apart from influence by language and imagery; we know through representations, the post-modernists argued, and what we know is often only a simulation of the real.

The term “postmodernism” has also been used to describe a new historical era in capitalism that is characterized by the ascendancy of finance capital over traditional production, the replacement of “Fordism” – the organization of capitalism around the mass production of commodities by a mass workforce that is often unionized and with whom a certain peace must be established and maintained – with more “flexible” forms of labor such as temporary labor, part-time workers, and outsourcing of work to foreign, extranational locations, and the globalization of capitalism through the spread of free market values and principles around the world.

“Postmodernism” was first used in this more negative sense by critics concerned with the poverty of American mass culture in the 1950s, but the term took on more positive connotations in the late 1960s, when critics such as Ihab Hassan celebrated postmodernism as a radical, new, emancipatory form of cultural production. However, Marxist critics such as Fredric Jameson have been highly suspicious of the subversive

and anti-authoritarian energies of postmodernism. For such critics, postmodernism was brought into being by the most recent developments in capitalism. As capitalism saturates all of life and spreads itself over the globe, human life must become profitable for an elite of wealthy investors. New thought processes develop that are congruent with a global capitalism that uproots old traditions and fragments previous ways of unifying human experience. Radical disparities in income develop within modern capitalist societies that can appear acceptable only if human consciousness is rendered incapable of critical thinking. The narratives and ideals of liberalism and socialism that provided moral compasses in the past for judging and condemning such disparities are rendered useless in a culture that fragments experience and makes critical judgment impossible. For the Marxist critics of this era, the postmodernist artistic, literary, and intellectual movement itself is a symptom of this new capitalist reality. Its celebration of fragmentation and play is part and parcel of a global market economy that thrives on decentering, distraction, and the disintegration of old certainties.

These critics rarely take into account the work of the most politically radical of the postmodernists, thinkers such as Jean Baudrillard, Gilles Deleuze, and Felix Guattari. Baudrillard's work evolves from a critique of the "society of consumption" to a dismissive evaluation of the discourse of Marxism (which he sees as complicit with capitalism in that it is a regime of labor exploitation) to an analysis of how modern culture fosters a simulated "hyper-reality" to gain compliance and consent from populations. We live in simulations of the real rather than the real itself because our lived experience is so pervasively constituted by the media. Other politically radical postmodernists were interested in how regimes of social order are also regimes of semiotic order. "Semiotic"

means "pertaining to signs." Kristeva noted that literature contains two aspects or levels. One is orderly, the grammar that arranges words so that we understand them according to conventional rules; the other is psychological and material, the realm of desire and fantasy, the flows of material and libidinal energy that make up our physical selves. This other realm, which is akin to the unconscious dimension of the mind that Freud and Lacan describe, is often figured as madness in literature. It emerges in what Kristeva describes as potentially revolutionary forms in avant-garde literary works. Gilles Deleuze and Felix Guattari advanced similar ideas in their analyses of capitalism and psychoanalysis, especially in *Anti-Oedipus* (1984 [1972]) and *A Thousand Plateaus* (1988 [1980]). They argue that society itself is dual. We live with civilized order, but underneath are flows of energy that pertain to the realm of matter and physicality that always threaten to disrupt our civilized orders. Order always consists of the repression of this realm in favor of the mandates (self-control, social discipline) of the capitalist economy.

Postmodernism considered as a cultural strain continues to be influential in artistic and intellectual circles and has made its impact felt throughout the world. The ideas of Baudrillard – that the real is a simulation constructed by the media – have influenced such films as *The Matrix* (1999), and the postmodernist idea that conventions fabricate our identities has influenced artists such as Madonna, Cindy Sherman, and David Byrne and writers such as Kathy Acker, Dave Eggers, and the cyberpunk novelist William Gibson. The postmodernist emphasis on fragmentation, artifice, and the radical difference that constitutes our reality has troubled many social critics who see such a development as a departure from the political values and ideals necessary for achieving a just society. But if the survival of

a capitalism untroubled by critique would sustain the exploitation and inequality that have haunted modernity, postmodernism potentially offers an alternative way of thinking that clears a space for new social relations and new models of knowledge that “dehierarchize” social power and that make possible just and egalitarian political institutions.

Postmodernism in Popular Culture

IRIS SHEPARD

Though first used in the 1930s to describe a specific conservative counter-trend within Latin American modernism, the term “postmodernism” as we now generally use it refers to a specific style of art and thought that rose to prominence in the United States and Europe after World War II, reaching its full definition as a movement by the early 1970s. As the name implies, postmodernism is generally defined in relation to Western modernism, though the exact nature of this relationship is still contested. One thing almost all theorists of postmodernism agree

on, however, is that, while it draws in significant ways upon the modernist tradition of “high” art, postmodernism also maintains a close connection with popular culture, bridging the gap between “high” and “low” art that many see as central to the ethos of modernism.

Andreas Huyssen (1986) presents an influential discussion of what he sees as the democratic potential of the postmodern collapse of the distinction between high art and popular culture. Huyssen sees modernism as an elitist (and sexist) form that preserves the long dichotomy between high art and popular culture. On the other hand, he views postmodernism as building upon the modernist paradigm by incorporating, in a potentially progressive way, elements from both the avant-garde and popular culture.

Fredric Jameson (1991) sees the postmodernist incorporation of elements from popular culture in a much more negative light. For him, postmodernist culture is a product of a genuinely new historical stage in the development of capitalism. Following Ernst Mandel in labeling this stage “late capitalism,” Jameson particularly associates this phenomenon with the rapid globalization of capitalism that began after World War II in conjunction with the dismantling of the great European colonial empires. This late stage of capitalism represents the completion of capitalist modernization and the thorough saturation of everyday life and culture with consumerist ideology; aesthetic production becomes integrated into commodity production, so that postmodernist art becomes the “cultural logic” of late capitalism, while the commodification of high art collapses any meaningful distinction between art and popular culture.

For example, if the contents of a media image such as a television show have obviously become products to be sold on the market, the same can be said of paintings, literary works, or other objects that might

conventionally be associated with high culture. Despite Jameson’s primary interest in the expression of postmodernism in avant-garde texts such as film and experimental video, he makes valuable contributions to defining salient characteristics of postmodernism and how they function in popular culture texts, most notably television. Television, according to Jameson, is thoroughly encoded by the dominant cultural discourse and enforces the cultural hegemony of late capitalist consumerism. Postmodern texts cannot represent an authentic historical past; they can only portray our ideas and stereotypes about the past. Additionally, the total flow of television, the hours and hours of uninterrupted programming, serves to displace the role of memory, which contributes to the loss of historical sense. In television programming, fragmentation is a stylistic device that includes quick shots, heavy editing, and the interruption of the program by commercials. Jameson asserts that fragmentation is detrimental to the development of a unified self; he sees the fragmentation of postmodern texts as heavily implicated in the development of a schizophrenic self. Despite his belief that certain aspects of postmodernism are detrimental to an individual’s well-being, Jameson finds a great deal of value in postmodernism. He encourages readers and viewers of postmodern texts to look for utopian moments in the texts. He advances the idea that postmodern texts can be interpreted in ways that resist capitalism. Additionally, Jameson identifies the possibility of resisting the psychic fragmentation of postmodernism.

Still, Jameson sees popular culture largely as the product of a capitalist culture industry, somewhat in the vein of Theodor Adorno and Max Horkheimer. Others, however, see popular culture as a heavily contested terrain of struggle between the dominant ideology and resistant groups.

Critics of popular culture investigate the signifying practices of representation within this context of struggle for social power. Michel de Certeau (1984[1980]) investigates the activities of users and consumers of popular culture, as well as other, everyday activities. He concludes that, in the mechanism he refers to as “poaching,” users make “innumerable and infinitesimal transformations of and within the dominant cultural economy in order to adapt it to their own interests and their own rules” (xiv). He explores the rules and logic that consumers use to resist the dominant ideology and “reappropriate the space organized by techniques of sociocultural production” (xiv). He also investigates the political dimensions of daily life and consumption practices, and he asserts that marginality is pervasive, though not homogeneous. The secondary production by nonproducers is dependent on their social situations and power relationships. Users of popular culture texts are actively insinuating their interpretations and life experiences into their reading of the texts. Texts, de Certeau asserts, are habitable, “like a rented apartment” (xxi).

Jim Collins (1989) explores the interconnectedness of popular culture and postmodernism. He asserts that postmodernism is not just a transitional reaction against modernism, but the “culmination of the ongoing proliferation of popular narrative that began nearly two centuries ago” (xiii). He identifies an important similarity between popular culture and postmodernism; both are discourse-sensitive, that is, both discard the totalizing narrative of a homogeneous society and adopt instead an appreciation of the multitude of narratives that inform contemporary culture. The tensions and lack of unity between the discourses impact society and the individual in powerful but complex ways.

John Fiske (1989b) opposes previous approaches to understanding popular

culture that either ignored popular culture’s involvement with the dominant ideology or overemphasized its complicity with the dominant ideology. He proposes a third alternative. He sees popular culture as a site of struggle between the dominant ideology and the people, and people’s participation in popular culture as highly creative and inventive. People, Fiske insists, don’t just passively consume a commodity, but they also rework the commodity to construct and express their self-identity and social identities. In a mass-culture text, Fiske asserts, it is possible to separate elements of the dominant ideology from popular resistance elements. Fiske also investigates the production of popular culture, arguing that popular culture involves not mere consumption, but instead “the active process of generating and circulating meanings and pleasures within a social system” (23). He asserts that the groups commonly considered the consumers are really the producers. Because television is a popular cultural medium, it reaches a mass audience composed of numerous subcultures. The diverse sociocultural experiences of the viewing audiences allow for differences in interpreting television programs: “The hegemony of a text is never total, but always has to struggle to impose itself against the diversity of meanings that the diversity of viewers will produce” (93). Fiske coined the term “semiotic democracy” to describe the capacity of viewers to inscribe their own meanings on the text. He interprets watching television as a “process of negotiation between the text and its variously situated readers” (64) and also asserts that television viewers will find pleasure only from a television show that allows for the articulation of their specific interests.

John Frow (1995) asserts that the conceptions of popular culture developed by Certeau and Fiske are inadequate because they try to construct a top-down model of social

domination and create an essential domain of the popular. Frow perceives Fiske's treatment of popular culture to be an attempt to sanitize popular culture by removing "all ambivalence, all complexity, perverse pleasure, and it becomes clear that the category is purely prescriptive (that is to say, a fantasy)" (61–2). According to Frow, Fiske refuses to ascribe any power to the text to govern its reading, but instead grants all the interpretive power to the viewer who creates meaning out of the text based on his or her social allegiances. Frow identifies a pervasive tension in popular culture studies between ascribing the interpretive power of texts solely to the viewers and acknowledging the systematic constraints within which textual choice is possible. Popular cultural texts are highly commodified and an integral part of capitalist culture. Frow sees both of these positions as valid but irreconcilable, an "impossible synthesis" (70). He thus rejects the current structure of the categories used to construct and describe popular culture. He asserts that the concept of the popular may be useful as a slogan for struggles against oligarchic power or in breaking down traditional canonical structures, but it is not a valid descriptive category. The category of the popular, however, is useful in developing our understanding of how cultural space is organized. Frow insists that this normative structure needs further investigation and analysis rather than unexamined acceptance.

John Docker (1994) explores the presence of elements of the carnivalesque in postmodern popular culture, applying Bakhtinian theories of the carnival to popular literature, melodrama, and television. Docker asserts that essential qualities of the carnivalesque – decentralization, populism, inversions, and role reversals – are vibrantly expressed in popular culture experiences and texts. Public experiences such as parades, political protests, and sporting events engage

audiences and encourage participation; these events are participatory, collective experiences. Engagement with popular cultural texts – movies, television programs, music videos, etc. – encourages enormous participation by mass audiences. Audiences also actively influence the broadcasting process, as networks and advertisers strive to produce shows and commercials with broad audience appeal.

Commercial television texts, according to Docker, contain numerous inversions, a carnivalesque concept involving the renegotiation and upheaval of traditional power relations. In these texts, the powerless characters triumph over the powerful: the fox outwits the hounds; the child successfully negotiates the adult world; gender roles are reversed. Docker concludes that a carnivalesque cosmology can be found in popular television's extravagance, energy, and conception of history as open and capable of transformation. This openness contains "utopian glimmers of abundance and equality in the reversal of usual relations of order and power" (1994: 281).

Mike Featherstone (2007) explores the various and often contradictory ways that postmodernism has been defined. He asserts that there is a need in postmodern theory for evidence about day-to-day popular culture practices. He attempts to relate postmodern theories to everyday practices and to explain in sociological terms how postmodernism is possible. He provides three key concepts to remember when approaching postmodernism: it involves changes in artistic, academic, and intellectual fields; it changes the modes of production; and it changes everyday practices by aestheticizing everyday life. The process of aestheticization involves the transformation of reality into images, of life into a work of art: "Postmodern everyday culture is... an overload of imagery and simulations" (121).

However they view the political ramifications of postmodernism in popular culture, virtually all serious critics of contemporary popular culture agree that popular culture is a pervasive phenomenon, erasing boundaries between high art and popular culture and functions of daily life. As a result, debates concerning the nature and significance of popular culture often become indistinguishable from debates about postmodernism.

Proletarian Literature

TIM LIBRETTI

Proletarian literature is literature created by, about, or for members of the working class, focused on working-class issues and usually conveying an anticapitalist, pro-socialist message. The term became particularly current, especially in the United States, during the 1930s, when the collapse of Western capitalist economies led many to give serious consideration to alternatives, such as socialism. In an editorial article titled “Go Left, young writers!” in the January 1929 issue of the *New Masses*, editor and proletarian novelist Mike Gold hailed the appearance of a new writer on the American literary scene, one he describes as “a wild youth of about twenty-two, the son of working-class parents, who himself works in the lumber camps, coal mines, and steel mills, harvest fields and mountain camps of America” (Gold 1972: 188). In terms of political perspective, Gold continues, “He is a Red but has few theories. It is all instinct with him. His writing is no conscious straining after a proletarian art, but the natural flower of his environment” (188). Certainly Gold’s position, while a prominent one in Left cultural politics of the 1930s, constitutes just one voice taking part in the critical dialogue constructing proletarian literature. Nonetheless, his pronouncement captures some of the unique features of this movement which was often, in its 1930s manifestations, inspired and fostered – although by no means limited or controlled – by the Communist Party of the United States in its efforts to cultivate a new revolutionary aesthetic to nurture class consciousness and direct class struggle in the United States.

Most notably, as Gold’s manifesto suggests, proletarian literature distinguishes itself in the literary history of the United States as the genre or movement most forthrightly identified with a particular socioeconomic

class and, arguably, ideological perspective: the new writer is of the working class and is a "Red." While both contemporary scholars and 1930s critics contest these and other defining criteria of proletarian literature, the genre is often understood as the dominant Marxist imaginative literary movement in US literature and one that brought working-class experiences and class issues front and center in aesthetic practice. By some definitions, a Marxist ideological perspective constitutes the defining criterion of a proletarian literary work. As Harvey Swados notes of literary production in the 1930s, "In numbers far out of proportion to the population at large, American writers turned away in revulsion from any such accommodation with fascism and toward various degrees of Marxism" (1966: xvii). Indeed, the marginalization and caricature, even outright erasure, that proletarian literature in US literary and cultural studies endured for decades are largely the result of the fact that its general ideological orbit and its effort to replace individualist narratives with those informed by a collectivist ethos were the very targets of the anti-communist ideology of the Cold War era, when critical works such as F. O. Matthiessen's *American Renaissance* (1941), Richard Chase's *The American Novel and Its Tradition* (1957), and R. W. B. Lewis's *American Adam* (1955), all of which hail romantic individualism as the hallmark of American democratic culture, effectively mapped the disciplinary field of American literature in ways that are still relatively entrenched.

A full-blown critical archeology of proletarian literature is still in the process of recovering the proletarian literary tradition in all its richness from the critical erasures and caricatures this body of literature fell victim to at the hands of American literary criticism during the Cold War. Critics have worked against the stereotype of proletarian literature as produced by "artists in

uniform" and as featuring hopelessly tendentious narratives of white male workers achieving class consciousness and standing in solidarity with their working-class brethren. This powerful stereotype has encouraged the rejection of this body of literature as mere "propaganda," lacking any aesthetic merit and sacrificing artistic craft to an ideological program. It would likely surprise many to know, for example, that Richard Wright reviewed the 1936 novel *Black Thunder*, written by the African American author Arna Bontemps and portraying Gabriel Prosser's failed slave insurrection in Virginia in 1800, as a proletarian novel, or that John Steinbeck's *The Grapes of Wrath* (1939), by many accounts an "American classic," is indebted to and in many ways an exemplar of the proletarian tradition.

Scholars of the literary Left in the United States, however, who have studied proletarian literature as a prominent genre or movement in the Left literary tradition, have revealed a rich corpus of literary works that have extended in theoretical and creative writing the terrain of literature to that of a vast range of labor and working-class experiences and cultures. Classic works associated with the 1930s such as, among many, Jack Conroy's *The Disinherited* (1933) or Tillie Olsen's *Yonnonddio: From the Thirties* (1974), for example, chart the economic dislocations and migrations of working-class characters from coal mines to urban industrial factories to rural farm life before and during the Great Depression, often also representing with varying degrees of explicitness evolutions of social and political consciousness in their characters. Works such as Mike Gold's *Jews without Money* (1930), Henry Roth's *Call It Sleep* (1934), Carlos Bulosan's short fiction and collective autobiography of Filipinos in the United States *America Is in the Heart* (1946), Anzia Yezierska's *Salome of the Tenements* (1923), Thomas Bell's *Out of This Furnace*

(1941), or Pietro Di Donato's *Christ in Concrete* (1939), treat with cultural specificity immigrant working-class life in the United States as lived out in its racial and ethnic dimensions. The poetry of Langston Hughes, Robert Hayden, and Sterling Brown and the novels of Richard Wright, William Attaway, and Ann Petry artistically portray working-class experience and American social life more generally from an African American cultural perspective rendered through the expressive forms of blues, jazz, and folk culture. Critics such as Constance Coiner and Paula Rabinowitz, additionally, have highlighted ways in which authors such as Meridel Le Sueur, Tillie Olsen, Agnes Smedley, Fielding Burke, Dorothy Myra Page, Grace Lumpkin, and others innovatively portray the experience of labor as conditioned by differences of gender and sexuality. In short, the creative practice of proletarian literature in the 1930s and the attendant critical models of a Marxist sociocultural approach in literary study underwriting it radically transformed US literature by extending into the representational realm of aesthetic practice working-class experiences hitherto marginalized in US literature, including industrial working-class experiences of the factory floor, experiences of agrarian and rural working-class existence, immigrant experiences, experiences of labor migrancy, experiences of labor strikes or other forms of working-class resistance, and the lumpenproletarian experiences of unemployment and poverty (as in the works of Nelson Algren and Edward Dahlberg). More to the point, proletarian literature revolutionized cultural practice by representing the experiences of love, nature, family, motherhood, and overall a whole range of human experiences from a radical working-class, and often feminist and anti-racist, perspective. As a result, recent critical studies of proletarian literature have added an important dimension to the attempt of

cultural studies to draw attention to aspects of cultural life outside the traditional realm of "high art."

While proletarian literature can lay claim to being, as termed by one critical voice, "the most visible and identifiable genres of the Thirties" (Madden 1968: xvi), proletarian literature nonetheless constituted a vociferously contested cultural terrain in the 1930s and continues in recent and contemporary scholarship to be a terrain the contours and content of which are still evolving and which are still the subject of critical controversy. A critical consensus on a definition of proletarian literature has never been achieved, either in the 1930s or in the present. Debates in the 1930s, at times revisited in contemporary scholarship, created more questions than resolutions, wrangling repeatedly over whether it was the working-class status of the author, the class experience represented, the ideological perspective that informed the work, appropriate style or form of the work itself, or some combination of these criteria that earned a literary work the label of proletarian. In the 1930s, for example, critics debated whether Roth's *Call It Sleep*, because of its high modernist Joycean style and Freudian dimensions, constituted proletarian fiction. In more contemporary criticism, Barbara Foley excludes Roth's work from her important reconsideration of the proletarian tradition, viewing the psychological dimensions of his work as overwhelming any class worldview. On the other hand, Joseph Freeman argues, in his introduction to the 1935 anthology *Proletarian Literature in the United States*, that what distinguishes proletarian from bourgeois literature is the experience transmitted, as he asks, "Is there no difference in the 'experience' grasped and transmitted by Catholic and Protestant poets, by feudal and bourgeois playwrights, by Broadway and the Theatre Union?" (1935: 10). Such a distinction, however, tends to exclude such

works as Grace Lumpkin's *The Wedding* (1939), which portrays from a class-conscious Marxist perspective the decay of the middle class in the South, or other works representing the decay of class society, which Walter Rideout (1956) identifies as a key subgenre in proletarian literature. Edwin Seaver, in a piece published in the proceedings of the 1935 American Writers' Congress, argues that "what makes a proletarian novel" is the author's "ideological approach to his story and characters, which approach is entirely conditioned by his acceptance of the Marxian interpretation of history" (1935: 7). As with many literary generic categories, that of proletarian literature is not stable but evolving through and contested within critical debate. Unlike other literary categories, however, the debates are perhaps more extensive and complicated because of the genre's forthright linkage to sociological and political categories that involve controversies of their own.

Moreover, if proletarian literature is an identifiable genre, not only have critics nonetheless been far from unanimous in agreeing upon which individual works compose the body of proletarian literature or what the criteria for inclusion are, but the full corpus of proletarian literature has yet to be mapped. As contemporary critics such as Alan Wald, Paul Lauter, Paula Rabinowitz, Barbara Foley, William Maxwell, James Smethurst, Laura Hapke, Bill Mullen, and the late Constance Coiner have demonstrated, the empirical ground and history of proletarian literature are still in the process of being explored, rediscovered, and charted as they break through the scholarly neglect conditioned by – and cultural devastation and amnesia wreaked by – the powerful anticommunist ideology of Cold War America. Just as works such as Americo Paredes's 1930s novel *George Washington Gomez* are still being recovered in ways that continue to provide new empirical

ground for elaborating the critical understanding of proletarian literature in the 1930s and US cultural history more generally, critical opportunities are arising to chart the persistence and evolution of proletarian literature beyond the 1930s to the present moment and even to chart working-class-based literature prior to the 1930s. Indeed, although Gold's 1929 exhortation for writers to produce a proletarian literature echoed his earlier 1921 call in his "Towards a proletarian art" in the February issue of the *Liberator*, proletarian literature has largely been studied within the narrow historical confines of the 1930s and understood as the fleeting aberration of a singular moment of intense political, social, and cultural ferment in US history – the Great Depression. Attempts to reconstruct a proletarian literary tradition, however, reveal a wealth of proletarian literary production since the "Red Decade" by writers nurtured during this moment of aesthetic transformation or influenced by its writers or the models of aesthetic practice developed in this moment. Writers such as John Oliver Killens, John Sanford, Harvey Swados, and the husband and wife collaborative authors K. B. Gilden are just some examples.

Additionally, important and politicized bodies of literature, such as Chicano literature and Native American literature, have strong proletarian dimensions that still need to be theorized and linked to the proletarian literary tradition to provide a fuller understanding of US literary history and working-class cultural history. In addition, the recent work of scholars such as Julia Mickenberg has called attention to the impact of the proletarian and other leftist literary movements on children's literature, an influence that remained strong even in the Cold War years when much of the impetus of proletarian literature was stifled by anticommunist repression. Finally, while the project of critical recovery of proletarian literature has

focused on literature produced in the United States, other studies have indicated allied traditions elsewhere, as in Caren Irr's extension of this project to Canadian literature, or in the efforts of M. Keith Booker, Andy Croft, and Pamela Fox to draw renewed attention to British working-class literature, though that literature tends to be tied more to long-term indigenous working-class cultural traditions than to the specific proletarian movement of the 1930s.

R

Radio Studies

HUGH CHIGNELL

Radio studies is a subfield of media studies that emerged in the 1990s to provide the same sort of analysis of radio as a medium that was already being applied to other media, such as film and television. Encouraged by the comparative neglect of radio in the larger subject, it was initiated by a decisive turn away from the study of visual media (mainly television and film) toward the nonvisual and older medium of radio. Because of these origins, radio studies, a diffuse and hybrid amalgam, is united simply by the attention paid to radio at the expense of television and film, rather than any coherent underpinning theory. Most published work that shares this focus can be classified as part of radio studies, and by this sleight of hand works of cultural history or on the wider auditory culture can be seen as part of the new subject, irrespective of the intentions of the author.

The search for the first books on radio would take us straight back to the beginning of the twentieth century and the largely technical literature on the new sound medium. There are, however, examples of theorizing about the distinctive properties and potential of radio written before World War II. Rudolf Arnheim (1936) discussed the phenomenology of radio listening in an

influential early work which predates but has contributed to radio studies. In the US, Hadley Cantril and colleagues at the Office of Radio Research at Princeton University studied the outbreak of panic following the infamous broadcast of *War of the Worlds* in 1938 (1940) and at the same time Paul Lazarsfeld's *Radio and the Printed Page* (1940) was a groundbreaking study of "serious" speech radio and its audience. In Britain the memoirs of former BBC staff provide important reflections on radio, most notably Lance Sieveking (1934).

The emergence of media studies within the broader field of cultural studies occurred in Britain in the 1970s. The intellectual groundwork was carried out under Stuart Hall at the Centre for Contemporary Cultural Studies at Birmingham University. However, although radio, the press, and television were all studied in the center, it was television that received the most attention because of its pre-eminent role in the British media. This understandable focus effectively marginalized radio within media studies for at least a decade.

Andrew Crisell's (1986) attempt to identify the characteristics of radio and the significance of these for its users is arguably the first published work of what we now know as radio studies. That this was a British contribution is not without significance, as the translation of the auditory turn in media

studies into a network of academics and other writers was largely a British development. Crisell's brief but controversial statement about the nature of radio (including, famously, his suggestion that radio is a "blind medium") perhaps unintentionally helped to found both an academic sub-discipline and a network of radio scholars more than a decade later. The founding of the *Journal of Radio Studies* in the US in 1992 was a decisive development, as was the launch of the *Radio Journal* in the UK in 2003. Michael Hilmes sees the growing influence of cultural studies in academe as important. The range of cultural artifacts and previously disparaged media forms that could be studied was greatly increased and even radio, "a vital, though ancillary, component of our informational and entertainment universe," was included (2002: 1). Hilmes also notes that another reason for renewed interest in radio is the way the demographic fragmentation of radio (especially in the US) makes it possible to observe the various "subaltern counter-publics" as minority and community groups take over.

Turning to specific concepts and theoretical debates within the subject, it would be truer to say that there are "clusters" of writing about radio-related themes rather than distinct radio specialisms. The nature and effects of talk on radio form one of these clusters, as does the phenomenon of community radio. A small but important collection of writings exists on music radio (which include the role of the radio DJ), while the technological innovations of web radio, digital radio, and podcasting are all areas of interest. The intensely commercial nature of much of the radio industry and the impact of this on content and the public sphere has been examined and often contrasted with public service broadcasting. Distinct genres within radio including the radio feature, radio news, and radio drama have all been researched and discussed. At

the margins of the subject is work on the broader field of audio, which includes the use of mobile phones and personalized media (such as the iPod). Finally, radio history has been and continues to be a particularly rich seam of research potential.

A more detailed look at some of these areas of research helps to illustrate the current direction of radio studies. Martin Montgomery's early analysis of "DJ talk" (1986) articulated the essentially artificial and performed nature of "broadcast talk" (a term subsequently coined by Scannell [1991]). Montgomery's characterization of DJ talk as "a discourse obsessively concerned with its own conditions of production and consumption" (423) has proved influential. Graham Brand & Paddy Scannell's masterly analysis of the performance of the British DJ Tony Blackburn (1991) incorporated ideas not only of talk but also of the fluid "persona" of the DJ and the paranoid "discursive world" over which they rule. More recently, Andrew Tolson has developed and codified the analysis of what he calls "media talk" and has broadened the field with analysis of talk on radio sport and news. The work of Karen Atkinson & Shaun Moores on "therapy radio" (2003) has further developed our understanding of speech performance with an important account of the performance of "intimacy" on air.

Changes in the technology used to produce and transmit radio and related forms of audio have been an ongoing area of radio studies research. The highly influential historical account of radio listening in America by Susan Douglas (1999) links the rise of an autonomous youth culture to the introduction in the early 1950s of the portable transistor radio. Other historical accounts have looked at the invention of sound recording on production (see Street 2006) and the democratic possibilities recording created for getting the voice of the citizen on air. There can be no doubt

that in the day-to-day teaching and networking of radio scholars the impact of the internet and personalized digital technologies on radio has been a major concern and interest. Internet radio, digital radio, and the phenomenon of the podcast have all been seen as either threatening conventional radio or offering it new opportunities. For radio studies this has been a useful area because it has forced some re-evaluation of the precise nature of radio and how it differs from what might be called "audio." The use of the iPod to listen to downloaded speech podcasts goes to the heart of this dilemma. Michael Bull's (2005) writing on the iPod describes a "personalized soundworld" to which the cocooned urban listener retreats. The iPod makes possible "intimate, manageable and aestheticized spaces" that are often a relief from an alien environment. Bull's intervention is important because it contributes to an understanding of the nature of radio listening without itself being concerned with radio; it forces the radio scholar to think about the boundaries between broadcast radio and the wider study of sound culture.

Radio is characterized by a particularly high level of organizational diversity. In the US commercial radio, often part of huge media conglomerates, is dominant. In the UK, public service radio in the form of the BBC is the main provider, and globally small community radio stations are extremely important. The study of the impact of relentless commercial pressures on American radio has been an important part of the subject. Robert Hilliard & Michael Keith's (2005) almost apocalyptic account of the virtual destruction of "localism" in American radio by the Republican-leaning media giants is an important example. A part of this has been the growth of radio formats that have served to commodify and standardize radio's output. Jody Berland's influential analysis of this process (1993) is

strongly reminiscent of the Frankfurt School (especially Adorno) with references to radio's narcotizing function. The study of community radio, especially as a global phenomenon, has been a major undertaking within radio studies and has given it a genuinely global perspective. Much of this work can be seen as part of a less theoretical and more policy-oriented intervention with particular attention given to issues of regulation and the use of radio for development.

In the US, there has been what Hilmes has called "a blossoming of radio studies" since 1990 (2002: 1) and almost all of that has been in the important field of radio history. American radio history has been adorned by two particularly important texts; both Hilmes (1997) and Douglas (1999) are feminist cultural histories that locate the medium in the wider national and social-cultural context. Douglas's work, arguably the more idiosyncratic, gives particular prominence to the culture of radio listening while Hilmes's contribution is nicely captured in the words of the radio historian, Jason Loviglio: "much of the best research in radio studies today can be described as Hilmesian" (2005: xi). Hilmesian research is rooted in the archive, and as a result is richly detailed, while at the same time reflecting on wider cultural trends. This approach is also a feature of much British radio history including Kate Lacey's work on prewar German radio (1996) and David Hendy's monumental history of BBC Radio Four (2007).

It seems likely that radio studies will continue to flourish with further research on personalized media as these become yet more ubiquitous features of everyday life. Radio history will receive further impetus from the continuing availability of online audio archives and, at least in the UK, the growth of community radio will contribute to that subfield. In a sense the first decade or so of the new subject needed to argue the

case for the importance of radio. That task behind it, radio scholars will be more ready to embrace the wider categories of audio, sound, and culture in research that is less defensive and more interdisciplinary.

Realist Theory

JOHN J. SU

Within Western philosophy realism refers to the twin propositions that the world exists independently of the beliefs and perceptions of any given individual and that our languages and theories have the capacity to describe that world more or less accurately. Realism as a philosophical position has existed for more than 2,000 years, but within contemporary literary theory it tends to refer to a set of related theories that emerged in the 1990s as a critical response to the dominance of postmodernism in the humanities and social sciences. These more recent versions of realism – sometimes referred to as “postpositivist realism” in the United States and “critical realism” in Great Britain – share a sense that the epistemological skepticism identified with post-

modernism is philosophically unfounded and politically debilitating. The most significant version of realist theory was formulated by scholars associated with the Future of Minority Studies Research Project, who argued that the critique of objectivity and truth by postmodern theories often undermines the experiences of minorities as significant sources of cultural and political knowledge. Initially drawing on philosophers of science including Hilary Putnam and Richard Boyd, and more indirectly on the political philosophy of Karl Marx, scholars of realist theory have attempted to provide a theory that contributes to progressive social struggles.

The term “realism” used in this context can be very confusing. The term also refers to the most important literary movement of the nineteenth century, associated with George Eliot and Charles Dickens in Great Britain; Honoré de Balzac, Émile Zola, Stendhal, and Gustave Flaubert in France; Ivan Turgenev in Russia; and Henry James in the United States. These authors sought to reproduce in their writings features of everyday life, rejecting romance, elevated language, and artifice. In philosophy, the debate between realists and idealists (who reject one or both of the realist propositions) dates back to Plato, at least, and philosophers associated with postmodernism such as Jacques Derrida, Jean-François Lyotard, and Jean Baudrillard have argued for idealist positions by advocating various forms of skepticism or relativism. In some of the most extreme forms, this has meant a rejection not only of the idea of objective knowledge but also of the possibility of determining the relative accuracy of competing accounts.

Realist theory, as it emerged in the 1990s, took as its starting point the defense of what might be called a “postpositivist” notion of objectivity. In his seminal work on realist theory, *Literary Theory and the Claims of History* (1997), Satya Mohanty acknowl-

edges the validity of postmodern critiques of positivist conceptions of objectivity. Positivists in the social and natural sciences asserted that empirical analysis could yield knowledge that is independent of historical and cultural contexts, as well as the subjective and theoretical biases of the researcher. Theorists of postmodernism convincingly demonstrated that no individual can escape entirely his or her philosophical biases, and that knowledge is never separable from questions of power. The notion that knowledge is never free from bias does not necessarily imply that all forms of objectivity are impossible, however. Mohanty argues that theoretical biases do not invariably distort an individual’s perception of reality, and can in many instances yield reliable and accurate knowledge by providing the means for an individual to interpret his or her experiences. According to this postpositivist view, every person’s theoretical perspective is limited but not to an equal degree and not in the same way. Mohanty offers what he calls a “cognitivist” account of experience, which suggests that theories can be evaluated based on their capacity to provide more accurate and reliable information rather than distortion and mystification.

Knowledge, from this perspective, is understood as something continuously produced in light of an individual’s personal experiences and interactions with others; knowledge is not an abstract, neutral, and static body of facts to be acquired. Error is an inevitable part of inquiry, but the apparent impossibility of ever arriving at an account free of error does not imply an endorsement of skepticism. Rather, it suggests that knowledge depends on an ongoing process of interpretation, and more objective accounts are those that can accommodate new information as it arises. Error is thus seen a crucial part of the process of acquiring knowledge, which is itself always socially situated.

The implication of this argument is that racial, gender, sexual, and other collective identities are not simply imposed on individuals, as Michel Foucault and other theorists characterized as postmodern maintain, but represent theoretical constructions for individuals to make sense of their experiences in light of the experiences of others who have been similarly positioned and coded by the societies in which they live. According to this idea, all social and economic systems sustain themselves by establishing hierarchies in which individuals are placed in positions of relative privilege or want. Identities represent social constructions that arise out of an individual's self-perceptions and those ascriptions given to that individual by others with whom he or she interacts.

The emphasis on identity as a dynamic social construction that arises out of an ongoing series of interactions with others distinguishes realist theory from earlier notions of identity politics circulating in the 1960s. These earlier notions of identity politics tended to posit what could be called an "essentialist" conception of identity. A collective identity was understood in terms of an unchanging essence that was shared by all members of a group. As many postmodern critics recognized, such a notion of identity denied both the differences between members of a group and the fluidity of any given identity. Realist theorists in the 1990s accepted the validity of these critiques, but insisted that such critiques did not imply that the notion of identity was inherently suspect. The ongoing realities of racism, sexism, and homophobia suggested that minorities within a given group had similar though not identical experiences because the social and economic structures of the communities in which they lived coded them in similar ways. Thus, an analysis of identity could minimally enable a researcher to clarify the mechanisms that

exclude certain individuals and accrue privileges to others.

The rehabilitation of identity by realist theory addresses a concern shared by many critics of postmodernism that postmodernism fails to adjudicate between conflicting accounts because it rejects the idea that material evidence or personal experience can provide accurate knowledge. Similarly, postmodern critiques of identity demonstrated how labels like "woman" or "Asian American" were social constructions that often limited the ability of individuals to express themselves, but such critiques failed to provide compelling reasons for individuals to organize and work collectively to accomplish political goals. As a result, theorists like Gayatri Spivak were forced to propose that political coalitions might require temporarily suspending one's philosophical beliefs. Her own initial endorsement and subsequent repudiation of "strategic essentialism" (Spivak 1989) point to the intellectual gymnastics required for a scholar committed to core principles associated with postmodernism to engage nonetheless in significant political activity. Even critics of postmodernism such as Geoffrey Galt Harpham often conceded Spivak's assumption that political practice and philosophical commitments were incompatible. Harpham (1999) argued that academics have been too fastidious in their efforts to apply their theories consistently in the political realm rather than that the theories themselves were flawed and needed to be replaced by better ones. Realist theories, in contrast, suggest that members of a particular identity group often demonstrate certain similarities, but such similarities are neither stable nor imply homogeneity of members. More importantly, such similarities can be negotiated over time, which in turn can provide the basis for the political commitments of the group. That is, identity politics is not a convenience

or strategy but rather the result of individuals recognizing and developing common interests.

Scholars who identify themselves as realists have consistently understood the importance of realist theory less in terms of reading particular literary or cultural texts and more in terms of identifying which texts are crucial to forwarding debates occurring on the national level. Indeed, realist theory provides one of the most compelling arguments for the defense of ethnic and gender studies programs on the university level. If knowledge is always produced from an individual's experiences and theories rather than an abstract body to be acquired, then everyone's knowledge is partial and limited. Those experiences associated with the minority populations of a given society can provide crucial knowledge of the economic and social conditions that govern the daily lives of everyone. Indeed, the experiences of minorities offer a necessary corrective to such phenomena as "white privilege" by enabling members of a majority population to recognize how their relative privileges come into being at the expense of other populations.

Realist theories have gained significant prominence since the 1990s both in the United States and in Great Britain. The edited collections *Reclaiming Identity: Realist Theory and the Predicament of Postmodernism* (Moya & Hames-García 2000) and *After Postmodernism: An Introduction to Critical Realism* (López & Potter 2001) indicate the breadth of scholarship and approaches taken by American and British scholars respectively. The tendency has remained, particularly in the United States, for realist theory to enjoy interest among scholars devoted to "minority" issues, though there has been notable expansion in terms of what constitutes minority. So, for example, disability studies has benefited significantly from the work of scholars like

Tobin Siebers and Rosemary Garland-Thompson. It remains unclear at this stage, however, whether the expansion of scholarship employing realist theories will lead to a coherent school of "realists" or whether it might continue to refer to a variety of loosely connected methodologies and theoretical approaches.

Romance

SARAH S. G. FRANTZ

“Romance” refers to the mass-market popular fiction written primarily by and for women that constitutes 50 percent of the American paperback fiction market. It typically revolves around a central romantic relationship, usually between a hero and a heroine, and requires an emotionally uplifting and optimistic ending. All of these considerations – its popularity, its optimism, its peculiarly feminine status – have relegated romance to the status of a critically scorned literature that is only beginning to receive sustained literary and cultural analysis.

Pamela Regis (2003) pinpoints eight universal narrative elements necessary for a novel to be considered a romance: the definition of a corruption in society, the meeting between the protagonists, the attraction that draws them together, the barrier that keeps them apart, the point of ritual death they suffer at which it looks like the relationship is doomed, the recognition that resolves the conflict, the mutual declaration of love, and the betrothal (but not necessarily marriage) that formalizes the relationship. While this structural approach to romance criticism emphasizes the formulaic nature of the narrative for which romance is so often derided, these elements can happen in any order and can be of varying degrees of importance in different narratives. It is in the infinite, sometimes surprising, variations of and experimentation with the familiar elements that the appeal and evolution of the romance narrative lie.

The term “romance,” however, has a much longer and more complicated literary history than its current definition reveals. When Northrop Frye, for example, includes romance in his four major tropes of literature, along with comedy, tragedy, and irony, he does not mean romance as defined above. He is referring, rather, to the medieval

poems that go back 1,000 years that detail the quests, adventures, and courtly loves of mythic princes and heroes, establishing the origin myths of England and France. These traditions of medieval romance continue in prose in the multivolume baroque romances published in sixteenth- and seventeenth-century France. In eighteenth-century Britain, “romance” was used as a term to elevate culturally sanctioned narratives above the upstart popular genre, the novel, which was condemned as harmful to its readers and artistically impoverished. These criticisms, not coincidentally, correspond with the commercial success of female novelists in the late seventeenth and eighteenth centuries and came from all directions. In 1792, proto-feminist Mary Wollstonecraft, for example, condemned “the reveries of stupid novelists” for producing a “feminine weakness of character” that condemned women to a life of financial, emotional, and intellectual dependence on men.

In the three centuries of the novel, individual canonical novels have helped to establish reader expectations for character types and narrative structure in modern popular romance. Samuel Richardson’s *Pamela* (1740) details the successful romance between an impoverished yet innocent serving girl and her licentious master, who is made to recognize the error of his ways and marries her. Fanny Burney’s *Evelina* (1778) relates, according to its subtitle, “The History of a Young Lady’s Entrance into the World,” and popularizes the trope of the hidden noble parentage of the heroine finally making her worthy of her lover’s hand. Jane Austen’s *Pride and Prejudice* (1813), some argue the perfect romance novel, demonstrates how both the hero and heroine must undergo a moral education in order to deserve their happy ending together. Charlotte Brontë’s *Jane Eyre* (1847) expands the late eighteenth-century

gothic themes of female isolation and emotional strength, and, in Mr. Rochester, solidifies and feminizes the tradition of the dangerous lover popularized by Byron 50 years earlier.

Additionally, popular fiction for and by women of the eighteenth, nineteenth, and early twentieth centuries, even if not technically romance, contributed to the audience, themes, and even marketing of the modern romance genre. These include the scandalous *roman-à-clef* of the early eighteenth century which anonymously detailed the lives and scandals of real members of the royal courts in England and France; the sentimental fiction of the 1770s with its overwrought emotions; the gothic fiction of the 1790s with its ominous castles and isolated heroines; the silver-fork novels of the 1820s detailing the soap opera loves of high society; the domestic fiction of the 1850s in the United States; the sensation fiction of the 1860s in Britain with its suspenseful tales of bigamy, murder, and mystery; and the conservative Christian fiction that spanned all three centuries and both continents. All of these genres of the popular novel were criticized for their quality, their scandalous and damaging subject matter, their formulaic nature, and their florid prose. The most famous condemnation was Nathaniel Hawthorne's frustrated letter to his editor in 1855: "America is now wholly given over to a damned mob of scribbling women, and I should have no chance of success while the public taste is occupied with their trash."

Romance grew into its name and crystallized its modern genre conventions most significantly when Mills and Boon in the United Kingdom, founded in 1908, began to focus solely on publishing and distributing category romance novels in the 1940s. Category or series romances are released once a month, are usually only available for that month, are sold in grocery stores as well as

bookstores, and are marketed as a disposable, interchangeable commodity. Category romances are published as part of a "line," like Mills and Boon Medical Romance, Harlequin Intrigue, or Silhouette Desire, which immediately indicates to the genre-literate reader not only aspects of the novel's plot (subgenre, setting, characters' professions) but also how sexually explicit the novels are. These lines quickly evolve and adapt in response to market forces and audience demand – for example, recent additions include a paranormal line, lines marketed for African Americans, and "inspirational" lines for Evangelical Christians. However, the apparently disposable nature and the formulaic construction of category romance serve to provide justification for critics over the years who have labeled the novels interchangeable trash.

In the early 1970s, the publication of Kathleen Woodiwiss's *The Flame and the Flower* (1972) and Rosemary Rogers's *Sweet Savage Love* (1974) created the second modern publishing explosion of romance with the genesis of the noncategory historical romance. These much longer stories, quickly dubbed "bodice-rippers" for their lurid covers and involved sex scenes, entered popular culture precisely at the moment the feminist movement was gaining momentum and power. While the books became bestsellers, spawning enough imitations to create literally an entire genre of popular literature, the feminist response to popular romance was almost universally negative. Feminists felt that the happy endings of popular romance, whether that of the tame category romances or of the racier historicals, reinforced the subjugation of women to the patriarchal imperatives of enforced heterosexuality, male domination, and oppressive gender roles. Germaine Greer, for example, in her seminal work *The Female Eunuch*, railed against the readers who "cherish the chains of their

bondage” (1970: 176). In her influential 1980 essay for the *New Republic*, Anne Douglas condemned romance as “soft porn” for women, enforcing heteronormativity and essentializing gender roles. Janice Radway’s seminal ethnographic study of romance readers, *Reading the Romance* (1984), used Nancy Chodorow’s feminist Freudian analysis of the importance and power of mothering to argue that women use romance to feel nurtured and “mothered” by the hero as a way to recharge themselves from the demands placed on them by their families. Radway decried, however, the false comfort and security that she felt romance readers gained from their reading because it prevented them from actively protesting their oppression in ways that would lead to real social change.

This view of popular romance prevailed until the 1990s, at which point romance writers, especially, began to defend the genre, arguing instead that romances present a positive, even feminist, view of female agency, female sexuality, and gender relations. Bestselling romance author Jayne Ann Krentz edited an anthology of essays, *Dangerous Men, Adventurous Women* (1992), in which romance authors declared the many different ways in which romances empowered them as women, as readers, and as authors. Krentz’s authors argued that the frank depictions of sexual activities written specifically by and for women are not only arousing, but also liberating and educational, the ultimate feminist act. More importantly, they maintained that the empowerment conferred on the reader by romance rested mainly on the fact that the required happy ending represents the romance hero being tamed and domesticated by his heroine. This “breaking in” of the hero, they argued, validates the readers’ worldview and thereby empowers them in their domestic lives. This argument does not invalidate the feminist argument against romance, how-

ever; rather, it agrees with the premise that women are reading romance to feel empowered, and argues that this empowerment is real and valuable instead of false and debilitating as the feminists claimed.

Recent criticism has argued that the underlying premise of both arguments – that the reader consumes romance because she is unhappy with her lot in life and needs empowerment – is invalid and that romance needs to be examined on its own merits, rather than solely as a psychoanalytic portrait of the abject female reader. Additionally, the evidence offered for both sides is often flawed, usually in one of three important ways. Most often, arguments are frequently based on one or two individual aspects of the entire genre, like the hero or the happy ending, without recognizing the representational differences between subgenres, authors, or individual novels. Second, the arguments sometimes examine just one subgenre and assume that the conclusions that can be drawn from, for example, historical romance, as Janice Radway argued, can be expanded to explain all romances, again, no matter the subgenre. Finally, these arguments sometimes go even further and examine just one or two individual texts as synecdoche for the whole genre. Rather than recognizing and examining the diversity of popular romance, romance criticism prior to the twenty-first century, both positive and negative, has claimed blindly that all romances are the same, denying the necessity of examining individual texts, authors, or subgenres. In response, more recent criticism argues that analysis of popular romance should not focus on the readers or on broad categories of novels, nor should it attempt to “explain” the appeal of the romance. Instead, it focuses on the individual texts themselves, on individual authors, or on subgenres, as literary and cultural artifacts. These recent evaluations avoid discussion of whether

romance is good for its readers or not – a debate as old as the female-authored novel – and examines, instead, one author's use of crying heroes, for instance, or the post-colonial implications of the popular sheikh category romance.

Recent critical and theoretical work has provided the tools to analyze and appreciate popular romance on its own terms, as a genre that presents an optimistic view of the human condition in which mature, reasoned, mutual love is paramount and human connectedness is a vigorous force for goodness and clarity in life. For example, an enduring charge against popular romance is that the novels are badly written: sentimental and formulaic, marred by "purple prose" and predictable content. Using historical and aesthetic analysis, recent criticism demonstrates that popular romance evolved from nineteenth-century sentimental prose and poetry and as such refuses to conform to more recent realist and modernist ideals of aesthetic success and originality. This refusal views the necessary optimistic ending of popular romance as something other than a failure of aesthetic sensibility.

While predictions about the future are always speculative, expectations for the future of criticism of popular romance return time and again to the proven possibilities of the World Wide Web for the distribution and discussion of the genre. Popular romance has a substantial presence on the World Wide Web: while traditional print publishers are slowly entering the electronic book market, following the lead of the e-publishers that have been offering e-books for years, loosely connected communities of readers and authors have sprung up online with individual and communal readers', writers', and publishers' blogs, collective and individual book review sites, and individual and joint author message boards. These sites reference each other, state and debate opinions, review good and bad

books, and generally create a vibrant community of people who debate genre trends, have an unrivaled communal memory of the history of the genre, and are taking popular romance seriously as a genre. While probably only a small percentage of the population of romance readers participate in the online communities, the online communities are changing the terms of debate used to analyze popular romance in ways that will enhance and extend future academic discussions of popular romance.

Rorty, Richard

STEVEN TAUBENECK

Richard Rorty (1931–2007) was internationally one of the most controversial and influential philosophers from the period after 1945. Though he started his career in Anglo-American analytic philosophy, Rorty began to turn against this tradition with his 1967 publication entitled *The Linguistic Turn: Recent Essays in Philosophical Method*. Over the next 40 years he broadened his critique of analytic philosophy to the professionalization of philosophy in general, until in his 2007 book, *Philosophy as Cultural Politics*, he argued for a reorientation of the discipline to make it relevant to “cultural politics.” Rorty’s transformation of philosophy into literature amounts to a radical call for far-reaching cultural change.

One of the best-written accounts of Rorty’s youth is his own article, “Trotsky and the wild orchids,” originally from 1992.

Rorty tells the story in the form of a “novel of maturation,” in which he matures by turning against his youthful dreams. He was born in New York City to Trotskyite parents, and early recognized as precociously intelligent. His family left the debates over communism and moved to the mountains of northwest New Jersey, where he learned to appreciate wild orchids. From these early experiences his life and writing were marked by the struggle between a desire for social justice and an appreciation of aesthetic beauty: while he was politically engaged and progressive, he also savored rare, precious forms of experience. His awareness of this tension encouraged him to study philosophy, which he hoped would harmonize these competing realms into a single, overarching vision. His early heroes were Plato, Aristotle, and Thomas Aquinas. In 1946 he entered the University of Chicago, where he studied in a department with Rudolf Carnap, Leo Strauss, and Richard McKeon as teachers and Alan Bloom as one of his classmates. Gradually his dream of reconciling Trotsky with the wild orchids faded, as he realized that philosophy would not provide him with the unifying vision he sought. Instead he came to believe that philosophy would make a difference only if it makes a difference to everyday practice, and so he embarked on a program of turning philosophy against itself. Rorty finished his MA at Chicago in 1952, then his PhD at Yale in 1956. After two years in the army, he taught for three years at Wellesley. In 1961 he accepted a position in philosophy at Princeton, where he remained until 1982.

PHILOSOPHY AS ANTIPHILOSOPHY

The story of the years from 1961 to 1982 involves the deepening of Rorty’s critique of analytic philosophy, and the broadening of his application of this self-critique. In *The*

Linguistic Turn he summarizes the accomplishments of analytic philosophy and at the same time announces the end of the movement. Although analytic philosophy had produced many important insights, Rorty suggests that it should be transformed through interaction with Heidegger and Wittgenstein, among others. This line of argument is continued in his important 1979 book *Philosophy and the Mirror of Nature*, where Rorty adds the pragmatism of John Dewey to the narrative about the end of analytic and the emergence of post-analytic philosophy. Dewey, Heidegger, and Wittgenstein have, for Rorty, put aside the epistemology and metaphysics that began with Descartes, Locke, and Kant and “have brought us into a period of ‘revolutionary’ philosophy (in the sense of Kuhn’s ‘revolutionary’ science)” (6). Now philosophy should become “therapeutic rather than constructive, edifying rather than systematic, designed to make the reader question his own motives for philosophizing rather than to supply him with a new philosophical program” (5–6). Rorty proposed that philosophy should change from dogmatically constructionist system-building into therapeutic, self-questioning edification. He sharpened and differentiated this point with his collection entitled *Consequences of Pragmatism* from 1982, in which he claims: “I think that analytic philosophy culminates in Quine, the later Wittgenstein, Sellars, and Davidson – which is to say that it transcends and cancels itself” (xviii). By 1982 Rorty had developed a dazzling, scintillating style of writing that is at times witty, acerbic, and deft but consistently well informed and insightful. He had also developed into a brilliantly antiphilosophical philosopher. He decided to leave Princeton, and during this same time (1981–6) he received the prestigious MacArthur Fellowship.

PHILOSOPHY AMONG THE HUMANITIES

Rorty worked at the University of Virginia from 1982 until 1998, during which time his fame and notoriety reached global proportions. He was often traveling and giving lectures and, although he wrote consistently throughout his career, the years at Virginia may have been his most productive: he published seven books and many articles over those years. Rorty held the position of Kenan Professor of Humanities, which freed him from all departmental and most committee duties. It was a unique position, one which he thoroughly enjoyed and which clearly benefited him. At the same time we can see him moving from a more narrowly understood position as a professor of philosophy to the broader position of a professor of humanities. Just as he was arguing against a narrow understanding of philosophy, he was reforming philosophy through interactions with other influences. Perhaps the most controversial result of these years was the 1989 book entitled *Contingency, Irony and Solidarity*. As Rorty reported in “Trotsky,” “My *Contingency* book got a couple of good reviews, but these were vastly outnumbered by reviews which said that the book was frivolous, confused and irresponsible” (1992). From the Left and the Right, Rorty was criticized for being either too elitist or too relativist, respectively. The book had touched a nerve, and Rorty used the controversy as a source of inspiration.

The book develops in the order mentioned in its title. The first section deals with the contingency of language, self, and community, the second develops the figure of the “liberal ironist,” and the third articulates a vision of solidarity on the basis of contingency and irony. With the concept of contingency, Rorty develops his histori-

cizing point that language, selfhood, and community formation all occur within contexts governed by temporality and chance. Hegel, in the first place, but also and especially Darwin, emerge as crucial supports for his position. In this section of the book Rorty shows how a thoroughgoing historicism will de-divinize many of our major concepts, and turn them into problems to be debated from different perspectives according to various contexts. He argues here for the advantages of an antifoundational, anti-essentialist, and antitranscendental intellectual culture. The heroine of such a culture, according to Rorty, will be a “liberal ironist,” a woman who is an unabashedly bourgeois liberal with a strong sense of self-irony. The bourgeois liberal, on Rorty’s account, is someone for whom cruelty is the worst thing we can do, and the ironist is someone who will ironize any claims for epistemological or metaphysical certainty. The “liberal ironist” is also someone who will focus on private projects of self-improvement and self-overcoming. Rorty makes a strong distinction at this point between the private and the public, whereby the private realm is the area where people should have maximum freedom to pursue their own goals. To support his vision of private ironists, Rorty mentions Nietzsche, Derrida, and Foucault, among others. These critics had, for Rorty, little to contribute to public political discourse but a great many insights into self-development. In the third section of the book, Rorty develops a concept of solidarity through readings of Nabokov’s and Orwell’s literary writings. Both Nabokov and Orwell wrote extensively about cruelty, and Rorty finds that their accounts of cruelty provoke readers to reject cruelty in favor of solidarity with other groups. In this section, Rorty uses a philosophical analysis of literature to develop a view of political consequences. Philosophy, literature, and politics are brought together into a provocative

combination that has sparked vigorous debate across the humanities.

PHILOSOPHY, LITERATURE, CULTURE

From 1998 until his death from pancreatic cancer in 2007, Rorty was Professor of Comparative Literature at Stanford University. His importance was such that Robert Brandom, one of his former students, edited an anthology in 2000 with 12 papers by distinguished critics, together with Rorty’s responses to each, called *Rorty and His Critics*. The volume gives a thorough overview of Rorty’s most characteristic positions, and includes enthusiastic debates from various perspectives. Rorty also continued to publish extensively. In 1999, for example, he brought out a collection called *Philosophy and Social Hope*, which offers a clearly written and very accessible overview of his various arguments, and in 2007 he published a short piece called “The fire of life,” in which he reflected on his own approaching death. These last years were marked by Rorty’s clearest statements that philosophy should be understood as a form of “cultural politics”: “I want to argue that cultural politics should replace ontology, and also that whether it should or not is *itself* a matter of cultural politics” (1999: 5).

Part of his argument is that philosophy should be seen as a “transitional genre” (89). Where religion had once been the most dominant cultural form, after the Renaissance and through the Enlightenment it became philosophy. With the rise of Romanticism, philosophy began to lose its dominant cultural status: “The transition from a philosophical to a literary culture began shortly after Kant, about the time that Hegel warned us that philosophy paints its gray on gray only when a form of life has grown old” (91). For Rorty, it was especially

the convergence of Romanticism and pragmatism that led to the demise of philosophical culture. Romanticism promoted the idea that “imagination is the source of language, and thought is impossible without language” (107). William James picked up the Romantic ideas of Emerson, who was working with ideas from Shelley and Coleridge. On Rorty’s account, pragmatism ends up making the most hopeful contributions to cultural change: “If pragmatism is of any importance – if there is any difference between pragmatism and Platonism that might eventually make a difference to practice – it is not because it got something right that Platonism got wrong. It is because accepting a pragmatist outlook would change the cultural ambience for the better” (119). Rorty shares the “exuberant” estimation of William James, who argues that pragmatism has the potential for “radical cultural change” comparable “to that of the Protestant Reformation” (Rorty 1999: x). His point is that the combination of Romanticism with pragmatism has the potential for transforming intellectual culture into a thoroughly literary, self-ironic, and liberal phase.

In sum, Rorty both taught and wrote about the ancient quarrel between philosophy and poetry. An important new biography by Neil Gross (2008) explains the background to Rorty’s early career. Rorty developed a narrative about the path of philosophy that would have it turn into literature. The tone of his narrative is both elegiac for what he considered the failed projects of analytic philosophy, and hopeful for the potential of a newly literary, postanalytic culture. What mattered most to him is that philosophy might make a difference to everyday practice, and in his view it can do that only if it embraces the imagination as the underlying source of its development. The great works of philosophy are, for Rorty, great works of imagi-

native thinking, works that create new vocabularies for people to use in order to change their lives for the better. Philosophy practiced as literature in this way would help people to imagine new possibilities for improving their everyday lives. A newly literary philosophy would also contribute centrally to culture and cultural theory, not as an elite specialty of a privileged few, but as a more relevant, interactive resource for rethinking social practices. Rorty promoted the convergence of philosophy in particular and culture more generally, and recommended that both should animate and inform each other in mutually enlivening ways.

Routinization and Rationalization

ALAN SICA

The term “routinization” and the alternative designation “rationalization” are used by social scientists to refer to the systematic removal from modern social and economic life of the unpredictable, unique, uncharted, unknown, or serendipitous. This process, often associated specifically with the rise and spread of capitalism, has been a defining goal of the Western intellectual, scientific, and technological elites since Francis Bacon, René Descartes, Galileo, and Newton established their competing versions of “scientific method” in the sixteenth and seventeenth centuries. There are plenty of data indicating that ordinary people, even in the “advanced” countries, still remain firmly attached to premodern notions, like the existence of gods, angels, and an afterlife, beliefs that would have puzzled even the earliest modern scientists. But for the cultural leaders, those who created industrialization, internationalization, and a sense of what secular cosmopolitanism can mean if fully developed, it has become an article of faith that deleting factors extraneous to the success of desired processes is essential in guaranteeing forward motion, however defined.

If, for instance, it “made sense” for John D. Rockefeller to proclaim in the late nineteenth century that his great wealth and power were part of “God’s plan,” nobody was fooled into thinking that Standard Oil was run by religious rules, or by godly prescriptions. It is no accident that both he and Andrew Carnegie were much taken with Herbert Spencer’s famous 1850 phrase, “the survival of the fittest,” since it legitimated both their merciless business practices as well as the riches that came from them. If they prayed to a “higher power,”

they kept one eye on the balance sheets and another on the Bible, which, in their self-serving cosmology, complemented rather than contradicted one another.

The various practices that such modern financiers and industrialists employed in pursuing success is only one ingredient to what we now call “rationalization processes.” The term is one of many usually attributed to Max Weber, even though it does not figure centrally in his own work as such, and was described somewhat differently as far back as the early social theorist, Henri de Saint-Simon. Proposing a general theory of social organization in 1825, Saint-Simon put forth the novel idea that religion was but a theory like any other, a medieval method for organizing information that had been superseded by Francis Bacon’s inductive epistemology. Saint-Simon believed that a “rational” plan for organizing social classes would pay rich dividends: “There will no longer be a fear of insurrection, and consequently no longer a need to maintain large standing armies to suppress it; no longer a need to spend enormous sums on a police force; no longer a fear of foreign danger, for a body of thirty millions of men who are a contented community would easily repel attack” (Sica 2005: 138). Saint-Simon, like his successor, Auguste Comte, taught that rational societies – free of dangerous superstitions and factional disputes – would “naturally” flow from a scientific approach to social and ecological existence. Reduction of unplanned and uncontrolled forces in human life would bring an end to anxiety, war, and unhappiness, as everyone became increasingly “contented.” Thus, a mindset fixed on the relentless search for more efficient, predictable, and money-saving techniques of manipulation in life at large – practicing what has been called “the domination of nature” – has left a permanent mark on social life in the

“advanced” nations for the last several centuries.

There has long been a steady stream of thinkers who imitated Saint-Simon’s ideas consciously or otherwise, including Karl Marx, Emile Durkheim, Ferdinand Tönnies, Thorstein Veblen, and many others. Yet rationalization and routinization officially became a hallmark of American business and cultural life only after the publication in 1911 of F. W. Taylor’s *Principles of Scientific Management*. The brainchild of a patrician who happened to work in steel mills, this slim volume revolutionized the relationship between workers, managers, and capitalists. Taylor measured with extraordinary care the “time and motions” of factory workers in order to maximize productivity while minimizing time spent and physical effort. He recommended breaks, not to be kind, but instead to increase long-term output. He determined by careful study, for instance, that a 21.5-pound shovel of coal was the “one best way” of working, and irritated his colleagues and underlings by insisting they follow his dictates. His ideas were assailed by labor leaders, yet loudly praised by both Vladimir Lenin from the Left and Benito Mussolini on the Right. When a high-school student nowadays labors in a fast-food restaurant, wears a uniform, is told precisely what to say to the customers, where to stand when making the “product,” how much raw material to use, to work a “split shift” during two parts of the same workday, he or she can thank Taylorism (also known as Fordism owing to Henry Ford’s success in applying the principles in his own factories). All scientific management, or routinization of labor, is based on the same few simple principles: there is “one best way” of accomplishing any task; the quicker a task is accomplished, the better; workers will mangle unless prod- ded to work quickly; and management must observe and correct labor at every turn.

Naturally, this sets up a hostile environment between capital and labor, to use Marx’s terms, and a negatively dialectical inter- action which plagues all modern workplaces, including offices – as Hegel had already explained in *Phenomenology of Spirit* (1807).

What is good for business, industry, or scientific advance is not often good for individuals who are called upon to serve these complex social formations. It is indeed necessary in a chemistry lab to follow strict procedures during experiments, but the people who work in the lab, especially technicians, may find that the repetitive drudg- ery diminishes their spirits and initiative. These collected phenomena of constraint were designated by Max Weber in 1905 as “the iron cage” (*stahlhartes Gehäuse*) or “the steel-hardened shell” (1930: 181). He wisely pointed out that the Protestant forebears of modern Europeans and Americans chose to live within rigid boundaries, while their descendants are forced to do so, exchanging virtuous choice for duty-bound obligation. Of course, the rewards for this sublimation of eros (as Freud described it) are material- istic, since orderly invention and production historically resulted in an explosion of pro- ductivity, drowning the advanced nations in goods and services that even a century before could not have been foreseen. As Weber said, “the pursuit of wealth, stripped of its reli- gious and ethical meaning, tends to become associated with purely mundane passions, which often actually give it the character of sport” (1992[1904–5]: 182). In this passage he referred to the US, but the ethic has since swept the globe.

Thus we see that Weber, more acutely than anyone else, reflected on the antinomic relation of ethics peculiar to precapitalist life and the wholly different focus of action suited to capitalist social organization. Pub- lished as part of his chaotic masterpiece *Economy and Society*, his typology of fun- damental social action originated here, as he

assessed the behavior of social actors moving from one historical period to the next. He understood that these structural transformations demanded rearrangements of personality. According to Weber's four fundamental types of social action – roughly translated as purpose-rationality, value-rationality, emotional, and traditional – it is most difficult to move from a traditional mode of behavior, characterized in almost pure form by the mindset of the agrarian peasant, to the purpose-rationality that typifies behavior driven by cost-benefit analysis within a capitalist environment. Weber understood as did few others at the time that each of these widely disparate *Weltanschauungen* offered strengths and weaknesses to the people who lived “within” them. And even though capitalist social organization pushed relentlessly to extirpate traditional and emotional modes of social action, there still lay within these spheres a reservoir of resistance to the cold logic of profit seeking that captivated Weber's imagination. He studied these “sites of resistance” through a variety of topics, particularly religiously modulated economic behavior. His famous trilogy – *The Religion of China*, *The Religion of India*, and *Ancient Judaism* – illustrated in unparalleled detail how religious sentiments responded to and also shaped civilizational rationalization.

Enlarging upon Marx, Weber explained that the enormous structural transformations that took hold in Europe and the US in the late nineteenth century necessarily demanded reconfigurations of individual character traits. What “worked” for laborers and entrepreneurs in early capitalist society no longer met the requirements of monopoly capital as practiced in the world's industrialized nations. Understanding this linkage between the micro-environment of interpersonal life and the macro-environment of large-scale, organizational interaction, then connecting them by means of

his theory of social action as part of a global rationalization process, is Weber's major contribution to our understanding of the modern world.

Though not an evolutionist, he recognized the irresistible power of rationality as it turned from one social institution to another – to use Hegelian imagery – creating sometimes irritating uniformity and predictability where before had been some measure of uniqueness and chance. Today's celebration of the other and “difference” were not welcome under the regimen of wholesale rationalization that Weber so carefully documented. The logic of modernization demanded predictability in mechanical as well as personal relations, in addition to consistency of approach, record keeping, and uniform action toward a specified goal. The fruits of this regimentation were obvious to all the celebrants of Victorian, imperialistic Europe, but Weber (along with Nietzsche and a few others) also saw the debilitating nature of profound rationalization, both for the individual and for social organization at large. What had begun in the eighteenth century as a “light cloak” of social reorganization had resolutely evolved into an “iron cage,” and in some of Weber's most famous lines, he warned: “No one knows who will live in this cage in the future . . . For of the last stage of this cultural development, it might well be truly said: Specialists without spirit, sensualists without heart; this nullity imagines that it has attained a level of civilization never before achieved” (1930[1904–5]: 182). This recalls Marx's prescient remark in his *Early Philosophic Manuscripts of 1844*: “An unobjective being is a nullity – an *un-being*.” For both theorists, the end result of thoroughgoing rationalization for the affected individuals was a condition of nonbeing in its most fundamental sense.

Because Weber's “discovery” of rationalization and routinization has so thoroughly

saturated subsequent discussions of these phenomena, his own late life summary is worth repeating:

For in all the above cases it is a question of the specific and peculiar rationalism of Western culture. Now by this term very different things may be understood . . . There is, for example, rationalization of mystical contemplation, that is of an attitude which, viewed from other departments of life, is specifically irrational, just as much as there are rationalizations of economic life, of technique, of scientific research, of military training, of law and administration. Furthermore, each one of these fields may be rationalized in terms of very different ultimate values and ends, and what is rational from one point of view may well be irrational from another. Hence rationalizations of the most varied character have existed in various departments of life and in all areas of culture. (26)

A number of important theorists have expanded on Weber's definition of rationalization. Karl Mannheim, writing much in Weber's shadow during the 1920s and 1930s, famously elaborated on these themes in *Man and Society in an Age of Reconstruction* (2001 [1936]). He struggled to reconcile Europe's apparent loss of rationality during World War I and the growth of "irrational" fascism with its Enlightenment heritage of reasoned debate and evidence-based decision making. Mannheim usefully distinguished between "formal" and "substantive" rationality. The former may appear reasonable and well ordered based on obedient rule-following, but in fact creates undesirable outcomes, often unforeseen, for those caught in its web (perhaps best portrayed in the novel *Catch-22* by Joseph Heller). Substantive rationality, also rule-bound, gains the larger objective of societal welfare, sometimes despite rationalization processes that have taken on an unhealthy life of their own. Following closely Mannheim's lead, Max Horkheimer and

Theodor Adorno published *Dialectic of Enlightenment* in 1944 (first English translation 1972), which carried Weberian rationalization themes into a new frame of reference. They argued that the Enlightenment, especially as embodied in de Sade and other hyperrationalists, held within it an irrationalist anti-enlightenment which made fascist imagery and behavior not only predictable, but virtually inevitable. They could not otherwise explain how the purely rationalized destruction of European Jewry could have been carried out by the Nazis, making their book as much an existential as an analytic work. Forty-five years later Zygmunt Bauman made this very notion famous in *Modernity and the Holocaust* (1989).

More recently, George Ritzer expanded a lighthearted article from the 1980s into several books, all built around the "McDonaldization" theme. Ritzer connects his work with Weber's, but applies it to the "postmodern" and globalized setting. Whereas Weber's understanding of rationalization, and the routinization that accompanies it, owed its inspiration to a heavy dose of cultural pathos, Ritzer's thesis about societal standardization that imitates the McDonald's restaurant chain bears less analytic weight. More recently "Walmartization" has also been invoked as the latest form of rationalization – a trivialization of Weber's original ideas, to be sure, even if useful in some analytic contexts.

S

Sahlins, Marshall

VICTOR LI

One of the most important figures in American anthropology, Marshall David Sahlins (b. 1930) is known not only for his ethnographic and historical studies of Polynesian societies but also for his vigorous championing and defense of anthropology's culture concept. Born in Chicago, Sahlins received his master's degree from the University of Michigan in 1952. After earning his doctorate in anthropology from Columbia University in 1954, he returned to teach at Michigan. In the 1960s, along with other faculty members, he organized teach-ins to protest against the war in Vietnam. In 1973, Sahlins moved to the University of Chicago where he is currently the Charles F. Grey Distinguished Service Professor of Anthropology Emeritus.

Sahlins's early work was influenced by the evolutionary materialism of the anthropologists Leslie White at Michigan and Julian Steward at Columbia. Adopting a neo-evolutionary approach, Sahlins synthesized White's general theory of the universal evolution of human society with Steward's call for a more specific approach to local patterns of evolutionary adaptation (Sahlins 1958, 1962; Sahlins & Service 1960).

Neo-evolutionary theory's division of societies into simple and complex organizations allowed Sahlins to argue that modern economies based on rational production and exchange, utility and efficiency cannot understand or account for tribal "stone age economies" in which economic activities were substantivist in nature, that is, based on household and kinship relations governed by reciprocity and solidarity rather than rational market principles. Challenging existing views of these pre-capitalist societies as poor, backward, and undeveloped, Sahlins coined the resonant phrase "the original affluent society" to describe a primitive utopia in which needs were easily met and people enjoyed ample leisure time with few hours of work. Sahlins's thesis, though influential, was also met with skepticism, and critics questioned both the ethnographic data and analytical categories he employed. Underlying his thesis, however, is the more important point that the West must avoid evaluating other societies based on its own ethnocentric beliefs (Sahlins 1972).

Sahlins's anti-ethnocentrism led him to the relativist conclusion that different societies had different cultural logics and that to understand a society we must first find out how it is structured by a system of rules or

beliefs. During a lengthy stay in Paris from 1967 to 1969, he found in the structuralism of Claude Lévi-Strauss theoretical support for the study of cultural logics or structures of thought. Rejecting his earlier neo-evolutionism, he turned away from White's Marxism-inflected evolutionary theory of material and technological progress, arguing that to avoid both positivist materialism and Western ethnocentrism one had to study societies according to their own specific cultural logics. Modern societies emphasized practical reason with its orientation toward utility and material advantage, forgetting that it is cultural reason, in the first place, that constitutes what is to be considered useful or advantageous. Culture as a symbolic scheme or sign system not only shapes our practices, but should also be seen as taking different forms in different societies. Thus what the West may deem to be materially advantageous will not be so to others who may value forms of activity the West would consider valueless or meaningless (Sahlins 1976).

Though structuralism revealed to Sahlins the centrality of symbolic cultural logic in society, it failed to theorize adequately the role played by historical change. Sahlins now turned his attention to the interaction between cultural logic and history in Polynesian societies. He sought to show how Hawaiians employed "mythopraxis" to make sense of the new; that is, Hawaiians assimilated and explained current events through their mythology, through an already established structure of meaning. What we discern in Hawaiian history, therefore, is a "structure of conjuncture" in which structure and event interact in such a way that even as the Hawaiian cultural scheme or structure is affected by history, history itself becomes meaningfully ordered only through that structure (Sahlins 1985).

The most striking example of mythopraxis offered by Sahlins is that of the apo-

theosis and death of Captain James Cook in eighteenth-century Hawaii. When Cook landed in Hawaii in January 1779, he was initially welcomed by the Hawaiians as the manifestation of Lono, the god of fertility; Cook was later killed by them in a ritual inversion which saw the god become a sacrificial victim. Cook's apotheosis and death can thus be interpreted as an example of mythopraxis in which a new event – the sudden appearance of a white stranger – is indigenized, made to fit meaningfully into a native cultural scheme (Sahlins 1985, 1995).

Sahlins's thesis was challenged by the Princeton anthropologist Gananath Obeyesekere who accused him of furthering the European myth of white men being taken for gods by myth-minded natives who lacked practical rationality (Obeyesekere 1992). Sahlins (1995) responded angrily, arguing that it was Obeyesekere who appealed to European notions of rationality and practicality while denying any role for Hawaiian cultural agency.

The detailed and often acrimonious exchange between Obeyesekere and Sahlins managed to highlight, however, the theoretical centrality of culture in Sahlins's work. Though culture is seen in his later work, for example, to be in dialectical relation to history, it is also clear that he regards history as organized by structures of cultural significance (Sahlins 1985, 2004). In short, even if culture is not all-determining, as he often reminds us, the anthropological experience of culture remains central in shaping any historical explanation of a particular society. As he asserts in *Culture in Practice*, an essay collection that sums up his work, "the culture concept encompasses any and all forms of human practice, including the social relationships thereof, everything constituted and organized symbolically" (2000: 16).

Science Fiction

ROGER LUCKHURST

Science fiction is a genre of popular culture, commonly considered to have emerged as a literature in the West in the nineteenth century, which addresses what it means to live in technologically saturated societies. Since its consolidation in mass cultural pulp magazines and novels in the 1920s, the genre has burst the bounds of the printed word and developed distinct forms in comic strips, radio, cinema, television, and computer games. Thus, for some commentators, it has become less a strictly identifiable genre

than a generalized mode of technocultural apprehension, and one with increasing significance.

Typically, science fiction works by pushing forward a speculative trajectory of its contemporary society in order to extrapolate imagined potential futures, developing a relatively conventionalized, although constantly mutating, set of narratives and icons to represent those futures. A cultural expression of modernity, science fiction can emerge only in a context where technological and scientific changes reach a stage of acceleration sufficient to destabilize traditional conceptions of human identity and theological systems of explanation. This makes it one of the quintessential forms addressing the cultural impact of the various scientific and Industrial Revolutions that started in the seventeenth century but really began to transform everyday existence only in the nineteenth century. Where horror generates fear from such transformations and tends to redraw the boundaries of human identity and ethics, science fiction is significantly more ambiguous. There are strands of science fiction that punish scientific overreaching – from Mary Shelley’s *Frankenstein* (1818) onward – or warn of the tyranny of technology – from E. M. Forster’s “The Machine Stops” (1909) or George Orwell’s *Nineteen Eighty-Four* (1949) to *The Matrix* (dir. Wachowski brothers, 1999). But the genre can also ecstatically embrace the possibilities of the transformation of self and society, welcoming the kind of posthuman future that is sublimely figured, say, at the end of *2001: A Space Odyssey* (dir. S. Kubrick, 1968). This sublime sense of wonder, a kind of secular transcendence of human limits, is an intrinsic part of the popular appeal of the genre.

Science fiction has often been regarded as an especially low-cultural form, one of the worst instances of cliché-ridden mass culture, full of incompetent hack writing,

inadvertently comic special effects in exploitative B-movies, or embarrassingly transparent wish-fulfillments. It has been stereotyped as an almost autistic culture of arrested male adolescence. Science fiction was simply ignored for much of its existence by critics operating with a narrow conception of what constituted proper art. This disdain continued even in those cultural critics who, along with Raymond Williams, helped expand the parameters of what might be regarded as culture in the 1950s. Science fiction was only noticed by Richard Hoggart in *The Uses of Literacy* (1957), only to be placed alongside sex novelettes and milk bars as phenomena of Americanized mass culture that threatened to destroy authentic folk culture. Critical attention has really been paid to science fiction only since the 1970s as cultural studies developed as a discipline.

HISTORY OF SCIENCE FICTION

The term “science fiction” was first used by the American pulp magazine editor Hugo Gernsback in 1929, after an earlier experiment with the awkward contraction “scientifiction.” Yet naming is not the same as origin. There have been convincing arguments that science fiction originates in the fantastical travel narratives of ancient Greece or medieval quest romances, and so is part of a longer tradition of romance writings that predate the default realism established for the eighteenth- and nineteenth-century novel and which remains the aesthetic dominant today (see Roberts 2006). But the conditions for the development of the modern genre are more overdetermined. There were four elements that converged in the late nineteenth century to produce the publishing context for science fiction: (1) the extension of literacy and primary education to the majority of the

population of North America and Western Europe, including the working classes; (2) at the same time, the displacement of older forms of mass literature, such as the “penny dreadful” or the “dime novel,” with new magazine formats that forced formal innovation and drove the invention of modern serial genre categories like detective or spy fiction as well as science fiction for new mass audiences; (3) the arrival of scientific and technical institutions that provided a training for a lower middle-class generation as scientific workers, teachers, and engineers, who began to use science to confront traditional loci of authority such as theology or classical education; (4) in a related way, the context of a culture being transformed by technological and scientific innovations of the second Industrial Revolution that began to saturate the everyday life of the majority of the population with experience mediated through technology, whether in the urban environment and the domestic sphere, or in the new communication technologies (telephones, wireless telegraphs, cinema, and so on).

In England, the figure who best embodied these conditions was H. G. Wells. Wells benefited from the 1870 Education Act, using a scholarship to escape an apprenticeship to a draper and to train instead at the new Normal School of Science (which was run by the Darwinist Thomas Henry Huxley) as a science teacher. Wells used the new publishing conditions to write science journalism and short stories in a variety of modes, often extrapolating fantastically from contemporaneous scientific and technological developments. He also published longer “scientific romances,” beginning with *The Time Machine* in 1895. Wells traversed many genres in his early years, including satire, comic social realism, and utopian writing (communicating his Fabian socialism and latterly a passion for world government to be run by a technocratic

elite). He invented the genre of “futurology” with *Anticipations* (1902) and scientized the gothic tradition. Wells thus tested a gamut of science-fictional modes in the new commercial writing environment. He was also important for his failure to formulate an aesthetic for this writing, casually ceding its status as a non- or para-literary form in a series of engagements with Henry James, the foremost theorist of the “art of fiction” as a serious cultural form. As these commercial genres developed, so did the modern formulation of the division between “high” and “low” culture. Science fiction and its allied genres have never quite recovered from this expulsion from the high Jamesian theorization of the literary novel as centered on the subtle refinement of character and the depths of subjective experience.

English writers of the scientific romance remained a small coterie, often considered anticultural and even antihuman for their interest in science and technology. After all, Matthew Arnold’s *Culture and Anarchy* (1869) placed machinery with the destructive forces of anarchy and termed it “our besetting danger.” In the US, however, the will to extend the frontier and domesticate Nature to the project of nation-building led to a cult of the engineer, making heroes of rags-to-riches inventors like Thomas Alva Edison, Alexander Graham Bell, and Henry Ford. An intrinsic part of this culture was the host of “boy inventor” tales, inaugurated by Edward Ellis with *The Steam Man of the Plains* (1868). In the later nineteenth-century cheap magazines (published on untreated wood-pulp paper – the origin of the term “pulp fiction”) issued hundreds of serial adventures featuring boy inventors like Frank Reade, Jr., Thomas Edison, Jr., and the most enduring figure, Tom Swift. The culture of small-scale entrepreneurial inventors directly fed the origin of science fiction. Hugo Gernsback traded in early wireless technologies and began to publish

magazines aimed at mail-order tinkerers. He added fiction to journals like *Modern Electrics* and *Science and Invention* before launching the fiction-only *Amazing Stories* in 1926, initially reprinting the “scientifiction” of Wells and Edgar Allan Poe. Gernsback’s journal promoted a somewhat inconsistent policy of scientific and technological rigor in its fiction, arguing for its educative role. Reader response became a key element in judging the scientific efficacy of the fiction, fostering a very early model of active “fans” so significant in later science fiction culture.

Gernsback’s role in developing science fiction was eclipsed, however, by the rival pulp magazine *Astounding Stories*, home in the 1930s to what became known as the “space opera.” In 1937, one of the young writers of these expansive, breathless interstellar adventures, John W. Campbell, Jr. became the editor of *Astounding*, a post he relinquished only in 1969. Campbell, a physics graduate, had a more subtle sense of the balance required between technoscientific rigor and the aesthetic pleasures of narrative (Campbell also wrote and edited gothic and “weird” fictions, in a parallel journal, *Unknown*, from 1939 to 1943). He fostered a group of writers that dominated American science fiction for decades, including Robert A. Heinlein, A. E. Van Vogt, and Isaac Asimov. Their writings spearheaded the so-called “Golden Age” of science fiction literature, bolstered by the translation of science fiction narratives and tropes first into comics (Buck Rogers appeared in 1929, Flash Gordon in 1934, and Superman in 1939) and then into cinema serials. The streamlined, art deco futurism of 1920s urban design and the political advocacy of the technocracy movement for a scientifically rationalized state threatened to make the whole American zeitgeist science-fictional. This futurism reached one of its central cultural

expressions in the New York World Fair of 1939.

The apotheosis of the Golden Age also marked a significant negative shift in general attitudes to techno-science. In 1945, Campbell's magazine was briefly subject to investigation by the FBI, since its predictive stories about potential nuclear weapons drifted close to the top secret Manhattan Project to build an atomic bomb. Campbell and Heinlein, in particular, grasped the new geopolitics of the nuclear era, shading in the Cold War logic of mutual assured destruction with remarkable speed after the American use of atomic bombs on the civilian towns of Hiroshima and Nagasaki in August 1945. Both men were politically conservative and advocated a militarized techno-scientific American state, most notoriously in Heinlein's military state of perpetual war against the extraterrestrial Bugs in *Starship Troopers* (1959). For others, the Manhattan Project represented the onset of what Eisenhower, in 1959, termed the "military-industrial complex," in reference to the burgeoning power of scientific research and development, with military aims and multinational corporations distorting the democratic institutions of civil society and the state. Metaphysically, too, the Bomb actualized the potential instant end of humanity. In postwar American science fiction ambiguities about bright, shiny futures developed new strands of science fiction. Apocalyptic fictions intensified: among the thousands of imagined depictions of nuclear war and postnuclear worlds, the best include Judith Merril's *Shadow on the Hearth* (1950), Bernard Wolfe's *Limbo* (1952), Mordecai Roshwald's *Level 7* (1959), and Walter Miller's *A Canticle for Liebowitz* (1960). A new branch of ironic or satirical science fiction, distrustful of technocracy, included three central figures. Kurt Vonnegut had been saturation bombed by the US Air Force as a prisoner

of war in Germany, and wrote a blistering satire on the Edisonian, Fordist American future of Golden Age science fiction in *Player Piano* (1952). Frederik Pohl, a left-wing editor and writer, published a sequence of satires on the ideology of capitalist consumption driving the postwar economic boom, most notably Cyril Kornbluth's *The Space Merchants* (1952). Philip K. Dick published a plethora of short stories, starting in the 1950s, exploring states of perpetual war, media distortions of reality, and the queasy sense that machines were becoming more animate and empathetic than humans. His great statement on these ambiguities, *Do Androids Dream of Electric Sheep?* (1968), formed the basis for the film *Blade Runner* (dir. R. Scott, 1982).

These divergent strands produced a rough bifurcation into "hard" and "soft" science fiction, divided by attitudes to technology but also by questions of aesthetics. They were soon at war. In the 1960s, a young British generation of writers, which became known as the New Wave, sought to challenge the dominance of "hard," technology-driven science fiction by reconnecting the genre to experimental literary practices and abandoning the expanses of outer space to explore the "inner space" of subjectivity. Centered on the journal *New Worlds* when it was edited by Michael Moorcock, the movement produced exemplary figures such as J. G. Ballard, whose fictions populated postapocalyptic landscapes with abandoned technologies and passive survivors intent on embracing ecstatic unions with death. Texts like *The Drowned World* (1962) and *The Drought* (1965) horrified many with their active refusal of the can-do, pragmatic engineering paradigm that still dominated American science fiction. Ballard's explorations of the perversities unleashed by the worlds of techno-science have appealed more to readerships trained

in modern and postmodern literature than science fiction. Other provocateurs of the New Wave era included Thomas Disch, Pamela Zoline, and Samuel Delany, the last a pioneer of using science fiction to explore dissident sexualities. The actual influence of the New Wave on science fiction remains contentious, and it was certainly a product of the synthesis of arts very specific to the 1960s. The era did not represent a decisive break in the history of science fiction, however, and the most successful science fiction of the era was in the Golden Age tradition. Frank Herbert's *Dune* (1965), a traditional aristocratic romance saga on an alien planet, is regularly voted the best science fiction novel of all time. *Star Trek* began its first run on American television in 1966.

Subsequent developments have made science fiction a complex culture, highly varied and thus difficult to summarize. It remains a literature, although the written form has certainly been eclipsed by the phenomenal success of science fiction cinema since *Star Wars* (dir. George Lucas 1977). Some grumble that the brash effects-driven spectacles of science fiction film, which have even latterly revived the cinema serial based on comic superhero characters like Superman and Batman, have reinfantilized the genre just as it was reaching maturity. Yet the analysis of commercial cinema demands different criteria than the analysis of literary forms of science fiction, which themselves remain vital. Three significant "waves" in the literature are worth noting. In the 1970s, coincident with the rise of the feminist movement, women writers began to explore the critical and utopian potential of science fiction as a means to project alternative worlds to Western patriarchal societies. The most important works include Joanna Russ's *The Female Man* (1975) and Marge Piercy's *Woman on the Edge of Time* (1976), both

of which move between an oppressive present and alternative utopian and dystopian futures for women. Octavia Butler's *Kindred* (1979) used time travel back to the slave plantations of the American South to explore the complex history behind the contemporary structural violence in and toward African Americans. Women had been present in the genre from the beginning, despite the stereotype, but the 1970s recovered overlooked figures like C. L. Moore and Leigh Brackett while significantly politicizing the genre as a vehicle for a substantial social movement. Second, in the 1980s, another new generation attempted to revolutionize the aesthetics of the genre. With the *Mirrorshades* anthology (1986), Bruce Sterling attempted to organize a group of American writers around the flag of "cyberpunk" fiction. Cyberpunk forced a conjuncture between emergent home-computer technology and the urban revolt of punk music: it was fixed in the cultural imaginary by the "console cowboys" hacking their way through cyberspace in William Gibson's *Neuromancer* (1984). Cyberpunk was notable for its reflexive awareness of genre, splicing together hard and soft science fiction, hard-boiled detective fiction, and quest tropes. It often abandoned figuring the future for a kind of harder, dirtier, and more technologically saturated alternative version of the present. The subgenre had a major impact on cultural representation of "postmodern" times. Third, post-"singularity" fictions have revitalized the "hard" science fiction tradition. The technological singularity is a theory, first popularized by the science fiction writer (and mathematician) Vernor Vinge in 1993, which argues that we are on the tipping point of a breakthrough to autonomous technology (either in artificial intelligence or in machines that can independently design other machines). The singularity can provoke utopian dreams of eternal human

life, existing as “software” for machines, but can also induce fantasies of a perpetual war between man and machine (as in the *Terminator* trilogy of films [1984, 1991, 2003] or the revived *Battlestar Galactica* television series [2003–8]). The posthumanist consequence of the singularity has been best addressed by writers such as Greg Egan and Charles Stross. This rich imaginative response to the third Industrial Revolution (the digital one) still suggests that science fiction remains a crucial place in advanced industrial cultures to work through the consequences of techno-science on the limits of the human.

CULTURAL CRITICISM OF SCIENCE FICTION

Early critical attention to the genre was simultaneously a defense of its intellectual worth and orientation exercises for the uninitiated, as suggested in Kingsley Amis’s title, *New Maps of Hell* (1960). The first academic grouping began in 1959 at the annual Modern Language Association conference, leading to the publication of the newsletter that became the journal *Extrapolation*. It was through this forum that in 1968 Samuel Delany lectured on his linguistic theory of science fiction and Darko Suvin proposed science fiction to be a literature of “cognitive estrangement.” For Delany, science fiction is a specific linguistic and ideational code that transforms the possibilities of how we might read (the romantic cliché of “her world exploded” is suddenly very literal in a science-fictional sentence and completely alters the reader’s horizon of expectation). Delany has since written of science fiction as a “para-literature” that must not be reduced to the “bourgeois ideology” that dominates the literary novel. Suvin similarly regarded science fiction as outside the novel tradition, but argued this

from a Marxian position. Using a stance developed from the radical dramatist Bertolt Brecht, Suvin proposed that in science fiction the reader entered an imaginative world different (estranged) in greater or lesser degree from the empirical world, but rendered different in a way that obeyed rational causation or scientific law (it is estranged *cognitively*). This allowed Suvin to differentiate science fiction from fantasy or gothic genres, which might be estranged but used nonscientific supernatural or magical causations. Suvin organized a helpful framework, although his didactic insistence that cognitive estrangement must determine a particular political and anticapitalist program for science fiction meant that much of his writing was concerned with denouncing and excluding the vast majority of work from his ideal model of the genre, discarding the clearly interdependent cultural work across the spectrum of the genres of the fantastic.

Since the 1970s, there have been four major strands of cultural theory on science fiction, loosely following the trajectory of cultural studies itself. First, structuralism helped to order and differentiate closely allied popular genres, while importantly suspending judgment on their aesthetic value. Tzvetan Todorov’s *The Fantastic* (1973) organizes a spectrum along which the fantastic is a liminal state of uncertainty between the “uncanny” (gothic) and the “marvelous” (that included science fiction). An artificial conceptual exercise, Todorov’s work has nevertheless generated a host of definitional projects in gothic and science fiction criticism. In *Structural Fabulation*, Robert Scholes (1975) argues that science fiction exposes the systematic grids that order human cognition, in part by imagining violations or discontinuities with current structures. This project was rather rigid and programmatic, but further validated science fiction as an object worthy of study.

Second, and much more importantly, Marxism provided the most sustained analytic framework for science fiction. This is unsurprising since science fiction is a profoundly *historical* genre. It generates narratives from changes plotted through larger social forces than are capable of being rendered by the novel of character. The genre might be said to illustrate Marx's position that human beings are created by their social conditions, not vice versa. Imagining transformations to the basic premises of contemporary societies and selves is often driven by a sense of critique (although not, of course, automatically of a leftist kind). The "cognitive" element of Suvin's "cognitive estrangement" is therefore less about actual scientific method than about pursuing Marx's political science of dialectical materialism.

Marxist critics have tended to focus on the utopian tradition, inaugurated by Thomas More's description of an ideal island state in *Utopia* (1516). The utopian genre has remained a distinct literary form, but has also intertwined with commercial science fiction. The trajectory of utopian writing since William Morris's eccentric socialist vision of the future *News from Nowhere* (1890) has increasingly become linked to the fate of actually existing socialist states. Yevgeny Zamyatin's *We* (1924) was already deeply ambivalent about the total technical organization of Soviet Russia, and George Orwell's *Nineteen Eighty-Four* (1949) locked the new form of the anti-utopia into Cold War debates. The nuclear age coined the term "dystopia" for myriads of post-apocalyptic futures, the utopian tradition being revived by women writers and ecologists only in the 1970s. Since 1980, with the rise of neoliberalism and the collapse of the Soviet Union, Marxist critic Tom Moylan has argued for the emergence of the "critical dystopia," a form that critiques contemporary capitalist conditions but

offers open possibilities about different futures, resisting didactic utopian models of society since these have now been tainted with murderous totalitarianism. The exemplary novelists in this new left-inflected mode have been Kim Stanley Robinson, whose *Mars* trilogy (1992–6) is a milestone in utopian writing, and Gwyneth Jones, who has imagined and written critically on incomplete utopias and the value of limited solutions.

There is a risk in Marxist criticism, evidenced in the denunciatory mode of Darko Suvin, that science fiction might be reduced to a small cluster of ideologically approved writings, principally in the utopian tradition, the rest of the genre being dismissed out of hand as either "bourgeois" or the insidious products of what Theodor Adorno termed the "culture industry." A new generation of Marxist critics, such as Rob Latham and Mark Bould, have developed a less partisan approach, informed by the more eclectic Marxian modes of cultural studies. They have been precisely concerned with the kind of work undertaken by mass cultural forms of science fiction.

Third, science fiction has been considered to exemplify postmodernism, an argument most obviously identified with the leading Marxist cultural theorist, Fredric Jameson. Jameson argued that postmodernism was the cultural expression of a new mode of hyper-capitalism that had become dominant by the election of Ronald Reagan in 1979. At the opening of his book, *Postmodernism* (1991, from a 1984 essay), Jameson proposed that William Gibson's cyberpunk might be considered the supreme literary expression of this culture: a bleak, amoral technoculture, with the future replaced by rapid cycles of product innovation and obsolescence. This apocalyptic version of the postmodern was endorsed by the modish nihilism of Jean Baudrillard, whose theory that the real had disappeared

into a virtual space of simulation chimed with science fiction writers like Philip Dick and J. G. Ballard (whose works Baudrillard incorporated into his theory). If the postmodern really was a new epoch, producing new modes of society and being, apocalypse was not the only register for describing the new dispensation. Donna Haraway's "Manifesto for Cyborgs" also appeared in 1984. This linked anti-essentialist feminism and radical socialism with the possibilities of new fusions between machine, human, and animal. She argued that we were now released from rigid humanist definitions and found potential for resistance and celebration in the new "cyborg" ontology. The gender divide between these negative and positive accounts of the postmodern has often been noted, although Jameson has now issued something of a corrective in his monumental study of the stubborn, if fugitive, persistence of utopian thinking in an era of global economic mutation, *Archaeologies of the Future* (2005).

These critical texts gave science fiction a new cultural centrality: a critic like Scott Bukatman could suggest that the world had *itself* become science-fictional, the genre bursting its bounds to become something like a cultural dominant. In an ingenious reversal, Istvan Csicsery-Ronay, Jr. (1991) suggested that it was not so much critical theory that explained science fiction, but that science fiction's intrinsic critical and analytic capacities were starting to absorb critical theory itself. This glut of critical writing on postmodernism often made cyberpunk the apotheosis of the genre. It was as if science fiction had finally overturned its marginal and despised status. Yet this was always a partial account of a now incredibly complex, variegated, and differentiated science fiction culture, and the privileging of William Gibson, who had an aggressive anti-Golden Age stance, distorted understandings of the field.

One way to negotiate this diversity is to follow the fourth mode of engagement with science fiction, through the identity politics that has burgeoned since the 1970s. Despite Jameson's magisterial contempt for any identitarian politics other than class, significant work has been conducted through examinations of gender, sexuality, and race in cultural studies. Each approach is itself a complex field; here it is possible only to gesture at how the science fiction genre's history might be reconfigured through the lens of different identity politics. Each might be said to thrive on one of the fundamental dialectics at the heart of science fiction – that between identity and difference, the known and the unknown, or self and other. Some of the primary narratives and tropes of the genre, such as the encounter with the alien other, can thus be read as suggestive allegories on the politics of identity. Feminists have offered a critique of a dominant science fiction mode of hierarchical or violent encounter with the other as a "masculinist" ideology, while examining how the estrangements and utopian imaginaries of the genre might be rewritten by women for women. Science fiction can *enact* the feminist insight that gender is socially and discursively constructed rather than a state of nature. A different historical trajectory opens up: the genre has its brilliant critics of masculinism (Judith Merrill or Alice Sheldon, who disguised her identity under the pseudonym James Tiptree, Jr.) and women-only utopias have been fixed in the genre for centuries, a tradition recovered and renewed by historians and writers in the 1970s. The violent enforcement of heterosexual norms is similarly open to transvaluation, as explored by queer theory, a mode which reads cultural history for its open networks of sexual possibilities. The science fiction writer Samuel Delany has written memoirs on his bisexual experience but also become a leading academic queer

theorist. His science fiction, such as the ambitious and sexually polymorphous *Dhalgren* (1975), is a rich resource, now joined by a whole field of gay and lesbian science fiction and scholarship.

Science fiction has often openly regarded alien or machinic otherness in racial terms. The biological impetus of Wellsian science fiction and the frontier concerns of early American science fiction saturated both with regressive racial obsessions. While this has become the subject of historical critique, science fiction also offers the potential to experiment with wholly other alien encounters, divorced from the violent dialectic of master and slave. Octavia Butler's fiction constitutes an impressive reflection on these concerns, from reflections on the legacies of slavery in *Kindred* (1979) to the *Xenogenesis* trilogy (1987–9), in which a tiny band of human survivors are compelled to enter the wholly other sexual and kinship structures of a superior alien race. Over and over, Butler imagines the fraught politics of symbiosis between human and alien, her last book *Fledgling* (2005) using the vampire mythos to imagine the complex interdependence of the undead and their multiple human partners. As with other fields, recovery of writers from ethnic minorities across the genre has forced a revision of science fiction histories and is actively reshaping its futures.

New political avenues continue to emerge. In the new millennium eco-criticism and animal studies have been significant strands in science fiction criticism, again refiguring the violent hierarchical binary of culture and nature or self and other. The genre has reached a stage of reflexivity, moving beyond rigid taxonomies that have artificially separated the interlinked genres of gothic, fantasy, and science fiction, freely exploiting tropes from each to generate what Gary Wolfe (2002) has termed the “post-genre fantastic.” Writers such as

China Miéville and other practitioners of the “New Weird” have been particularly adept at this multigeneric approach. Science fiction continues to be an incredibly flexible set of narratives and tropes for cultures to think about their trajectories through modernity.

Science Studies

SAL RESTIVO AND JENNIFER CROISSANT

Science studies is a field of inquiry and criticism that treats science itself as an institution and practice to be interpreted within a social context. As a specific, emergent field, science studies owes its origins to a network of scholars with a primarily sociological orientation. However, more recent analyses of science, which emphasize its textual character (i.e., its character as a meaningful signifying system that requires interpretation), constitute a turning point

in science studies that stakes out a new terrain of study that merges science studies with literary theory and cultural studies. The original science studies movement began to crystallize in the late 1960s. The early centers of this development were at the University of Sussex in the United Kingdom, where the emphasis was on science policy and society, and the University of Edinburgh, where the focus was on theoretical and research agendas for studying science as a social institution and social construction. The Sussex program, founded by Christopher Freeman, was known as SPRU (Science and Technology Policy Research at the University of Sussex). Freeman, a distinguished economist, was awarded the J. D. Bernal Prize by the Society for Social Studies of Science in 1987 (see Freeman 2008).

David Edge was appointed the founding director of the Science Studies Unit at the University of Edinburgh in 1966. In this capacity, he became the founding coeditor, with Roy McLeod, of the journal *Science Studies* in 1970; the journal was renamed *Social Studies of Science* in 1974. Edge, a former radio astronomer and BBC radio producer for science, was instrumental in bringing Barry Barnes, David Bloor, Steven Shapin, and Gary Werskey into the program. These scholars unfolded a research program in the sociology of scientific knowledge that generated the “strong programme” (see below) and “the Edinburgh school” in science and technology studies. The sociology of scientific knowledge (SSK) program promoted research on scientific knowledge, the very content of science. Edinburgh became one of the key centers out of which the science studies movement emerged. As one of the early fruits of this program, Edge and Michael Mulkay (1976) published a celebrated study of Edge’s field, radio astronomy.

Other significant factors that were important in fueling this early stage in the

development of science studies were the sociology of science program at Cornell in the 1970s (led by Robert McGinnis), the scientometrics and “science of science” movement in Eastern Europe and elsewhere (Garfield 2007), and the scientific-technical revolution paradigm guiding research on science in the Soviet Union (see, e.g., Cooper 1977). In this founding stage the field drew researchers from across the full spectrum of the sciences, social and policy sciences, the humanities, and the arts. A group of students of science concentrated in the field of sociology met at the annual meeting of the American Sociological Association in 1975 to found the Society for Social Studies of Science. The first meeting of the society was held at Cornell University in 1976, and among the roughly 110 attendees at that meeting were scholars from all over the world, including a large number of science of science researchers and policy scientists from the Soviet Union and the Eastern European bloc. Eastern European and Soviet science of science emphasized quantitative studies of the social system of science. Disciplines from physics to sociology and anthropology, and from history and philosophy of science to the humanities, were all represented. Science studies was still a fragile field with an uncertain future. Within a few years, however, as the first fruits of this new research agenda started to get published, it was clear that innovation and controversy were going to fuel the growth of this interdisciplinary endeavor.

The field was launched onto the intellectual landscape in the late 1970s and early 1980s by a series of on-site studies of scientific laboratories. This led to the introduction of the idea that scientific facts were socially constructed. In *Laboratory Life: The Social Construction of Scientific Facts* (1979), Bruno Latour & Steve Woolgar describe scientists interacting with their instruments and materials and producing

inscriptions. These two pioneering science studies researchers entered the laboratory as anthropologists and carried out an ethnography of laboratory practices. One of the key activities of scientists, they reported, is the construction of inscriptions, representations of physical phenomena in textual, mathematical, and graphic forms. These inscriptions circulate, are intended for specific audiences, and are carefully crafted to present facts as independent of the production process that brought them into being. The analysis of scientific practice as a text differed from the traditions associated with students of the rhetoric of science (see Gross 1996). The activities of scientists, Latour & Woolgar demonstrated, along with their various drafts, sketches, and preliminary representations, were connected through the material practices of the scientists in context. The scientists, their interactions, their social contexts, their inscriptions, and what counted as scientific facts in this setting and moment were all bound together inseparably. This focus owed much to the impact of postmodernism on the social sciences and on the social science of science.

Whatever else postmodernism has achieved and whatever it reflects about the milieu of our era, it is the crucible within which science studies and cultural studies grew and unfolded as independent yet intertwined solutions to the problems of intellectual life and intellectual organization in the twentieth century. We can characterize those solutions as having a distinct preference for turning to the text, to narrative, to strategies that strain against the chains of conventional classifications and categories. We can see how what would become two distinguishable interdisciplinary efforts to construct new boundaries of inquiry were already evident in the approach Latour & Woolgar adopted in their innovative study of science as discourse and practice.

By the time the second edition of *Laboratory Life* was published in 1986, “social construction” was already blossoming into a source of conflict within science studies and in the relationships between science studies and traditional sociology, philosophy, and history of science, as well as other fields of study. The cultural studies perspective implicit in their work contained a number of potential controversies, from those over social constructionism, to the science wars (see below) and the red herring of relativism. This occurred the moment Latour & Woolgar gave up the ghost of a privileged account – theirs was different from but equal to the scientists’ accounts – and labeled their work a “fiction.” “Fiction” is used here agnostically, and is applied to the process of fact production as a whole. Latour & Woolgar emphasized that they were concerned with the production of reality. “Fiction” was used to draw attention to the centrality of literature and writing accounts in the construction of facts and the production of reality. It is easy to see in this approach the seeds of what would lead the critics of science studies and cultural studies to see relativism everywhere they looked. It is also clear that if the roots of cultural studies were not already growing in science studies, they were growing in the wider postmodern context that nourished the emergence of science studies.

Latour & Woolgar’s work was followed by related attempts to get at science through analyses of representations (see Lynch & Woolgar 1990), and methodologically through the expansion of fieldwork-based studies of laboratories and other sites of scientific production. This work reiterated what had been articulated by earlier scholars (Karl Marx, Durkheim, and Fleck, for example), re-emphasizing that science is a particular culture in and of itself, and that what is perceived to be universal is an “achievement” of various social practices,

networks, and power plays (see Latour 1993a; Knorr-Cetina 1999). Gieryn (1999) also points out that what counts as science and the degree to which scientific knowledge is given precedence is historically and culturally specific.

Nonetheless, a great divide remains between studies of scientific practice and knowledge production and the circulations of science outside the laboratory. The embeddedness of laboratories and the insight that science is a culture get elided and science is reinscribed as outside of the larger social world. Consider, for example, what Harry Collins (1981) set up as a three-phase programmatic approach to understanding science: looking for interpretive flexibility, tracing closure mechanisms, and understanding the circulation and social contexts for science. The result of this approach is in fact to reinscribe the lab/world divide. There are several notable breaches of the lab/world divide. For example, Kleinman (2003) traced how the assumptions of industry filter their way into scientific practice. Thus, standard agribusiness chemical treatments are considered the baseline or control group for assessing new biocontrol agents, not the absence of treatment altogether.

It has been very productive for feminist analysts of life science research to trace how gendered language, metaphor, and assumptions are built into research design and interpretive practices. Emily Martin (1994) breaches the lab/world divide by tracing how the metaphors of competition, identity, and flexibility are reflected both in scientific models of the immune system, and in popular circulations of immunological knowledge. Donna Haraway’s (1991, 1992) work on cyborgs, primates, and more recently companion species similarly transgresses the boundaries between scientific production and consumption. These works emerged somewhat independently of the public understanding of science (Irwin &

Wynne 1996) as a subfield of science studies, which has developed a thorough critique of prior work which presumed a unified public and produced a deficit model that privileged formal scientific knowledge.

However, these works on public engagements and cultural representations of science have largely been the purview of anthropologists, sociologists, and historians. Research by scholars taking literary and cultural theory as their primary approach is a more recent development. For example, the anthologies by Reid & Traweek (2000) and Ong & Collier (2005) rely primarily on anthropological methodologies. Cultural studies of science outside of anthropology and sociology have been primarily caught up with the representation of science or specific scientific projects in literature, film, and media, or nearly swept away by a fascination with information technology and virtuality. In this regard, cultural and literary studies of science and technology have again reinvented the lab/world divide by focusing on the circulation and reception of ideas about science or derived from science, and only rarely on the specific institutional contexts and networks that produce science.

The lab/world divide makes critical analysis difficult. Analyses that cannot get to the heart of scientific matters are easily dismissed. (That this is true is itself an important moment for an analysis of the current legitimacy of science.) And while it might be compelling to argue that the lab/world divide is not real in some way, that it is an artifact of disciplinary boundaries and the discourses within and about science, it is experienced by many as real and performed as such. For example, scientists only rarely read cultural studies treatments of their fields. The role of critique in science studies has its origins in social movements such as Science for the People, as Hess (1997) points out, and has been most effectively carried

out through feminist analysis. In fact, Haraway (1994) playfully suggests that science studies is derivative of feminist science studies.

Science studies, like cultural studies, is a multifaceted interdisciplinary research arena characterized by a complex history and multiple origin stories. These stories come together in a variety of cooperative and conflictful ways and have led to efforts to seek rapprochements between the two fields. Perhaps the major conceptual focus for rapprochements and oppositions is the idea of “social construction.”

The view that social constructionism is the (or at least *a*) source of the postmodern movement, and furthermore that it is the root of cultural studies, is misleading at best. It is common, but again misleading, to distinguish strong and weak social constructionism. Conventionally, weak social constructionism does not dismiss the factuality or “out-there-ness” of reality. Strong social constructionists, by contrast, while they do not dismiss the notion of the ontologically real, argue that “real” and “unreal” are social constructs. This is sometimes interpreted to mean that what is real is simply a matter of social convention. The context of this distinction is one in which the social sciences and the realm of the social are invisible, and the world of science is the world of physics, biology, and chemistry. This leads to sociologically absurd claims by philosophers, psychologists, cognitive scientists, and physical scientists to the effect that some but not all categories are social constructions (Pinker 2002: 202); or that some facts called “brute facts” have no institutional grounds and indeed exist independently of language (Searle 1992: 238–9). This confusion about a concept that is at the core of the sociological sciences has been in no small part nourished by a lack of sociological imagination at the very center of science studies. Consider, for example, that in the

first edition of *Laboratory Life* (1979), Latour & Woolgar use the subtitle *The Social Construction of Scientific Facts*. They are primarily concerned with the construction of sense in science; to say that scientific knowledge is socially constructed is to draw attention to the process of making sense of observations in science. Their study is designed to demonstrate ethnographically that technical events are social and not merely psychological operations.

In the second edition of *Laboratory Life* (1986), Latour & Woolgar did not substantively alter the body of the text. However, they changed the subtitle to *The Construction of Scientific Facts*. They explain this change in the postscript written for this new edition. In a section on “The demise of the social,” Latour & Woolgar make the curious claim that the term “social” is no longer needed because it has become pervasive in its applicability, that is, we now know that everything is social, so the term can be dispensed with. This can be the case only if “social” has no ontology, and this status can be a reality only in a world without a social realm and with no need for a sociological perspective. What we have here is a failure of the sociological imagination that has by this time already contaminated the concept of social construction by associating it with relativism. The details of these developments are reported in Restivo & Croissant (2008). What is important for the cultural studies reader in this moment is that if we stay closer to the realm of the social to which we have access through the lenses of the sociological sciences, we can identify three basic ways in which social constructionism is used in the literature(s).

“Social construction” is nothing more or less in the first place than the fundamental theorem of the sociological sciences. In this sense, it conveys the idea that the only way that humans can come to know or believe,

the only way they can discover or invent, the only way they come to know that something is true or that it is false is through their social interactions in social contexts nested in the material systems of everyday life. This requires a commitment to the idea that there is indeed a social realm, that there are indeed social facts, and that sociology is indeed a science. There are two levels of confusion that attend this understanding of social construction. In some areas of the social sciences, the term is used as a synonym for labeling theory. This is the sense of social construction that leads the sociologically naïve to claim that the term implies that the sun is the sun by way of conventions rather than being an “objective” entity. Confusing labeling theory with social construction as a fundamental theorem leads opponents to try to refute the idea by banging coffee cups on table tops and shouting that the moon is *not* made of green cheese. This error is compounded by the idea that social constructionism is necessarily a critically and politically engaged set of views on knowledge and science (Smith 2006: 33). In this view, social constructionism is an ideologically driven approach to studying and understanding science in the spirit of the radical science studies movement, Science for the People, and related approaches to science as social relations. Latour’s (2004b) observation that social construction, while originating in left-oriented critiques of science, has on occasion been coopted by conservative elites, for example to defer action on global warming or to add credence to creationism, should serve as a reminder that constructionism is not inherently socially progressive or “leftist.”

There are then three moments of consequence for cultural studies scholars and readers to attend to if they wish to understand science studies and the social construction of science. The first is when Latour

& Woolgar announced the demise of the social by dropping the term from the revised edition of their book. The second occurs in the debate over the strong program between David Bloor and Latour (Bloor 1999). The third is the emergence of the “science wars” in the mid-1990s.

The debate between Bloor and Latour is essentially the result of Latour’s failure to acknowledge or even to understand the fundamental posture of sociology. Bloor’s sociology is “strong” in several respects, the most important of which is that he takes seriously the scientific nature and findings of the discipline, and grounds his thinking in the works of sociologists within the Durkheimian tradition, from Durkheim himself to Mary Douglas. Latour has continued to try to unravel the sociology entailed in the anthropological approach he and Woolgar adopted in *Laboratory Life*. His advocacy of the demise of the social reaches a high point in his most recent publications (see, especially, Latour 2004b, and the review by Restivo 2005).

The seeds of the science wars were planted in the view that scientific facts are, to recall Latour & Woolgar, “fictions,” and in the idea that scientific facts are made rather than given (e.g., Knorr-Cetina 1981: 5). This, in combination with the fact that sociological thought is not well understood and that the status of sociology as a science is at best controversial across the academic community, led to serious misunderstandings about the conclusions being reached by science studies researchers. Science studies in general, and the idea of social construction in particular, became associated with relativism in the minds of many physical and natural scientists, and the more conventional philosophers and historians of science. It escaped all the critics that there were no “anything goes” relativists among the leading figures in science studies (Croissant & Restivo 1995: 49). Nonethe-

less, among various engagements between science studies researchers and their critics, one stands out as arguably the defining “first shots fired” moment in the science wars; that was the debate between science studies pioneer Harry Collins and biologist Lewis Wolpert at the fall 1994 meeting of the British Association for the Advancement of Science.

One of the significant volleys fired in the science wars came from Paul Gross, a biologist, and Norman Levitt, a mathematician. In their book *The Higher Superstition: The Academic Left and Its Quarrel with Science* (1994), they argued that science critics and theorists who viewed science through social and cultural lenses had it all wrong and were threatening Western values and reason itself. This book, as physicist and social scientist Brian Martin (1996b) has pointed out, is more of a political intervention than a scholarly critique. Gross & Levitt engaged in a process called “boundary work” (see Gieryn 1999). Their work is designed to protect the boundaries of what they consider science as a discipline and the legitimacy and credibility of science. They think of science as a unitary thing, a single object you can either favor or oppose. Any sort of criticism or theorizing from “outside” of science itself is viewed as an “attack” that might fuel cuts in funding and cause science to lose credibility in the eyes of the public. Their view of science, however, is not sustained empirically by an investigation of the very researchers Gross & Levitt target on philosophical and ideological grounds. On careful reading, sociologists of science labeled antiscience and relativist turn out to be staunch supporters of science and its methods. Those who do not do so explicitly defend forms of inquiry that provide robust, socially and environmentally sustainable, and just answers to important questions (e.g., Easley 1987; Martin 1996a; Kleinman et al. 2005).

The so-called Sokal affair, which occurred at the height of the science wars, is a singular moment in the cultural studies–science studies drama. In 1996 the journal *Social Text*, at that time not peer-reviewed, published a piece by Alan Sokal which he admitted simultaneously in the journal *Lingua Franca* was a complete fabrication, a parody designed to illustrate the poor standards and ideological underpinnings of postmodern critiques of science. Sokal's revelation was followed immediately by extensive scholarly and public commentaries. As a central salvo in the science wars, Sokal's hoax brought the conflict as close as it would get to popular attention. As an "affair," Sokal's paper and responses to it took up a great deal of energy and media space in the mid-1990s, but apparently with few material or institutional consequences.

The rise and fall of the science wars have yet to be adequately explained. It is hard to pin down exactly when the science wars begin and end, although several books and conferences marked the height of the conflict between "real scientists" and non-scientist intellectuals analyzing and critiquing science. Similarly, at the end of the 1990s several conferences were convened to try to reach rapprochement. Nelkin (1996) argued that the "science wars" were best understood as a displacement of conflicts about science and its decline in status and resources.

As the science wars have faded away, there continue to be skirmishes in classrooms and laboratories, in university lunch rooms and in conversational niches at conferences and workshops. The ongoing creationism/intelligent design versus evolutionary theory controversy is a science wars phenomenon, though one more firmly grounded in the broader culture wars. In the larger context of the culture wars, the science wars represent a set of tensions around issues of political economy, religion, and society that

will fuel and reflect social change and conflict in the future. The issues at stake have to do with reconfiguring the systems of belief and knowledge, truth and untruth, and the relations between power and knowledge.

In all of these moments, the conflicts and struggles arise out of a failure to understand social construction as an explanatory construct. As noted by feminist poststructuralists such as Judith Butler, Haraway, and Dorothy Smith, the primary question is not whether or not something *really* is socially constructed, whether it be bodies or protons or planets, but what is at stake in trying to drag a referent to one or the other side of the nature/culture divide. Latour (1993a, 2004a) comes closest to this insight, yet backpedals from its implications.

Projects in the cultural study of science and technology would do well to clarify what they are talking about when they are talking about science. Science is variously conceived of as a social institution, anchored in specific relations of capital, organizational forms, and political and cultural legitimacy. Science is also understood as a specific body of knowledge, a collection of facts that is produced, circulated, and contested. The methodologies that will integrate these definitions of science will have to reach beyond the lab/world divide and disciplinary divides that have shaped the current state of the field.

Both science studies and at least some versions of cultural studies are founded on the concept of "social construction." It may thus be difficult in some cases to say exactly where science studies end and where cultural studies begin. What is important, however, is the paradigm shift these fields reflect, one that elevates the social and the cultural to new levels of explanatory power in studies of society and culture. Nonetheless, cultural studies expresses more directly the concept of social constructionism

that Smith (2006) describes as socially and politically engaged. Thus, when cultural studies scholars turn their attention to science, they tend to escape the criticisms leveled at science studies by its more radical critics; that science studies is disengaged from activist agendas and the issues and troubles of everyday life. Science studies seems to have become increasingly professionalized into the pantheon of scientific disciplines, and despite its own findings about discourse and practice in science it has tended to recapitulate notions of a value-free or value-neutral standpoint. The provocation by Woolgar & Pawluch (1985) to take social construction more seriously in a radically reflexive manner seems to have impacted cultural studies more than science studies. Cultural studies moved more easily into the heterogeneous spaces created by the postmodernist turn than did science studies or for that matter sociology.

To the extent that Haraway and Latour, for all of their differences, give us compatible “views of considerably more widely dispersed actants across mobile networks than disciplinary sociology ever imagines” (Schneider 2008: 747), it may be at the cost of many significant contributions of sociology. This is in great part due to the fact that Haraway and Latour are joined in defending the demise of the social, a movement that reflects a failure to grasp the sociological imagination.

Science studies is indeed prone in at least some of its practices to the criticism that it ignores such issues as that of the “Science Machine” (Mills 1963: 234), and science as itself a social problem (Croissant & Restivo 1995). Mills’s notion of the “Science Machine” drew our attention to the difference between the ideal of science as ethos and orientation and modern science as a social institution operated and controlled by technicians on behalf of the military-

industrial complex. On the other hand, the field also does not merit the criticisms of its science wars opponents who see anti-science and relativism where no such oppositions exist. On balance, science studies has for nearly 40 years given us increasingly detailed empirically grounded narratives of discourse and practice in science and revolutionized our understanding of truth, objectivity, and method without succumbing to the most numbingly nihilistic conclusions of the postmodern pessimists. As Dorothy Smith (1999: 96–130) has noted, postmodernism has actually taught us *how* to tell the truth. We are not at the mercy of postmodernism but rather fashioners of new forms of knowing, new ways of understanding science. Science studies and cultural studies are partners in this endeavor.

Silverman, Kaja

KAY ARMATAGE

Kaja Silverman (b. 1947) is Class of 1940 Professor of Rhetoric and Film at the University of California at Berkeley. She taught at Yale University, Trinity College, Simon Fraser University, Brown University, and the University of Rochester before joining the Rhetoric Department and the Film Studies program at the University of California at Berkeley in 1991. Her writing and teaching are concentrated primarily on phenomenology, psychoanalysis, photography, and time-based visual art, but she continues to write about and teach courses on cinema, and has a developing interest in painting. She maintains a continuing commitment to feminist theory, poststructuralist theory, queer studies, masculinity, and theories of “race.” This distinguished career in scholarship is all of a piece, speaking consistently to the deepest reaches of human subjectivity. Its project is profoundly political and heroically transformative.

Silverman made an immediate impact with the publication of *The Subject of Semiotics* in 1983. At that time, feminist film scholars had spent a decade tracking the semiotics of Christian Metz, playing the dutiful daughters of Jacques Lacan (without really grappling with the intricacies of either Lacan or Freud), and worrying about Roland Barthes’s declaration of the death of the author just as women filmmakers and feminist scholars were constituting themselves as authors. *The Subject of Semiotics* took it all on meticulously, with a chapter on each of the most influential thinkers, explicating in

detail and then reworking their principal concepts in order to insert the feminine subject. Identifying the “subject” as a semiotic construction that cannot be understood apart from signification, discourse, and the symbolic order, the book seeks to destabilize the ideology and subject positions reified by the classic film text. Her discussions of suture and the subject are by now canonical, assigned on every course in many cultural fields.

With *The Acoustic Mirror* (1988), Silverman continued her innovations in film theory by shifting the emphasis from the cinematic image to that of sound and the voice. Like *The Subject of Semiotics*, *The Acoustic Mirror* provides a comprehensive summary of the positions taken regarding the role of the maternal voice in the formation of the subject. Previous thinkers had produced a concept of a kind of acoustic cocoon woven around the newborn infant by the sound of the mother’s voice, variously characterized as a “bath of sounds” (Didier Anzieu), a “sonorous envelope” (Guy Rosalato and Mary Ann Doane), an “umbilical net” (Michel Chion), and a “mobile receptacle” (Julia Kristeva’s *chora*). Silverman’s book characterizes the sonorous envelope and the umbilical net as the utopian and dystopian extremes among these retrospective conceptualizations of the maternal voice. It offers new ways of thinking about desire, lack, subjectivity, and the lost object of the maternal voice in relation to classic cinema. Nearly 20 years later, feminist film scholars find this text richly productive as transnational approaches to cinema encounter new speaking subjects breaking cultural silences.

Silverman had been interested in male subjectivity all along. “Male subjectivity and the celestial suture” appeared as early as 1981; “Masochism and male subjectivity” (1988) arrived just as *The Acoustic Mirror* was coming out; “White skins, brown

masks" came in 1989; and "Historical trauma and male subjectivity" was in press in E. Ann Kaplan's anthology, *Psychoanalysis and Cinema* (1990). In *Male Subjectivity at the Margins* (1992), Silverman gathered together these early articles and added substantial new chapters to presage what was to become, in the late 1990s, a flood of studies on masculinity and modern culture. In her discussion of "deviant" masculinities, specifically male masochism, she took up the turn to queer theory that Judith Butler's *Gender Trouble* had massively installed in 1990. Examining the boundaries of what is normally considered male – for example, the work of Fassbinder – she accepted another daring challenge, an interrogation of the politics of desire and identification. This ambitious work declares itself an "attempt to demonstrate that these masculinities represent a tacit challenge not only to conventional male subjectivity, but to the whole of our 'world' – that they call sexual difference into question, and beyond that, 'reality' itself" (1992: 1). Her venture is to articulate a much more complex interaction between the psyche and the social order than Foucault does in *The History of Sexuality*. This articulation of "libinal politics" is motivated by an urgent feminist project, that of reconfiguring male identification and desire in such a way as not only to permit female subjectivity to be lived differently, but also to "render null and void virtually everything else that commands general belief" (1992: 2–3).

At this point in Silverman's already capacious worldview, love enters the picture. *The Threshold of the Visible World* (1996) explores what Lacan calls "the active gift of love." While continuing with her great overriding theme, a psychoanalytic examination of the field of vision turning on the gaze, the look, and the image – above all what it means to see – love emerges as a central category of "productive looking."

Embracing yet another daunting "ethical-political project" – "The larger project of this book is to offer an ethics of the field of vision" – she seeks to correct the "serious strategic mistake" made in the past by those, including herself, who had written deconstructively about gender, race, class, and other forms of "difference" (1996: 1–2). The text reformulates the process of idealization, the psychic activity at the heart of love. Turning to visual texts that have the power to re-educate the look, *The Threshold of the Visible World* concludes that the aesthetic text can assist us in a collective project that exceeds the capacity of the individual subject alone. These visual texts can instruct us in the arts of love and productive looking.

After *Speaking about Godard* (1998), a totally unexpected and fresh incursion into close reading of complex texts, came *World Spectators* (2000), about which Leo Bersani wrote in a back-cover blurb, "This original and important book demonstrates the inseparability of philosophy and psychoanalysis for any serious attempt to answer a question so profoundly relevant to the very nature of our being that it does not 'belong' to any one discipline: the question, as Silverman puts it, of what it means for the world that each one of us is in it."

A monograph on photographer James Coleman followed in 2002, and *Flesh of My Flesh* (2009) brings together phenomenology, psychoanalysis, and a range of visual works, to effectively rethink what is meant by "claiming" another person, a different culture, a foreign nation, or a pre-existing aesthetic object. Silverman is currently working on a book tentatively entitled *Appropriations*, which is centrally concerned with racial, sexual, and economic difference. Both *Flesh of My Flesh* and *Appropriations* follow closely from *World Spectators*.

Simmel, Georg

LAWRENCE A. SCAFF

Georg Simmel (1858–1918) was an influential social theorist, sociologist, and philosopher whose work was concerned with the processes and forms of social differentiation, stratification, group formation, and conflict. He wrote widely on topics in philosophy, art, literature, economics, and sociology; his work on women and culture and on the dynamics of cultural change is particularly important to cultural studies. His books and essays addressed major figures like Kant, Goethe, Schopenhauer, and Nietzsche; artists like Rembrandt, Rodin, and Böcklin; and themes as varied as the philosophy of history, the nature of religious belief, and methods of sociological inquiry. At the University of Berlin he introduced the first sociology courses and became famous for his lectures. His two major works, *The Philosophy of Money*

(1978[1900]) and *Sociology* (1908), were milestones of modern thought. With the publication of his 24-volume collected works, the *Georg Simmel Gesamtausgabe* (from 1989), we have begun to appreciate the extraordinary range, depth, and originality of his contributions to social and cultural theory and the understanding of modernity.

Simmel's sociological theory depends importantly on two major concepts: "interaction" (*Wechselwirkung*) and "lived experience" (*Erleben*). "Interaction" is a relational concept referring to reciprocal macro-level causes and effects brought about by exchanges among individuals at the micro level. It specifies the way individuals come together to create social structures and institutions and give meaning to their actions. Interaction accounts not only for associative life, but also for social differentiation, functional specialization, social conflict, and relative social distance. By contrast, the concept of "lived experience" captures the reverse set of relationships: it emphasizes the way social structure and institutions shape the individual in space and time. It alerts the observer to the deeper understanding of self and world that becomes internalized as the individual engages in social activity.

Sociology, a reflexive mode of inquiry, is for Simmel the science par excellence of association, or the formation of social relations among interacting individuals and groups – dyads, triads, and more complex combinations. His writings are concerned with abstract "forms" of interaction, such as triadic relationships; types of associative activity, such as the conspiratorial group; and types of actors and personalities, such as the stranger or the dandy. Simmel is also fascinated by the problems of association in modern settings like the fast-paced metropolis. His innovative essays on life in the city and the significance of style and fashion

contain remarkable insights into the dynamics of modernity and its limitless possibilities and discontents. This work was important for later critics like Walter Benjamin and Siegfried Kracauer, as well as George Herbert Mead and the school of thought known as symbolic interactionism.

One of the most striking aspects of Simmel's contribution is the way he develops a far-reaching theory of culture and cultural change, as did Sigmund Freud, Max Weber, or Max Horkheimer and Theodor Adorno. In the final chapter of *The Philosophy of Money* (on the "style of life") and in late essays like "The concept and tragedy of culture" (1911) and "The conflict in modern culture" (1918), he suggests that the modern subject is confronted with a particularly ferocious struggle between the vital, finite forces of "life" and the fixed, timeless forms of culture. By culture he means "objective" culture, that is, the products, processes, and technologies that envelop and condition our existence – the totality of the cultural capital of an era. The problem is that in modernity the "objective" culture becomes more refined, complex, comprehensive, and dominant, whereas the "subjective" culture of objects and processes that individuals are capable of assimilating and calling their own becomes cruder, simpler, more limited, and fragmentary. The former expands or increases, while the latter is diminished and struggles to keep pace. The money economy intensifies the tension. Quantity is transformed into quality, time and space are compressed, and the pace of life accelerates.

For Simmel the problem of subjectivity thus assumes a new form: the individual has difficulty grasping the rapidly changing dynamics of objective culture and struggles to maintain a sense of worth, autonomy, and freedom. It is as if we have created a world of objects that are now set against us as active powers with reified content. The result in

modern society is resistance and adaptation that produce competing lifestyles or attitudes, such as ostentatious display, asceticism, avarice, cynicism, religiosity, a life of adventure, or an escape into art or science. Resistance can also give rise to various political and social movements, such as socialism and feminism. For Simmel all such responses represent ways of coping by arresting, obstructing, accelerating, or going with the flow of modern times.

Simmel is one of the first theorists to extend these ideas to women. In his path-breaking experimental essays on "female culture" he hypothesizes that "objective" culture is predominantly though not exclusively male, and asks the question: as they break free from patriarchy and traditional roles, might women create a qualitatively different culture? His provisional answer, a variant of an argument based on gender "difference," is that women's interaction may do exactly that, or at the very least inaugurate significant changes in the dominant objective culture.

Aesthetic modernity holds a particular fascination for Simmel. Acutely aware of new technologies and media, such as film and photography, he was struck by the attraction that the manifold expressions of modern art offered as a salvation from the everyday. The aestheticization of everyday life and the dissolution of traditional forms lies at the heart of modernity, signifying a loss of historical consciousness or "historicity" that Hegel had labored to establish. Because of its fixation on the present moment or "presentism," modernity runs the risk of losing its bearings in the maelstrom of incessant innovation and self-renewal. For the individual the result is a paradox: while the modern, technologically driven society offers liberation from an oppressive past, it also poses the most serious challenge to our individuality and identity. For Simmel, however, this is a

paradox containing a creative tension that must be preserved.

Simmel was a master at extracting meaning from the particular, immediate, and transient, or as he stated, finding the totality of life's meaning in each of its details. He avoided philosophical system-building and criticized what has been called a foundational epistemology (Richard Rorty) or a grand metanarrative (Jean-François Lyotard). Simmel's epistemological perspectivism, appreciation of the fragmentary character of experience, and emphasis on the significance of the marginal can appear to make him a postmodernist *avant la lettre*. Many of his essays do indeed offer brilliant illustrations of the kaleidoscopic and heightened quality of our experience in the "eternal present" of our times, which for Simmel are simply quintessentially modern. It is, above all, because of his unique grasp of modernity and his compelling theory of culture and society that his thought has continued to attract attention and grow in significance.

Simulation/Simulacra

ROCIO GÓMEZ

In contemporary cultural studies, the terms "simulation" and "simulacra" invariably refer to Jean Baudrillard's theory of post-modern simulation as the representation of a representation, rather than of reality. As a critic of the image in the age of mass media, Baudrillard highlights its ability to destroy the original predecessor of its kind. He details his theories of simulacra in his books, *Symbolic Exchange and Death* (1993 [1976]) and *Simulations* (1983), but consistently referred back to it in other books such as *The Consumer Society* (1998 [1970]) and *The Evil Demon of Images* (1987[1984]). Simulacra challenge the perception of what is the real, rendering the philosophical study of the real, or metaphysics, useless. By serving as a substitution for the original rather than as a representation of it, the simulacrum creates a distance between itself and the original that negates its origin or reality. This lack of origin spawns what Baudrillard calls the "hyper-real." In hyper-reality images, or signs, no longer allude to their respective original, or real, which is now deemed unnecessary.

In "The Orders of Simulacra," an essay in *Simulations*, Baudrillard writes that there are three orders of simulacra. The first occurs from the Renaissance and to the Industrial Revolution. During this period, there is a simple original and counterfeit, or the "natural" value of the simulacrum (1983: 83). Because of the close generational difference between the sign and the real, signs at this time refer only to the real. For example, a Roman vase duplicated in Renaissance Florence is far closer to its original, or real, than if it were mass produced in the twentieth century. The second order sees that difference grow during the Industrial Revolution. In this period, the "commercial" value of signs signifies the growing loss of what exactly is the real (83). There is now greater generational distance between the sign and the real, or the counterfeit and the original, presenting the dilemma and anticipated loss of the real. Of course, during the Industrial Revolution, the repetitive and innumerable counterfeits made on the factory floors also "murdered" any remaining notion of the real. Baudrillard writes, "The relation is no longer that of an original to its counterfeit – neither analogy nor reflection – but equivalence, indifference. In a series, objects become undefined simulacra one of the other" (97). Third, "structural" simulacra make up the final order, dominating the era between the Industrial Revolution and today (83). This order demonstrates a complete break from reality and a complete simulacrum of the real. However, the new real is a perverted reality and unlike the first order, it is a "tactical hallucination" (117). The simulacra's attempt to capture the real creates, therefore, even more distance between itself and the original. As with nostalgia, the distance is emphasized and the recognition of the distance further discredits the counterfeit's longing to embody the original.

Because simulacra take on "murderous capacity," it is unsurprising that Baudrillard should use degrees of benevolence and malevolence, or "order of sacrament," to characterize them (12). While the original is essentially the utopian good, every subsequent order decays into "evil" and "sorcery" until it is pure simulation.

For Baudrillard, a reader of sociological thought, simulacra impact three major realms of social life in the present day: consumerism/labor, the loss of the divine, and the disconnection from reality. The first is directly related to technology, advertising, and television. Feeding the viewer images, the mass media tell the public what to buy and who to be, tuning into basic human needs and desires. For the consumers and viewers of these advertisements, these simulacra inspire a narcissism that makes them believe that, indeed, they will simulate the happiness, sexiness, and beauty in the advertisement's simulacra. Simulation of the ad and hope that the signs on the shirt's tag will self-reflect on the purchaser make everyone a star in their own Gap advertisement, or a simulation of a simulation. As a result, there is a complete detachment from reality as described in the third order of images. Second, simulacra threaten the objects of holiness that populate churches, temples, and home shrines. Baudrillard writes in *Simulations* that Western faith and its artistic representations of holy persons believed that a sign could carry the gravity of meaning and holiness. When mimicry and mysticism cross paths, however, "the whole system becomes weightless, it is no longer anything but a gigantic simulacrum" (1983: 11). With the reproduction of icons and holy signs and as the distance between the counterfeit and the original grows, the original purpose is lost. For example, one may see this in Mexico's Virgin of Guadalupe. While the original image's holy origin was proclaimed by the colonial viceroy and the

Catholic Church, the proliferation of the image now in everyday items has taken a domestic turn with kitchen magnets, bottle cap earrings, and stickers that bear it. The counterfeit nature of these detracts from the natural value of the real, leaving the knick-knacks with the image in the state of pure, unholy simulacra. The third social repercussion of simulacra is the loss of reality altogether, taking society into the “real, neo-real, and hyperreal whose universal double is a strategy of deterrence” (12). Baudrillard illustrates this best in his book *The Gulf War Did Not Take Place* (1995 [1991]). Despite the controversial title and the facts that contradict it, Baudrillard was most concerned with the perpetuation of war simulacra that populated the screens of CNN and other news outlets. As the world watched the first “virtual” war (30), green, night-vision screens made the images a video game console, distancing the audience from the real. The images seen on screen were solely reproductions of the very real events in Iraq, yet the world public saw only the simulacra time and again.

When the internet, film, and television became commonplace in homes, signs were increasingly aimed at human emotions and desires. Portrayal of experiences, occupations, and even people were proliferated and absorbed by the viewer. For example, a city-dweller visiting a farm would refer back to the images of a farm provided by the media. Because these simulacra burned an idealized farm into the viewer’s thoughts, the real farm would fall short of the simulacra. By killing the real with the idealized sign, the media defined the neoreal in the viewer’s expectations. In creating simulacra, the real is, again, no longer necessary.

Ethnologists and anthropologists have also manipulated and unwittingly employed simulacra, according to Baudrillard. When a previously undiscovered tribe was encoun-

tered in the Philippine mountains in 1971, it became the model for every tribe before the modern age (1983: 14–15); it became a simulacrum for how life was once lived. Furthermore, ethnology’s attempts to protect these people from modernity only encouraged the perception that “we are only able to imagine this other or anterior to simulation in terms of simulation itself” (Butler 1999: 43). As the tribe retreated back to the forest, ethnologists’ understanding of the tribe only simulated the real. Consequently, there are two worlds, according to Rex Butler, the real one and the simulated one which is readily available and subject to the public’s already internalized perceptions of what a tribe is, who a Filipino is (43). Even when the real is present, it is still considered part of that other reality because ethnology and anthropologists of the West still define them as such. The other is perpetually part of another reality that can be absorbed only through simulations on television, in a book, or in a picture.

The epitome of simulation for Baudrillard comes in the form of Disneyland, with all the different thematic areas of which it is composed: Tomorrowland, Frontierland, and others surround the counterfeit castle at the center of the theme park. As millions visit the park every year, they are bombarded by images that allude to imaginary icons in the American consciousness. This “deep frozen infantile world” (1983: 25) is a third-order simulation in which no reality exists. Attempting to conceal all of “real” America, with its poverty and politics, Disneyland paints an idealized nation with the same values as America. It is delivered under the cover of the imaginary, “concealing the fact that the real is no longer real” (25). The simulation of the “happiest place on earth” also disguises adults’ refusal to accept their own mortality and very real death, and to (re)live a simulated childhood

they never had. In essence, Disneyland is a simulation of a simulation.

Surrounding the park itself are a plethora of similar parks that offer an otherworldly real. SeaWorld, Magic Mountain, Knott's Berry Farm, and other "imaginary stations" (Baudrillard 1983: 26) offer further simulation of what an adventure at sea, in the mountains, or on the farm might offer, respectively. Los Angeles itself produces simulations of reality in the highly lucrative filmmaking business that makes its home in Hollywood. Film simulates everyday reality but it creates and manipulates a hyper-real that is thereafter alluded to in the viewers' experiences and encounters. Specifically dealt with in Baudrillard's 1984 book, *The Evil Demon of Images* (trans. 1987), film, cinema, and photography "are in the overwhelming majority much more 'figurative,' 'realist,' than all images from past cultures. It is in its resemblance, not only analogical but technological, that the image is most immoral and most perverse" (1987 [1984]: 13–14). (Ironically enough, the box-office hit, *The Matrix* [1999], referenced a great deal of Baudrillard's work on simulation in a science fiction context, though Baudrillard himself dismissed the film as having nothing to do with his work.) Film especially has the danger of alienating its public because its simulation is too good, too perfect, as Baudrillard notes with regard to *The Last Picture Show*, a 1970s imitation of a 1950s teen film (1987[1984]: 31).

The theories involving simulation are unsettling as media and technology bombard the public with images. While cultural studies certainly benefited from Baudrillard's work regarding simulacra, it also influenced recent work such as Stuart Moulthrop's studies of hypertext, which build on the hyper-real along with gender studies on seduction (Baudrillard 1990 [1979]).

Situationist International, The

TOM BUNYARD

The Situationist International (SI) was a group of artists, theorists, and activists that existed between 1957 and 1972. The group emerged from the milieu of avant-

garde art and culture, but its stated aim of uniting art and life entailed a theoretical output that was chiefly concerned with the relation between capitalism and subjectivity, and with the possibilities for revolutionary social change.

The SI was formed at the International Congress of Free Artists, held in the Italian town of Alba, Italy in 1957. This event brought together several avant-garde groups, deemed by the organizers to be dealing with similar issues: the Letterist International (a French group concerned with the negation and supersession of bourgeois culture); the International Movement for an Imaginist Bauhaus (which sought to combine expressionism with the ideals of the German Bauhaus movement in architectural modernist ideals); and the London Psychogeographical Association (an “association” – possessed of just one confirmed member, British artist Ralph Rumney – that sought to study the psychological effects of the urban landscape). Each was characterized by the view that art, architecture, and culture should be employed in shaping lived experience. The delegates agreed to unite as the SI after several days of debate, and the new group’s inaugural conference was held the following year at Cosio d’Arroscia, also in Italy.

For the Situationists, the culture of modern society was in a state of “decomposition.” It had become stagnant, they claimed, as a result of the arrest that capitalism had placed on human history: capitalism’s technical advances heralded a world of automation, in which wage labor might be abolished and the attendant possibilities for new experiences, pleasures, and desires realized; and yet capitalism remained in place, as the determination and guidance of human history had been surrendered to a self-perpetuating economic system. These concerns, coupled with their view that the role of the avant-garde

was that of driving culture’s development forwards, meant that the SI became explicitly concerned with social revolution.

Prior to this collapse into decomposition (which they dated from the 1930s onward) radical avant-garde culture – most notably Dada and surrealism – had been tending toward the unification of art and life. Presenting themselves as the last avant-garde, whose historical role would be to complete the development of culture by negating its bourgeois existence, the Situationists concerned themselves with the construction of “situations”: moments of life designed and lived as art, shaped and experienced according to the subject’s own wishes. Their work would thus be to research and demonstrate the possibilities of postrevolutionary society.

Their famous concept of “spectacle,” developed by the group’s principal theorist Guy Debord, arose from these concerns. Social experience was said to be entirely shaped by the exigencies of capital, meaning that human individuals were mere “spectators” of a life that had been set out for them. Rather than acting autonomously, spectators passively consumed “images” of self-determination and satisfied desire that maintained their submission (e.g., career, car, entertainment, etc., but also unions, political parties, and all forms of Leninism). In consequence, the Situationists stressed the need to reintroduce vitality and autonomy into subjective experience.

The concept of spectacle came to the fore as the group developed and became increasingly oriented toward theory, a shift that was markedly demonstrated in 1962, when members who had refused to renounce traditional artistic practice were expelled (the SI would go on to become notorious for its many splits and expulsions). The group subsequently became increasingly focused around Debord and centered in Paris, although it maintained sections in

many European countries (and, albeit briefly, the US).

In 1967 the group's two main theorists – Debord and Raoul Vaneigem – published, respectively, *The Society of the Spectacle* and *The Revolution of Everyday Life*. The availability of book deals had been assisted by the SI's increasing notoriety, due in part to a scandal at Strasbourg University the previous year. A group of students sympathetic to the SI had been elected to the student union, contacted the group, and subsequently used all the funds at their disposal to disseminate a Situationist essay entitled *On the Poverty of Student Life*. This had been composed especially for the occasion, and described the university as little more than a training ground for the docile roles of “spectacular” society. It was followed by calls for open insurrection, and, although order was subsequently re-established, the SI's name came to carry an increased air of menace.

The event added to an existing air of student radicalism, which culminated in the events of May 1968 in France: the University of Nanterre was occupied, as was the Sorbonne, and student protest developed into a general strike and the occupation of factories. Barricades were erected in the streets and Situationist slogans were painted on walls. With students and workers united in their rejection of capitalism and its “official” alternatives (i.e., the unions and the Communist Party), and with the de Gaulle government verging on collapse, the Situationists felt that they'd seen history prove them right.

The SI's subsequent notoriety gained it admirers, which thus entailed the danger of the group being turned into a spectacular image of revolution. Such individuals were dismissed as disciples, spectators, and “pro-situs,” but the sense grew that the SI's moment had passed. The final issue of their journal, *Internationale Situationniste*, was

produced in 1969, and the group was eventually dissolved in 1972.

The SI has been credited as prefiguring both punk and postmodernism, and has influenced many activist groups. Since Debord's death in 1994 their work has also been adopted into the academic canon, chiefly through research into the group's relation to art history, media theory, and postmodernity.

Sobchack, Vivian

SEAN REDMOND

Vivian Sobchack (b. 1940) is Emeritus Professor of Critical Studies in the Department of Film, Television and Digital Media, and former Associate Dean of the School of Theater, Film and Television at the University of California, Los Angeles. Her groundbreaking work on the carnality of the screen and perceptual, intersubjective affect, has led to a resurgence in employing phenomenology to understand the relationship between film/video and the viewer. Her essays have appeared in *Science Fiction*

Film and Television, Camera Obscura, Film Comment, Quarterly Review of Film and Video, Body & Society, Film Quarterly, Senses of Cinema, and History and Theory. She was the first woman elected president of the Society for Cinema and Media Studies and was awarded its Distinguished Service Award in 2005. She sits on the Board of Directors of the American Film Institute.

Sobchack's landmark book *The Address of the Eye* (1992) examines the living/live nature of cinema and the viewer's actively embodied relationship to it. Film is both a sensory technology and a sensing, feeling, sense-making subject. According to Sobchack, not only does film see and hear, touch and feel, but the viewer intersubjectively recognizes this becoming as sensorial life, and is "touched-in-the-body" by it:

Insofar as the film is visible as the successful realization of a perceptive act in an intended perceived object, the camera and projector and all other enabling cinematic technology are synaesthetically synopsisized as the film's body. Together, co-operatively, they are the film's means of directly having and behaving in a world . . . Invisible to itself as we are to ourselves in the intentional action and direction of our glance in the world, the film's body is indeed "capable of leaping over distance, piercing into the perceptual future" and carving out with its vision the particularity of a lived-world and a unique discursive existence within it. (215–16)

In terms of film theory, Sobchack makes a radical intervention in suggesting that there are always two viewers present in the moment of cinematic exhibition: the film text itself and the watcher, each existing as both subject and object of vision. She thus challenges the (then dominant) poststructuralist and psychoanalytical accounts of the film-viewer relationship that envisions a

causal, one-way effects process, with the viewer often labeled as passive in relation to the omnipotent vision of the cinema machine.

Sobchack argues that the "doubleness" of film's vision is unique in that it allows the viewer to directly experience others' perception, and to simultaneously self-reflexively address (*feel*) their own perception. As she writes, "we speak back to the cinematic expression before us" (1992: 9). Drawing on social semiotics, and phenomenology, and particularly on the work of Merleau-Ponty, Sobchack reimagines the way in which film and viewer can be understood, defining them as ethical centers of interaction.

In *Screening Space: The American Science Fiction Film* (1997[1987]), Sobchack explores the visual and aural conventions of the genre from the 1950s to the 1970s, arguing that a formal or aesthetic approach could open up new ways with which to define its complexities and pleasures. For example, she argues that, unlike the Western or gangster film, the visual iconography of a science fiction film is "unfixed" in its dependence on actual time and/or place. The signifiers of science fiction film, such as the spaceship, are many and varied, but these multiplicities or variances allow for greater and more wondrous forms of engagement to take place. However, Sobchack's intention with this book is also to validate genre studies more generally, and science fiction's place within it:

Given the current resurgence of popular interest in the genre, it now seems appropriate that the SF film receive more intensive analysis than it has received in the past. It is the purpose of the following work to fill in only a small part of that vast black hole in space which metaphorically represents the lack of aesthetic criticism available to serious film scholars (and fans) of the genre. (11–12)

In the extended edition of the book (1997), Sobchack includes an additional chapter titled "Postfuturism." The chapter allows her to consider the postmodern turn in science fiction studies, and to address what she describes as the "political unconscious" in the 1980 films not addressed in the first edition. For Sobchack, the politics of science fiction film need conjoining with its poetics so that ideology or meaning-making can be examined through aesthetics.

In *Carnal Thoughts* (2004b) Sobchack returns to a fully energized social-phenomenological exploration of the moving image and its relation to body culture. In what is a highly original account of the flesh, eyes, and touch of the screen, Sobchack asks us to consider the carnality of the vision that one encounters (or screen senses) when viewing film, video, and computer terminals. For Sobchack, the body of the screen and the body of the viewer meet in a realm of sensory revelation, producing a "cinesthetic subject," or one that

not only has a body but is a body and, through an embodied vision in-formed by the knowledge of the other senses, "makes sense" of what it is to "see" a movie – both "in the flesh" and as it "matters." The senses translate each other without any need of an interpreter, and they are mutually comprehensible without the intervention of any idea. Thus, the cinesthetic subject both touches and is touched by the screen, able to commute seeing to touching and back again without a thought and through sensual and cross-modal activity able to experience the movie as both here and there rather than clearly locating the site of that cinematic experience as "on-screen" or "off-screen." (70–1)

Sobchack considers embodiment to be an ethical issue, since, for example, the living sense of the human body allows it sensually to empathize with another human body that

is in pain, or experiences pleasure. Touching on case studies as diverse as leg amputation (her own) and prosthetics, she argues that the object and subject of being-in-the-world are entwined, and that this has transgressive or liberating possibilities for the self in the modern world. Sobchack's work has influenced writers such as Linda Williams and Laura U. Marks, particularly in terms of exploring the relation of the body to/in cinema.

Sports Studies

TERRENCE TUCKER

Sports studies is an emerging, interdisciplinary field that examines the history, impact, and role of athletics in societies. Employing primarily sociological, psychological, and anthropological analyses, sports studies interrogates how sports form identities in relation not only to society's constructions of competition, health, and entertainment, but also to economics, politics, and nationhood. Steve Pope notes, "Prior to the 1940s, most scholars ignored the history of sport because most of them considered it a frivolous anecdotal research interest that added little to the coherent national (political) narratives" (1997: 1). Since then, however, the study of sport has revealed its progression, in the West at least, from entertaining the ruling and upper classes, to bringing small communities together, to acting as a national obsession. Critics like Eric Dunning view sport in ancient Greece and Rome as a mechanism by means of which individuals were trained for war and which was based on "a warrior ethos rather than an ethos of fairness" (2004: 10). The study of sport in ancient Greece and Rome began by examining how sport adapted to the particulars of local geography and custom and eventually reflected national desires and anxieties. Sports studies has developed in response to the development of modern sports as a space where nations can be seen to infuse their cultures with ideas of fairness within specific national and ideological precepts. The study of sports in medieval Europe, of the popularity of golf and horse racing among the ruling classes in Britain, and of the emergence of

more recent sports in the nineteenth century has given us a greater understanding of these respective cultures. In the 1950s, historians like Rickard Bettes began examining the opportunities for the masses to participate in sports. Thus critical study moved from the study of sports as spectacle and entertainment for the masses in the direction of participation by the masses. Mass participation, according to critics, provided a renewed focus on ideas of health and exercise in addition to the traditional relationship of sport with industrialization and technology. Sport, then, became a mode of transmitting specific moral and ideological tenets. So Clifford Putney, in *Muscular Christianity* (2001), views Christian support of health and sport through the establishment of the Young Men's Christian Association (YMCA) as an opportunity to build character and to convey Christian ideals of goodness and care of the body provided by God.

LANGUAGE AND PERFORMANCE

To be sure, while society often imposes its own anxieties and aspirations onto sport, William Morgan suggests that sport "imposes its own set of moral standards and requirements on those who participate in it" and that these standards are "usually applied to sport after due consideration has been given to sport's moral character" (Morgan et al. 2001: 2). Therefore, one of the key elements of sports studies has been the imposition of rules in the development of modern sports in contrast to the ancient Greek and Roman codes of honor and victory. The rules that are imposed are often a reflection of the ideology of mainstream society. Sports studies examines how sport acts as a space in which ideas of competition and character are linked to national ideals. Indeed, Morgan claims that "if morality is

best thought of as a vernacular language, as the common language of the community we identify with, and if the national community is the community that commands our primary loyalty and the one therefore, by which we set our moral compass, then sports are an important way we learn to speak this national language in morally intelligent terms" (2001: 372). The shared language of sports and society generates a symbiotic relationship by which the drama of life itself is mirrored and enacted for the pleasure and entertainment of society. Therefore, an important element in sports studies is, of course, performance. However, unlike other forms of entertainment that involve performance, the audience is emotionally bound up with the quality of the performance they witness, and is often lauded (e.g., home-field advantage, the fan as extra player) for its enthusiastic support. As Roland Barthes observes, "in sport [the fan] is a participant, an actor" (2007: 59), and as a result "man experiences life's fatal combat as distanced by the spectacle, reduced to its forms, cleared of its effects, of its dangers, and of its shames: it loses its noxiousness, not its brilliance or its meaning" (61). So, while it is seen by many as solely a leisure activity, sport has become a central element in individual identity formation, especially in terms of gender, and of regional and national character. Sport has come not merely to reflect pre-existing ideas of celebrated social characteristics, but also to shape those ideas: it is a significant means by which moral ideals are communicated. As a result, critics of the national obsession with sport frequently point out that elevating sports figures to the level of cultural icons can often convey messages that reinforce practices that oppress and exclude, whether those messages are about body image and the collective gaze or about the corporate exploitation of labor.

RACE, GENDER, AND IDENTITY

The onset of the Civil Rights Movement and the second wave of feminism introduced new subjects and perspectives on sports. Moreover, sports studies expanded from history to include anthropology and sociology. Figures like Elias and Max Weber extended the field by viewing sport as having been influenced by, and at times embodying, the changes within specific societies. The invocation of race and gender further expanded sports studies by providing critics with the opportunity to explore how sports crossed racial and gendered lines, even as women and minorities viewed the entrance into the traditionally white male arena of sports as an issue of civil rights as well as of entertainment. Viewed from the perspective of race and gender, sport has a significance that goes beyond entertainment and it moves in a realm where questions of social justice are actively engaged. Much work has been done on the Negro Baseball League and on a variety of women's sports, as well as on the presence of minority ethnic groups in integrated sports and on the impact, in the US, of Title IX, the prohibition of exclusion on the basis of sex from participation in sports funded by college athletic programs. The study of race and gender, then, revises traditional discussions on sport's impact on national identity, whether as a catalyst to social equality or as an avenue for class uplift.

An examination of the career of boxer Joe Louis reveals the complex mixture of violence, race, and nationalism that centered on his defeat of the German boxer Max Schmeling in 1938. Louis's career can be seen in the context of the history of boxing, which can be traced back to Greek and Roman societies, and its development as a proving ground for gladiatorial superiority to become the apex of masculine power and

toughness, inviting both admiration and fear and expanding the boxer's appeal beyond his sport to become a representative of an idealized masculinity. Nations have seen the success of their boxers as a microcosmic representation of their military strength and societal legitimacy. Thus, Schmeling's initial defeat of Louis in 1936 was hailed by Nazi Germany as a demonstration of German superiority. Louis's eventual defeat of Schmeling in 1938, coupled with sprinter Jesse Owens's defeat of German rivals in the 1936 Olympics, was regarded by the United States as a display of its own national greatness and of the superiority of its democracy and pluralism over Germany's growing fascism and persecution of its Jewish citizens. However, a study of Louis also reveals contradictions in America's claims of superiority because of its own persecution of African Americans: Louis was unable to benefit from the democratic ideals that his victory over Schmeling was used to justify and promote. In fact, some white Americans celebrated Louis because he was distinctly different from Jack Johnson, the first black heavyweight champion and the most dominant boxer at the beginning of the twentieth century. Johnson's flamboyance and defiance – his taunting of white opponents and his involvement with white women – was bitterly resented and gave rise to the search for a white boxer (“The Great White Hope”) to defeat him. Regardless of the reasons for white support of Louis, in the African American community he was seen as a hero, where his success was celebrated for different reasons. Louis became an African American icon to all Americans who was radically different from destructive stereotypes of African Americans. Additionally, within the confines of boxing, Louis was able to compete against and to defeat white men without the violent backlash most African Americans would face. Thus, sports studies engages

the cross currents of race, media, boxing, and national identity.

Some critics adopted the approach of British Marxists to study the class dynamics within sports and the class anxieties that sports can transcend or inflame. *Labor Relations in Professional Sports* (Berry et al. 1986) traces the development of players' unions and their complicated and contentious relationships with management, including strikes and collective bargaining agreements, and their impact on the nature of individual sports. Meanwhile, Kern's *The Economics of Sports* (2000) analyzes the power of sport in the marketplace and the impact of sports teams in the economies of neighborhoods. For example, the popularity of Michael Jordan not only helped to popularize basketball on the international arena, but has become the embodiment of consumer-driven materialism that is the cornerstone of American economic power. Jordan is a prime example of how individual players are constructed by the media and how those images play into certain ideas of American mythology, as well as how they create and revise perceptions of specific groups and impact on mainstream society's sense of personal, communal, and national identity.

SPORTS AND NATION

In illuminating the connections between sport and culture, sport studies recognizes sport's construction “out of the substance of a nation, out of its soil and climate” (Barthes 2007: 47). Thus, “in Canada to play hockey is constantly to repeat that men have transformed motionless winter, the hard earth and suspended life, and that precisely out of all this they have made a swift, vigorous, passionate sport” (47). Similarly, American football reflects not only specific national traits, but also a specific moment in American national life, namely

the post-World War II emergence of the United States as one of the dominant military nations in the world, which is maintained by an unmistakable international presence and a collective will among usually contentious, individualistic parts. In tracing the history of sport in a nation, scholars are often able to use sport as a lens to view the development of a society. Steven Riess's *City Games* (1989) argues that the development of the city was central to the development of modern sports in the late nineteenth and the twentieth centuries. One of the most significant shifts has been "the transformation of the traditional agrarian pastime into the commercial spectacles of urban-industrial societies" (Pope 1997: 4). Therefore, sports studies in the latter part of the twentieth century has sought to respond to the national shift in tone and in action from the rural to the urban as well as the significance of the racial, class, and gender dynamics fueled by the Civil Rights Movement. More recently, the rise of material culture and celebrity has led many to call for sports to be depoliticized in order to appeal to the broadest possible audience. Critics have maintained that this has more to do with maximizing product and ticket sales than with using sports to bring together athletes and fans for a common purpose in a way that mirrors national pride and democratic idealism. With the unprecedented expansion in media outlets to cover sports and the response of fans to those sports, from sports-centered networks like ESPN to team websites and blogs to the emergence and popularity of commentary over reporting, the study of sport has become a fertile ground from which ideas about and perceptions of society can be explored and uncovered.

Structuralism, Poststructuralism, and Cultural Studies

CHRIS BARKER

Structuralism and poststructuralism have been widely influential within cultural studies because both schools of thought focus on how meaning is made, and meaning-making is an essential function of culture.

Cultural studies is an interdisciplinary field of inquiry concerned with the intersection of power and meaning in popular culture. Structuralism is a theoretical approach that identifies patterns in social arrangements, mostly notably language. While poststructuralism builds on the insights of structuralism, it holds all meaning to be fluid rather than universal and predictable. Both structuralism and poststructuralism are important theoretical influences in cultural studies and have enabled the field to explore culture as a set of signifying practices. That said, all three of the key terms in this equation – cultural studies, structuralism, and poststructuralism – are contestable, and the intellectual terrain they cover is vast. To make the task almost manageable it is necessary to adopt a broadly historical approach, and as a way of anchoring the slippery notion of cultural studies it is useful to focus on the work of Stuart Hall as the discipline's quintessential figure.

NEO-MARXISM AND THE SPECIFICITY OF CULTURE

To grasp the place of structuralism and poststructuralism in cultural studies we first need to understand the problems faced by Western Marxism in theorizing “culture,” for structuralism and poststructuralism were crucial influences that enabled a neo-Marxist-oriented cultural studies to move away from a reductionist theory of culture. Hall's directorship (1968–79) of the Centre for Contemporary Cultural Studies (CCCS, also known as “the Birmingham School”) marked the beginnings of a clearly defined domain called “cultural studies.” A West Indian-born British thinker associated with the New Left, Hall sought to bring Western Marxism to bear on the study of popular culture. He

was, however, critical of Marxism's reductionist tendencies, and sought to eradicate them through the addition of the synchronic semiotic approach of structuralism (Hall 1992a).

For classical Marxism culture is shaped by the production and organization of material existence. This idea is expressed through the metaphor of the base and the superstructure. Here the base or mode of economic production exerts a powerful determining influence on the character of the cultural superstructure. As Karl Marx himself pointed out, “the ideas of the ruling class are, in every age, the ruling ideas i.e., the class which is the dominant material force in society is at the same time its dominant intellectual force” (1961: 93).

However, as a metaphor, “base and superstructure” tends toward mechanical economic determinism, suggesting that the profit motive and class relations *directly* determine the form and meaning of cultural products. This would suggest, for example, that because a television company is driven by the need to make a profit, all its programs promulgate pro-capitalist ideology. Theorists of cultural studies rejected economic reductionism early on as simplistic because it fails to grant cultural practices any specificity. While the analysis of economic determinants is required, Hall and his colleagues also saw it as necessary to examine culture's independent dynamics. Structuralism offered cultural studies a way to examine cultural phenomena as a separate signifying system with particular effects and determinations that are irreducible to the economic.

STRUCTURALISM

Structuralism is concerned with social and cultural structures, or predictable regularities. A structuralist understanding of culture

is focused on the “systems of relations” of an underlying structure (usually language) and the grammar that makes meaning possible. Ferdinand de Saussure is the founding figure of linguistic structuralism because he explains the generation of meaning by reference to a system of structured differences in language. He explores the rules and conventions that organize language (*langue*) rather than the specific uses and utterances that individuals deploy in everyday life (*parole*). Saussure (1960[1916]) argues that language does not *reflect an external reality* of independent objects but *constructs meaning* from within itself through a series of conceptual and phonetic differences. For Saussure, this signifying system is constituted by a series of signs composed of the signifier and the signified.

Crucially, the relationship between signifiers and the signified is arbitrary, that is, a particular meaning is not tied to any specific signifier. The arbitrary character of the signifier–signified relationship suggests that meaning is fluid; it is culturally and historically specific rather than fixed and universal. As Jonathan Culler puts it: “Because it is arbitrary, the sign is totally subject to history and the combination at the particular moment of a given signifier and signified is a contingent result of the historical process” (1976: 36). Thus “meaning” is a social convention organized through the relations between signs and not a reflection of an independent object world.

Saussure was primarily concerned with words. However, Roland Barthes (1972 [1967]) extended structuralist principles to cultural signs that were not conventional languages. This move was a significant influence on the development of cultural studies. Barthes analyzed human relations, material objects, and images through the structures of signs as if culture was analogous to (or structured like) a language.

After Saussure (1960[1916]) and Barthes (1972[1967]), cultural texts could not be understood as transparent bearers of universal meanings. Rather they were historically contingent productions premised on selection and the operations of power. In cultural studies, Judith Williamson (1978) applied these ideas to advertising. For her, advertisements are constituted by signifiers that we decode in the context of known cultural systems thereby associating commodities with other cultural “goods.” An image of a particular product may denote only beans or a car but it is made to connote “nature” or “family” and whole lifestyles that we buy into.

Structuralism’s most enduring lesson for cultural studies was the argument that all cultural texts are constructed with signs that could be read like a language. To hold that culture works like a language is to argue that all meaningful representations are assembled and generate meaning with the same mechanisms as a language; that is, the selection and organization or “grammar” of signs. Consequently, textual analysis became the primary tool for understanding culture and politics was commonly grasped at the level of signification.

Dick Hebdige’s *Subculture: The Meaning of Style* (1979) illustrates the structuralist influence within the Birmingham School. Hebdige explores subcultures through the autonomous play of signifiers and so asserts the specificity of the semiotic and cultural. For Hebdige, style is a signifying practice of spectacular subcultures that display fabricated codes of meaning. Style signifies difference and constitutes a group identity. This is achieved by transforming the signs of commodities into a *bricolage* that acts as a form of semiotic resistance to the hegemonic order. British punk of the late 1970s, an especially dislocated, self-aware, and ironic mode of signification, was Hebdige’s favored exemplar.

STRUCTURALISM AND MARXISM

Structuralism gave cultural studies the conceptual tools to explore popular culture in its own terms without reducing it to an economic “base.” Hall had not, however, abandoned Marxism but rather sought to give it a more sophisticated grasp of culture. CCCS scholars now read the work of the structuralist Marxist Louis Althusser to argue that ideology, politics, and the economy were discrete levels or practices of a social formation that worked relatively autonomously from each other. The work of Antonio Gramsci (1968) was deployed by Hall to analyze meaning, ideology, and hegemony at the level of culture, which was now understood as a zone of contestation in which worldviews compete for ascendancy.

Here ideology refers to discourses that “bind” social groups and “justify” their actions. The Gramscian concept of hegemony describes a situation where a “historical bloc” of ruling-class factions exercises social authority and leadership over the subordinate classes through a combination of force and, more importantly, consent. Hegemony involves a temporary closure of meaning supportive of the powerful and describes the process of making, maintaining, and reproducing the governing sets of meanings of a given culture.

One of the early seminal texts of cultural studies, *Resistance through Rituals* (Hall & Jefferson 1976), explains British youth subcultures as stylized forms of resistance to the hegemonic culture using structuralist and Marxist ideas. It was argued that in reaction to the decline of traditional working-class values, spaces, and places, youth subcultures sought to reinvent through stylization the lost community and values of the working class. For example, skinheads were held to be recapturing in an imaginary way the tradition of working-class male “hardness”

through their cropped hair, boots, jeans, and braces.

The themes of signification, ideology, and hegemony are also apparent in Hall et al.’s *Policing the Crisis* (1978), which explores the British moral panic surrounding street robbery. The authors explore the articulation of “mugging” with race and the alleged black threat to law and order. Hall and his colleagues sought to demonstrate the ideological work done by the media in constructing mugging and connecting it with racial disorder and threats to the British way of life. In particular, *Policing the Crisis* explores the popularization of hegemonic ideology through the professional working practices of the media. The book is an example of the articulation of structuralism and Marxism in cultural studies.

POSTSTRUCTURALISM

A key feature of modern culture is its ever-changing nature. And just as culture is continually being transformed so cultural studies has been marked by perpetual evolution. In particular, during the 1990s it was strongly stamped with the mark of poststructuralism. The term “poststructuralism” implies “after structuralism.” It embodies a notion of critique and absorption. That is, poststructuralism accepts and absorbs aspects of structural linguistics while subjecting it to a critique which, it is claimed, surpasses structuralism. The most influential poststructuralist writers for cultural studies have been Jacques Derrida and Michel Foucault.

Cultural studies has appropriated from Derrida the key notions of writing, intertextuality, deconstruction, *différance*, trace, and supplement, all of which stress the instability of meaning, its deferral through the interplay of texts. The central conclusion is that no linguistic categories have essential

universal meanings. All meanings are social constructions of language. This is the core of the anti-essentialism prevalent in cultural studies. Thus, identities such as man, woman, American, black, and so on are not to be understood as fixed universal “things” but as culturally shaped descriptions in language.

FOUCAULT: DISCOURSE, PRACTICE, AND POWER

Like Derrida, Foucault (1972) argues against the structuralist conception of language as an autonomous system with its own rules and functions (i.e., semiotics). Instead, Foucault explores the particular and determinate historical conditions under which statements are combined and *regulated* to form and define a distinct field of knowledge/objects requiring a particular set of concepts that delimit a specific “regime of truth” (i.e., what counts as truth).

For Derrida, meaning has the potential to proliferate into infinity, but for Foucault the operation of power temporarily stabilizes meanings into a discourse. A discourse is a regulated mode of language/knowledge that gives meaning to material objects and social practices. Discourse constructs, defines, and produces objects of knowledge in an intelligible way while excluding other forms of reasoning as unintelligible. Since for Foucault discourse regulates not only what can be said under determinate social and cultural conditions but also who can speak, when, and where, his work is concerned with the historical investigation of power.

For Foucault, power is distributed throughout social relations; it is not to be reduced to centralized economic forms and determinations (as in classical Marxism) nor to its legal or juridical character. Rather, power forms a dispersed capillary woven

into the fabric of the entire social order. Further, power is not simply repressive but is *productive*: it brings subjects into being. Power is implicated in “generating forces, making them grow, and ordering them, rather than one dedicated to impeding them, making them submit, or destroying them” (Foucault 1980: 136).

Foucault’s influence within cultural studies has been immense and his work has spawned numerous studies on the productivity of power and the fashioning of subjectivity. The concepts of discourse, subjectivity, governmentality, and power/knowledge have become firmly embedded within the vocabulary of cultural studies. It is not possible, of course, to outline all the work in cultural studies that was inspired by Derrida or Foucault, but a consideration of issues surrounding identity will give us its flavor.

IDENTITY AND THE POLITICS OF DIFFERENCE

Driven by political struggles as well as by philosophical concerns, “identity” was the central theme of cultural studies in the 1990s. Following Derrida, cultural studies argued that identity is not a stable entity but a matter of representation forged from unstable meanings. Identity is not a thing but a becoming. By contrast, the influence of Foucault is seen when identity is described as a discursive construction that is regulated by power. In particular, cultural politics is understood as the power struggle over “naming” ourselves, that is, the power of discourse to describe and regulate cultural identities, social action, and resistance.

These questions of cultural power translate into practical identity politics when African Americans challenge the invisibility of black people on television or their representation as marginal and criminalized;

when women redescribe themselves as citizens of equal standing with men; when the “grey wolves” voice the discontents of forgotten and excluded older people, and when gays and lesbians stage “Pride.” Thus the politics of feminism, of ethnicity, and of sexual orientation, among others, have been high-profile concerns intimately connected to notions of identity.

Stuart Hall’s (1992b, 1993a, 1996) widely cited anti-essentialist theory of cultural identity illustrates the influence of Derrida and Foucault in cultural studies. Since, as Derrida argues, language has no stable meanings, the “naming” of identity is subject to the play of *differance*. Thus Hall grasps cultural identity not as a reflection of a fixed, natural state of being but as a fluid construction of representation; that is, identity is always in the making. There is no essence of identity to be discovered, rather cultural identity is continually being produced within the vectors of similarity and difference.

For Hall, the formation of cultural identity involves identification with continually shifting positions in language. These include, among others, identifications of class, gender, sexuality, age, ethnicity, nationality, and religion. Each of these discursive positions is unstable. The meaning of Americanness, Britishness, blackness, masculinity, etc. are subject to continual change since meaning is never finished or completed.

Despite the instability of language, in practice we do of course stabilize the way we talk about identities. Thus, identity is a “cut” or a snapshot of unfolding meanings, a strategic positioning or regulation that makes meaning, and action, possible. For Hall, there has to be a full stop, albeit a provisional one, a cut in the flow of meaning so that while identities and identification are fictions they are necessary ones:

Politics, without the arbitrary interposition of power in language, the cut of ideology, the positioning, the crossing of lines, the rupture, is impossible . . . All the social movements which have tried to transform society and have required the constitution of new subjectivities, have had to accept the necessarily fictional, but also the fictional necessity, of the arbitrary closure which is not the end, but which makes both politics and identity possible. [This is] a politics of difference, the politics of self-reflexivity, a politics that is open to contingency but still able to act . . . there has to be a politics of articulation – politics as a hegemonic project. (1993a: 136–7)

Since identity categories like class and gender are discursive constructions they have no eternal form; the meaning of women for example is unstable. However, concepts are culturally regulated so that in practice they do have contextually specific meanings. A feminist politics needs at least momentary agreement about what constitutes a woman and what is in women’s interests under particular circumstances. It is here that the Foucauldian notion of discourse comes into play. That is, unfolding meanings of identity are regulated in practice through the disciplinary powers of discourse.

Hall’s anti-essentialist position does not mean that we cannot speak of identity. Rather, it points us to the political nature of identity as a “production” and to the possibility of multiple, shifting, and fragmented identities, which can be articulated together in a variety of ways. The concept of articulation suggests that those aspects of social life (identities or nation or society) that we think of as a unity (and sometimes as universals) are temporary stabilizations or arbitrary closures of meaning. For Hall this stabilization of identity is part of a hegemonic project occurring through the operation of power. Here Hall’s Gramscian Marxism is given a poststructuralist twist

(which he has called post-Marxism) so that key categories like class, race, and gender are not grasped as eternal forms but as discursive constructions.

Feminists influenced by poststructuralist thought (Nicholson 1995; Weedon 1997) have argued that sex and gender are social and cultural constructions and not fixed categories of biology. They suggest that femininity and masculinity are not universal entities but discursive constructions. That is, femininity and masculinity are not entities but simply ways of describing and disciplining human subjects. As such, poststructuralist feminism is concerned with the cultural construction of a range of possible masculinities and femininities and the continual political struggle over their meanings.

Poststructuralist feminists suggest that there is no universal cross-cultural category of “woman” or “man,” because after Derrida these terms are held to be unstable with no fixed meaning. They suggest that the forms of sex and gender are in principle infinitely malleable. Julia Kristeva (1986), for example, has argued that femininity is a condition or subject position of marginality that some men can occupy. She argues that degrees of masculinity and femininity exist in biological men and women. Rather than a conflict between two opposing male/female masses, sexual identity concerns the balance of masculinity and femininity within specific men and women.

Other writers put the more Foucauldian argument that through practice gender is regulated into specific forms under particular historical and cultural conditions. Judith Butler argues that discourse defines, constructs, and produces bodies as objects of knowledge. Discourse is the means by which we understand what bodies are:

The category of “sex” is, from the start, normative; it is what Foucault has called a “regulatory ideal.” In this sense, then, “sex”

not only functions as a norm, but is part of a regulatory practice that produces the bodies it governs, that is, whose regulatory force is made clear as a kind of productive power, the power to produce – demarcate, circulate, differentiate – the bodies it controls. Thus, “sex” is a regulatory ideal whose materialization is compelled, and this materialization takes place (or fails to take place) through certain highly regulated practices. (1993: 1–2)

Thus sex is a discursive construction, not an eternal entity, but it is nonetheless an indispensable construction that regulates subjects and governs the materialization of bodies.

CRITICISMS OF POSTSTRUCTURALISM IN CULTURAL STUDIES

Structuralism and poststructuralism have been major theoretical forces within cultural studies. The central consequence of their influence has been to put the study of representation, and specifically language, at the core of cultural studies. This has been a major gain for the study of contemporary culture. Any student of cultural studies would now understand that culture can be read as a text and that cultural texts cannot be regarded as transparent bearers of universal meanings. Nor would they be ignorant of the play of power and politics at the heart of culture.

Hence, cultural studies has contributed to the formation of a culturally literate set of students who have learned not only to deconstruct texts (from novels to television) but to grasp the plasticity of gender, race, age, and other forms of cultural classification. In this, cultural studies played a significant if unquantifiable part in Western cultures’ increased level of tolerance and solidarity for cultural difference. However, it can be argued that the structuralist and

poststructuralist accounts of signification have led to an overemphasis on textual analysis (Barker 2002). For example, when textual subject positions are held to be identical with and constitutive of speaking subjects, the living, embodied subject is lost from view. Some practitioners of cultural studies have wanted to restore the balance by adding studies of living persons to its studies of texts and subject positions. This is most clearly seen in the ethnographic and audience studies strands of cultural studies (Willis 1977, 1990; Ang 1985; Fiske 1989; Morley 1992) and the evidence presented that audiences generate meanings at odds with those identified by critics.

Jim McGuigan (1992) and Tony Bennett (1992, 1998) argue that the poststructuralist influence in cultural studies has led to a displacement of politics solely onto the level of signification. For McGuigan, this occurs because cultural studies lacks a political economy of the media, housing, labor markets, educational achievement, etc. and thus overlooks material inequalities and relations of power. For Bennett, culture is not just a matter of representation, rather it is caught up in, and functions as a part of, cultural technologies of institutions which organize and shape social life and human conduct. Bennett (1992) argues that cultural studies' textual politics ignores the institutional dimensions of cultural power. He urges cultural studies to adopt a more pragmatic approach and to work with cultural producers and to "put policy into cultural studies."

While poststructuralist cultural studies emphasizes texts over living audiences or institutional politics, these three approaches are by no means incompatible or absent from the core of cultural studies. Stuart Hall, who has been the anchor theorist in this chapter, long ago developed a model called the "circuit of culture" (Du Gay et al. 1997) in which each moment of the

circuit – representation, regulation, consumption, production, and identity – are articulated together and produce meanings that are necessary for the continuation of the circuit but insufficient to determine the form and content of other instances, which have their own specificity. We can readily accept, then, the notion that a full exploration of cultural practices requires a multi-perspectival approach involving both political economy and textual analysis.

Subculture

KEN GELDER

A subculture is best understood as a social group that is in some way non-normative or nonconformist. Subcultures are “minor” social formations, usually distinguished from dominant modes of sociality – family, religion, vocation, school, politics, nation, “society” itself – and from what are often rather loosely referred to as “mainstream” cultural practices and tastes. The sociological use of the term developed during the 1940s (e.g., Gordon 1947), even though subcultures of one kind or another have of course been with us for a very long time. But the analysis of subcultures raises two immediate problems which follow from the definition given above. First, in what ways can a subculture’s non-normativity or nonconformity be defined? And second, how can the sociality of a subculture be accounted for?

The formal study of subcultures followed in the wake of the emergence during the nineteenth century of key modern social sciences – sociology, anthropology, criminology – each of which installed a set of (related) binaries for organizing and classifying human life. Sociology’s view of modernity depended on a distinction between community and society, a binary given definition in Ferdinand Tönnies’s profoundly influential work, *Gemeinschaft und Gesellschaft* (1887). Community was understood as residual, tied to premodern social forms and practices: family, kinship, patriarchy (or matriarchy), neighborhood, tradition, collectivity, and cooperation. Society, by contrast, is modern: shifting the emphasis from collectivity to individuality, fragmenting and impersonalizing relationships, destroying traditions, and replacing patriarchy with remotely imposed (e.g., by state bureaucracies or corporations) rules

and conventions. Anthropology restaged this distinction through the ways in which it juxtaposed the West and the native, the self and the other: in terms of different notions of exchange and ownership (e.g., Marcel Mauss), and through the related binary that associated the West with an “alienated” but sedentary life and the native with “tribal” movement and “nomadism.” In Emile Durkheim’s *The Elementary Forms of Religious Life* (2008[1912]), an important study which drew sociology and anthropology together, premodern communities such as precontact Australian Aborigines were regarded as essentially and perhaps unconsciously conformist, without a category of the “individual” and (so it seemed) without the capacity for dissent. Modern capitalist society, on the other hand, is potentially and structurally nonconformist, its investment in individuality always running the risk of working against the grain of social conventions and established rules. A question for modern society is: how do individuals consent to social conventions? In fact, social adjustment in modern society occurs as a matter of course, more willingly and routinely than one might at first assume. Criminology, on the other hand, looked closely at the maladjusted, at those people who seemed to refuse to integrate into the framework of social norms – or who achieved those norms in unlawful ways. The “deviant” became one modern social type among many others, the focus of early twentieth-century criminologists like Edwin Sutherland, as well as later cultural theorists such as Michel Foucault. Deviance itself has been understood in many ways: accounting for the full range of criminal activity, unconventional sexual practices, forms of “innovative” behavior, madness, social dissent, social marginality, forms of exile and displacement (whether one leaves one’s family and neighborhood by choice or otherwise: from a teenager who leaves home, to a migrant, a refugee, an

asylum seeker, etc.), and so on. All of these things have informed the narratives through which modern subcultures are represented, which owe a great deal to these three human sciences and the binaries they have bequeathed to us.

A key early location for the formal study of modern subcultures was the so-called Chicago School, located in the Department of Sociology at the University of Chicago. Chicago itself was a remarkable resource for sociologists there, rapidly industrializing and the destination for a phenomenal number of migrants from villages and towns across Europe, America, and elsewhere. For Robert E. Park, migrating to Chicago was literally a deviant act: it involved leaving a small community – relatively isolated, stable, conformist – to enter a society where one is cheek by jowl with otherness, a city defined by instability and dispersal, a place where conformity seems altogether impossible to achieve. Park, who himself had come to Chicago from Red Wing, Minnesota, saw migration into the city as a process of “emancipation,” allowing immigrants to indulge (rather than normalize) their eccentricities, establishing their own “little worlds” and developing their own “divergent moral codes”: becoming modern and marginal at the same time (1925: 45–6). Segregation and proximity sit side by side in this “ecological” view of the city, as various distinctive “moral milieus” flourish and intermingle. Park’s account of migration into Chicago can be placed alongside other, more conspicuously subcultural kinds of studies at the University of Chicago – for example, Nels Anderson’s *The Hobo* (1923), an ethnographic account of the ways in which homeless men moved through this city, gravitating around particular streets, parks, and camps (“jungles”) and frequenting “characteristic institutions” (lodging houses, cheap hotels, welfare agencies, barber

shops, etc.); or Frederic M. Thrasher's *The Gang* (1927), an elaborate mapping of over 1,300 ethnically distinguished gangs, each of which inhabited the "cracks" and "fissures" of Chicago, the "badlands" and "wildernesses" of a modern city. Both studies produced what might be called subcultural *geographies* (Gelder 2007), that is, ways of seeing places in terms of the manner in which subcultures occupy or territorialize or move through them. They also tied their subcultures to the primitivist discourses of anthropology, describing hobos and gangs as "tribal," defined through both their solidarity and their nomadism. These subcultures form a social underclass, modern incarnations of Karl Marx's *Lumpenproletariat*, disenfranchised itinerant social groups located outside or adjacent to the framework of (legitimate) organized labor and property ownership, many of which have in fact been with us at least since the Middle Ages: vagrants, vagabonds, beggars, thieves, prostitutes, bohemians, street performers, and so on. But the combination of tightly knit social solidarity, segregation from "normal" society, and nomadic movement is replayed over and over even in descriptions of modern subcultures. Hunter S. Thompson's high-voltage account of outlaw "Wild West" biker clubs and brotherhoods in *Hell's Angels* (1967) is a good example: an ethnographic chronicle that owed much to the Chicago School's emphasis on "participant observation," the sociological method of living in and among a subculture in order to represent more effectively its worldviews.

Other, later US studies complicated the early Chicago School methods and practices. Howard S. Becker was a Chicago School graduate with a sociological interest in deviant social groups. His classic study *Outsiders* (1963) looked at marijuana use among Chicago's jazz musicians, mostly older white men who (successful as they

may have been in their careers) nevertheless played out a form of "self-segregation." Becker saw that sociability was a matter both of conformity and of differentiation, with people belonging "to many groups simultaneously." Deviance and conformity are thus two sides of the same coin, a "transaction" or "interactive process" that sees the former created by the rules and labels that the latter puts into play (Becker 1963: 8–9). The deviant perspective is also a relative one: Becker understood that social "outsiders" have normative logics too, a set of conventions through which they "rationalize" their predicament, normalizing their non-normativity. The emphasis on social interaction came out of an earlier Chicago School model which drew attention to the ways in which social relations are staged, that is, performed. Herbert Blumer coined the phrase "symbolic interaction" in 1937; Erving Goffman, another Chicago School graduate, developed this concept by looking at the roles played out by particular social groups in institutional settings (the asylum, for instance, or the hospital), noting how social performance is also often a matter of adapting to one's surroundings. The point was developed further by John Irwin, a Californian sociologist who had written a classic criminological study, *The Felon* (1970), and had himself spent time in prison. In *Scenes* (1977), Irwin returned to Park's concern with the kinds of socialization that occur in the modern city. The city draws strangers together, especially in the pursuit of leisure and entertainment. Various "scenes" come into being: the "bar scene," for example, or the "disco scene." Irwin shifted away from the Chicago School's emphasis on determinism and solidarity in *Lumpenproletariat* subcultures, noting instead a sense of casualness and "lifestyle" among the middle classes that also included some "grand scenes" such as

hippies and surfers. Inheriting a symbolic interactionist perspective, Irwin saw that people perform particular kinds of roles depending on the kind of scene they inhabit, helped by the media (especially film and television) which “objectifies” scenes of one kind or another as a matter of entertainment. For Irwin, a scene was more long-lasting than a craze or a fad. But it was casual – a combination of script and improvisation – and unstable. For the Chicago School, subcultural participants were segregated and inwardly turned, adjusting into and remaining within their particular “moral milieu.” For Irwin, however, scenes are part of the social diversity of modern life, a consequence of cultural pluralism. Even so, Irwin shared the Chicago School’s emphasis on subcultures as migratory and cross-cultural; he agreed with the Chicago School’s premise that urban subcultures are a reaction against the anonymity and impersonality of the modern city.

The 1970s also saw a sustained interest in subcultures among British sociologists, those associated with the University of Birmingham’s Centre for Contemporary Cultural Studies (CCCS), established in 1964 under the directorship of Richard Hoggart. Hoggart’s *The Uses of Literacy* (1990[1957]) had paid tribute to the solidarity of working-class communities in Britain: in this account, *solidarity* and *community* were inextricably linked. But he also registered the influence of mass culture – what Irwin had called the “entertainment machine” – on working-class life. Working-class teenagers were one of the casualties of this influence, deviating away from their communities in pursuit of leisure interests. One youth subculture attracted Hoggart’s scorn: the “juke-box boys,” teenagers who leave the family home to hang out in “harshly lighted milk-bars” listening to US-imported “nickelodeons,” a “depressing group ...

rather less intelligent than the average, and ... therefore even more exposed than the others to the debilitating mass-trends of the day” (1990[1957]: 247–9). Hoggart’s distinction between local, working-class communities and deviant teenage subcultures under the influence of imported mass cultural forms installed a binary that came to haunt later British studies of subcultures at CCCS. In 1975 the Centre published a collection of essays on subcultures called *Resistance Through Rituals* (Hall & Jefferson 1993). Youth subcultures here are understood as an outcome of a working-class teenager’s deviation – under the influence of mass cultural forms – from his or her (usually, his) “parent culture.” Losing a sense of community as a consequence, teenagers “solved” the problem of their urban alienation by becoming subcultural. Sociality was therefore understood not in terms of community but in terms of displacement and the subsequent territorialization of other zones (e.g., the street corner, the café) outside the framework of labor and property. Class became less important to teenage subcultural sociality. Under the influence of Continental semiotics, especially the work of Roland Barthes, sociologists at the CCCS in fact saw youth subcultures first and foremost as a matter of aesthetics or style. Dick Hebdige’s *Subculture: The Meaning of Style* (1979) crystallized this association through an examination of late 1970s punk, its various “postures” and “attitudes,” its fashion, and, most important, its meanings (or lack of them). Hebdige’s book was a foundational text for British cultural studies as the latter turned away from sociology toward a combination of cultural theory and media studies.

We have already seen a set of available terms other than “subculture” to describe smaller kinds of sociality: “community,” for example, or “scene.” Much later, British accounts would turn to more “fluid” ways

of understanding subcultural groups: for example, as “neo-tribes” (Bennett 1999), a term adapted from Michel Maffesoli’s *The Time of the Tribes* (1996[1988]), a Durkheim-influenced meditation that saw contemporary social bonds as primarily “emotional,” with the myriad of contemporary social worlds understood (idiosyncratically, perhaps) as something akin to a postmodern restaging of ancient Dionysian cults. In these accounts, subcultures can seem to be everywhere. For Hebdige, interested in style and aesthetics, youth subculture in particular was an often defiant form of public spectacle. But British sociologists soon criticized this emphasis, reminding us instead that subcultures could be equally mundane, embedded in (rather than distinguished from) the “ordinary” aspects of everyday life (Cohen 1980; Clarke 2005). The term “subculture” has certainly been debated by sociologists, some of whom find it restricting as a way of accounting for the range of people’s cultural tastes and affiliations. Some post-Thatcher British sociologists have rejected it altogether, turning instead to the vaguer, albeit neoliberal, notion of *lifestyle*, emphasizing consumer choice and “the individual” over any kind of social solidarity (Muggleton 2000; Chaney 2004). But subcultures of one kind or another seem to persist in the modern, or postmodern, world, as Maffesoli rightly noted. A growing sociological interest in alternative popular musical forms in the 1980s saw commentators identifying a huge range of music-based social worlds, many of which were claimed as subcultural through their marginal or “extreme” position in the cultural field: various heavy metal musical cultures, for example (e.g., Weinstein 1991; Walser 1993; Kahn-Harris 2006), or aspects of hip hop culture (e.g., George 1999; Quinn 2005). Elaborate histories are written into these accounts, some of which may be endearingly romantic

– as in George’s chronicle of hip hop’s “founding fathers” and its originating spirit of “openhearted innocence” (1999: 20). The phenomenal proliferation of dance music cultures has also led to an identification of a large number of rapidly changing club-affiliated subcultures, described by Simon Reynolds as so many “subsubgenres and microscenes” (Reynolds 1998). Sarah Thornton (1995) has looked at what she calls “club cultures,” groups of people who congregate nocturnally in the dance clubs and come to imagine themselves as discrete “social worlds” distinguished through their musical tastes from the “mainstream” – a distinction that is crucial to their self-valorization as a subculture. She draws on the work of Pierre Bourdieu to argue that club cultures also produce internal distinctions built around musical tastes and musical-social knowledges, where some people are more “in the know” and better connected than others. Bourdieu’s notion of cultural capital is modified here to become *subcultural capital*, accounting for the way subcultural participants articulate their status and taste hierarchies in club and dance scenes. Thornton also returns to Becker’s *Outsiders* to make a similar point, that subcultural status is a matter of who is “hip” – or who is regarded as “hip” – and who isn’t.

The social worlds Thornton investigates in *Club Cultures* are “predominantly straight and white,” and with a “heterosexual manifestation” (1995: 6). But subcultural studies (if such a discipline properly exists) has also turned to less conformist club-based socialities. Fiona Buckland has looked at performativity and self-fashioning among queer clubbers in New York, describing what she calls “lifeworlds” that unfold some distance away from more normative instances of “community-building” (2002: 38). Disco has often been given an underground gay

history that begins with New York's Sanctuary nightclub, "the first urban venue that made disco rhyme with homo" (Fikentsche 2000: 26). The police raid on June 27, 1969, on the Stonewall Inn, a gay and transsexual bar in Greenwich Village, produced a point of origin for modern homosexual identity and gay activism against "mainstream" prejudice and discrimination. But clubs have provided "scenes" – sometimes underground, sometimes not – for homosexual and queer socialities for many years now. George Chauncey has charted "a topography of gay meeting places" in New York between 1890 and 1940 in order to trace what he calls "the making of the gay male world" well before 1960s "gay liberation" (Chauncey 1994: 23). There are now a number of histories of lesbian bar scenes in a number of North American cities: Detroit, Montreal, Boston, Colorado, and Buffalo (e.g., Kennedy & Davis 1993). There are also histories of drag queen scenes, again tied to the social/commercial worlds of clubs and entertainment precincts (Senelick 2000). Esther Newton's *Mother Camp* (1972) was an early, groundbreaking ethnographic study of drag queen club scenes, the result of anthropological fieldwork she had undertaken at the University of Chicago in the 1960s, before Stonewall. At this time, homosexual subcultures were relatively invisible; by contrast, drag queen scenes bore "the visible stigma of homosexuality" only too openly, with their camp, performative theatrics (Newton 2000: 23). Camp itself became a way of coping with the drag queen's dual marginalization, a style and a strategy for articulating a particular way of life. The drag queen's counterpart is the drag king, that is, lesbian women performing as men. Judith Halberstam (1998) has examined drag king performances at clubs in New York, distinguishing these events from drag queen scenes precisely in

terms of levels of performativity and campness which the more "restrained" drag kings tend to downplay.

Subcultures continue to be accounted for in terms of style and performativity, as social worlds that deploy distinctive – although not always spectacular – modes of self-fashioning. Dressing up has always been the prerogative of the aristocratic social classes, a matter of excess and self-indulgence which can itself be nonconformist or non-normative: like the Macaronis in London just after the mid-eighteenth century with their extravagant Italian styles, linked to foppishness and homosexuality and connoting what Miles Ogborn calls "luxurious effeminacy" (1998: 457). The late eighteenth-century dandy is understood in the opposite way, perhaps recalling the above distinction between drag queens and drag kings: that is, restrained and elegant, unperfumed and masculine, and generally inconspicuous. For Ellen Moers, "The dandy's distinction was to be apparent only to the initiate" (1978: 35), a point which provides us with another way of understanding how subcultural sociality might work. Subaltern classes can dress up as well, of course, and there have been spectacular examples of extravagance "from below," as it were: like the zoot-suiters in Los Angeles in the early 1940s, or the "Edwardian" Teds in Britain in the 1950s and 1960s, grudgingly admired by the British journalist T. R. Fyvel for having left their working-class communities "to swagger along their drab streets in their exaggerated outfits" (1961: 51). The last 20 years have seen a rapidly growing literature on subcultural self-fashioning and body adornment. Clinton R. Sanders's *Customizing the Body* (1989) is an important early study of "tattoo communities" that rejected the prevailing tendency to see a tattooed individual as pathological or deviant, and turned instead toward tattooing as a *social* experience. "Wearing a tattoo,"

Sanders writes, “connected the person to significant others who were similarly marked” (45). Processes of self-adornment throw up complex questions to do with artifice and appropriation, with the origins and derivations of what one has adopted, with the meanings that particular kinds of self-adornment generate, and for whom. The modern tattooed body has often been associated with a certain “primitivism,” and anthropologists themselves have had much to say about this matter. Self-adorning subcultures have generated their own discourses of primitivism, of course, usually tied to a key value for certain kinds of subcultural identity, authenticity. Subcultures routinely draw distinctions between authentic and inauthentic levels of participation, something that Sarah Thornton (1995) noted in her account of club cultures and subcultural capital, where the more one knows or the more developed one’s subcultural tastes are, the more “authenticity” one can lay claim to. In this respect, some subcultures might be said to be self-anthropologizing systems, relishing their own apparent anachronisms in the modern world. The growth of wicca, and the proliferation of magazines and newsletters and online sites devoted to wicca activity, is a good example: a neopagan, ecologically oriented subculture that lives out its anachronistic predicament by bringing pre-Christian beliefs and rituals into the modern world, producing elaborate descriptions of its “craft” and its various social hierarchies. Geoff Mains’s *Urban Aboriginals* (1984) was one of a number of chronicles from within of “modern primitives,” in this case, “leatherfolk,” a mostly homosexual, SM (sodomasochism) subculture that relishes the “primitive” and sexual connotations of leather and casts itself, precisely, as a “tribe” out of place in an inauthentic modern world that has lost the ability to *feel*. Leather and authenticity go

hand in hand here, in a scene which also typically emphasizes issues of trust, intimacy, and self-discipline among its participants. We might understand this as performance without artifice: as one participant advises, “Do not bluff your way into an SM or leather scene. No pretending. About *anything*” (Bean 1994: 1).

Performativity remains an important aspect of the analysis – as well as the self-representation – of subcultures. It might rely on a notion of authenticity in face-to-face social situations, as we have seen with leatherfolk and the SM scene. But social worlds do not always materialize in face-to-face situations. The internet has provided a virtual forum for a myriad of social worlds, some of which are themselves literally devoted to performance. Gary Fine’s early Chicago School-based study of role-playing games such as *Dungeons and Dragons* had already noted that “fantasy gaming” constitutes a social world, an “avocational” one requiring what he called “engrossment,” that is, players must leave their actual environment – family, school, workplace – and “lose themselves in the game” (1983: 4). Fantasy gaming here is presented as an act of deviance, in other words, where one leaves one’s “normal” surroundings to find sociality elsewhere. The “engrossment” or immersion of gamers in their fantasy worlds has also naturally been cause for concern among parents, teachers, employers, and so on. Engrossment is a useful notion to explore through subcultural sociality, where participants – like the leatherfolk above, for example – do seem to turn their backs on the plurality of the modern world in order to immerse themselves in what we might call (to draw on Raymond Williams) a particular “structure of feeling.” Immersed levels of participation can lead to pathologization, as some fandoms know only too well. Fandom (with the word “fan” being an abbreviation of “fanatic”) is an

excessive form of textual consumption, where participants run the risk of being seen as *too* immersed in their text-objects. When fandom and fantasy gaming combine, normative anxieties about levels of engrossment can prevail, as we saw through the “moral panic” over the *otaku* subculture in Japan in the late 1980s (Kinsella 2000). But the sense that fantasy gamers, role-players, and fans also (potentially, at least) inhabit *social* worlds can help to offset these anxieties.

Howard Rheingold (1994) had coined the term “virtual community” in 1994, replacing the stereotyped image of the individualized loner sitting in front of a computer screen with a sense that going online actually facilitated socialization. But the term “community” retains its premodern connotations (Rheingold talks of his online community as an extended family, a “virtual village,” etc.) and is not always appropriate as a synonym for “subculture.” “Virtual subcultures” might generally have a less normative role to play online: as hackers do, for example, or (to give a darker example) “underground” child pornography networks. The term “network” is also useful for describing online social worlds, capturing the shift from the old Durkheimian notion of *solidarity* to a newer, postmodern notion of *liquidity* as a way of accounting for the complex horizontality and ever-transforming realms of virtual, as well as nonvirtual, sociality. In a postmodern world, subcultures need no longer be tied to underclasses. Quite the opposite in many instances: they may well be the privilege of the rich and globally mobile, those people who are indeed able to transform their social predicaments and extend the range of their cultural tastes. Manuel Castells’s *The Rise of the Network Society* (1996) mentions subculture only once, to describe the “spatially bound, interpersonally networked” worlds of new managerial elites, sealed off from the

world around them inside their “gated communities” (446–7). Virtual subcultures might relish their autonomy, aspiring even toward a condition of self-governance online. This is the view of the US writer Hakim Bey (aka Peter Lamborn Wilson), who developed his notion of pirate-like “counter-Net” sites of activity in *The Temporary Autonomous Zone* (1985, 1991), “sovereign” but ephemeral places that somehow evade the internet’s various (and generally unsuccessful) regulatory controls. These “islands in the Net,” to use Bruce Sterling’s phrase, are also understood as “better worlds,” utopian sites of play and social transaction (Ludlow 2001: 22). This gives us another way of understanding subcultures which, although they can rarely be said to be revolutionary, are indeed often able to invest their non-normative social worlds and practices with utopian imperatives.

Suvin, Darko

DEREK C. MAUS

Darko Ronald Suvin is among the most influential scholars of science fiction in the late twentieth century. Over the course of a five-decade career, Suvin has sought to

transform dismissive critical attitudes toward science fiction, contending not only that science fiction is a venerable tradition dating back to classical antiquity, but also that it is unique among literary genres in expressing visions of other worlds that depart (often radically) from accepted reality, while still retaining the capacity to comment on and ultimately to alter that reality. Because of this sociological function, Suvin values science fiction above other literary forms, such as myth, fantasy, and fairy tales, with which it has sometimes been linked.

Suvin was born in Zagreb, Yugoslavia (now Croatia) in 1930 and attended the University of Zagreb, receiving a BA in 1956 and a doctorate in comparative literature in 1970. He also earned an MSc in chemical engineering in 1954, a detail he mentions regularly in explaining his interest in science fiction. After teaching for eight years at Zagreb, Suvin emigrated to North America in 1967, first to the United States, and then to Montreal, Canada, where in 1968 he took up a professorship at McGill University that he would hold until his retirement in 1999. At McGill, Suvin quickly became involved with the Science Fiction Research Association (SFRA), which was founded in 1970 and has since become the foremost organization of scholars working on science fiction. He also served as editor of *Science Fiction Studies*, SFRA's scholarly journal, from 1973 to 1980. This period also witnessed the publication of Suvin's most influential work on science fiction, *Metamorphoses of Science Fiction* (1979). Suvin has published – either as author or editor – more than a dozen books of literary criticism, along with more than 400 essays, the majority of which cover topics related to Russian, Eastern European, British, and/or American science fiction.

Although Suvin's body of work includes invaluable bibliographies, compilations, a book on the German playwright Bertolt

Brecht, and even several volumes of poetry, his theoretical contributions to the field of science fiction studies are the bedrock of his scholarly reputation. *Metamorphoses of Science Fiction* radically altered the vocabulary of science fiction criticism and in doing so provided a fresh generation of scholars with new tools to examine seriously a genre that, until the late 1960s, had for the most part been shunned by academics as “low” or “popular” literature. Suvin does not dispute science fiction's status as popular literature and even admits that the vast majority of published science fiction is, in his words, “strictly perishable stuff”; however, he claims that this very feature makes science fiction worthy of formal study, given the greater potential social effect of literature that has a comparatively large audience. In this way, Suvin serves as a precursor to cultural studies scholars wanting to work on pop-culture media such as television or comic books.

Suvin (1979) establishes a clear litmus test for what is – and consequently what is not – science fiction. In doing so, he dramatically alters the contents of the category, a change that has opened up numerous avenues of critical inquiry since. He claims that three conditions must be met to classify a literary work as science fiction. First, the world depicted must differ from the author's own world in significant ways (e.g., time, social structures, geography, language, etc.). Second, the world depicted, despite its differences, must still cohere to what Suvin calls “the cognitive norms” of the author's own time. In other words, even if the circumstances depicted within a given work are *unlikely*, they must still be *possible* within the rational, empirical (i.e., scientific, rather than mythic or religious) understanding of the universe at the time the work was written. Finally, the afore-mentioned two elements must work together to produce a cognitive effect called “estrangement”

(*ostranenie*), a concept Suvin appropriates from the Russian formalist critic Viktor Shklovsky, filtered through Brecht. Simply put, “estrangement” (sometimes also translated as “making strange” or “defamiliarization”) is the process by which a recognizable place, person, or object is depicted in an unusual manner in order to make readers critically reassess their fundamental assumptions (and all the other associations that flow from those assumptions) about that thing.

Suvin notes that many other genres utilize estrangement, but posits that only science fiction requires its departures from presumptive reality to be consistent with reason, even if only at the outer margin of scientific understanding (e.g., novels about time travel that utilize quantum theory). In this regard, science fiction differs from fairy tales or mythic hero stories, both of which also depict “estranged” realities, but without obligation to explain rationally the existence of dragons or flying carpets. Suvin suggests that the necessity to present a reasonable, if also occasionally far-fetched, alternative to the author’s present-day situation makes science fiction an inherently oppositional, at times even revolutionary, genre with innate rhetorical appeal for disempowered groups. He argues that, like science, science fiction is part of a dynamic, creative, yet empirically grounded thought process that seeks (but cannot guarantee) a better future. This fact differentiates science fiction from two other “estranged” types of literature:

myth and fantasy. In those genres, outcomes are predetermined by nonrational factors such as the favor of gods, magical aid, or incorruptible virtue on the part of the hero, and therefore reinforce the status quo (e.g., the “happy ending” of the fairy tale reasserts the moral norms of the author and the presumed reader). Suvin interprets historical trends suggesting increased production of science fiction works just prior to and during times of great social unrest as evidence for science fiction’s subversive nature.

T

Technology and Popular Culture

ROBIN STOATE

While not really a field in itself with obvious, consistent boundaries, the study of technology and its relationship with popular culture is a growing enterprise involving the work of an increasing number of critics and theorists in a diverse set of disciplines. The “question” of technology and how it affects everyday life and culture is also one that occurs frequently and explicitly within cultural texts themselves (books, films, websites, and the like, whether fictional or otherwise).

While the study of technology and popular culture takes many forms, it is possible still to highlight some common threads. Concerns common to approaches to the topic within theory and criticism include examining the effect of technological developments on popular culture and vice versa (and indeed ways of determining which has more influence on the other), the way such developments are portrayed *within* popular cultural texts, and what the significance of those portrayals may be.

It is worth keeping in mind that both the terms “technology” and “popular culture” are themselves unstable and open to various interpretations. Indeed, both terms exhibit a number of shifts in meaning across the

history of their use, perhaps most notably in that “popular” culture is not automatically as negative a term within critical and theoretical circles as it once was – owing to widespread Western reassessments of the boundaries between “high” and “low” culture. For practical purposes, one can consider “technology” to refer to human-produced practices, devices, and entities and “popular culture” to encompass both the production and the consumption of specific kinds of texts and certain everyday cultural practices that come under scrutiny in the study of the collision between the two things. These are contingent, temporary definitions, however, and the specific definitions used by a particular critic or theorist should be understood and kept in mind when approaching their work. The clearest way to account concisely for the study of the interaction between these two things, unstable as they are, is to provide an overview of some of the better-known and most widely cited critical approaches to the subject that have been taken over the years, and to give a sense of the disciplines in which they are rooted.

MAJOR CRITICAL AND THEORETICAL APPROACHES

One of the best-known early engagements with the effect of a specific technological

development upon popular culture came in 1936, in an essay by the German Marxist critic and theorist Walter Benjamin entitled "The work of art in the age of mechanical reproduction." The essay describes how the development of mechanical means to produce copies of works of art dislodges those works from what Benjamin termed the "aura" of their elitism and separation from mass culture: when a work of art is able to be copied easily in great numbers, viewing that work is no longer restricted to those privileged enough to have the time, the means, or the social standing to access the original pieces. This separation of a work of art from its aura meant that so-called "high" art, associated with the ruling class, could no longer maintain its sense of cultural superiority. Benjamin's essay was widely influential in both its response to the effects of technologies on art itself and the way it shows a clear shift in the way that culture can be conceived – this is one of the first well-known explicit examples of high art being unseated from its privileged social position because of a technological innovation, and of mass or popular culture becoming an item worthy of study. Among other disciplines, the essay has influenced cultural theory as well as theories of media and communications. Benjamin's work stands in contrast to that of some of his colleagues in the group of Marxist thinkers known as the Frankfurt School, such as Theodor Adorno, who lamented the rise of popular culture and its apparent soporific and manipulative effect on the masses, but the influence and popularity of Benjamin's work has not waned.

Marshall McLuhan, a Canadian philosopher and media theoretician, was responsible for a number of widely cited observations about the relationship between technology and popular culture, specifically focusing on the media technologies that burgeoned in the years following World War II. He is

perhaps best known for his 1964 book *Understanding Media*, which inspired the phrase "The medium is the message," drawing attention to his belief that it is more important to study the *ways* in which people communicate than what is actually being communicated itself, as a way of understanding human cultures. Naturally, this focus led to examination of much of the newer media technology that was emerging, such as television. He also coined the term "global village" in reference to the idea of a culture connected by electronic networks rather than geographical proximity, anticipating the internet years before its popular inception.

An important shift to note in the study of media technologies in particular is the move toward studying "new media" that occurred in the 1980s. Oriented around figuring the relationship between culture and emerging, mainly digital, technologies (digital photography/video, the web/internet, hypertext, electronic/interactive literature, computer/video games, and so on), thinkers such as the German theorist Friedrich Kittler, the interdisciplinary theorist Marie-Laure Ryan, and the Russian-born new media theorist and practitioner Lev Manovich study both the history of the relationship between new media technologies and culture and the ways in which those newer media technologies draw upon and repeat the features of earlier ones.

Working explicitly on a very literal collision between technology and the human body are those contemporary critics inspired by the "cyborg theory" propounded in a 1985 essay by the feminist philosopher of science Donna Haraway entitled "A manifesto for cyborgs." Haraway argues that a number of categorical boundaries we perceive – between human and machine, human and animal, nature and culture, male and female, artificial and natural, and so on – are no longer tenable when we are able

to intervene so fundamentally in the building blocks of what would previously have been considered “nature”; mixing “natural” things with things that we, as humans, have created (the word “cyborg” is a contraction of the term “cybernetic organism,” a hybrid of organic and human-built parts): artificial hearts, corneal implants, and so on. While this essay was originally conceived to move metaphorically beyond a deadlock between essentialism and social constructionism within socialist feminism, it has been widely influential in critical and theoretical discourses aiming to reconcile the influence that technological advances have had on contemporary cultures. Cyborg theory is also linked to (but not the same thing as) posthuman/transhuman research, which also tracks and theorizes the ways in which the relationship between human beings and technological agents has fundamentally altered the liberal humanist category of “human” itself. American literary critic N. Katherine Hayles (1999) has, for instance, written an exhaustive account of the origins of the posthuman, which tracks a trend in post-World War II cybernetics whereby it became possible to think of human subjectivity in terms of information patterns across bodies – whether human or technological or both – rather than as some kind of inherent essence.

Many other contemporary theorists are concerned with the role of technology in and alongside the production of popular culture. A key example is the French philosopher Jean Baudrillard, who lamented what he saw as the dissolution of reality itself into a series of copies without originals, or “simulacra.” This was, for Baudrillard, brought about by a postmodern tendency to experience the world through a procession of endlessly reproduced digital images – to the extent that those images undermine and eventually replace the objects they were originally supposed to

represent. The French cultural theorist Paul Virilio has produced work linking the birth of popular cinema to the invention of World War I and II military technologies; other contemporary thinkers, such as the feminist philosopher and cultural theorist Rosi Braidotti (1997), have produced work seeking to understand the emancipatory potential of what are seen as new relationships between humans and their technology.

Working on a more abstract notion of “technology” than we are perhaps used to today, philosopher and social theorist Michel Foucault described how power can be seen to operate within and through society, based on what he called “technologies of the self.” Technologies, for Foucault, were sets of socially enacted practices and techniques through which people police their own behavior. These practices show power to be something not just residing in the hands of a single controlling group or being imposed “from above,” but existing in complex networks and relationships between individuals or groups. Foucault’s work, which covers a great deal of ground and is widely cited in many fields, is of importance to the study of the relationship between technology and popular culture in its abstract and nuanced understanding of the notion of technology’s permeation of that culture.

In addition to these specific approaches, there are larger trends of debate. For instance, throughout these fields there is ongoing controversy over whether it would be considered correct to ascribe too much agency to technologies in their influence on culture when it could also be said that technological developments are the outcome of complex social forces. This argument against “technological determinism” is against the notion that technology somehow develops in a vacuum, at its own speed, and that human society must somehow

“catch up,” leading to cultural changes. Common examples within popular culture involve such technological developments as television and the internet, which have obviously had a great impact on contemporary society, but which may themselves be the results of phenomena of which they are sometimes seen as the cause.

POPULAR CULTURAL TEXTS DEALING WITH TECHNOLOGY

Science fiction is a category of popular culture that often deals with technologies not yet actually in existence, though science-fictional technologies are often extrapolations of existing technologies. For example, robots, androids, cyborgs, and artificial intelligences have been depicted within popular fiction and film for some time – the first widely known example is German director Fritz Lang’s 1927 movie *Metropolis*, a film set in 2026 and heavy with futuristic technology; here, Maria, the young champion of a futuristic underclass, is kidnapped and replaced with a duplicitous robotic copy. More recently, Ridley Scott’s film *Blade Runner* (1982), based on Philip K. Dick’s novella *Do Androids Dream of Electric Sheep?* (1968), tells the story of a man whose job it is to hunt down rogue “replicants” – artificial humanoid life forms so indistinguishable from the “real thing” in appearance, emotion, and memory that the boundary between them and human beings becomes necessarily blurred. *Blade Runner* is widely cited for its use of replicant figures to examine whether anything can ever constitute “authentic” humanity when all aspects previously considered natural can be simulated. Advanced spacecraft that enable interstellar travel are common in science fiction, as are time machines, which provide particularly rich possibilities as narrative devices.

In the 1980s, a genre of fiction called “cyberpunk” emerged, largely in the wake of the 1984 novel *Neuromancer* by William Gibson. Cyberpunk novels often display a dystopian view of a future absorbed by corporate warfare, in which physical augmentation of the human body with advanced technological devices is a fact of everyday life. Cyberpunk tropes have had a lasting impact on popular culture, and turn up frequently in contemporary popular texts. *Neuromancer* itself coined terms now in everyday use such as “cyberspace,” describing a virtual plane that represents a field of digital information, reminiscent (but coined before the widespread proliferation) of the internet. Meanwhile, this proliferation has made the internet an unavoidable feature of cultural texts, as well as a stage for their production and presentation.

Television Studies

SU HOLMES

Television studies is a discipline that seeks to understand and analyze the medium of television, whether at the level of industry, policy, programs, history, or audience. Television was “studied” and analyzed long before the rise of what we now call “television studies,” which emerged in the 1970s and ’80s. It initially consisted of research into television that was prompted by anxiety about its negative influence and perceived social and cultural “effects.” The anxiety over the effects of television was especially apparent in the US, where television (like radio before it) was built upon a commercial framework. A key area of concern – which was certainly also traceable in other national contexts – was the relationship between television and the behavior of children. Emerging from within the social sciences tradition, this approach was informed by quantitative methods of analysis, and by statistical techniques of data interpretation (Allen 2004: 3). In the 1950s and ’60s, during the emergence of the baby boom generation, concerns over juvenile delinquency, as well as the relatively new status of television as a mass medium,

ensured that social science studies devoted considerable attention to the (often negatively perceived) relationship between television and the young.

ORIGINS

Although, in the US context, academic departments began to take an interest in aspects of television in the 1960s, the “effects” research remained the most known and available approach to the analysis of television, and there was little work on the medium that connected with existing arts traditions (literature, history, philosophy, cinema studies, theater) (Allen 2004: 4). But developing university programs in broadcasting or mass communication also had strong links with the commercial broadcasting industry, not least because training students for jobs in the industry was seen as part of their function. This meant that there were close relations between emergent television criticism and the industry, and the agenda of academic work on the medium of television in the 1960s and early 1970s (referred to as “administrative research”) was partly framed by perceptions of what would be of use to broadcasters (Allen 2004: 5).

It is worth sketching out this previous history in order to give sharper definition to the approaches and concerns that began to structure the study of television in the 1970s and ’80s. Unlike scientific or administrative research, this new focus was less interested in anxieties about the perceived social “effects” of television, than in a qualitative approach to questions of representation, interpretation, and pleasure. Although concentrating on the British history, Charlotte Brunsdon lists three major bodies of commentary on television: (1) television journalism; (2) an interest in ideas of authorship (although the writer or the

dramatist, rather than the director, remained the focus for discussion); and (3) an interest in the political economy of television – as placed in a wider context of “the media” – here, interest was focused on nontextual elements such as media ownership, regulation, and public opinion (1998: 99). This list indicates how the study of television drew upon a number of approaches and theoretical frameworks, ranging from traditional Marxist political economy to the representational concerns of film and literary studies.

TELEVISION STUDIES AND POWER

A major strand of television studies has focused on issues of power. For example, Marxist approaches to popular culture have been important here – shaping analyses of television texts, institutions, and audiences. In this regard, it is hard to distinguish television studies from cultural studies, as there was a great deal of cross-fertilization between these spheres. The Marxism taken up by television/cultural studies was a “critical Marxism,” insofar as it aimed to contest what were perceived as the more reductive implications of earlier Marxist approaches to the study of culture. Marx and Engels argued in *The German Ideology* that the ideas of the “ruling class are in every epoch the ruling ideas, i.e. the class which is the ruling material force in society, is the same as the ruling intellectual force” (Marx & Engels 1968: 64). This suggests that those who control the means of economic and cultural production also control the circulation of ideas in society. These “ideas” are often referred to as ideologies – dominant value systems and beliefs that often present themselves as “normal,” “natural,” and “common sense,” but are in fact the product of particular ways of seeing the world.

In earlier television scholarship, there was a tendency to see television as a site of ruling ideological power. But later revisions of Marxism, especially those labeled as neo-Marxist, differed in how they understood the concept of ideology or power. This is important here as it also influenced the study of television. Most famous in this regard is the work of the Italian sociologist Antonio Gramsci who developed the concept of “hegemony.” This concept is not based on the assumption that domination was achieved by the powerful controlling the worldview of the “masses.” Rather, it suggests that the dominant group has to engage in negotiations with opposing groups, classes, and values, and that these negotiations must result in some genuine accommodation (Turner 1996: 194). When applied to popular culture, this lent itself to the idea of a “battleground” on which dominant as well as oppositional values are “mixed” in different permutations (Bennett 1980: 17). This model offered a more flexible and dynamic understanding of cultural production. Furthermore, the focus was no longer specifically on class, and this framework of power was also applied to other fields of analysis, such as gender, sexuality, and ethnicity.

This emphasis on a more complex understanding of power also influenced how the relationship between television and its viewers was conceived. Investigations of the television audience were central to the more visible development of television studies, and a number of analyses were produced within the cultural studies paradigm. In broad terms, these analyses challenged the idea (which still had currency in film studies) that the viewer was locked into a “subject position” offered by the text, which in turn promoted ruling ideologies by making the subject feel himself or herself to be a coherent individual free of all determination by society or history. Furthermore,

unlike the earlier “effects” studies within the social sciences, this research was qualitative rather than quantitative. It was still interested in questions of power, but it did not position television as all-powerful, and the viewer as a “passive” repository of its meanings.

Key interventions were offered by Stuart Hall’s “Encoding/decoding” (1980) and David Morley’s (1980) work on the audience for the British news program, *Nationwide*. Hall emphasized the range of subject positions (or “reading positions”) that might be occupied by the television viewer, while Morley’s study sought to explore this paradigm via empirical research with real audiences. Morley’s interviews with viewers of *Nationwide* revealed a range of interpretations, which correlated – to some degree – with the class identities of the viewers. (So while some were in general agreement with the ideological discourses of the program, others were only in partial agreement, while others rejected the “preferred” meanings on offer.) What is important here is that these studies, along with others in the field, foregrounded the relative “interpretive openness” of television texts, as well as the importance of factors such as ethnicity, class, and gender in understanding how viewers comprehend television.

Insofar as it cut across the interest in power, as well as audience interpretation, it is also important to emphasize the significance of feminist work where television studies is concerned. Although feminist television criticism is not a unified field, early feminist research in the area focused on questions of women’s employment opportunities in television (Brunsdon 1998: 101), but it quickly moved to debate what was seen on screen – with a particular focus on “positive” or “negative” images of women. With the emphasis often on the second category, there came a search for more encouraging or complex representations

of femininity. Key work here includes the study of the American crime series *Cagney and Lacey* (D’Acci 1994), as well as the considerable body of work on television soap opera. The latter was significant in aiming to give serious attention to an often devalued “women’s” form. In dealing with programs aimed at women and which focused on the domestic sphere, it also provided an important counterbalance to what had been an emphasis on primarily “masculine,” “public” genres, such as TV news. Work on soap opera also investigated questions of audience reception, not only by analyzing responses from female soap viewers, but by exploring how the textual form of the genre addressed the rhythm of women’s domestic work (and viewing) in the home (Modleski 1984). The feminist work on soap opera certainly took the pleasures of the form seriously, but it did not simply celebrate soap opera as a “feminist” genre. Rather, feminist work was interested in exploring how the genre recognized women’s cultural experience – even if it did so variously and often problematically. Although soap opera is no longer the prevalent generic focus in television studies it once was, the interest in women’s representation, and women’s reception of women on screen, continues within the discipline (for example, the academic interest in *Sex and the City*).

But the work on soap opera had wider implications for television studies that exceeded the particular concerns of feminist theory. It carved out a space for proper attention to be paid to “popular” television (which gained increasing attention throughout the 1980s). It also contributed to the growing theorization of television *form* – which became another important focus for the discipline. For example, soap opera also became a site to explore and theorize the nature of television narrative, and television’s use of the serial form.

Yet by the end of the 1980s, a number of scholars were voicing anxiety about the increasingly “populist” directions of television studies, although this was less in relation to the texts or genres studied, than with regard to audience response. Following on from the “turn to Gramsci” discussed above, the second half of the 1980s had seen television studies become increasingly interested in how dominant ideologies were resisted or subverted. John Fiske’s work, principally in *Television Culture* (1987), is now seen as representative of this shift, and he opens by explaining that “Programs are produced, distributed and defined by the industry: texts are a product of their readers” (13). In fact, Fiske argued that the motivations of TV producers do not determine how programs are read by viewers. For some critics, this marked a drift into a “critical populism.” Fiske’s work, which analyzed popular drama, TV news, quiz shows, and other forms of television, was accused of offering an uncritical celebration of popular pleasures, of implying a simplistic opposition between dominant and subordinate cultures, and of neglecting the *contexts* in which texts were produced and consumed. Although this debate often simplified Fiske’s work, it did mark an important point in the development of both television and cultural studies. It indicated how it had become increasingly concerned with the circuit of relationships between text and viewer. In contrast to the television of the social sciences, this television was very “textualized”: the focus was on programs, genres, and viewers rather than on questions of industry and economy (Brunsdon 1998: 105).

This usefully indicates how the primary focus of television studies developed (although, as indicated below, that is certainly not to suggest that questions of industry and production are absent in the field). But the emphasis Brunsdon places on the “text”

here should be qualified. This is because, especially when compared to film studies, the close analysis of the text in television studies has, historically, had to jostle for space with an emphasis on audiences and reception, as well as wider questions of power and culture. A textual approach to television describes a method of analysis that focuses on the techniques and forms, but this approach initially had less importance in television studies than other disciplines. Indeed, some of the earliest and most visible work to concentrate on television began with the audience. In comparison, film studies began with the text, and while it invested much attention in the textual construction of the “spectator,” it did not turn to empirical investigations of audience and reception until a later stage. Furthermore, film was studied as an “art” form, whereas when the television text was studied, it was often in terms of ideological analysis and representation. Questions of aesthetics did not have a central place on the agenda – which reflected perceptions of television’s lower cultural value, as well as its more pervasive intertwining with everyday life. However, it is nevertheless crucial to indicate that there emerged a developing body of literature on questions of television form (from the 1970s onwards). This is also important to the formation of television studies as a discipline. After all, if television was to be analyzed and studied, and appropriate theories and methods developed in order to pursue the task, it was important to think about how television was similar to, but also different from, other media forms.

TELEVISION STUDIES AND TELEVISION FORM

John Ellis’s book *Visible Fictions*, first published in 1982, represented a key attempt to

compare television and film, ranging across areas such as image composition, editing, narrative, and sound, as well as broader concepts such as stardom. Ellis also offered an influential theorization of spectatorship/viewership, arguing that while films seek to engage the “gaze” of the spectator, television is based on an economy of the “glance,” and assumes a viewer who is watching only intermittently. Ellis argued that broadcast television had developed particular forms of address to suit the circumstances within which it is used, and he emphasized how the domestic location of television shaped everything from image composition to the use of sound (to ensure “continuity of attention”). Although it has since been suggested that Ellis’s analysis positioned television as the poor relation of film, and that his observations about television are too generalizing and broad, *Visible Fictions* remains an influential intervention in debates about the particular nature of television form.

Other key interventions had already been made in this regard. Raymond Williams’s *Television, Technology and Cultural Form* (1974) had approached television form from a broader perspective, focusing less on shot composition, sound, or editing, than on the wider concept of broadcasting as “planned flow” (86). Williams drew attention here to how television does not operate at the level of discrete texts to the same degree as cinema, nor does it necessarily offer a discrete viewing experience. This has offered a point of departure for many discussions of television form, and the concept of “flow” has been influential in television studies on an international scale. These debates are useful in indicating how the apparent specificities of television form played an important role in the developing study of the medium.

It is also possible to point to a resurgence of interest in television form and aesthetics, and the close analysis of the television text.

For example, we might describe a move away from approaches that use television to study something else (such as images of society, class, or gender) and toward an interest in television as a medium of expression – and programs as specific artworks (see Cardwell 2006: 72). But to suggest that this marks the increasing maturation or “legitimate” acceptance of television studies as an academic discipline is to mirror some of the judgments about popular television that work in the field initially set out to challenge. The growth of interest in television as art has often focused on a rather narrow range of programming (such as “American quality television,” in the form of *The Sopranos*, *Sex and the City*, *24*, *Desperate Housewives*, or *Six Feet Under*). Quiz and game shows, reality TV, soap opera, or daytime magazine programming do not appear to be analyzed as specific artworks. As this makes clear, debates about the popular, and questions of taste and value, persist.

In this regard, the emergence of “fan-scholar” work, in which academics occupy – often openly – the dual position of analyst and fan, raises some interesting questions about discourses of cultural value in television studies. An example here would be the considerable academic interest in the program *Buffy the Vampire Slayer*. With its own online journal (*Slayage: The Online Journal of Buffy Studies*), as well as numerous books, articles, and conferences, the program has been approached by fan-scholars and scholars from a number of different disciplinary and/or theoretical perspectives, including feminism, queer theory, philosophy, fandom, and aesthetics. But even while it is recognized as a subset of television and cultural studies, “Buffy studies” continues to attract derision from outside of the academy (and sometimes from *within* it, given that pervasive scholarly presence). While this might be seen as speaking to the broader

struggle that television studies still faces with regard to securing academic and cultural legitimacy, this particular case study (a “fantastical” text about the goings-on in the “Buffyverse”) is a good example of how the discipline has challenged conventional binaries of “high”/“low” culture, insofar as *Buffy* is now subject to the same kind of detailed intellectual scrutiny once reserved for literature and “art.”

But as in film or literary studies, the concept of genre (often positioned as the antithesis to “art”) has also played a role in approaches to television. Genre comes from the French word meaning “type” or “kind,” and scholars have used genre to further understand the specificities of television (how might television use genre differently from film?), to understand the textual conventions of television programming, to think about audience pleasure, and to explore the medium’s social functions. As this suggests, there are a number of approaches and interests that characterize genre studies in television. Textual approaches would emphasize how genres are constituted by a repertoire of elements – setting, iconography, character types, narrative, and style – as well as by the shared expectations that render a text comprehensible to its viewers (Lacey 2000). Ideological approaches to genre would investigate these elements further in order to think about how genres play out particular themes, oppositions, and concerns that reflect back on the collective unconscious of a society at any one time. For example, crime drama contains the narrative oppositions of “police versus crime,” “law versus rule,” “authority versus technology,” “intuition versus technology,” and “comradeship versus rank” (Lacey 2000: 163). In comparison, quiz shows may play out concerns surrounding intelligence versus luck, achievement versus failure, competition versus cooperation, and individualism versus community.

However, genre studies often grapples with some of the fundamental tensions and problems that surround the idea of genre as a concept. There is always the difficulty of producing an exclusive category or definition that is widely accepted by all, and genres are always changing over time. This fact has also influenced attempts to theorize what is specific to television genre (compared to other media forms). For example, critics have suggested that because television programs do not operate as discrete texts to the same extent as films (they are part of a continuous flow), there is a greater tendency toward mixing multiple genres in a single work. While it might actually be argued that film genres are always – or often – hybrid (see Neale 1990), particular attention has been paid to this idea with regard to television. For example, while *The Royle Family* has been analyzed as a comedy that drew upon a “documentary” look (and *The Office* has been theorized as a new form of comedy *vérité*), programs such as *Sex and the City* and *Ugly Betty* have been described as “dramadies.” Equally, while a medical drama such as the British *Holby City* has increasingly been seen as shifting toward a form of “medicated soap” (insofar as its narrative structures and storylines come to approximate those of soap opera) so a program such as *The X-Files* draws upon the investigative structure of the realist crime genre in conjunction with the more fantastical possibilities of science fiction and horror. Recent shifts in factual programming, as principally associated with the term “reality TV,” have also prompted renewed efforts to analyze television’s relations with genre – which appears to be becoming ever more complex and multifaceted. A program such as *Big Brother*, for example, draws upon the genres of the documentary, the soap opera, the talk show, and the game show – often deliberately foregrounding its apparent hybridity.

Other approaches to television genre, such as a discursive approach, would be more interested in how the material circulating *around* the text (reviews, promotion, fan sites, TV schedules) seeks to position a program's generic identity. This approach would emphasize (among other things) that generic categories are not objective labels, but also work to evaluate texts. For example, while one source might describe the reality-format *Wife Swap* as an "important documentary series," others may describe it as "reality trash" – with very different intentions in mind. Thus, although genre is an important aspect of television studies, it is characterized, like other spheres, by different interests and approaches.

A further framework of analysis where the text is concerned, which is often set in opposition to genre, is that of authorship. Unlike film, which often positions the director as the origin of meaning, television is usually seen as a writer's medium. Writers such as Dennis Potter, Ken Loach, Tony Garnett, Lynda La Plante, and Andrew Davies have all been explored from this perspective, and critics would be interested in analyzing the particular themes, issues, and patterns that may permeate a particular writer's work.

TELEVISION HISTORY

The study of television history has grown considerably since the 1990s, and there has been a very visible interest in television archives. The study of television history can take many forms, and television historians have studied the history of particular genres, the insertion of television into the family home, audience memories of early television, and questions of regulation, policy, and institutional change. Such archival work can involve a range of different methods and draw upon different forms

of evidence. For example, in addition to existing programs, television historians have drawn upon internal memos, scripts, press reviews, and adverts, as well as audience memories. This now parallels the strong archival interest that exists in film studies, but archival documents can be particularly crucial in the study of television history because so little of early programming actually survives. Up until 1955, much of television programming was broadcast live, and still more has not been preserved. This means that television historians may be studying or discussing programs that no longer exist in audiovisual form. Importantly, this is not seen as an "impoverished" compromise, but another way of investigating television history that pays close attention to the evidence available. Detailed analysis of scripts, reviews, production documents, and audience comments provides another way of accessing (and understanding) television's past. Clearly, television histories also have a *national* inflection. British histories, with a particular emphasis on the BBC, have been written under the historical dominance of a public service model – with a particular emphasis on questions of nation, public sphere, or citizenship. In contrast, American histories have assumed a commercial model of broadcasting and the different textual, cultural, and regulatory framework this implies.

This raises a broader point: the study of television history, as well as the wider study of television, is inflected by different national contexts. In addition to the differences noted above, we might point to the study of television in Australia, which (more so than the US or the UK) has been organized around issues of national identity (Allen 2004: 10). National differences persist, but the discipline is increasingly expanding its focus across national borders in order to investigate global or transnational television culture. This in part reflects

the increasing globalization of television itself. With the deregulation of the medium, the expansion of channels, as well as the increasing use of global formats, television is now a much more *transnational* medium compared to previous decades. Studies of international or world television may consider the relationship between the “local” and the “global,” the construction of identity in indigenous television, or national adaptations of the same format. For example, Roy Abhik (1998) has investigated the construction of domesticity and motherhood in Indian television commercials, while Sujata Moorti (2004) has examined the construction of Tamil identity in game shows. Equally, scholars have offered frameworks for analyzing the adaptation of the same format across different cultures – a focus that has been applied to genres such as reality TV, drama, and quiz shows.

But just as it is difficult to provide a simple and generalizing narrative of how television studies came into being, so it is difficult to suggest where it is “now,” and this essay has aimed to offer an insight into the diversity and hybridity of the discipline. Nevertheless, the launching of a new television journal in 2006, *Critical Studies in Television*, offered a snapshot insight into the range of topics and approaches that now characterize the field. Articles include “Some thoughts on television history and historiography: A British perspective” (Lacey 2006), “Production studies” (Messenger Davies 2006), “Quality television” (Nelson 2006), “Television aesthetics” (Cardwell 2006), “The demon section of the card catalogue: *Buffy* studies and television studies” (Wilcox 2006), and “Feminist television criticism: Notes and queries” (McCabe & Akass 2006). Ranging across questions of production, representation, power, history, reception, and aesthetics, this list gives an insight into the contemporary study of television.

Television studies is still seldom offered as a degree subject in its own right, but is often taught jointly with film studies, whether as a straight academic degree, or with a practical component. But the study of television represents a thriving field of intellectual and creative endeavor. It may, of course, be somewhat ironic that just as the study of television is maturing, so the era of broadcast television (on which it was founded) is coming to an end. Yet with its interdisciplinary base, television studies is well positioned to meet the challenge of analyzing the multifaceted nature of television itself.

Thompson, E. P.

DENNIS DWORKIN

E. P. Thompson (1924–93) is among the most influential historians of the second half of the twentieth century. His masterpiece, *The Making of the English Working Class* (1968[1963]), helped define the new social and labor history, which aspired to produce “total history” grounded in a bottom-up or “history from below” perspective. Thompson’s revision of Marxist

class theory, his emphasis on the cultural domain of social life, and his stress on the role of human agency in history inspired more than a generation of historians and influenced sociologists, anthropologists, and cultural theorists. In addition to being a historian, Thompson was a poet and a political activist. He was among the founders of the British New Left in the 1950s and a long-time proponent of nuclear disarmament. A leading figure in the European disarmament movement, he debated Casper Weinberger, Secretary of Defense under President Ronald Reagan, at the Oxford Union in 1984. Thompson’s academic career was spent in working-class adult education, at the University of Leeds, and at the Social History Centre at the University of Warwick, which he helped found in 1968. He resigned from Warwick in 1971, following his critique that the university pandered to the corporate sector, and spent the rest of his life as a political activist and independent scholar.

Following in his brother Frank’s footsteps, Thompson joined the British Communist Party while a Cambridge undergraduate in the 1930s and remained a loyal communist until the “crisis of 1956,” although retrospectively he would see his biography, *William Morris: Romantic to Revolutionary* (1955), as a work of “muffled revisionism.” Following Nikita Khrushchev’s 1956 speech, which admitted to crimes committed by Stalin’s regime, Thompson emerged as the most vocal critic within the party, which he subsequently left, following the Soviet invasion of Hungary in November. In the late 1950s, Thompson helped found the British New Left, a “third away” alternative to communism and social democracy, and was a leading activist in the Campaign for Nuclear Disarmament. Thompson described himself as a socialist humanist, and, with the cultural theorists Stuart Hall and Raymond Williams, he

helped give shape to British cultural Marxism, which emphasized the constitutive role of the cultural realm within the context of material social relations, while insisting upon the centrality of human agency to the making of history.

Thompson's historical writing was deeply influenced by his New Left experience, but it was also part of a tradition of British Marxist historiography, which grew out of the Communist Party's Historians' Group, active between 1946 and 1957. Despite blinders regarding Stalin's regime and the nature of their own party, communist historians openly debated Marxist theory, critically examined historical issues central to British and European history, and conceived of the historical process from the bottom up. Thompson's *The Making of the English Working Class* exemplified this trend. He conceived of the book as an alternative to established labor-history writing, which emphasized early working-class agitation that facilitated the development of the mainstream labor movement. Rejecting such teleological thought, Thompson sought to recover forms of resistance as their creators saw it, to rescue them from the "enormous condescension of posterity."

The Making of the English Working Class was central to contemporary debates on class. Thompson was responding to Labor Party revisionists, for whom postwar changes implied classlessness and an erosion of working-class consciousness. Thompson acknowledged the far-reaching consequences of the transformations and that working-class life was in flux, but he rejected the contention that the changes meant the end of class consciousness and socialism. Another intellectual opponent at whom the book takes aim is orthodox Marxism, which Thompson portrayed as equating working-class people with the productive relations in which they were embedded. Thompson acknowledged that class is founded on

exploitative relations of production. His emphasis, however, was on class consciousness: how these relations "are handled in cultural terms: embodied in traditions, value-systems, ideas, and institutional forms" (1968[1963]: 10). The experience of these relations might be determined but not the cultural handling of them. Class was a process and was relational. Classes changed over time and in relationship to other classes: they were the result rather than the cause of class struggles.

Thompson's original understanding of class was based on the historical case of the formation of the working class. Much of his subsequent historical work concerned eighteenth-century English society prior to the industrial revolution, a time when pronounced forms of class consciousness had yet to materialize. In books such as *Whigs and Hunters* (1975) and *Customs in Common* (1991), he portrayed eighteenth-century popular culture as simultaneously rebellious and conservative. The "people" persistently resisted capitalism, evoking tradition as a means of defending themselves and attacking the landowning class or gentry. Yet they never actually threatened to overthrow the system and accepted the order of things as natural. Thompson viewed this culture in class terms. Subservient groups in the eighteenth century did not develop the class consciousness typical of industrial workers, nor were their political practices attributable only to their role in the productive process: Thompson described this as "class struggle without class." Thompson's theoretical defense of the dynamic process of class struggle in the eighteenth century was indebted to the founder of the Italian Communist Party Antonio Gramsci, whose work was just becoming available in English translation. Thompson used the Gramscian idea of hegemony to understand the power relationships governing eighteenth-century English society.

For the rising generation of young radical scholars and their older associates, whose sympathies lay with the grassroots, student, and countercultural movements of the 1960s, Thompson's *The Making of the English Working Class* had a remarkable impact. This enthusiasm was enhanced by Thompson's own practice as a radical and a scholar, as he was an adult education teacher of working-class students when he wrote the book. In Britain, Thompson's book, and the tradition to which it belonged, were a major inspiration for the History Workshop, founded at Ruskin College, Oxford University in 1966. A group of socialist and feminist historians (created in large part because of the galvanizing efforts of Raphael Samuel), they launched *History Workshop Journal* in 1976. Thompson's book was also influential on the rise of social history in the United States. It is difficult to recall a work in European history that has affected American historians so deeply or so immediately.

Despite the acclaim that Thompson has received, his ideas have often been provocative and controversial. Despite being an early influence on British cultural studies, he was critical of Raymond Williams, whose book *Culture and Society, 1780–1950* (1958), he believed, had suffered from appropriating the language of conservative romantic critics. Where Williams, following T. S. Eliot, viewed culture as “the whole way of life,” Thompson, from a Marxist perspective, thought of it as “the whole way of struggle.” In the mid-1960s, Thompson and Perry Anderson, the editor of *New Left Review*, crossed swords over the trajectory of modern British history, the political potential of the labor movement, the nature of historical practice, and what it meant to be a socialist intellectual. Their exchange represented a confrontation between two intellectual traditions within Marxism. Thompson defended socialist humanism

and the English empirical idiom. Anderson located himself within a more philosophically rooted Western Marxist theoretical tradition. This debate was simultaneously renewed and expanded as a result of the growing influence of Louis Althusser's theoretical practice in Britain in the 1970s. Thompson's powerful polemical assault on Althusser's Marxism, “The poverty of theory” (1978), provided the lightning rod. Thompson masterfully dismantled the crude deterministic elements in Althusser's work. Yet in failing to distinguish those who had critically engaged with Althusser's ideas – for instance, Stuart Hall – from dogmatic Althusserians, he produced false polarities that hindered genuine intellectual exchange. In the debate that ensued, following the publication of Thompson's critique, the relationship between theory and evidence in historical inquiry, the connection between structure and agency in human history, the link between class structure and class consciousness, and the relation between ideology and experience were all intensely discussed.

Since the 1980s, Thompsonian social history has been the subject of widespread debate. Its portrayal of British historical development has been called into question. So also have its theoretical assumptions: the privileging of experience, materialist explanations of political practices, and the centrality of class struggle. Ironically, while the status of Thompson's legacy pervades these critical appraisals, the historiographical debate that most directly confronted it focused on a subject that he himself did not analyze in any real depth – Chartism, the first national working-class movement. The debate was precipitated by Gareth Stedman Jones's pathbreaking essay, “Rethinking Chartism” (1983). For Stedman Jones, the idea that Chartism was a political movement, rooted in social or class grievances, was founded on a problematic notion of the

relationship between society and politics originally formulated by Marx and powerfully developed by Thompson. Drawing on insights from structuralist linguistics, Stedman Jones argued that Chartism, rather than representing the grievances of a class, was part of a much older discourse of political radicalism. In effect, he challenged the very materialist assumptions on which Thompson had based his work. He saw culture and language as autonomous forces in their own right. He argued that discourse, rather than objective class conditions, was responsible for the class politics of the nineteenth and twentieth centuries.

Stedman Jones's critique of Thompsonian history was controversial itself, but it marked the beginning of challenges to Thompson's work on multiple fronts. Feminists, who believed that his narrative of working-class formation assigned women a secondary role, have attacked Thompson. Postcolonial and black radical critics have portrayed him as being Eurocentric and ignoring the relationship between working-class formation and slavery. In later years, Thompson himself seemed to lose some confidence in his earlier positions. In "Agenda for radical history," a talk given at the New School for Social Research published in 1986, Thompson distanced himself from Marxism, suggesting that he was bored by it as a system and regarded its provisional categories as "difficult but still creative concepts," although he still embraced the term "historical materialism." Meanwhile, for younger generations of scholars, no longer as optimistic as those who had been inspired by the Civil Rights Movement or who had demonstrated against American intervention in Vietnam, Thompson's faith in the ability of the oppressed to remake their world has not had the same appeal. One notable exception was the emergence of the South Asian Subaltern Studies Group,

which in numerous monographs sought to reclaim the lives of the oppressed from imperialist narratives. Yet even here, while originally the impetus was (following Thompson) to recover marginalized social groups, Subaltern Studies scholars came to embrace a poststructuralist understanding of the subaltern at odds with the original thrust of Thompsonian social history. They discovered traces of the subaltern in the gaps, recesses, and silences of the historical archives and elitist historiography.

In the end, Thompson remains one of the intellectual giants of his time. There are limits to his thinking, as several types of critics have made clear. But it is difficult not to appreciate his political, intellectual, and scholarly achievement or value just how widespread his influence has been. As *The Making of the English Working Class* approaches its 50th anniversary, E. P. Thompson remains a figure with whom to be reckoned.

V

Visual Studies/Visual Culture/Visual Culture Studies

JOANNE MORRA AND MARQUARD SMITH

Visual culture studies is a contemporary, emerging interdisciplinary field of inquiry that employs a variety of approaches to analyze and interpret visual images. Visual culture studies does not designate a discipline so much as what John Walker and Sarah Chaplin call “a hybrid, an inter- or multi-disciplinary enterprise formed as a consequence of a convergence of, or borrowing from, a variety of disciplines and methodologies” (1997: 1). Visual culture studies borrows from many disciplines in the arts and humanities, such as art history, cultural studies, media studies, literary criticism, feminism, queer studies, postcolonial theory, anthropology, and sociology. As a result of these borrowings or convergences, visual culture studies offers us a variety of interpretive ways of engaging with our past and present visual cultures – including semiotics, Marxism, feminism, historiography, social history, psychoanalysis, queer theory, deconstruction, postcolonial studies, ethnography, and museology. From these interpretive strategies, visual culture studies enables a wider range of analyses. It sustains investigations that are concerned

with the production, circulation, and consumption of images; the changing nature of subjectivity; the ways in which we visualize or reflect upon or represent the world to ourselves; what Irit Rogoff (1998) has called “viewing apparatuses,” which include our ways of seeing and practices of looking, knowing, and doing, and even sometimes our misunderstandings and unsettling curiosity in imagining the as yet unthought.

Sometimes these analyses within visual culture studies are diachronic, marking a broad historical timeframe from the Middle Ages to the present, while at other times they are synchronic studies that consider a singular historical moment from the history of visual culture, and do so within a specific place, places as diverse as territories from Wales to Latin America. And still other works cut across a variety of themes or subject matter such as race, class, gender, and sexuality that have been at the heart of debates in the humanities for four decades, and thus are central to the emergence of visual culture studies as a political and ethical field of study. What this abundance of types of analyses, methodologies, interests, political, and ethical positions attests to is that visual culture studies offers us, in Amelia Jones’s words, “the formation of new interdisciplinary strategies of interpretation” (2003: 2).

These strategies of interpretation are deployed in the analysis of something called “visual culture”: the objects, subjects, media, and environments of the world around us and from the past. This includes all manner of visual culture – from high culture to popular, mass, and subculture, from the elite to the everyday, from the marginal to the mainstream, from the ordinary to the extraordinary. The objects, subjects, media, and environments embraced by visual culture studies can include anything from painting, sculpture, installation, and video art, to photography, film, (terrestrial, cable, satellite) television, the internet, and mobile screenic devices; fashion; medical and scientific imaging; the graphic and print culture of newspapers, magazines, and advertising; the architectural and social spaces of museums, galleries, exhibitions, and other private and public environments of the everyday.

Sometimes the term “visual culture” is employed to characterize a historical period or geographical location such as the visual culture of the Renaissance or Aboriginal visual culture. Sometimes “visual culture” is used to designate a set of thematic individual or community-based concerns around the ways in which politically motivated images are produced, circulated, and consumed both to construct and reinforce, *and* to resist and overthrow, articulations of sexual or racial ontologies, identities, and subjectivities – such as black visual culture or feminist visual culture or lesbian and gay visual culture (Horne & Lewis 1996; Doy 2000; Lloyd 2001). Sometimes “visual culture” marks a theoretical or methodological problematic that can be caught up in epistemological debates, or discussions of knowledge, of what determines our looking, seeing, or viewing practices, and how we can articulate this in terms of questions of disciplinarity, pedagogy, and what constitutes an “object” of visual culture (Jay 1988;

Buck-Morss 1989; Crary 1990; Jay 1993; Melville & Readings 1995; Brennan & Jay 1996; Levin 1997; Wollen & Cooke 1999; Foster 2002).

Interestingly, visual culture studies recognizes most acutely the points where images, objects, subjects, and environments overlap, blur, converge, and mediate one another. The practitioners of this field argue, for instance, that interacting with newspapers or the internet always involves a coming together of text and image, of reading and looking simultaneously; that cinema always comprises sight and sound, viewing and hearing at once; that video phones necessitate a confluence of text (texting), image (photographing/videoing), sound (ring-tones), and touch (the haptic or tactile bond between the user and his or her unit). The theorists and practitioners of visual culture studies recognize, then, that every encounter taking place between a viewer, participant, or user, *and* her or his visual (and multi- or inter-sensory) culture makes it possible to imagine a distinct new starting point for thinking about or doing visual culture studies, as well as a new “object” of visual culture.

In order to understand the complexity of this interdisciplinary field of study, it is important to consider the genealogy of visual culture studies. Inevitably, there are a number of interwoven accounts about the emergence of visual culture studies as a discursive formation.

1 *The search for origins.* Some accounts of visual culture studies do their best to locate the origins of the area of study as specifically as possible, trying, for instance, to identify the person who first used the phrase “visual culture,” and in so doing identify the founding moment of the field. Alternatively, but sometimes simultaneously, accounts seek to identify the earliest historical period to be discussed or described *as* a visual culture.

The two often cited winners of this contest are Michael Baxandall for his *Painting and Experience in Fifteenth-Century Italy* (1972), a social history of style and the period eye, and Svetlana Alpers for *The Art of Describing: Dutch Art in the Seventeenth Century* (1983), a study of seventeenth-century Dutch description, representation, images, appearance, cartography, and visuality. This is all well and good; however, this approach suggests that the “naming” of a field of inquiry necessarily pinpoints the first time a certain kind of interrogation has taken place, or the first time a historical period can be understood as a visual culture. Yet analyses of visual culture were being carried out long before visual culture studies emerged as an academic field of inquiry, and of course our visual culture has itself existed for longer than that.

2 *The return of the “forefathers.”* What is more useful to our minds is not to isolate individuals using the phrase “visual culture” reasonably recently, but rather to follow researchers and academics who have begun to excavate the humanities and visual arts for the writings of earlier generations of scholars and practitioners working in and against a variety of disciplines that has led to the emergence of the study of visual culture as a truly interdisciplinary project. Such visual culture studies scholars *avant la lettre* might include Aby Warburg (*Mnesmosyne Atlas* [c.1925–9]) and Erwin Panofsky, Siegfried Kracauer, Walter Benjamin (*Pas-sagenwerk* [1927–40]), André Malraux (*The Voices of Silence* [c.1950]), Roland Barthes, Raymond Williams, John Berger, and Gerhard Richter (*Atlas* [1961–present]). While calling these scholars and practitioners “forefathers” is meant to be a little facetious, they do nonetheless offer earlier prototypical models or visual cultural practices that form part of the genealogy of visual culture studies, and a series of methodological techniques that are proper to its interdisciplinary nature, its criticality, and its

often awkward arrangement of images, objects, and environments of study.

3 *The practices of pedagogy.* Also useful is an account of the emergence of visual culture studies as a field of inquiry charting its historical development back to the 1970s and 1980s in the university, former polytechnic, adult education, and art and design school sector of the British education system. For instance, former polytechnics in the UK such as Middlesex and Northumbria have been delivering undergraduate degrees in visual culture studies – without being named as such – for over 30 years in some cases. Here, art history, design history, media studies, and studio staff work toward equipping practice-based as well as academic-stream students with the interdisciplinary tools necessary for their craft: to introduce social history, context, and criticality into a consideration of art history and fine art practice; to present students with a history of (not just fine art) images; to furnish them with the resource of a diverse visual archive; and to mobilize practice itself. As a history of visual culture studies that emerges specifically from pedagogical and practice-based imperatives, this is in the main a push to encourage students to think outside of, or past, the tenets of formalism within the discourse of modernism.

4 *The limits of disciplinarity.* Concomitant with this account, another suggests that visual culture studies as a reasonably distinct series of interdisciplinary intellectual practices surfaces around the same time, and that it is brought on by feelings of discontent experienced by academics struggling within art history, design history, comparative literature, and other disciplines in the humanities to become more self-reflexive about their own disciplinary practices. Individuals, clusters of academics, and in some cases whole departments are frustrated by what they feel are the limitations of their own discipline: What subjects and objects can they include in their purview?

What range of critical tools do they have at their disposal, and do they have the wherewithal to wield them? How best to motivate their students in a critical analysis of the historical, conceptual, and aesthetic nature of an ever-changing visual culture? Needing to converse with new visual, tactile, sonic objects of convergence, as well as other spaces and environments – how, for instance, would the discipline of art history deal fully with the intricate and intersensory multivalences of performance art or video art or installation art or site-specific art? – these academics were driven by an impulse if not to break down, then certainly to question established disciplines and to put pressure on existing disciplinary boundaries.

5 *Theorizing between disciplines.* Allied to this is the impact of “theory.” As well as attending to new forms of visual arts practice, along with the emergence of Marxist and feminist “New Art History” in the late 1960s and early 1970s exemplified by the work of T. J. Clark, Linda Nochlin, and Baxandall, scholars began to pay close attention to allied developments in film studies, in particular to semiotics and psychoanalysis. At the same time, they began to integrate the interests of cultural studies – just as cultural studies had drawn on anthropology. For, while questions of class, gender, and race had already been integral to the development of the New Art History, cultural studies offered a series of analogous concerns that paid more obvious attention to the ordinary, the everyday, the popular, and the politics of representation, of difference, power, and grounded cultural practices in ways that reminded us how cultural practices themselves do make a difference. Thus emerged what we might call a visual take on cultural studies. Here visual culture studies, like cultural studies before it, begins to function as an interdiscipline, drawing from existing disciplines and ways of thought, and because of it finding techniques to articulate the objects of visual culture differently.

6 *Conferences and programs.* Still another flashpoint in the development of visual culture studies is the period 1988–9 in which two events took place. The first was a conference on vision and visibility held in 1988 at the Dia Art Foundation in New York. Participants included Norman Bryson, Jonathan Crary, Hal Foster, Martin Jay, Rosalind Krauss, and Jacqueline Rose. The proceeds of this event went on to appear as the influential collection *Vision and Visibility*, edited by Foster (1988). Of this collection, Martin Jay has remarked that its publication “may be seen as the moment when the visual turn . . . really showed signs of turning into the academic juggernaut it was to become in the 1990s [because] a critical mass [began] to come together around the question of the cultural determinants of visual experience in the broadest sense” (2002: 267–8). The second event is the establishment in 1989 of the first US-based graduate program in visual and cultural studies at the University of Rochester, which gave a certain academic and institutional legitimation to visual culture studies (founding staff in the program included Mieke Bal, Bryson, Lisa Cartwright, and Michael Ann Holly).

Offering this account of the recent genealogies of visual culture studies is part of the process of legitimizing it as an academic field of inquiry, a discipline in its own right, or at least as a discursive formation, a site of interdisciplinary activity, a “tactic” or a “movement.” This is necessary because the question of the disciplinary status of visual culture studies matters, and it matters for two reasons in particular. First, because introducing such accounts of the emergence of visual culture studies as a potentially legitimate discipline, as we have done here, makes certain that we are all aware of the fact that it *does* have its own distinct, albeit interwoven, histories that need to be acknowledged and articulated.

For a field of inquiry that is so often accused of ahistoricism, it is imperative to recognize that visual culture studies did not simply appear from nowhere, as if by magic, at some point in, say, the late 1980s, but does in fact have a series of much longer, divergent, and interconnecting genealogies. The status of visual culture studies continues to be hotly contested, and everyone has a different story, her or his own story, to tell about its origins.

Second, if visual culture studies were inaugurated out of frustration in relation to the stifling effects of disciplinary policing and border controls, as a call to look self-reflexively both inwardly toward the limitations of one's own discipline and outwardly to the opportunities made available by others, it can safely be said that it continues to do this, and to productive ends. In working with and against other disciplines and between fields of inquiry, following its counter- or anti-disciplinary impetus, it has led to disciplines questioning their own foundations and imperatives, even as it has also displayed outward hostility toward the prospect of its own conditions of possibility. Perhaps even more importantly, it has found, made even, its own methodologies and its own objects of study. It is a good example of what Barthes says of interdisciplinary study, that it "consists of *creating* a new object *that belongs to no one*" (quoted in Rogoff 1998).

Finally, in bringing this discussion of "disciplinarity" to a close, it is useful to sound a note of concern: in its ongoing and ever more successful search for legitimation, visual culture studies has the potential to become too self-assured, and its devotees too confident. In so doing, it can all too easily lose sight of its drive to worry or problematize other disciplines. It is important to remember to continue plotting a fractious course between disciplines, learning from them and teaching them lessons in

return; and to continue engendering new objects or mobilizing more established things in new ways, by carrying on *doing* the work that it does. Visual culture studies should be careful not to lose, as Mitchell puts it, its "turbulence," its "incoherence," its "chaos," or its "wonder" as an "*indiscipline*": the "anarchist" moment of "breakage or rupture" when "a way of doing things . . . compulsively performs a revelation of its own inadequacy" (Mitchell 1995).

In fact, it is at this point one comes to realize that it is not its disciplinary status that is of interest so much as the prospect that visual culture studies might be a whole new *strategy* for doing research, of seeing and knowing, of outlining our encounters with visual culture, and mining them for meaning, constituting its own objects, subjects, media, and environments of study that belong to no one, as Barthes would have it, *and* that can come into existence, be made, and made sense of only as "a way of doing things" that is particular to visual culture studies (Mitchell 1995: 541). It is in this way that the object of visual culture, and the question of the object *in* visual culture studies, comes into view.

Mitchell's conception of visual culture studies as an *indiscipline* is very appealing. Here, the chance to consider attending to the field of inquiry as "a way of doing things" is fascinating, as is gesturing toward the extent to which studies of visual culture have the potential to, indeed must, make evident their own limitations as a necessary part of their capacity and willingness to comprehend and perform these new "way[s] of doing things." So given the work that visual culture studies *does*, with what objects does it engage and how are they constituted?

Some academics are happy simply for visual culture studies to include an expanded field of vision, an expanded purview, an expanded object domain, to include all things "visual." Others are more attentive

to its particular character. In writing of and on visual culture studies some scholars have returned, explicitly and implicitly, to mull over meticulously the full implications of Barthes's remarks on interdisciplinarity mentioned earlier. Rogoff, for instance, has drawn on Barthes's ideas in thinking of visual culture studies and its interdisciplinarity as "the constitution of a new object of knowledge" (1998: 15). Bal has made similar comments, pointing out that "If the tasks of visual culture studies must be derived from its object, then, in a similar way, the methods most suitable for performing these tasks must be derived from those same tasks, and the derivation made explicit" (2003: 23). Likewise, in suggesting that this field of inquiry has the potential to be an example of interdisciplinarity in an "interesting" sense, James Elkins has suggested that it "does not know its subjects but finds them through its preoccupations" (2002: 30). All of this is to say that, whether we are discussing objects, subjects, media, environments, ways of seeing and practices of looking, the visual, or visuality, visual culture studies as an interdisciplinary field of inquiry has the potential to *create new objects of study*, and it does so specifically by *not determining them in advance*.

What this means is that visual culture studies is not simply "theory" or even "visual theory" in any conventional sense, and it does not simply "apply" theory or visual theory to objects of study. Rather, it is the case that between (1) finding ways of attending to the historical, conceptual, and material specificity of things, (2) taking account of "viewing apparatuses," and (3) our critical encounters with them, the "object" of visual culture studies is born, emerges, is discernible, shows itself, and becomes visible. In these moments of friction, the "object" of visual culture studies comes into view, engendering a way of being, of being meaningful, of being

understood, and even of not being understood, and what the implications of this might be. It is not a matter of *which* objects are "appropriate" or "inappropriate" for visual culture studies, but of how, beginning from the specifics of our visual culture, our preoccupations and encounters with it, and the acts that take place in and by way of visual culture, *none of which are determined in advance*, make it possible for us to focus in discursive ways on visual culture studies as the most fitting, nuanced, and productive means by which to encounter, engage with, and make sense of our visual culture.

W

Weber, Max

ALAN SICA

Karl Emil Maximilian Weber (1864–1920) was one of the most influential German thinkers of the early twentieth century. An important political economist and social historian, he is best known as one of the founders of modern sociology. The first of eight children, Weber was born in Erfurt, now central Germany. His father, Max Weber, Sr., was a lawyer and government magistrate there, who later relocated to Berlin to pursue a notable political career. Weber's mother, Helene Fallenstein, came from a well-established family of international merchants and professionals, and lived an ethically aware and constrained life of Pietist propriety which strongly influenced the ideas of her eldest son. This contrasted sharply with the pragmatic realpolitik that her husband exemplified while helping to shape the new German nation-state. Weber's early life followed the pattern immortalized by Thomas Mann in *Buddenbrooks* (1902), that of the highly educated, monied bourgeoisie with cosmopolitan interests. Surprisingly, until he finished undergraduate school in 1885, Weber did not seem exceptional, having been bored by conventional schooling. Yet his parents' home in Berlin did provide a cultural setting that suited a sickly young man (weakened by

meningitis) with bookish tendencies, since it offered not only enormous "cultural capital," but also a regular stream of notables, political and scholarly, whom Weber got to know personally as he matured, listening in at his parents' social events.

In his twenties, Weber probably accomplished more than any social scientist before or since in the same period of life, not only finishing his required military service and an undergraduate degree in economics and pre-law, but also a law degree (1886), a doctorate in medieval economic history (1889), and a second doctorate in Roman history (1891). More astonishing, though, was the 900-page technical report (1892) that he compiled (from survey data and reports) and wrote for a reformist religious group. This thick volume, entitled "The Condition of Agricultural Workers in Eastern Germany," was recognized as an astonishing performance for a 28-year-old scholar with no formal training in "empirical social science" methods. By analyzing over 600 documents, Weber helped answer a series of pressing questions of wide political interest in Germany, attempting to gauge the influence of Slavic culture and politics on the large agricultural holdings of the *Junker* class. Thus, before the age of 30, Weber had qualified himself to practice law, teach Roman history (a high-status enterprise), teach economic history, and

carry out what would now be regarded as “mainstream” social science via questionnaires and interviews – all to acclaim among the intelligentsia. He was offered a series of coveted academic posts before he was 30, married his first cousin once removed, the feminist scholar Marianne Schnitger, in 1893, and had already been marked as the brightest young star in the German *Geisteswissenschaften* of his day.

Then catastrophe struck, upending his private and public life, yet inspiring him eventually to achieve much more as an intellectual than would likely have been the case without years of introspective suffering. In the summer of 1897 Weber and his father argued with unprecedented passion over his mother’s economic and personal role in the family, and six weeks later, before they could reconcile, Max Sr. died. This event, and exhaustion from a dozen years of unremitting mental labor, led to Weber’s psychological and physical collapse. Between 1898 and 1903, he was unable to lecture, or to read or write anything scholarly, and endured a long catalogue of psychosomatic ailments including chronic insomnia and neuralgia.

Never fully recovering, Weber nevertheless was able to visit the US with his wife for 13 congested weeks of travel in 1904, and partly inspired by this, turned out the two essays that together make up *The Protestant Ethic and the Spirit of Capitalism* (1930 [1904–5]). Weber’s dense text revealed that the steady accumulation of money, the necessary precursor to capitalism, occurred in part in sixteenth-century northern Europe because Protestant religious sects prohibited what Thorstein Veblen in 1899 had called “conspicuous waste.” What upright Protestants earned through trade and manufacturing they were obliged to save and reinvest, or else they risked damnation from an unforgiving God. The Catholic countries of southern Europe did not

operate this way, committing their wealth to art, pageantry, castles, and finery, mainly because their religion allowed for absolution, and did not reward asceticism as a way of life (beyond the nunnery or monastery). It was a short step for Weber to move from this religion-specific observation to a much larger analytic framework called “rationalization processes” which, he argued, characterized the more advanced segments of Western societies. For Weber, the relentless search for more efficient, predictable, and money-saving techniques of production, as well as the more general life-transforming practices that naturally accompanied this mindset, have left a permanent mark on social life in the “advanced” nations for the last several centuries.

These two essays in a small-circulation social science journal set off an international debate that has not yet ceased, producing thousands of books and articles in dozens of languages. Weber removed himself from the heated argument a few years later, but the central question that inspired *The Protestant Ethic* – Why did capitalism first develop in northern Europe, but not elsewhere? – propelled him to take on the single largest solo sociological research project of modern times, perhaps second only to Marx’s *Das Kapital*. Using sources in several languages, and relying on Asian-language experts he knew well, Weber analyzed the major world religions in order to answer this single question. He produced long and detailed articles later turned into books called *The Religion of China*, *The Religion of India*, and *Ancient Judaism*. (His study of Islam focused only on its legal system.) Weber had learned Hebrew for his confirmation classes as a boy, and he put this knowledge to use when studying Judaism. His arguments about the relationship between various belief systems and economic behavior were complex, multifaceted, and innovative. These books have also given rise to entire libraries of commentary

and elaboration, particularly ever since the charge of “Orientalism” was leveled against Western scholars, Weber included, during the 1980s. Yet attacks on Weber’s scholarship have seldom been sustainable, and his sociology of world religions remains a landmark achievement in the study of global cultures.

Almost incidentally, Weber also created the first and still most exacting sociology of music. He studied the piano and music theory, and using these unsociological bases, was able to explain in *The Rational and Social Foundations of Music* (1911) that “rationalization processes” were evident in the Western chromatic system that had not occurred in Arabian or Asian musical forms. This gave European music its unique sound, its harmonic structure, and its use of special instruments, particularly the piano and its precursors. Very few social scientists know enough music theory to delve very far into this small, dense book, but the musicologists who know of it have sung its praises. Once again Weber created a new answer to a very old question: why does Asian music sound so different from European music? He did the same thing by analyzing at length European versus Islamic law in his *Sociology of Law* (like his musical study, part of his larger work, *Economy and Society*). This monograph has recently grown in importance given the supposed “clash of civilizations” that is consuming so much international attention and energy at present.

West, Cornel

TERRENCE TUCKER

Cornel West is one of the most visible and popular African American public intellectuals in the latter half of the twentieth century and the early years of the twenty-first. Born in Tulsa, Oklahoma in 1953, West has been teaching religion and African-American studies at Princeton University since 2008. He has also taught at Union Theological Seminary, Yale University, Harvard University, and the University of Paris. West’s works have ranged from the academic to the political to the pop-cultural. Whether writing about philosophy and Marxism, supporting the presidential campaigns of Bill Bradley, Al Sharpton, or Barack Obama, or recording hip-hop albums (*Sketches of My Culture* [2001] and *Never Forget: A Journey of Revelations* [2007]), West has explicitly advocated for a progressive social justice agenda. In his initial works, West challenged fixed ideas of morality and ideology in an attempt to explore ways of achieving social justice. In *The Ethical Dimensions of Marxist Thought* (1991) he views Marx’s ethical concerns as paramount to his critiques of capitalist exploitation of the working class. He rejects the criticisms of Marx as simultaneously inconsistent and morally nihilistic by embracing the idea of a weak relativism that allows for a shift from one position to another and from one strategy to the next.

He sees this as necessary to move beyond a paralysis that results from a reduction of Marxism to epistemic concerns that fail to seek concrete social change. West attempts to snatch Marx away from those who would relegate Marx's work to the philosophical.

West continues a similar thread in his next book, *The American Evasion of Philosophy* (1989). Tracing the history of pragmatism in America through a variety of philosophers, his discussion situates America as a nation enacting Marx's ideas of relativism in order to achieve concrete change. Moving away from frequent associations of Marxism with communism, West views American pragmatism, because of its own complicated, contradictory tradition, in much the same way he viewed Marx at his best: "American pragmatism is a diverse and heterogeneous tradition. But its common denominator consists of a future-oriented instrumentalism that tries to deploy thought as a weapon to enable more effective action" (1989: 145). West's desire for philosophy to engage political and moral concerns allows him to begin with Ralph Waldo Emerson and to include figures that cut across disciplinary (with theologian Reinhold Niebuhr) and racial (with W. E. B. Du Bois) lines. West situates John Dewey, one of the premier philosophers of the twentieth century, at the center of the book's (and his) pragmatic consciousness. Dewey combines the elements of philosophy, education, and activism that West deems vital to both pragmatism and social change. West's own prophetic pragmatism, a cultural criticism that because of "its roots in the American heritage and its hopes for the wretched of the earth, constitutes the best chance of promoting an Emersonian culture of creative democracy by means of critical intelligence and social action" (1989: 150), combines elements of the figures he studies to maintain America's traditional ability to eschew the trappings of absolutism and

paralysis of epistemology in order to produce a society driven equally by collective deliberation and action.

West cemented his status as a significant public intellectual with the publication of *Race Matters* (1993). This book presents clearly the themes that permeate West's works, namely pragmatism, nihilism, and social justice. For example, in citing an increased spiritual emptiness as the cause for nihilistic threat in black America, West moves philosophy aside in order to view the structural forces that are the cause of nihilism: "Nihilism is to be understood here not as a philosophic doctrine that there are no rational grounds for legitimate standards or authority; it is, far more, the lived experience of coping with a life of horrifying meaninglessness, hopelessness, and (most important) lovelessness" (23). He sees structural forces, alongside the ideological limitations of left- and right-wing policies, forcing the nation into a regression from the gains of the Civil Rights Movement. West centralizes the significance of both lived experience and love. Not surprisingly, he looks beyond the structural and philosophical to argue for the production of a "love ethic" as a necessary element that will sit "at the center of a politics of conversion" and help in the recovery from the reconfiguration of white supremacist hegemony. To be sure, West covers topics from black leadership and conservatism to affirmative action to black sexuality. Yet his desire to both begin and end with a message of love ultimately transcends these individual issues. For West self-love is the key to eliminating the black poverty that affirmative action should seek to diminish; it is also central in ending black bourgeois obsession with white approval as well as bringing to an end the assaults on black women's bodies by black men and the tensions between blacks and Jews. Using Toni Morrison's novel *Beloved* (1987) and the rage of

Malcolm X as the embodiment of his love ethic, West seeks to address the concerns of victimology by black conservatives while promoting a love-driven activism against the forces of white supremacy that recalls the Civil Rights Movement. In arguing that Malcolm X's rage emerges "primarily because of his great love for black people," West posits, "Malcolm believed that if black people felt the love that motivated that rage, the love would produce a psychic conversion in black people; they would affirm themselves as human beings, no longer viewing their bodies, minds, and souls through white lenses, and believing themselves capable of taking control of their own destinies" (1993: 136). West continues and expands his project in *Democracy Matters* (2004), where he discusses nihilism in America and the need for various Christian, Jewish, and Islamic identities as a way to reject religious, cultural, and ideological fundamentalism. Yet it is the need to revive "democratic energies" and to reconnect to America's democratic tradition that occupies the book's attention. In *Democracy Matters* we see the elements that have made West's presence in American critical and popular culture the subject of celebration, criticism, and discourse: a direct challenge to structural and institutional forces; a flexible, nuanced, and politically engaged pragmatism; and a belief in transcendent (if differently defined) ideas of love, faith, and democracy.

Williams, Raymond

ANDREW MILNER

Raymond Williams was a key figure in the early development of British cultural studies and the founder of "cultural materialism," a school of literary and cultural theory often likened, perhaps misleadingly, to American "New Historicism." He was also the single most important intellectual spokesman for the early British New Left. He was a prolific writer, whose work included realist novels and science fiction, television drama and literary criticism, political manifestos and pioneering studies of the mass media, historical philology and high cultural theory. He was born into a Welsh working-class family in Pandy, Monmouthshire in 1921, won a scholarship to grammar school and later a place at Cambridge University, where he studied English. He served in the British Army during World War II, returned to complete his degree, worked in adult education, then as a lecturer and later Professor of Drama at Cambridge. In his last years, he became increasingly sympathetic to Welsh nationalism and radical ecopolitics. He died of a heart attack at Saffron Walden in Essex, England in 1988, and is buried at Clodock in Monmouthshire.

Williams derived much of his initial critical vocabulary from F. R. Leavis, the leading English literary critic of the time, whose lectures he attended at Cambridge. Williams was also a lifelong socialist, however, with an enduring interest in Marxian theory. During the 1950s and early 1960s, he attempted to define a third position, dependent upon

but in contradictory relation to Leavisism and Marxism. The two key texts in this evolution, which together established his intellectual reputation, were *Culture and Society 1780–1950* (1963[1958]) and *The Long Revolution* (1965[1961]). In the late 1960s and the 1970s, his writing ranged widely across the whole field of literary and cultural studies. Work on drama and on television exhibited a growing awareness of the interrelationship between cultural forms and technology, which led him to stress the materiality of what Marxists typically viewed as “ideal” superstructures. He used the term “cultural materialism” to denote a simultaneous break from Marxism’s materialism, which tended to reduce culture to the ideal effects of an economic “base,” and from Leavis’s idealism, which valorized culture as the positive antithesis of material “civilization.” The cumulative effects of this work were registered theoretically in *Marxism and Literature* (1977). In the 1980s, much of Williams’s work centered on an attempt to explain and critique the cultural politics of postmodern late capitalism. The key texts here were *Towards 2000* (1983) and the unfinished, posthumously published *The Politics of Modernism* (1989).

Williams described his “cultural materialism” as “a theory of the specificities of material cultural and literary production within historical materialism” (1977: 5). This entailed two central propositions: that culture itself, in all its aspects, is a social and material process of production; and that the arts are social uses of material means of production. Williams was thus using language normally reserved by Marxism for the economic base to describe what Marxists normally regarded as superstructures. The means of literary production – language, the technologies of writing and of mechanical and electronic communication – were all therefore just as material, and their

uses just as social, as the means of industrial or agricultural production. “These are never superstructural activities,” he wrote: “They are necessarily material production” (93). Williams insisted that cultural materialism was part of “the central thinking of Marxism” (6). But it was certainly not part of what had been previously understood as Marxism and it might more plausibly be seen as part of a wider movement, begun in the 1960s and 1970s, toward new theoretical paradigms that acknowledged the materiality of cultural texts and institutions. The works of Pierre Bourdieu and Michel Foucault are relevant instances. The most distinctive concepts in Williams’s cultural materialism are “selective tradition” and “structure of feeling.” To these, we might also add the distinction between “emergent,” “residual,” and “dominant,” which he introduced into the theory of hegemony originally propounded by the Italian Marxist, Antonio Gramsci.

Tradition had been a key notion in English literary criticism: for Leavis, as for T. S. Eliot, literary and cultural tradition evolved in roughly analogous fashion to the unfolding of a group mind, as something bequeathed to the present by the past. In *Culture and Society*, Williams argued, to the contrary, that tradition was in fact the outcome of a set of interested selections made in the present. A “tradition is always selective,” he wrote, adding that such selection tends to be “governed by the interests of the class that is dominant” (1963[1958]: 307–8). This argument is repeated in *Marxism and Literature*. Here, however, tradition is seen, not only as selective, but also as necessarily dependent upon “identifiable institutions” (1977: 116–17), such as churches, universities, and schools.

Structure of feeling is one of a series of related concepts – discourse, ideology, and world vision are others – used by literary and cultural studies to denote the patterned

“articulation” of different texts and sign-systems. Superstructure doesn’t belong in this series because it suggests relations merely epiphenomenal to a primary reality located elsewhere. Nor does tradition because it denotes a relation of historical sequence, rather than a set of contemporaneous relations. Williams’s formulation is thus neither classically idealist nor classically materialist, but part of a broader movement toward the newly “synthetic” paradigms of the late twentieth century. The term “structure of feeling” appears only occasionally, and in relatively untheorized fashion, in *Culture and Society*, but it is clear that Williams intended it to refer to a more generally common possession than the specifically intellectual content of the selective tradition (1963[1958]: 119).

In *The Long Revolution* Williams uses an analogy with chemistry in the notions of the solution and precipitate, where the former is the whole lived experience and the latter an aspect of the whole subsequently recovered only abstractly. To get the sense of the lived experience, he argues, we need the sense of a further common element, which is the structure of feeling: “as firm and definite as ‘structure’ suggests, yet it operates in the most delicate and least tangible parts of our activity” (1965[1961]: 64). The concept combines a Leavisite sense of experience, or “feeling,” with a Marxist sense of “structure.” These structures of feeling are neither universal nor class specific. Nor are they formally learned, whence follows their often peculiarly generational character. The concept was to prove fruitful, both in Williams’s own work and in the work of other critics. In *Marxism and Literature* it was combined with the theory of hegemony so as to produce a new stress on what Williams termed “pre-emergence.”

Williams’s interest in Gramsci derived from his own attempt to understand how culture could both transcend class and yet

be irredeemably marked by it. In *Marxism and Literature* he argues for the theoretical superiority of Gramscian “hegemony” over both Leavisite notions of “culture” and Marxian notions of “ideology,” on the grounds that it successfully combines a culturalist sense of the wholeness of culture with a Marxist sense of the interestedness of ideology. Like Gramsci himself, but unlike many Gramscians, Williams was primarily concerned with the problem of counter-hegemony. Despite his own attention to hegemonic traditions and institutions, Williams remained insistent that, at the level of “historical” as distinct from “epochal” analysis, that is, at the level of movement rather than system, there is much in any lived culture that cannot be reduced to the dominant (1977: 121).

Williams further historicized the notion of hegemony through the concepts of “dominant” (or hegemonic), “residual,” and “emergent” cultural elements. By “residual” he meant, not the “archaic,” which is wholly recognized as an element of the past, but rather those cultural elements, external to the dominant culture, that nonetheless continue to be lived and practiced as an active part of the present, on the basis of the residue of some previous social and cultural institution. Unlike the archaic, the residual may be oppositional or, at least, alternative in character. Thus Williams distinguishes organized religion and the idea of rural community, which are each predominantly residual, from monarchy, which is merely archaic.

Williams was particularly concerned with the properly “emergent,” genuinely new meanings, values, and practices substantially alternative or oppositional to the hegemonic culture. For Williams, the primary source of an emergent culture is likely to be a new social class. But there is a second source: “alternative perceptions of others, in immediate relationships; new perceptions and

practices of the material world" (1977: 126). He argues that an emergent culture will require not only distinct kinds of immediate cultural practice, but also "new forms or adaptations of forms." Such innovation, he continues, "is in effect a *pre-emergence*, active and pressing but not yet fully articulated" (126). The concept of structure of feeling is brought back into play at this point. Returning to the solution/precipitate metaphor, but significantly reworking it, Williams argues that structures of feeling can be defined as social experiences "in solution," as distinct from other social semantic formations, which have been "precipitated" (133–4). This means they are quite specifically counterhegemonic, just as the selective tradition is typically hegemonic.

The substantive question of the interplay between the emergent or pre-emergent and novelty within the dominant became pressing in his work on postmodernism. He saw late capitalism as effectively collapsing the distinction between minority and mass arts. So modernism, which had once threatened to destabilize the certainties of bourgeois life, had now been transformed into a "post-modernist" establishment, which takes "human inadequacy" as "self-evident." The deep structures of this new post-modernism inform popular culture as "debased forms of an anguished sense of human debasement" (1983: 141–2). The "pseudo-radicalism" of postmodern art is thus neither pre-emergent nor emergent, but rather a moment of novelty within the dominant. Hence, Williams's urgent insistence on the need for an art that will "break out of the non-historical fixity of *post-modernism*" and address itself "to a modern *future* in which community may be imagined again" (1989: 35).

Williams's work was a significant influence on the whole phenomenon of cultural studies and on thinkers as diverse as Edward

Said, Stuart Hall, and Stephen Greenblatt. It informs Terry Lovell's and Janet Wolff's feminism, Nicholas Garnham's work in media studies, and Jonathan Dollimore and Alan Sinfield's work in Renaissance studies. There are followers of Williams in Italy (Eagleton 1989: 95–107), Brazil (Cevasco 2003), and Australia (Jones 2004). But the most significant contemporary figure in this lineage is almost certainly Terry Eagleton, who is himself a former student of Williams.

With more than 300 accessible entries on the important concepts, theorists, and trends in post-1900 literary and cultural theory, *The Encyclopedia of Literary and Cultural Theory* is a highly informative reference work in this multidisciplinary field. The entries provide explanations of complex terms and important theoretical concepts, as well as summaries of the work and ideas of key figures.

Arranged in three volumes, *Literary Theory from 1900 to 1966*, *Literary Theory from 1966 to the Present*, and *Cultural Theory*, the entries cover all aspects of twentieth-century literary and cultural theory from M. H. Abrams to Virginia Woolf, aesthetic theory to Slavoj Žižek, and Tariq Ali to Raymond Williams.

The Wiley-Blackwell Encyclopedia of Literature is a comprehensive, scholarly, authoritative, and critical overview of literature and theory comprising individual titles covering key literary genres, periods, and sub-disciplines. Available both in print and online, this groundbreaking resource provides students, teachers, and researchers with cutting-edge scholarship in literature and literary studies.
